awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

Related Commands [neighbor peer-group \(add a neighbor\) \(BGP and BGP+\)](#)
[neighbor route-map \(BGP and BGP4+\)](#)

neighbor prefix-list (BGP and BGP4+)

Use this command to distribute BGP and BGP4+ neighbor information as specified in a prefix list.

Use the **no** variant of this command to remove an entry.

Syntax [BGP/BGP4+] `neighbor <neighborid> prefix-list <listname> {in|out}`
`no neighbor <neighborid> prefix-list <listname> {in|out}`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code><ipv6-addr></code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><listname></code>	The name of an IP prefix list.
<code>in</code>	Specifies that the IP prefix list applies to incoming advertisements.
<code>out</code>	Specifies that the IP prefix list applies to outgoing advertisements.

Mode [BGP] Router Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use this command to specify a prefix list for filtering BGP or BGP4+ advertisements. Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denials are listed at the top.

The **neighbor distribute-list** command is an alternative to the **neighbor prefix-list** command and only one of them can be used for filtering to the same neighbor in any direction.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 prefix-list list1 in
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 prefix-list list1
in
```

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 prefix-list list1
in
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 prefix-list
list1 in
```

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 prefix-list list1 in
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 prefix-list list1 in
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list list1 deny
                2001:0db8:010d::1/128

awplus(config)# router bgp 10

awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:: prefix-list
                           list1 in
```

```
awplus# configure terminal
awplus(config)# router bgp 10

awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:: prefix-list
                           list1 in
```

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny
                2001:0db8:010d::1/128

awplus(config)# router bgp 10

awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
                           10

awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
                           group1
awplus(config-router-af)# neighbor group1 prefix-list list1 in
```

```
awplus# configure terminal
awplus(config)# router bgp 10

awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 prefix-list list1
                           in
```

Related Commands **ip prefix-list (IPv4 Prefix List)**
 neighbor peer-group (add a neighbor) (BGP and BGP+)
 neighbor route-map (BGP and BGP4+)

neighbor remote-as (BGP and BGP4+)

Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

Syntax [BGP/BGP4+] `neighbor <neighborid> remote-as <as-number>`
`no neighbor <neighborid> remote-as <as-number>`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code>ipv6-addr</code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><as-number></code>	<code><1-4294967295></code> Neighbor's Autonomous System (AS) number.

Mode [BGP/BGP4+] Router Configuration

Usage [BGP/BGP4+] This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

Examples [BGP] To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

Examples [BGP4+] To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-
as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1
remote-as 345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

neighbor remove-private-AS (BGP)

Use this command to remove the private Autonomous System (AS) number from external outbound updates. Use the **no** variant of this command to revert to the default (disabled).

Syntax `neighbor <neighborid> remove-private-AS`
`no neighbor <neighborid> remove-private-AS`

Parameter	Description
<code><neighborid></code>	<code>{<ip-address> <tag>}</code>
<code><ip-address></code>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><tag></code>	Name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor remote-as (BGP and BGP4+) command on page 45.156. When this parameter is used with a command, the command applies on all peers in the specified group.

Default This command is disabled by default.

Mode BGP Router Configuration

Usage The private AS numbers range from <64512-65535>. Private AS numbers are not advertised to the Internet. This command is used with external BGP peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This command removes private AS numbers for BGP in Router Configuration mode. This command is not supported for BGP4+ in IPv6 Address Family Configuration mode. This command removes a private AS number and makes an update packet with a public AS number as the AS path attribute. So only public AS numbers are entered in Internet BGP routing tables, and private AS numbers are not entered in Internet BGP tables.

For the filtering to apply, both peering devices must be set to use either 2-byte or extended 4-byte ASN (with the same ASN type set on both peers). For example, if a device (which defaults to use a 4-byte ASN), is peered with a device that defaults to a 2-byte ASN, then the device using a 2-byte ASN device also needs to be configured with the command **bgp extended-asn-cap** for the filtering to apply.

See the [How to remove private AS numbers for BGP](#) section in the [BGP and BGP4+ Introduction](#) chapter for further information about removing private AS numbers.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.63 remove-private-AS
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.63 remove-private-AS
```

Related Commands [show ip bgp \(BGP\)](#)

neighbor restart-time (BGP and BGP4+)

Use this command to set a different restart-time other than the global restart-time configured using the **bgp graceful-restart** command for BGP and BGP4+.

Use the **no** variant of this command to restore the device to its default state (see the default value of the **bgp graceful-restart** command).

Syntax [BGP/BGP4+] `neighbor <neighborid> restart-time <delay-value>`
`no neighbor <neighborid> restart-time <delay-value>`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code><ipv6-addr></code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP4+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><delay-value></code>	<code><1-3600></code> Delay value in seconds.

Mode [BGP] Router Configuration

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] This command takes precedence over the restart-time value specified using the **bgp graceful-restart** command.

The restart-time value is the maximum time that a graceful-restart neighbor waits to come back up after a restart. The default is 120 seconds.

Make sure that the restart time specified using this command does not exceed the stalepath-time specified in the Router Configuration mode.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 restart-time 45
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

Related Commands [bgp graceful-restart \(BGP and BGP4+\)](#)
[neighbor peer-group \(add a neighbor\) \(BGP and BGP+\)](#)
[neighbor route-map \(BGP and BGP4+\)](#)

neighbor route-map (BGP and BGP4+)

Use this command to apply a route map to incoming or outgoing routes for BGP or BGP4+.

Use the **no** variant of this command to remove a route map from a BGP or BGP4+ route.

Syntax [BGP/BGP4+] `neighbor <neighborid> route-map <mapname> {in|out}`
`no neighbor <neighborid> route-map <mapname> {in|out}`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code>ipv6-addr</code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><mapname></code>	Specifies name of the route-map.
<code>in</code>	Specifies that the access list applies to incoming advertisements.
<code>out</code>	Specifies that the access list applies to outgoing advertisements.

Mode [BGP] Router Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use the **neighbor route-map** command to filter updates and modify attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

Examples [BGP] The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 route-map
rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 route-map
rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named **group1** in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named **group1** in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 route-map rmap2 in
```

Examples [BGP4+] The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv6 address `2001:0db8:010d::1` in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 route-map
rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv6 address `2001:0db8:010d::1` in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 route-
map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named `group1` in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named `group1` in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 route-map rmap2 in
```

Related Commands [address-family \(BGP and BGP4+\)](#)
[neighbor peer-group \(add a neighbor\) \(BGP and BGP+\)](#)
[route-map \(Route Map\)](#)

neighbor route-reflector-client (BGP)

Use this command to configure the router as a BGP route reflector and configure the specified neighbor as its client.

Use the **no** variant of this command to indicate that the neighbor is not a client.

Syntax `neighbor <neighborid> route-reflector-client`
`no neighbor <neighborid> route-reflector-client`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code><peer-group></code> }
<code><ip-address></code>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration or IPv4 Address Family Configuration for a VRF instance

Usage Route reflectors are a solution for the explosion of iBGP peering within an autonomous system. By route reflection the number of iBGP peers within an AS is reduced. Use the **neighbor route-reflector-client** command to configure the local router as the route reflector and specify neighbors as its client.

An AS can have more than one route reflector. One route reflector treats the other route reflector as another iBGP speaker.

In the following configuration, Router1 is the route reflector for clients 3 . 3 . 3 . 3 and 2 . 2 . 2 . 2; it also has a non-client peer 6 . 6 . 6 . 6:

```
Router1#
router bgp 200
neighbor 3.3.3.3 remote-as 200
neighbor 3.3.3.3 route-reflector-client
neighbor 2.2.2.2 remote-as 200
neighbor 2.2.2.2 route-reflector-client
neighbor 6.6.6.6 remote-as 200
```

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72
route-reflector-client
```

```

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
                        route-reflector-client
  
```

neighbor route-server-client (BGP)

Use this command to specify the peer as route server client.

Use the **no** variant of this command to disable this function.

Syntax neighbor <neighborid> route-server-client
 no neighbor <neighborid> route-server-client

Parameter	Description
<neighborid>	{<ip-address> <peer-group>}
<ip-address>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode Router Configuration

Examples

```

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 route-server-client

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
                        route-server-client
  
```

neighbor send-community (BGP and BGP4+)

Use this command to specify that a community attribute should be sent to a BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove the entry for the community attribute.

Syntax [BGP/BGP4+] `neighbor <neighborid> send-community {both|extended|standard}`
`no neighbor <neighborid> send-community {both|extended|standard}`

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
both	Sends Standard and Extended Community attributes. Specifying this parameter with the no variant of this command results in no standard or extended community attributes being sent.
extended	Sends Extended Community attributes. Specifying this parameter with the no variant of this command results in no extended community attributes being sent.
standard	Sends Standard Community attributes. Specifying this parameter with the no variant of this command results in no standard community attributes being sent.

Default [BGP/BGP4+] Both **standard** and **extended** community attributes are sent to a neighbor.

Mode [BGP] Router Configuration

Mode [BGP4+] Router Configuration and IPv6 Address Family Configuration

Usage [BGP/BGP4+] This command is used to specify a community attribute to be sent to a neighbor. The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes the router reannounces them to the neighbor. Only when the **no** parameter is used with this command the community attributes are not reannounced to the neighbor.

By default, both **standard** and **extended** community attributes are sent to a neighbor.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 send-community
extended
```

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 send-community
extended
```

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.72 send-community
extended
```

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.72 send-community
extended
```

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 send-community extended
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
send-community extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
send-community extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
send-community extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
send-community extended
```

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 send-community
extended

awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 send-community
extended
```

[neighbor route-map \(BGP and BGP4+\)](#)

neighbor shutdown (BGP and BGP4+)

Use this command to disable a peering relationship with a BGP or BGP4+ neighbor.

Use the **no** variant of this command to re-enable the BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+] neighbor <neighborid> shutdown
no neighbor <neighborid> shutdown

Parameter	Description
<neighborid>	{<ip-address> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] This command shuts down any active session for the specified BGP or BGP4+ neighbor and clears all related routing data.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

Related Commands [neighbor peer-group \(add a neighbor\) \(BGP and BGP+\)](#)
[neighbor route-map \(BGP and BGP4+\)](#)

neighbor soft-reconfiguration inbound (BGP and BGP4+)

Use this command to configure the switch to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward route filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor. This is so that the full set of the neighbor's updates are available locally to be used in a soft-reconfiguration event.

You may need to apply this older method of clearing routes if the peer does not support route refresh.

Use the **no** variant of this command to disable this function for a BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+] `neighbor <neighborid> soft-reconfiguration inbound`
`no neighbor <neighborid> soft-reconfiguration inbound`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code><ipv6-addr></code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP] Router Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use this command to store updates for inbound soft reconfiguration. Soft-reconfiguration may be used in lieu of BGP route refresh capability. Using this command enables local storage of all the received routes and their attributes. This requires additional memory. When a soft reset (inbound) is done on this neighbor, the locally stored routes are re-processed according to the inbound policy. The BGP neighbor connection is not affected.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10
                        soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10
                        soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.10
                        soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.10
                        soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 soft-reconfiguration
                        inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 soft-reconfiguration
                        inbound
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
                        soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
                        soft-reconfiguration inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
                        10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
                        group1
awplus(config-router-af)# neighbor group1 soft-reconfiguration
                        inbound
```

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router- no neighbor group1
af)# soft-reconfiguration inbound
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor timers (BGP and BGP4+)

Use this command to set the keepalive, holdtime, and connect timers for a specific BGP or BGP4+ neighbor.

Use the **no** variant of this command to clear the timers for a specific BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+]

```
neighbor <neighborid> timers
    {<keepalive> <holdtime>|connect <connect>}
no neighbor <neighborid> timers [connect]
```

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<keepalive>	<0-65535> Frequency (in seconds) at which a router sends keepalive messages to its neighbor. The default is 30 seconds as per RFC 4271. The default Cisco IOS keepalive timer is 60 seconds.
<holdtime>	<0-65535> Interval (in seconds) after which, on not receiving a keepalive message, the router declares a neighbor dead. The default is 90 seconds as per RFC 4271. The default Cisco IOS keepalive timer is 180 seconds. Modify this value as needed for interoperability.
<connect>	connect <1-65535> Specifies the connect timer in seconds. The default connect timer value is 120 seconds as per RFC 4271. Modify this value as needed for interoperability.

Default The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode [BGP] Router Configuration

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router. The holdtime interval is the time the router waits to receive a keepalive message and if it does not receive a message for this period it declares the neighbor dead. The holdtime value must be 3 times the value of the keepalive value.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 timers 60 120
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 timers
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 timers 60 120
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

Examples [BGP4+]

```

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 timers 60
120

```

```

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 timers

```

```

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 timers 60 120

```

```

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers

```

neighbor transparent-as (BGP and BGP4+)

Use this command to specify not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking **neighbor attribute-unchanged (BGP and BGP4+)** and specifying the optional **as-path** parameter.

Syntax [BGP/BGP4+] neighbor <neighborid> transparent-as

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP/BGP4+] Router Configuration

Examples [BGP]

```

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-as

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-as

```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-as

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-as
```

neighbor transparent-nexthop (BGP and BGP4+)

Use this command to keep the nexthop value of the route even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking **neighbor attribute-unchanged (BGP and BGP4+)** and specifying the optional **next-hop** parameter.

Syntax [BGP/BGP4+] neighbor <neighborid> transparent-nexthop

Parameter	Description
<neighborid>	{<ip-address> <ipv6-addr> <peer-group>}
<ip-address>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<ipv6-addr>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<peer-group>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.

Mode [BGP/BGP4+] Router Configuration

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-nexthop

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-nexthop
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-nexthop

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-nexthop
```

neighbor unsuppress-map (BGP and BGP4+)

Use this command to selectively leak more specific routes to a particular BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove selectively leaked specific routes to a particular BGP or BGP4+ neighbor.

Syntax [BGP/BGP4+] `neighbor <neighborid> unsuppress-map <route-map-name>`
`no neighbor <neighborid> unsuppress-map <route-map-name>`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code><ipv6-addr></code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><route-map-name></code>	The name of the route-map used to select routes to be unsuppressed.

Mode [BGP] Router Configuration or Address-Family Configuration for IPv4 unicast

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] When the [aggregate-address \(BGP and BGP4+\)](#) command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use this command instead to selectively leak more-specific routes to a particular neighbor.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 unsuppress-map
mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# neighbor 10.10.0.70 unsuppress-map
mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 unsuppress-map
mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# no neighbor 10.10.0.70 unsuppress-map
mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 unsuppress-map mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 unsuppress-map
mymap
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# neighbor 2001:0db8:010d::1
                           unsuppress-map mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
                           unsuppress-map mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
                           10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
                           group1
awplus(config-router-af)# neighbor group1 unsuppress-map mymap

awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 unsuppress-map
                           mymap
```

Related Commands **aggregate-address (BGP and BGP4+)**
 neighbor peer-group (add a neighbor) (BGP and BGP+)
 neighbor route-map (BGP and BGP4+)

neighbor update-source (BGP and BGP4+)

Use this command to specify the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface. The specified interface is usually the local loopback (10) interface to allow internal BGP or BGP4+ connections to stay up regardless of which interface is used to reach a neighbor.

Use the **no** variant of this command to remove the IPv4 or IPv6 address from the interface as the source IPv4 or IPv6 address of BGP or BGP4+ packets sent to the neighbor, and restores the interface assignment to the closest interface, which is also called the best local address.

Syntax [BGP/BGP4+] `neighbor <neighborid> update-source <interface>`
`no neighbor <neighborid> update-source`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code><ipv6-addr></code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><interface></code>	Specifies the local loopback interface (10).

Default [BGP/BGP4+] Use of this command sets a default value of 2 for the maximum hop count.

Mode [BGP] Router Configuration

Mode [BGP4+] Router Configuration

Usage [BGP/BGP4+] Use this command in conjunction with any specified interface on the router. The local loopback interface is the interface that is most commonly used with this command. The use of local loopback interface eliminates a dependency and BGP or BGP4+ does not have to rely on the availability of a particular interface for making BGP or BGP4+ peer relationships.

Examples [BGP] To source BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit

awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor 10.10.0.72 remote-as 110
awplus(config-router)# neighbor 10.10.0.72 update-source lo
```

To remove BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.72 update-source
```

To source BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit

awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.72 remote-as 100
awplus(config-router)# neighbor 10.10.0.72 peer-group group1
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

Examples [BGP4+] To source BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit

awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
110
awplus(config-router)# neighbor 2001:0db8:010d::1
update-source lo
```

To remove BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
update-source
```

To source BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit

awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-group
group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

Related Commands [neighbor peer-group \(add a neighbor\) \(BGP and BGP+\)](#)
[neighbor route-map \(BGP and BGP4+\)](#)

neighbor version (BGP)

Use this command to configure the switch to accept only a particular BGP version.

Use the **no** variant of this command to use the default BGP version (version 4).

Syntax `neighbor <neighborid> version <version>`

`no neighbor <neighborid> version`

Parameter	Description
<code><neighborid></code>	<code>{<ip-address> <peer-group>}</code>
<code><ip-address></code>	The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP4+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><version></code>	{4} Specifies the BGP version number.

Mode Router Configuration

Usage By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 version 4
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 version 4
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 version
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 version
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

neighbor weight (BGP and BGP4+)

Use this command to set default weights for routes from this BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove a weight assignment.

Syntax [BGP/BGP4+] `neighbor <neighborid> weight <weight>`
`no neighbor <neighborid> weight [<weight>]`

Parameter	Description
<code><neighborid></code>	{ <code><ip-address></code> <code><ipv6-addr></code> <code><peer-group></code> }
<code><ip-address></code>	Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
<code><ipv6-addr></code>	Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X.
<code><peer-group></code>	Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) (BGP and BGP+) command on page 45.148, and neighbor route-map (BGP and BGP+) command on page 45.163. When this parameter is used with this command, the command applies on all peers in the specified group.
<code><weight></code>	<code><0-65535></code> Specifies the weight this command assigns to the route.

Mode [BGP] Router Configuration

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] Use this command to specify a weight value to all routes learned from a BGP or BGP4+ neighbor. The route with the highest weight gets preference when there are other routes on the network.

Unlike the local-preference attribute, the weight attribute is relevant only to the local router.

The weights assigned using the **set weight** command overrides the weights assigned using this command.

Examples [BGP]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 weight 60
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 weight
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 weight 60
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 weight
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 weight 60
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 weight
```

Examples [BGP4+]

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 weight 60
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 weight
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as
10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 peer-
group group1
awplus(config-router-af)# neighbor group1 weight 60
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 weight
```

Related Commands **neighbor peer-group (add a neighbor) (BGP and BGP+)**
neighbor route-map (BGP and BGP4+)

network (BGP and BGP4+)

Use this command to specify particular routes to be advertised into the BGP or BGP4+ routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Note that you can specify a prefix length for the prefix being added, and you can also specify a classful network without a prefix length and an appropriate prefix length is added. Note that specifying a non-classful prefix without a prefix length results in a /32 prefix length on an IPv4 route.

Use the **no** variant of this command to remove a network route entry.

Syntax [BGP] `network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>] [route-map <route-map-name>] [backdoor]`

`no network {<ip-prefix/length>|<ip-network-addr>} [mask <network-mask>][route-map <route-map-name>] [backdoor]`

Syntax [BGP4+] `network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`

`no network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map <route-map-name>]`

Parameter	Description
<code><ip-prefix/length></code>	IP network prefix and prefix length entered in dotted decimal format for the IP network prefix, then slash notation for the prefix length in the format A.B.C.D/M, e.g. 192.168.1.224/27
<code><ip-network-addr></code>	IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224
<code><network-mask></code>	Specify a network mask in the format A.B.C.D, e.g. 255.255.255.224.
<code><ipv6-prefix/length></code>	IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X::X::X/M, e.g. 2001:db8::/64
<code><ipv6-network-addr></code>	IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224
<code><route-map-name></code>	Specify the name of the route map.
<code>backdoor</code>	Specify a BGP backdoor route that is not advertised.

Mode [BGP] Router Configuration and IPv4 Address Family [`ipv4 unicast`] mode

Mode [BGP4+] IPv6 Address Family Configuration

Usage [BGP/BGP4+] It does not matter how the route is arranged in the IP or IPv6 routing table. The route can arrive in the IP routing table by a static route, or the route can be learnt from OSPF or OSPFv3 or RIP or RIPv6 routing.

If you configure a route-map, then that route-map will be used in filtering the network, or the route-map will be used to modify the attributes that are advertised with the route.

Example [BGP] The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 will be internally derived, that is, 2.0.0.0/8.

```
awplus(config)# router bgp 100
awplus(config-router)# network 2.0.0.0
```

Output [BGP] **Figure 45-1: Example output from the show running-config command after entering network 2.0.0.0**

```
awplus#show running-config
!
router bgp 100
 network 2.0.0.0/8
!
```

Example [BGP] The following example illustrates a network address which does not fall into its natural class boundary, and hence, is perceived as a host route, that is, 192.0.2.224/27.

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224 mask 255.255.255.224
```

Output [BGP] **Figure 45-2: Example output from the show running-config command after entering network 192.0.2.224 mask 255.255.255.224**

```
awplus#show running-config
!
router bgp 100
 network 192.0.2.224/27
!
```

Example [BGP] The following example is the same as the previous example for host route 192.0.2.224/27, but is entered in prefix/length format using slash notation (instead of prefix plus mask in dotted decimal format using the **mask** keyword before the network mask in dotted decimal format):

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224/27
```

Output [BGP] **Figure 45-3: Example output from the show running-config command after entering network 192.0.2.224/27**

```
awplus#show running-config
!
router bgp 100
  network 192.0.2.224/27
!
```

Example [BGP4+] The following example is the same as the previous example for host route 2001:db8::/32:

```
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# network 2001:db8::/32
```

Output [BGP4+] **Figure 45-4: Example output from the show running-config command after entering network 2001:db8::/32**

```
awplus#show running-config
!
router bgp 100
  address-family ipv6
    network 2001:db8::/32
!
```

network synchronization (BGP and BGP4+)

Use this command to ensure the exact same static network prefix, specified through any of the **network** commands, is local or has IGP reachability before introduction to BGP or BGP4+.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+] network synchronization
no network synchronization

Default [BGP/BGP4+] Network synchronization is disabled by default.

Mode [BGP] Router Configuration and IPv4 Address Family [ipv4 unicast] Configuration

Mode [BGP4+] IPv6 Address Family [ipv6 unicast] Configuration

Examples [BGP] The following example enables IGP synchronization of BGP static network routes in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv4-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# network synchronization
```

Example [BGP4+] The following example enables IGP synchronization of BGP4+ static network routes in the IPv6-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# network synchronization
```

redistribute (into BGP or BGP4+) (BGP and BGP4+)

Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

Syntax [BGP/BGP4+]

```
redistribute {ospf|rip|connected|static} [route-map <route-map-entry-pointer>]
no redistribute {ospf|rip|connected|static} [route-map <route-map-entry-pointer>]
```

Parameter	Description
connected	Specifies the redistribution of connected routes for both BGP and BGP4+.
ospf	Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+.
rip	Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+.
static	Specifies the redistribution of Static routes for both BGP and BGP4+.
route-map	Route map reference for both BGP and BGP4+.
<route-map-entry-pointer>	Pointer to route-map entries.

Mode [BGP] Router Configuration

Mode [BGP4+] Router Configuration or IPv6 Address Family Configuration

Usage [BGP/BGP4+] Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

Examples [BGP/BGP+] The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface vlan1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the `redistribute route-map` command allows you to filter which routes are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

restart bgp graceful (BGP)

Use this command to force the switch to perform a graceful BGP restart.

Syntax `restart bgp graceful`

Mode Privileged Exec

Usage Before using this command, BGP graceful-restart capabilities must be enabled within the router BGP ([bgp graceful-restart \(BGP and BGP4+\) command on page 45.32](#)), and each neighbor configured on the device should be set to advertise its graceful-restart capability ([bgp graceful-restart graceful-reset \(BGP and BGP4+\) command on page 45.34](#)). The neighbor devices also need to have BGP graceful-restart capabilities enabled ([bgp graceful-restart \(BGP and BGP4+\) command on page 45.32](#)).

This command stops the whole BGP process and makes the switch retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all the address families received in the Graceful Restart Capability exchange.

When a **restart bgp graceful** command is issued, the BGP configuration is reloaded from the last saved configuration. Ensure you first issue a **copy running-config startup-config**.

Example

```
awplus# restart bgp graceful
```

Related Commands [bgp graceful-restart \(BGP and BGP4+\)](#)
[bgp graceful-restart graceful-reset \(BGP and BGP4+\)](#)

router bgp (BGP and BGP4+)

Use this command to configure a BGP routing process, specifying the 32-bit Autonomous System (AS) number.

Use the **no** variant of this command to disable a BGP routing process, specifying the 32-bit AS number.

Syntax `router bgp <asn>`
`no router bgp <asn>`

Parameter	Description
<asn>	<1-4294967295> Specifies the 32-bit Autonomous System (AS) number.

Mode Global Configuration

Usage The **router bgp** command enables a BGP routing process:

```
router bgp 1
  neighbor 10.0.0.1 remote-as 1
  neighbor 10.0.0.2 remote-as 1
  !
router bgp 2
  neighbor 10.0.0.3 remote-as 2
  neighbor 10.0.0.4 remote-as 2
```

Examples

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)#
```

```
awplus# configure terminal
awplus(config)# no router bgp 12
awplus(config)#
```

route-map (Route Map)

Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The switch uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

Syntax `route-map <mapname> {deny|permit} <seq>`
`no route-map <mapname>`
`no route-map <mapname> {deny|permit} <seq>`

Parameter	Description
<code><mapname></code>	A name to identify the route map.
<code>deny</code>	The route map causes a routing process to discard matching routes or BGP update messages.
<code>permit</code>	The route map causes a routing process to use matching routes or BGP update messages.
<code><seq></code>	<code><1-65535></code> The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

Mode Global Configuration

Usage Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

Examples To enter route-map mode for entry 1 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

Related Commands

- show route-map (Route Map)**

set as-path (Route Map)

Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

Syntax `set as-path prepend <1-65535> [<1-65535>]...`
`no set as-path prepend [<1-65535> [<1-65535>]...]`

Parameter	Description
<code>prepend</code>	Prepends the autonomous system path.
<code><1-65535></code>	The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces.

Mode Route-map mode

Usage Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

Related Commands [match as-path \(Route Map\)](#)
[route-map \(Route Map\)](#)
[show route-map \(Route Map\)](#)

set community (Route Map)

Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

Syntax

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}

no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}

set community none

no set community none
```

Parameter	Description
<1-65535>	The AS number of the community as an integer not in AA:NN format.
AA:NN	The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA (www.iana.org) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator.
local-AS	The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).
internet	The community of routes that can be advertised to all BGP peers.
no-advertise	The community of routes that must not be advertised to other BGP peers.
no-export	The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).
none	The device removes the community attribute from matching update messages.
additive	The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Examples To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

Related Commands [match community \(Route Map\)](#)
[route-map \(Route Map\)](#)

show bgp ipv6 (BGP4+)

Use this command to display BGP4+ network information for a specified IPv6 address.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 <ipv6-addr>`

Parameter	Description
<code><ipv6-addr></code>	Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 2001:0db8:010d::1
```

Related Commands [show bgp ipv6 longer-prefixes \(BGP4+\)](#)

show bgp ipv6 community (BGP4+)

Use this command to display routes that match specified communities within an IPv6 environment. Use the [show ip bgp community \(BGP\)](#) command within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

You may use any combination and repetition of parameters listed in the `<type>` placeholder.

Syntax `show bgp ipv6 community [<type>] [exact-match]`

Parameter	Description
<code><type></code>	<code>{[AA:NN][local-AS][no-advertise][no-export]}</code>
<code>AA:NN</code>	Specifies the Autonomous System (AS) community number, in AA:NN format.
<code>local-AS</code>	Do not send outside local Autonomous Systems (well-known community).
<code>no-advertise</code>	Do not advertise to any peer (well-known community).
<code>no-export</code>	Do not export to next AS (well-known community).
<code>exact-match</code>	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

Mode User Exec and Privileged Exec

Examples Note that the AS numbers shown are examples only.

```
awplus# show bgp ipv6 community 64497:64499 exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
exact-match
awplus# show bgp ipv6 community 64497:64499 64500:64501
no-advertise 64510:64511
awplus# show bgp ipv6 community no-advertise no-advertise
no-advertise exact-match
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise local-AS no-export
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show bgp ipv6 community no-export 64497:64499
no-advertise local-AS no-export
```

Related Commands [show ip bgp community \(BGP\)](#)

show bgp ipv6 community-list (BGP4+)

Use this command to display routes that match the given community-list within an IPv6 environment. Use the [show ip bgp community-list \(BGP\)](#) command within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 community-list <listname> [exact-match]`

Parameter	Description
<code><listname></code>	Specifies the community list name.
<code>exact-match</code>	Displays only routes that have exactly the same specified communities.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 community-list mylist exact-match
```

Related Commands [show ip bgp community-list \(BGP\)](#)

show bgp ipv6 dampening (BGP4+)

Use this command to show dampened routes from a BGP4+ instance within an IPv6 environment. Use the [show ip bgp dampening \(BGP\)](#) command to show dampened routes from a BGP instance within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 dampening {dampened-paths|flap-statistics|parameters}`

Parameter	Description
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.
parameters	Display details of configured dampening parameters.

Mode User Exec and Privileged Exec

Usage Enable BGP4+ dampening to maintain dampened-path information in memory.

Examples

```
awplus# show bgp ipv6 dampening dampened-path
```

```
awplus# show bgp ipv6 dampening flap-statistics
```

```
awplus# show bgp ipv6 dampening parameter
```

Related Commands [show ip bgp dampening \(BGP\)](#)

show bgp ipv6 filter-list (BGP4+)

Use this command to display routes conforming to the filter-list within an IPv6 environment. Use the [show ip bgp filter-list \(BGP\)](#) command to display routes conforming to the filter-list within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 filter-list <listname>`

Parameter	Description
<listname>	Specifies the regular-expression access list name.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 filter-list mylist
```

Related Commands [show ip bgp filter-list \(BGP\)](#)

show bgp ipv6 inconsistent-as (BGP4+)

Use this command to display routes with inconsistent AS Paths within an IPv6 environment. Use the [show ip bgp inconsistent-as \(BGP\)](#) command to display routes with inconsistent AS paths within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 inconsistent-as`

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 inconsistent-as
```

Related Commands [show ip bgp inconsistent-as \(BGP\)](#)

show bgp ipv6 longer-prefixes (BGP4+)

Use this command to display the route of the local BGP4+ routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 <ipv6-addr/prefix-length> longer-prefixes`

Parameter	Description
<code><ipv6-addr/prefix-length></code>	Specifies the IPv6 address with prefix length. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 2001:0db8::/64 longer-prefixes
```

Related Commands [show bgp ipv6 \(BGP4+\)](#)

show bgp ipv6 neighbors (BGP4+)

Use this command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment. Use the [show ip bgp neighbors \(BGP\)](#) to display detailed information on peering connections to all BGP neighbors within an IPv4 environment. See the [Usage](#) section about what you can verify using this command.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 neighbors [<ipv6-addr> [advertised-routes|received prefix-filter|received-routes|routes]]`

Parameter	Description
<code><ipv6-addr></code>	Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X.
<code>advertised-routes</code>	Displays the routes advertised to a BGP4+ neighbor.
<code>received prefix-filter</code>	Displays received prefix-list filters.
<code>received-routes</code>	Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP4+ soft reconfigure first.
<code>routes</code>	Displays all accepted routes learned from neighbors.

Mode User Exec and Privileged Exec

Usage You can verify many of the BGP4+ settings using this command:

- [show bgp ipv6 neighbors session information:](#)
- [show bgp ipv6 neighbors IPv6 unicast address family information:](#)
- [show bgp ipv6 neighbors connection information:](#)

show bgp ipv6 neighbors session information:

- Neighbor address, ASN information and if the link is external or internal
- BGP version and status
- Neighbor capabilities for the BGP session
- Number of messages transmitted and received

show bgp ipv6 neighbors IPv6 unicast address family information:

- BGP4+ table version
- IPv6 Address Family dependant capabilities
- IPv6 Communities
- IPv6 Route filters for ingress and egress updates
- Number of announced and accepted IPv6 prefixes

show bgp ipv6 neighbors connection information:

- Connection counters
- Graceful restart timer
- Hop count to the peer
- Next hop information
- Local and external port numbers

Examples [BGP4+]

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1
advertised-routes

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received
prefix-filter

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1
received-routes

awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 routes
```

Output **Figure 45-5: Example output from the show bgp ipv6 neighbors 2001:db8:b::1 command**

```
awplus#show bgp ipv6 neighbors 2001:db8:b::1
BGP neighbor is 2001:db8:b::1, remote AS 200, local AS 100, external link
  BGP version 4, remote router ID 2.2.2.1
  BGP state = Established, up for 01:03:26
  Last read 01:03:26, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    4-Octet ASN Capability: advertised and received
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 157 messages, 0 notifications, 0 in queue
  Sent 228 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
  Update source is lo
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 2, Offset 0, Mask 0x4
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

For address family: IPv6 Unicast
  BGP table version 66, neighbor version 66
  Index 2, Offset 0, Mask 0x4
  AF-dependant capabilities:
    Graceful restart: advertised, received

  Community attribute sent to this neighbor (both)
  Default information originate, default sent
  Inbound path policy configured
  Incoming update prefix filter list is *BGP_FILTER_LIST
  Route map for incoming advertisements is *BGP_LOCAL_PREF_MAP
  8 accepted prefixes
  8 announced prefixes

Connections established 1; dropped 0
Graceful-restart Status:
  Remote restart-time is 90 sec

  External BGP neighbor may be up to 2 hops away.
  Local host: 2001:db8:a::1, Local port: 179
  Foreign host: 2001:db8:b::1, Foreign port: 50672
  Nexthop: 1.1.1.1
  Nexthop global: 2001:db8:a::1
  Nexthop local: ::
  BGP connection: non shared network
```

Related Commands **show ip bgp neighbors (BGP)**

show bgp ipv6 paths (BGP4+)

Use this command to display BGP4+ path information within an IPv6 environment. Use the [show ip bgp paths \(BGP\)](#) command to display BGP path information within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 paths`

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 paths
```

Related Commands [show ip bgp paths \(BGP\)](#)

show bgp ipv6 prefix-list (BGP4+)

Use this command to display routes matching the prefix-list within an IPv6 environment. Use the [show ip bgp prefix-list \(BGP\)](#) command to display routes matching the prefix-list within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 prefix-list <list>`

Parameter	Description
<code><list></code>	Specifies the name of the IPv6 prefix list.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 prefix-list mylist
```

Related Commands [show ip bgp prefix-list \(BGP\)](#)

show bgp ipv6 quote-regexp (BGP4+)

Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp quote-regexp \(BGP\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 quote-regexp <expression>`

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 quote-regexp myexpression
```

Related Commands [show ip bgp quote-regexp \(BGP\)](#)

show bgp ipv6 regexp (BGP4+)

Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the [show ip bgp regexp \(BGP\)](#) command to display routes matching the AS path regular expression within an IPv4 environment.

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 regexp <expression>`

Parameter	Description
<i><expression></i>	Specifies a regular-expression to match the BGP4+ AS paths.

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 regexp myexpression
```

Related Commands [show ip bgp regexp \(BGP\)](#)

show bgp ipv6 route-map (BGP4+)

Use this command to display BGP4+ routes that match the specified route-map within an IPv6 environment. Use the [show ip bgp route-map \(BGP\)](#) command to display BGP routes that match the specified route-map within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 route-map <route-map>`

Parameter	Description
<code><route-map></code>	Specifies a route-map that is matched.

Mode User Exec and Privileged Exec

Example To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show bgp ipv6 route-map myRouteMap
```

Related Commands [show ip bgp route-map \(BGP\)](#)

show bgp ipv6 summary (BGP4+)

Use this command to display a summary of a BGP4+ neighbor status within an IPv6 environment. Use the [show ip bgp summary \(BGP\)](#) command to display a summary of a BGP neighbor status within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show bgp ipv6 summary`

Mode User Exec and Privileged Exec

Example

```
awplus# show bgp ipv6 summary
```

Related Commands [show ip bgp summary \(BGP\)](#)

show bgp nexthop-tracking (BGP)

Use this command to display BGP nexthop-tracking status.

Syntax `show bgp nexthop-tracking`

Mode User Exec and Privileged Exec

Example To display BGP nexthop-tracking status, use the command:

```
awplus# show bgp nexthop-tracking
```

Related Commands [bgp nexthop-trigger-count \(BGP and BGP4+\)](#)
[show bgp nexthop-tree-details \(BGP\)](#)

show bgp nexthop-tree-details (BGP)

Use this command to display BGP nexthop-tree-details.

Syntax `show bgp nexthop-tree-details`

Mode User Exec and Privileged Exec

Example To display BGP nexthop-tree-details, use the command:

```
awplus# show bgp nexthop-tree-details
```

Related Commands [show bgp nexthop-tracking \(BGP\)](#)

show bgp memory maxallocation (BGP)

This command displays the maximum percentage of total memory that is allocated to BGP processes.

For information on output options, see [“Controlling “show” Command Output” on page 45.6](#).

Syntax `show bgp memory maxallocation`

Mode User Exec and Privileged Exec

Example To display the maximum amount of memory allocated for BGP processes, use the command:

```
awplus# show bgp memory maxallocation
```

Output [Figure 45-6: Example output from the show bgp memory maxallocation command](#)

```
BGP maximum RAM allocation is 100%
```

show debugging bgp (BGP)

Use this command to display the BGP debugging option set.

For information on output options, see [“Controlling “show” Command Output” on page 45.6](#).

Syntax `show debugging bgp`

Mode User Exec and Privileged Exec

Example

```
awplus# show debugging bgp
```

Output **Figure 45-7: Example output from the show debugging bgp command**

```
BGP debugging status:
  BGP debugging is on
  BGP events debugging is on
  BGP updates debugging is on
  BGP fsm debugging is on
```

Related Commands [debug bgp \(BGP\)](#)

show ip bgp (BGP)

Use this command to display BGP network information.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp [<ip-addr>|<ip-addr/m>]`

Parameter	Description
<ip-addr>	Specifies the IPv4 address and the optional prefix mask length.
<ip-addr/m>	

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp 10.10.1.34/24
```

Output **Figure 45-8: Example output from the show ip bgp command**

```
BGP table version is 7, local router ID is 80.80.80.80

```

show ip bgp community (BGP)

Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community \(BGP4+\)](#) command within an IPv6 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

You may use any combination and repetition of parameters listed in the `<type>` placeholder.

Syntax `show ip bgp community [<type>] [exact-match]`

Parameter	Description
<code><type></code>	<code>{[AA:NN][local-AS][no-advertise][no-export]}</code>
<code>AA:NN</code>	Specifies the Autonomous System (AS) community number, in AA:NN format.
<code>local-AS</code>	Do not send outside local Autonomous Systems (well-known community).
<code>no-advertise</code>	Do not advertise to any peer (well-known community).
<code>no-export</code>	Do not export to next AS (well-known community).
<code>exact-match</code>	Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated.

Mode User Exec and Privileged Exec

Examples Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match
awplus# show ip bgp community 64497:64499 64500:64501
no-advertise 64510:64511
awplus# show ip bgp community no-advertise no-advertise
no-advertise exact-match
awplus# show ip bgp community no-export 64510:64511
no-advertise local-AS no-export
awplus# show ip bgp community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show ip bgp community no-export 64497:64499
no-advertise local-AS no-export
```

Related Commands [set community \(Route Map\)](#)
[show bgp ipv6 community \(BGP4+\)](#)

show ip bgp community-info (BGP)

Use this command to list all BGP community information.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp community-info`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp community-info
```

show ip bgp community-list (BGP)

Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 community-list \(BGP4+\)](#) command within an IPv6 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp community-list <listname> [exact-match]`

Parameter	Description
<code><listname></code>	Specifies the community list name.
<code>exact-match</code>	Displays only routes that have exactly the same specified communities.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp community-list mylist exact-match
```

Related Commands [show bgp ipv6 community-list \(BGP4+\)](#)

show ip bgp dampening (BGP)

Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the [show bgp ipv6 dampening \(BGP4+\)](#) command within an IPv6 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp dampening {dampened-paths|flap-statistics|parameters}`

Parameter	Description
dampened-paths	Display paths suppressed due to dampening.
flap-statistics	Display flap statistics of routes.
parameters	Display details of configured dampening parameters.

Mode User Exec and Privileged Exec

Usage Enable BGP dampening to maintain dampened-path information in memory.

Examples

```
awplus# show ip bgp dampening dampened-paths
```

Output **Figure 45-11: Example output from the show ip bgp dampening command**

```
dampening 15 750 2000 60 15
Reachability Half-Life time      : 15 min
Reuse penalty                    : 750
Suppress penalty                 : 2000
Max suppress time                : 60 min
Un-reachability Half-Life time   : 15 min
Max penalty (ceil)               : 11999
Min penalty (floor)              : 375
```

The following example output shows that the internal route (i), has flapped 3 times and is now categorized as history (h).

Figure 45-12: Example output from the show ip bgp dampening flap-statistics command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      From          Flaps  Duration  Reuse    Path
hi1.1.1.0/24 10.100.0.62      3     00:01:20  i
```

The following example output shows a dampened route in the 1.1.1.0/24 network.

Figure 45-13: Example output from the show ip bgp dampening dampened-path command

```
awplus# show ip bgp dampening dampened-paths
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          From             Reuse           Path
di 1.1.1.0/24      10.100.0.62      00:35:10       i

Total number of prefixes 1
```

Related Commands [show bgp ipv6 dampening \(BGP4+\)](#)

show ip bgp filter-list (BGP)

Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the [show bgp ipv6 filter-list \(BGP4+\)](#) command to display routes conforming to the filter-list within an IPv6 environment

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp filter-list <listname>`

Parameter	Description
<listname>	Specifies the regular-expression access list name.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp filter-list mylist
```

Related Commands [show bgp ipv6 filter-list \(BGP4+\)](#)

show ip bgp inconsistent-as (BGP)

Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the [show bgp ipv6 inconsistent-as \(BGP4+\)](#) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp inconsistent-as`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp inconsistent-as
```

Related Commands [show bgp ipv6 inconsistent-as \(BGP4+\)](#)

show ip bgp longer-prefixes (BGP)

Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp <ip-address/m> longer-prefixes`

Parameter	Description
<code><ip-address/m></code>	Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M. Where M is the subnet mask length.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
```

show ip bgp neighbors (BGP)

Use this command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment. Use the **show bgp ipv6 neighbors (BGP4+)** to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment. See the **Usage** section about what you can verify using this command.

For information on output options, see **“Controlling “show” Command Output” on page 45.6.**

Syntax [BGP] `show ip bgp neighbors [<ipv4-addr> [advertised-routes|received prefix-filter|received-routes|routes]]`

Parameter	Description
<ipv4-addr>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.
advertised-routes	Displays the routes advertised to a BGP neighbor.
received prefix-filter	Displays the received prefix-list filters.
received-routes	Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP soft reconfigure first.
routes	Displays all accepted routes learned from neighbors.

Mode [BGP] User Exec and Privileged Exec

Usage [BGP] You can verify many of the BGP settings using this command:

- **show bgp ip neighbors session information:**
- **show bgp ip neighbors IPv4 unicast address family Information:**
- **show bgp ip neighbors connection information:**

show bgp ip neighbors session information:

- Neighbor address, ASN information and if the link is external or internal
- BGP version and status
- Neighbor capabilities for the BGP session
- Number of messages transmitted and received

show bgp ip neighbors IPv4 unicast address family Information:

- BGP table version
- IPv4 Address Family dependant capabilities
- IPv4 Communities
- IPv4 Route filters for ingress and egress updates
- Number of announced and accepted IPv4 prefixes

show bgp ip neighbors connection information:

- Connection counters
- Graceful restart timer
- Hop count to the peer
- Next hop information
- Local and external port numbers

Examples [BGP]

```
awplus# show ip bgp neighbors 10.10.10.72 advertised-routes
awplus# show ip bgp neighbors 10.10.10.72 received
prefix-filter
awplus# show ip bgp neighbors 10.10.10.72 received-routes
awplus# show ip bgp neighbors 10.10.10.72 routes
```

Output **Figure 45-14: Example output from the show ip bgp neighbors 10.10.10.72 command**

```
awplus#show ip bgp neighbors 10.10.10.72
BGP neighbor is 10.10.10.72, remote AS 100, local AS 100, internal
link
Member of peer-group group1 for session parameters
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read          , hold time is 90, keepalive interval is 30 seconds
  Received 0 messages, 0 notifications, 0 in queue
  Sent 0 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 0
  Index 1, Offset 0, Mask 0x2
  group1 peer-group member
  NEXT_HOP is always this router
  0 accepted prefixes
  0 announced prefixes

Connections established 0; dropped 0
Next connect timer due in 33 seconds
```

Related Commands **show bgp ipv6 neighbors (BGP4+)**

show ip bgp neighbors connection-retrytime (BGP)

Use this command to display the configured connection-retrytime value of the peer at the session establishment time with the neighbor.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors <ipv4-addr>
connection-retrytime`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 connection-retrytime
```

show ip bgp neighbors hold-time (BGP)

Use this command to display the configured holdtime value of the peer at the session establishment time with the neighbor.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors <ipv4-addr> hold-time`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Default The holdtime timer default is 90 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp neighbors 10.11.4.26 hold-time
```

Related Commands [neighbor timers \(BGP and BGP4+\)](#)
[show ip bgp neighbors keepalive-interval \(BGP timers \(BGP and BGP4+\)\)](#)

show ip bgp neighbors keepalive (BGP)

Use this command to display the number of keepalive messages sent to the neighbor from the peer throughout the session.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors <ipv4-addr> keepalive`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp neighbors 10.11.4.26 keepalive
```

Related Commands [show ip bgp neighbors keepalive-interval \(BGP\)](#)

show ip bgp neighbors keepalive-interval (BGP)

Use this command to display the configured keepalive-interval value of the peer at the session establishment time with the neighbor.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors {<ipv4-addr>|<ipv6-addr>} keepalive-interval`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Default The keepalive timer default is 60 seconds as per RFC 4271. Keepalive is holdtime / 3.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp neighbors 10.11.4.26 keepalive-interval
```

Related Commands [neighbor timers \(BGP and BGP4+\)](#)
[show ip bgp neighbors hold-time \(BGP\)](#)
[timers \(BGP and BGP4+\)](#)

show ip bgp neighbors notification (BGP)

Use this command to display the number of notification messages sent to the neighbor from the peer throughout the session.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors {<ipv4-addr>|<ipv6-addr>} notification`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 notification
```

show ip bgp neighbors open (BGP)

Use this command to display the number of open messages sent to the neighbor from the peer throughout the session.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors <ipv4-addr> open`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 open
```

show ip bgp neighbors rcvd-msgs (BGP)

Use this command to display the number of messages received by the neighbor from the peer throughout the session.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors <ipv4-addr> rcvd-msgs`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 rcvd-msgs
```

show ip bgp neighbors sent-msgs (BGP)

Use this command to display the number of messages sent to the neighbor from the peer throughout the session.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors <ipv4-addr> sent-msgs`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 sent-msgs
```

show ip bgp neighbors update (BGP)

Use this command to display the number of update messages sent to the neighbor from the peer throughout the session.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp neighbors <ipv4-addr> update`

Parameter	Description
<code><ipv4-addr></code>	The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp neighbors 10.11.4.26 update
```

show ip bgp paths (BGP)

Use this command to display BGP4 path information within an IPv4 environment. Use the [show bgp ipv6 paths \(BGP4+\)](#) command to display BGP4+ path information within an IPv4 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp paths`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp paths
```

Related Commands [show bgp ipv6 paths \(BGP4+\)](#)

show ip bgp prefix-list (BGP)

Use this command to display routes matching the prefix-list within an IPv4 environment. Use the [show bgp ipv6 prefix-list \(BGP4+\)](#) command to display routes matching the prefix-list within an IPv6 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp prefix-list <list>`

Parameter	Description
<code><list></code>	Specifies the name of the IP prefix list.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp prefix-list mylist
```

Related Commands [show bgp ipv6 prefix-list \(BGP4+\)](#)

show ip bgp quote-regex (BGP)

Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 quote-regex \(BGP4+\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp quote-regex <expression>`

Parameter	Description
<i><expression></i>	Specifies a regular-expression to match the BGP AS paths.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp quote-regex myexpression
```

Related Commands [show bgp ipv6 quote-regex \(BGP4+\)](#)

show ip bgp regexp (BGP)

Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the [show bgp ipv6 regexp \(BGP4+\)](#) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the *<expression>* parameter

Use the regular expressions listed below with the *<expression>* parameter:

Symbol	Character	Meaning
^	Caret	Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
\$	Dollar sign	Used to match the end of the input string.
.	Period	Used to match a single character (white spaces included).
*	Asterisk	Used to match none or more sequences of a pattern.
+	Plus sign	Used to match one or more sequences of a pattern.
?	Question mark	Used to match none or one occurrence of a pattern.
_	Underscore	Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	Specifies a range of single-characters.
-	Hyphen	Separates the end points of a range.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp regexp <expression>`

Parameter	Description
<i><expression></i>	Specifies a regular-expression to match the BGP AS paths.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp regexp myexpression
```

Related Commands [show bgp ipv6 regexp \(BGP4+\)](#)

show ip bgp route-map (BGP)

Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the [show bgp ipv6 route-map \(BGP4+\)](#) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp route-map <route-map>`

Parameter	Description
<code><route-map></code>	Specifies a route-map that is matched.

Mode User Exec and Privileged Exec

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

Related Commands [show bgp ipv6 route-map \(BGP4+\)](#)

show ip bgp scan (BGP)

Use this command to display BGP scan status.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp scan`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip bgp scan
```

Output **Figure 45-15: Example output from the show ip bgp scan command**

```
BGP scan is running
BGP scan interval is 60
BGP instance : AS is 11,DEFAULT
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

show ip bgp summary (BGP)

Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the [show bgp ipv6 summary \(BGP4+\)](#) command to display a summary of BGP4+ neighbors.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip bgp summary`

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip bgp summary
```

Output **Figure 45-16: Example output from the show ip bgp summary command**

```
awplus>show ip bgp summary
BGP router identifier 0.0.0.0, local AS number 100
BGP table version is 10
BGP AS-PATH entries 0
BGP community entries

Neighbor          V      AS  MsgRc  MsgSnt  TblVer  InOutQ  Up/Down  State/PfxRcd
10.10.10.72       4      100    0      0       0 0/0    never    Active
2001:0db8:010d::1 4        1    0      0       0 0/0    never    Active

Number of neighbors 2
```

Related Commands [show bgp ipv6 summary \(BGP4+\)](#)

show ip community-list (BGP and BGP4+)

Use this command to display routes that match a specified community-list name or number.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip community-list [<listnumber>|<listname>]`

Parameter	Description
<code><listnumber></code>	Specifies the community list number in the range <1-199> as specified by a previously issued ip community-list command.
<code><listname></code>	Specifies the community list name as specified by a previously issued ip community-list (BGP and BGP4+) command.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip community-list mylist
awplus# show ip community-list 99
```

Related Commands [ip community-list \(BGP and BGP4+\)](#)
[ip community-list expanded \(BGP and BGP4+\)](#)
[ip community-list standard \(BGP and BGP4+\)](#)

show ip extcommunity-list (BGP and BGP4+)

Use this command to display a configured extcommunity-list.

For information on output options, see [“Controlling “show” Command Output” on page 45.6.](#)

Syntax `show ip extcommunity-list [<1-199>|<extcommunity-listname>]`

Parameter	Description
<code><1-199></code>	Extcommunity-list number
<code><extcommunity-listname></code>	Extcommunity-list name

Mode User Exec and Privileged Exec

Example

```
awplus# show ip extcommunity-list 33
```

Related Commands [ip extcommunity-list expanded \(BGP and BGP4+\)](#)
[ip extcommunity-list standard \(BGP and BGP4+\)](#)

show ip prefix-list (IPv4 Prefix List)

Use this command to display the IPv4 prefix-list entries. Note that this command is valid for RIP and BGP routing protocols only.

Syntax `show ip prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of a prefix list in this placeholder.
detail	Specify this parameter to show detailed output for all IPv4 prefix lists.
summary	Specify this parameter to show summary output for all IPv4 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

Related Commands [ip prefix-list \(IPv4 Prefix List\)](#)

show ipv6 prefix-list (IPv6 Prefix List)

Use this command to display the prefix-list entries. Note that this command is valid for RIPng and BGP4+ routing protocols only.

Syntax `show ipv6 prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
detail	Specify this parameter to show detailed output for all IPv6 prefix lists.
summary	Specify this parameter to show summary output for all IPv6 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

Related Commands [ipv6 prefix-list \(IPv6 Prefix List\)](#)

show ip protocols bgp (BGP)

Use this command to display BGP process parameters and statistics.

For information on output options, see [“Controlling “show” Command Output” on page 45.6](#).

Syntax show ip protocols bgp

Mode User Exec and Privileged Exec

Example To display BGP process parameters and statistics, use the command:

```
awplus# show ip protocols bgp
```

Output

```
Routing Protocol is "bgp 100"
  IGP synchronization is disabled
  Automatic route summarization is disabled
  Default local-preference applied to incoming route is 100
  Redistributing:
  Neighbor(s):
  Address AddressFamily FiltIn FiltOut DistIn DistOut RouteMapIn RouteMapOut
  Weight
  10.10.10.1                unicast
```

show route-map (Route Map)

Use this command to display information about one or all route maps.

Syntax `show route-map <map-name>`

Parameter	Description
<code><map-name></code>	A name to identify the route map.

Mode User Exec and Privileged Exec

Example To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

Output **Figure 45-17: Example output from the show route-map command**

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:
```

Related Commands [route-map \(Route Map\)](#)

synchronization (BGP and BGP4+)

Use this command in Router Configuration mode or in Address Family Configuration mode to ensure BGP does not advertise routes learned from iBGP peers until they are learned locally, or are propagated throughout the AS via an IGP.

Use the **no** variant of this command to disable this function.

Syntax `synchronization`
`no synchronization`

Default Disabled.

Mode Router Configuration and Address Family Configuration mode

Usage Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). These routes must be in the RIB (Routing Information Base) learned locally or via an IGP.

Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

Use the **no synchronization** command when BGP router can advertise routes learned from iBGP neighbors, without waiting for IGP reachability, when routes are in the RIB.

Example The following example enables IGP synchronization of iBGP routes in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# synchronization
```

The following example enables IGP synchronization of iBGP routes in IPv4 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv4 unicast
awplus(config-af)# synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv6 unicast
awplus(config-af)# synchronization
```

timers (BGP and BGP4+)

Use this command sets the BGP keepalive timer and holdtime timer values.

Use the **no** variant of this command to reset timers to the default.

Syntax `timers bgp <keepalive> <holdtime>`
`no timers bgp [<keepalive> <holdtime>]`

Parameter	Description
<code><keepalive></code>	<p><code><0-65535></code> The frequency with which the keepalive messages are sent to the neighbors. The default is 30 seconds as per RFC 4271.</p> <p>Cisco IOS uses a 60 second keepalive timer default value. Adjust keepalive timers for interoperability as required. Maintain the keepalive value at the holdtime value / 3.</p>
<code><holdtime></code>	<p><code><0-65535></code> The interval after which the neighbor is considered dead if keepalive messages are not received. The default holdtime value is 90 seconds as per RFC 4271.</p> <p>Cisco IOS uses a 180 second holdtime timer default value. Adjust holdtime timers for interoperability as required. Maintain the holdtime value at the keepalive value * 3.</p>

Default The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive * 3.

Mode Router Configuration

Usage This command is used globally to set or unset the keepalive and holdtime values for all the neighbors.

Examples

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# timers bgp 40 120
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp 30 90
```

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp
```

Related Commands [neighbor timers \(BGP and BGP4+\)](#)
[show ip bgp neighbors hold-time \(BGP\)](#)
[show ip bgp neighbors keepalive-interval \(BGP\)](#)

undebg bgp (BGP)

Use this command to disable BGP debugging functions.

Syntax `undebg bgp [all|dampening|events|filters|fsm|keepalives|nht|nsm|updates]`

`undebg all bgp`

Parameter	Description
all	Disable all debugging for BGP.
dampening	Disable debugging for BGP dampening.
events	Disable debugging for BGP events.
filters	Disable debugging for BGP filters.
fsm	Disable debugging for BGP Finite State Machine (FSM).
keepalives	Disable debugging for BGP keepalives.
nht	Disable debugging for BGP NHT (Next Hop Tracking) messages.
nsm	Disable debugging for NSM messages.
updates	Disable debugging for BGP updates.

Mode Privileged Exec and Global Configuration

Example

```
awplus# undebg bgp events
awplus# undebg bgp nht
awplus# undebg bgp updates
```

Related Commands [debug bgp \(BGP\)](#)

Chapter 46: Route Map Configuration

Introduction	46.2
Structure of a route map	46.2
Route-Map example for filtering BGP	46.3
Configuring route maps for filtering and modifying OSPF routes	46.5
Configuring a match clause	46.5
Configuring a set clause	46.6
Applying route maps in OSPF	46.7

Introduction

This chapter introduces route maps for filtering in BGP and OSPF. For details about the commands used in these examples, or the outputs from validation commands, see [Chapter 47, Route Map Commands](#).

Route maps offer a complex combination of match criteria and actions. They can be used to filter BGP and OSPF routes and also to alter the attributes in BGP update messages.

Structure of a route map

There are various levels of structure within a route map:

- A route map is an entity with a name
- Each route map consists of multiple entries, identified by sequence numbers
- Each entry can consist of multiple clauses

In effect, an entry defines an individual filter. It can have a **match** clause that defines what it will match on, and it can have multiple **set** clauses that can specify actions to be taken.

A BGP update packet or a route is matched against each entry in turn. Once an entry is found that matches the packet or route, the action(s) associated with that entry is (are) performed, and no further entries are considered.

For example, if you create an entry that will permit an update packet, followed by an entry that would deny that packet, the packet is permitted. As another example, if you create two conflicting **set** clauses, the first change is applied, not the second.

There is an implicit “match all” filter at the end of the route map. The action on that implicit entry is **deny**. By default, any update packet or route that does not explicitly match any particular entry in the route map will be dropped.

You can change this by ending the route map with a “permit all” clause, such as the following:

```
awplus(config)# route-map <map-name> permit 65535
```

Clauses

There are two types of clauses that can be present in a route map entry:

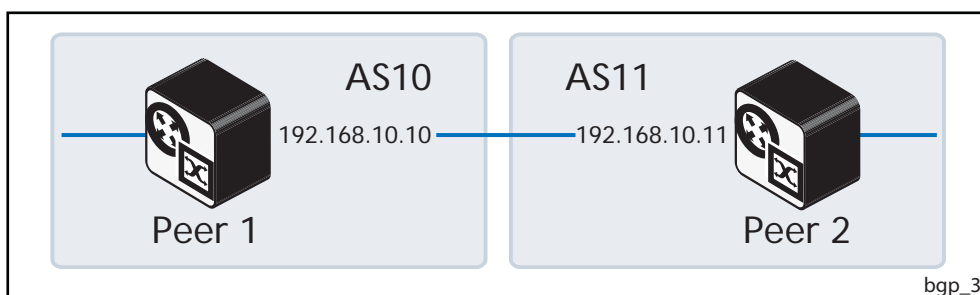

- **match clauses**, which specify attributes or prefixes to match on
- **set clauses**, which specify the changes to be made to attribute values

A given route map entry can never have more than one match clause, but it can have multiple set clauses.

Route-Map example for filtering BGP

This section contains a simple example of use of a route map. For detailed information and examples, see [How To Use Route Maps and Other Filters to Filter and Alter BGP and OSPF Routes](#). This How To Note is available from the [documentation library at alliedtelesis.com](#).

Use route-maps to filter incoming updates from a BGP peer. In this example, a prefix-list `list1` on Peer 1 is configured to deny entry of any routes with the IP address `1.1.1.0/M` ($M = 26, 27, 28$). To test the filter, Peer 2 is configured to generate network addresses `1.1.1.0/27` and `1.1.2.0/24`. To verify, use the [show ip bgp \(BGP\) command on page 45.224](#) on Peer 1; it displays Peer 1 receiving updates from only `1.1.2.0/24`.

Peer 1

<code>awplus#</code>	
<code>configure terminal</code>	Enter the Global Configuration mode.
<code>awplus(config)#</code>	
<code>ip prefix-list prefixlist1 seq 5</code>	Create the prefix-list named <code>prefixlist1</code> as shown opposite. <code>prefixlist1</code> contains two entries. The first entry with a deny action is to not match any routes in the <code>1.1.1.0/24</code> range that have prefix lengths from 26 to 28 (inclusive). The second entry allows all other routes.
<code>deny 1.1.1.0/24 ge 26 le 28</code>	
<code>awplus(config)#</code>	
<code>ip prefix-list prefixlist1 seq 10</code>	Also note the sequence number (<code>seq 5 seq 10</code>) in the prefix-list specifies the sequence for each entry.
<code>permit any</code>	
<code>awplus(config)#</code>	
<code>route-map routemap1 permit 1</code>	Enter the route-map mode to set the match operation.
<code>awplus(config-route-map)#</code>	
<code>match ip address prefix-list</code>	Set the match criteria. This match criterion on this route-map entry is to match the incoming route updates against the prefix-list <code>prefixlist1</code> . If a route matches the permit criteria of the prefix-list <code>prefixlist1</code> , then packets are permitted by the route-map, since this route-map entry has a permit action. Because this is the only entry route-map, all routes that are not permitted by this entry route-map will be dropped.
<code>prefixlist1</code>	

Peer 1(cont.)

<code>awplus(config-route-map)#</code>	
<code>exit</code>	Exit the Route-map mode and return to Global Configuration mode.

<code>awplus(config)#</code>	
<code>router bgp 10</code>	Define the routing process. The number 10 specifies the AS number of R1.

<code>awplus(config-router)#</code>	
<code>neighbor 192.168.10.11 remote-as 11</code>	Define BGP neighbors. 192.168.10.11 is the IP address of the neighbor (Peer 2) and 11 is the neighbor's AS number.

<code>awplus(config-router)#</code>	
<code>neighbor 192.168.10.11 route-map routemap1 in</code>	The route-map is now applied as the filter for route updates that are received from the neighbor 192.168.10.11. Routes are accepted from the neighbor 192.168.10.11 if they match the permit criteria of route-map routemap1.

Peer 2

<code>awplus(config)#</code>	
<code>router bgp 11</code>	Define the routing process. The number 11 specifies the AS number of Peer 2.

<code>awplus(config-router)#</code>	
<code>neighbor 192.168.10.10 remote-as 10</code>	Define BGP neighbors. 192.168.10.10 is the IP address of the neighbor (Peer 1) and 10 is the neighbor's AS number.

<code>awplus(config-router)#</code>	
<code>network 1.1.1.0/27</code>	Specify a route to be advertised by the BGP routing process.

<code>awplus(config-router)#</code>	
<code>network 1.1.2.0/24</code>	Specify a route to be advertised by the BGP routing process.

Names of Commands Used

ip prefix-list
neighbor remote-as (BGP and BGP4+)
route-map
match ip address
network (BGP and BGP4+)

Validation Commands

show ip bgp (BGP)

Configuring route maps for filtering and modifying OSPF routes

Route maps can be applied to OSPF routes as well as BGP routes. Of course, the route maps that can be used with OSPF are rather limited in comparison with those that are used with BGP, as OSPF route updates do not carry attributes in the way that BGP route updates do.

OSPF route maps can be applied to importing:

- OSPF-learned routes into the main IP route table, or
- static, BGP or RIP routes into OSPF

Filtering **cannot**:

- remove an entry from the LSA database once the entry has been added
- prevent the switch from advertising an entry to interfaces in the same area that the entry is relevant to
- prevent updates that OSPF learns from being put into the LSA database
- change the properties of an entry in the LSA database

This is because OSPF shares LSAs between all the routers in an area. The protocol assumes that all the routers in the area have shared all the advertisements among each other, and that all agree on the state of the complete link state database for the area. If some routers in the area are learning, but not advertising, that breaks the OSPF model.

Configuring a match clause

A match clause can match on the following clauses.

When configuring a match clause, make sure you are in route map mode. The prompt should look like:

```
awplus(config-route-map)#
```

Metric

The entry will match all routes whose metric is equal to that specified in the clause.

To match a metric value, use the command:

```
match metric <value>
```

Interface

The entry will match all routes learned via the specified VLAN.

To match a VLAN, use the command:

```
match interface <vlan>
```

External route type

The entry will match all routes of either Type 1 External or Type 2 External.

To match a route type, use the command:

```
match external {type-1|type-2}
```

A prefix, by using a prefix list

The entry will match one or more route prefixes.

Once you have made the prefix list, apply it to the match clause of a route map entry by using the command:

```
match ip address prefix-list <list-name>
```

A prefix, by using an ACL

An ACL is an alternative to a prefix list for matching route prefixes.

Once you have made the ACL, apply it to the match clause of a route map entry by using the command:

```
match ip address <acl-number-or-name>
```

A next hop address

The entry will match the route's next hop.

You can use either a prefix list or an ACL to specify a next hop address. Once you have made the prefix list or ACL, apply it to the match clause of a route map entry by using one of the commands:

```
match ip next-hop prefix-list <list-name>
```

```
match ip next-hop <acl-number-or-name>
```

Configuring a set clause

If a route matches the **match** clause, then the action of the route map entry will be applied to that route. The action might simply be to permit or deny the route, or it might be to update its parameters by applying one or more **set** clauses.

When configuring a set clause, make sure you are in route map mode for the same route map name sequence number as you used for the match clause. The prompt should look like:

```
awplus(config-route-map)#
```

A set clause can alter the following parameters on a route.

Metric This changes the route metric. You can:

- Set the metric, by using the command:

```
set metric <0-4294967295>
```

- Increase or decrease the metric by a specified amount, by using one of the commands:

```
set metric +<amount>
```

```
set metric -<amount>
```

For example, to increase the metric by 2, use the command:

```
set metric +2
```

Next hop This specifies the next hop for matching routes.

Use the command:

```
set ip next-hop <ipadd>
```

Type This sets the route type to either Type 1 External or Type 2 External.

Use the command:

```
set metric-type {type-1|type-2}
```

Applying route maps in OSPF

To specify a route map to be applied to static, BGP, RIP or connected routes as they are imported to OSPF, use the commands:

```
router ospf
redistribute {rip|connected|static} route-map <map-name>
```

Note that if you want to filter OSPF routes as they are imported into the main IP route table, you need to use a distribute filter instead of a route map.

Use commands like the following:

```
router ospf 88
distribute-list list1 in
```

Command List

This chapter provides an alphabetical reference for route map commands. These commands can be divided into the following categories:

- **route-map** command, used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes or BGP update messages the route map applies to
- **set** commands, used to modify matching routes or BGP update messages

match as-path

Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list. To create the AS path access list, enter Global Configuration mode and use the **ip as-path access-list** command.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

Syntax `match as-path <as-path-listname>`
`no match as-path [<as-path-listname>]`

Parameter	Description
<code><as-path-listname></code>	Specifies an AS path access list name.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To add entry 34 to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

Related Commands **ip as-path access-list (BGP and BGP4+)**
route-map
set as-path
show route-map

match community

Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the **ip community-list (BGP and BGP4+)** command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

Syntax `match community {<community-listname> | <1-99> | <100-199>} [exact-match]`
`no match community [<community-listname> | <1-99> | <100-199>] [exact-match]`

Parameter	Description
<code><community-listname></code>	The community list name or number.
<code><1-99></code>	Community list number (standard range).
<code><100-199></code>	Community list number (expanded range).
<code>exact-match</code>	Exact matching of communities.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using **match** and **set** commands. Community lists are used to identify and filter routes by their common attributes.

Example To add entry 3 to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

Related Commands [ip community-list \(BGP and BGP4+\)](#)
[route-map](#)
[set comm-list delete](#)
[set community](#)
[show route-map](#)

match interface

Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

Syntax `match interface <interface>`
`no match interface [<interface>]`

Parameter	Description
<code><interface></code>	The VLAN to match, e.g. <code>vlan2</code> .

Mode Route-map Configuration

Usage This command is valid for RIP and OSPF routes only.

Example To add entry 10 to the route map called `mymap1`, which will process routes if they use the interface `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface vlan1
```

To remove all interfaces from the route map called `mymap1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

Related Commands [match ip address](#)
[match ip next-hop](#)
[match route-type](#)
[match tag](#)
[route-map](#)
[show route-map](#)

match ip address

Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the access list or prefix list.

Each entry of a route map can have at most one access list-based IP address match clause and one prefix list-based IP address match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given prefix. The route map action and its **set** clauses determine what the route map does with routes that contain that prefix.

Use the **no** variant of this command to remove the IP address match clause from a route map entry. To remove a prefix list-based match clause you must also specify the **prefix-list** parameter.

Syntax `match ip address {<accesslistID>|prefix-list <prefix-listname>}`
`no match ip address [<accesslistID>]`
`no match ip address prefix-list <prefix-listname>`

Parameter	Description
<accesslistID>	{<access-list-name> <1-199> <1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which prefixes to match.
<prefix-listname>	The prefix list name.

Mode Route-map Configuration

Usage The `match ip address` command specifies the IP address to be matched. If there is a match for the specified IP address, and `permit` is specified, the route is redistributed or controlled, as specified by the `set` action. If the match criteria are met, and `deny` is specified then the route is `not` redistributed or controlled. If the match criteria are `not` met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

This command is valid for routes in BGP update messages, and for OSPF and RIP routes.

Examples To add entry 3 to the route map called `myroute`, which will process routes that match the ACL called `List1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match ip address List1
```

To add entry 3 to the route map called `rmap1`, which will process routes that match the prefix list called `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

Related Commands

- [access-list \(extended numbered\)](#)
- [access-list \(standard numbered\)](#)
- [ip prefix-list](#)
- [route-map](#)
- [show ip access-list](#)
- [show route-map](#)

match ip next-hop

Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by either:

- specifying the name of an access list. To create the access list, enter Global Configuration mode and use the **access-list** command.
- specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the access list or prefix list.

Each entry of a route map can have at most one access list-based next-hop match clause and one prefix list-based next-hop match clause. If the route map entry already has one of these match clauses, entering this command replaces that match clause with the new clause.

Note that access lists, prefix lists and route map entries all specify an action of deny or permit. The action in the access list or prefix list determines whether the route map checks update messages and routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with update messages and routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

Syntax

```
match ip next-hop {<accesslistID>|prefix-list <prefix-listname>}
no match ip next-hop [<accesslistID>]
no match ip next-hop prefix-list [<prefix-listname>]
```

Parameter	Description
<accesslistID>	{<access-list-name> <1-199> <1300-2699>} The IP access list name or number.
<access-list-name>	The IP access list name.
<1-199>	The IP access list number.
<1300-2699>	The IP access list number (expanded range).
prefix-list	Use an IP prefix list to specify which next hop to match.
<prefix-listname>	The prefix list name.

Mode Route-map Configuration

Usage This command is valid for BGP update messages and OSPF and RIP routes.

Examples To add entry 3 to the route map called `rmap1`, which will process routes whose next hop matches the ACL called `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip next-hop mylist
```

To add entry 3 to the route map called `mymap`, which will process routes whose next hop matches the prefix list called `list1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

Related Commands

- [access-list \(extended numbered\)](#)
- [access-list \(standard numbered\)](#)
- [ip prefix-list](#)
- [route-map](#)
- [show ip access-list](#)
- [show ip prefix-list](#)
- [show route-map](#)

match ipv6 address

Use this command to specify the match address of route.

Use the **no** variant of this command to remove the `match ipv6 address` entry.

Syntax `match ipv6 address {<access-list-name>|prefix-list <prefix-listname>}`
`no match ipv6 address [<access-list-name>|prefix-list <prefix-listname>]`

Parameter	Description
<code><access-list-name></code>	The name of the IPv6 access list that specifies criteria for the addresses to match. Valid only with BGP and RIPng.
<code><prefix-listname></code>	The name of the IPv6 prefix list that specifies criteria for the addresses to be matched. Valid only with BGP and RIPng.

Mode Route-map Configuration

Usage The **match ipv6 address <access-list>** command specifies the IPv6 address to be matched. If there is a match for the specified IPv6 address, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The **match ipv6 address prefix-list** command specifies the entries of prefix-lists to be matched. If there is a match for the specified prefix-list entries, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

Examples

```
awplus# configure terminal
awplus(config)# route-map rmap1 deny 1
awplus(config-route-map)# match ipv6 address rmap1

awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

match ipv6 next-hop

Use this command to specify a next-hop address to be matched by the route-map.

Use the **no** variant of this command to disable this function.

Syntax

```
match ipv6 next-hop {<access-list-name>|<ipv6-addr>|prefix-list
  <prefix-listname>}
no match ipv6 next-hop [<access-list-name>|<ipv6-addr>|prefix-list
  [<prefix-listname>]]
```

Parameter	Description
<i><access-list-name></i>	The name of the IPv6 access list that specifies criteria for the addresses to match.
<i><ipv6-addr></i>	The IPv6 address of the next hop. The IPv6 address uses the format X:X::X:X.
<i><prefix-listname></i>	The name of the IPv6 prefix list that specifies criteria for the addresses to be matched.

Mode Route-map Configuration

Usage The `match ipv6 next-hop` command specifies the next-hop address to be matched. If there is a match for the specified next-hop address, and `permit` is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

Note This command is valid only for BGP.

Example

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 next-hop 2001:0db8::/32
```

match metric

Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric. A BGP update message matches the route map if its MED attribute value matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

Syntax `match metric <metric>`
`no match metric [<metric>]`

Parameter	Description
<code><metric></code>	<code><0-4294967295></code> Specifies the metric value.

Mode Route-map Configuration

Usage This command is valid for BGP update messages and OSPF and RIP routes.

Example To stop entry 3 of the route map called `myroute` from processing routes with a metric of 888999, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

Related Commands [route-map](#)
[set metric](#)
[show route-map](#)

match origin

Use this command to add an origin match clause to a route map entry. Specify the origin attribute value to match.

A BGP update message matches the route map if its origin attribute value matches the route map's origin value.

Each entry of a route map can only match against one origin in one origin match clause. If the route map entry already has an origin match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the origin match clause from the route map entry.

Syntax `match origin {egp|igp|incomplete}`
`no match origin [egp|igp|incomplete]`

Parameter	Description
egp	Learned from an exterior gateway protocol.
igp	Learned from a local interior gateway protocol.
incomplete	Of unknown heritage, for example a static route.

Mode Route-map Configuration

Usage The origin attribute defines the origin of the path information. The **egp** parameter is indicated as an **e** in the routing table, and it indicates that the origin of the information is learned via Exterior Gateway Protocol. The **igp** parameter is indicated as an **i** in the routing table, and it indicates the origin of the path information is interior to the originating AS. The **incomplete** parameter is indicated as a **?** in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

The **match origin** command specifies the origin to be matched. If there is a match for the specified origin, and **permit** is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and **deny** is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for BGP update messages only.

Example To add entry 34 to the route map called "rmap1", which will drop externally-originated routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match origin egp
```

Related Commands [route-map](#)
[set origin](#)
[show route-map](#)

match route-type

Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

Syntax `match route-type external {type-1|type-2}`
`no match route-type external [type-1|type-2]`

Parameter	Description
type-1	OSPF type-1 external routes.
type-2	OSPF type-2 external routes.

Mode Route-map Configuration

Usage Use the **match route-type external** command to match specific external route types. AS-external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes.

This command is valid for OSPF routes only.

Example To add entry 10 to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

Related Commands

- [match tag](#)
- [route-map](#)
- [set metric-type](#)
- [show route-map](#)

match tag

Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

Syntax `match tag <0-4294967295>`
`no match tag [<0-4294967295>]`

Mode Route-map Configuration

Usage This command is valid for OSPF routes only.

Example To add entry 10 to the route map called `mymap1`, which will process routes that are tagged 100, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

Related Commands [match interface](#)

[set tag](#)
[show route-map](#)

route-map

Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The switch uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

Syntax `route-map <mapname> {deny|permit} <seq>`
`no route-map <mapname>`
`no route-map <mapname> {deny|permit} <seq>`

Parameter	Description
<mapname>	A name to identify the route map.
deny	The route map causes a routing process to discard matching routes or BGP update messages.
permit	The route map causes a routing process to use matching routes or BGP update messages.
<seq>	<1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map.

Mode Global Configuration

Usage Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

Examples To enter route-map mode for entry 1 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called `route1`, and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface vlan2
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

Related Commands **show route-map**

For BGP:

- bgp dampening (BGP and BGP4+)**
- neighbor default-originate (BGP and BGP4+)**
- neighbor route-map (BGP and BGP4+)**
- neighbor unsuppress-map (BGP and BGP4+)**
- network (BGP and BGP4+)**
- redistribute (into BGP or BGP4+) (BGP and BGP4+)**
- show ip bgp route-map (BGP)**

For OSPF:

- distribute-list (OSPF)**
- default-information originate (OSPF)**
- redistribute (OSPF)**

For RIP:

- redistribute (RIP)**

set aggregator

Use this command to add an aggregator set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets the update's aggregator attribute. The aggregator attribute specifies the AS and IP address of the device that performed the aggregation.

Use the **no** variant of this command to remove the set clause.

Syntax `set aggregator as <asnum> <ip-address>`
`no set aggregator as`

Parameter	Description
<asnum>	The AS number of the aggregator.
<ip-address>	The IP address of the aggregator.

Mode Route-map Configuration

Usage An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the **set aggregator** command to assign an AS number for the aggregator.

This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `myroute` to set the aggregator attribute to 43 10.10.0.3 in matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set aggregator as 43 10.10.0.3
```

To remove all aggregator attributes for entry 3 of the route map called `myroute`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no set aggregator as
```

Related Commands [route-map](#)
[show route-map](#)

set as-path

Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

Syntax `set as-path prepend <1-65535> [<1-65535>]...`
`no set as-path prepend [<1-65535> [<1-65535>]...]`

Parameter	Description
<code>prepend</code>	Prepends the autonomous system path.
<code><1-65535></code>	The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces.

Mode Route-map mode

Usage Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `myroute` to prepend ASN 8 and 24 to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

Related Commands [match as-path](#)
[route-map](#)
[show route-map](#)

set atomic-aggregate

Use this command to add an atomic aggregate set clause to a route map entry.

When a BGP update message matches the route map entry, the device adds the atomic aggregate attribute to the update.

Use the **no** variant of this command to remove the set clause.

Syntax `set atomic-aggregate`
`no set atomic-aggregate`

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `rmap1` to add the atomic aggregator attribute to matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set atomic-aggregate
```

Related Commands [route-map](#)
[show route-map](#)

set comm-list delete

Use this command to delete one or more communities from the community attribute of a BGP update message. Specify the communities to delete by specifying a community list. To create the community list, enter Global Configuration mode and use the **ip community-list (BGP and BGP4+)** command.

When a BGP update message matches the route map entry, the device deletes the specified communities from the update's comm.unity attribute.

Use the **no** variant of this command to stop deleting the communities.

Syntax `set comm-list {<1-199>|<100-199>|<word>} delete`
`no set comm-list {<1-199>|<100-199>|<word>} delete`

Parameter	Description
<1-99>	Standard community-list number.
<100-199>	Expanded community-list number.
<word>	Name of the Community-list.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `myroute` to delete the communities in community list 34 from matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set comm-list 34 delete
```

Related Commands **ip community-list (BGP and BGP4+)**
match community
route-map
set community
show route-map

set community

Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

Syntax

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}

no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}

set community none

no set community none
```

Parameter	Description
<1-65535>	The AS number of the community as an integer not in AA:NN format.
AA:NN	The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA (www.iana.org) and can be obtained from the registry in your region. AA and NN are both integers from 1 to 65535. AA is the AS number; NN is a value chosen by the ASN administrator.
local-AS	The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation).
internet	The community of routes that can be advertised to all BGP peers.
no-advertise	The community of routes that must not be advertised to other BGP peers.
no-export	The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself).
none	The device removes the community attribute from matching update messages.
additive	The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Examples To use entry 3 of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry 3 of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14 no-export
```

To use entry 3 of the route map called `rmap1` to put matching routes into a single AS community numbered 16384, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

Related Commands

- [match community](#)
- [route-map](#)
- [set aggregator](#)
- [set comm-list delete](#)

- [show route-map](#)

set dampening

Use this command to add a route flap dampening set clause to a route map entry.

Also use the route map by specifying it in the command **bgp dampening (BGP and BGP4+) route-map**.

When a route matches the route map entry, the device enables route flap dampening for that route. If the set clause includes dampening parameter values, the device uses those values when dampening the matching route.

Use the **no** variant of this command to remove the set clause. This disables dampening on matching routes.

Syntax

```
set dampening
set dampening [<reachtime>]
set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
  [<unreachtime>]
no set dampening
no set dampening [<reachtime>]
no set dampening <reachtime> [<reuse> <suppress> <maxsuppress>]
  [<unreachtime>]
```

Parameter	Description
<reachtime>	<p><1-45></p> <p>The time it takes, in minutes, for the route's instability penalty to halve if the route remains stable. The instability penalty is called the Figure of Merit (FoM). For example, if reachtime is 15, the FoM of a stable route halves over a 15 minute period, quarters over a 30 minute period, and so on.</p> <p>The default is 15 minutes.</p>
<reuse>	<p><1-20000></p> <p>The value that the instability penalty (FoM) must reach for the device to use a suppressed route again. Once a route is suppressed, it remains suppressed until its FoM falls below this threshold. Reuse must not exceed suppress. The default is 750.</p>
<suppress>	<p><1-20000></p> <p>The instability penalty (FoM) at which the route is suppressed. Suppress must be greater than or equal to reuse.</p> <p>If suppress is less than 1000, a route is suppressed when it becomes unreachable for the first time. The default is 2000.</p>
<maxsuppress>	<p><1-255></p> <p>A number that is multiplied by reachtime to give the maximum time in minutes for which a suppressed route must remain stable in order to become unsuppressed. The lowest maxsuppress value of 1 gives a maximum suppression time of 1 x reachtime, and the highest maxsuppress value of 255 gives a maximum suppression time of 255 x reachtime.</p> <p>For example, if reachtime is 15 and maxsuppress is 4, the route is unsuppressed after 60 minutes of stability even if its FoM still exceeds reuse. The default is 4.</p>

Parameter(cont.)	Description(cont.)
<code><unreachtime></code>	<code><1-45></code> The time it takes, in minutes, for the route's instability penalty to halve if the route remains unstable. The default is 15 minutes.

Mode Route-map Configuration

Usage The **suppress** value must be greater than or equal to the **reuse** value.

Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

This command is valid for BGP routes only.

Example To use entry 24 of the route map called R1 to enable dampening of matching routes and set the dampening parameters, use the commands:

```
awplus# configure terminal
awplus(config)# route-map R1 permit 24
awplus(config-route-map)# set dampening 20 333 534 30
```

Related Commands **bgp dampening (BGP and BGP4+)**
route-map
show route-map

set extcommunity

Use this command to add an extended community set clause to a route map entry. A route map entry can have a route target extended community set clause, a site-of-origin extended community set clause, or both.

When a BGP update message matches the route map entry, the device sets the update's extended community attribute to the specified value or values.

Use the **no** variant of this command to remove the set clause.

Syntax `set extcommunity {rt|soo} <extcomm-number>`
`no set extcommunity {rt|soo} [<extcomm-number>]`

Parameter	Description
rt	Configure a route target extended community. This consists of routers that will receive matching routes.
soo	Configure a site-of-origin extended community. This consists of routers that will inject matching routes into BGP.
<extcomm-number>	The extended community number, in the format AA:NN or IPADD:N.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Examples To use entry 3 of the route map called `rmap1` to set the route target extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 0.0.0.6:01
```

To use entry 3 of the route map called `rmap1` to set the site-of-origin extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 0.0.0.6:01
```

Related Commands

- [match community](#)
- [route-map](#)

- [set community](#)
- [show route-map](#)

set ip next-hop (route map)

Use this command to add a next-hop set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set ip next-hop <ip-address>
no set ip next-hop [<ip-address>]
```

Parameter	Description
<ip-address>	The IP address of the next hop, entered in the form A.B.C.D.

Mode Route-map Configuration

Usage Use this command to set the next-hop IP address to the routes.

This command is valid for BGP update messages, and OSPF and RIP routes.

Example To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

Related Commands

- [match ip next-hop](#)
- [route-map](#)
- [show route-map](#)

set ipv6 next-hop

Use this command to set a next hop-address.

Use the **no** variant of this command to delete an entry.

Syntax `set ipv6 next-hop {<ipv6-addr-global>|local <ipv6-addr>}`
`no set ipv6 next-hop [<ipv6-addr-global>|local [<ipv6-addr>]]`

Parameter	Description
<code><ipv6-addr-global></code>	The IPv6 global address of next hop. The IPv6 address uses the format X:X::X:X.
<code>local</code>	Specifies that the address is local.
<code><ipv6-addr></code>	The IPv6 local address of next hop. The IPv6 address uses the format X:X::X:X.

Mode Route-map Configuration

Usage Use this command to set the next-hop IPv6 address to the routes.

This command is valid only for BGP.

Examples

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set ipv6 next-hop local
                             fe80::203:47ff:fe97:66dc
awplus(config-route-map)# no set ipv6 next-hop
```

set local-preference

This command changes the default local preference value.

The local preference indicates the BGP local preference path attribute when there are multiple paths to the same destination. The path with the higher preference is chosen.

Use this command to define the preference of a particular path. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default setting.

Syntax `set local-preference <pref-value>`
`no set local-preference [<pref-value>]`

Parameter	Description
<code><pref-value></code>	<code><0-4294967295></code> Configure local preference value. The default local preference value is 100.

Mode Route-map Configuration

Examples

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set local-preference 2345555

awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-route-map)# no set local-preference
```

Related Commands For related Route Map commands:

route-map
show route-map

For related BGP commands:

bgp default local-preference (BGP)
neighbor route-map (BGP and BGP4+)

set metric

Use this command to add a metric set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device takes one of the following actions:

- changes the metric (or for BGP, the MED attribute value) to the specified value, or
- adds or subtracts the specified value from the metric or MED attribute, if you specify + or - before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

Syntax `set metric {+<metric-value>|-<metric-value>|<metric-value>}`
`no set metric [+<metric-value>|-<metric-value> |<metric-value>]`

Parameter	Description
+	Increase the metric or MED attribute by the specified amount.
-	Decrease the metric or MED attribute by the specified amount.
<metric-value>	<0-4294967295> The new metric or MED attribute value, or the amount by which to increase or decrease the existing value.

Mode Route-map Configuration

Usage For BGP, if you want the device to compare MED values in update messages from peers in different ASes, also enter the command **bgp always-compare-med (BGP and BGP4+)**. The device always compares MED values in update messages from peers in the same AS.

This command is valid for BGP update messages, and OSPF and RIP routes.

Examples To use entry 3 of the route map called `rmap1` to give matching routes a metric of 600, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called `rmap1` to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

Related Commands [match metric](#)
[route-map](#)
[show route-maps](#)

set metric-type

Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set metric-type {type-1|type-2}
no set metric-type [type-1|type-2]
```

Parameter	Description
type-1	Redistribute matching routes into OSPF as type-1 external routes.
type-2	Redistribute matching routes into OSPF as type-2 external routes.

Mode Route-map Configuration

Usage This command is valid for OSPF routes only.

Example To use entry 3 of the route map called `rmap1` to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

Related Commands

- default-information originate (OSPF)**
- redistribute (OSPF)**
- match route-type**
- route-map**
- show route-map**

set origin

Use this command to add an origin set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets its origin attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax

```
set origin {egp|igp|incomplete}
no set origin [egp|igp|incomplete]
```

Parameter	Description
egp	Learned from an exterior gateway protocol.
igp	Learned from a local interior gateway protocol.
incomplete	Of unknown heritage, for example a static route.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `rmap1` to give matching update messages an origin of `egp`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set origin egp
```

Related Commands

- [match origin](#)
- [route-map](#)
- [show route-map](#)

set originator-id

Use this command to add an originator ID set clause to a route map entry.

The originator ID is the router ID of the IBGP peer that first learned this route, either via an EBGP peer or by some other means such as importing it.

When a BGP update message matches the route map entry, the device sets its originator ID attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax `set originator-id <ip-address>`
`no set originator-id [<ip-address>]`

Parameter	Description
<code><ip-address></code>	The IP address of the originator, entered in the form A.B.C.D.

Mode Route-map Configuration

Usage This command is valid for BGP update messages only.

Example To use entry 3 of the route map called `rmap1` to give matching update messages an originator ID of `1.1.1.1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set originator-id 1.1.1.1
```

Related Commands [route-map](#)
[show route-map](#)

set tag

Use this command to add a tag set clause to a route map entry.

When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.

Use the **no** variant of this command to remove the set clause.

Syntax `set tag <tag-value>`
`no set tag [<tag-value>]`

Parameter	Description
<code><tag-value></code>	<code><0-4294967295></code> Value to tag matching routes with.

Mode Route-map Configuration

Usage This command is valid only when redistributing routes into OSPF.

Example To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

Related Commands [default-information originate \(OSPF\)](#)
[redistribute \(OSPF\)](#)
[match tag](#)
[route-map](#)
[show route-map](#)

set weight

Use this command to add a weight set clause to a route map entry.

The weight value assists in best path selection of BGP routes. It is stored with the route in the BGP routing table, but is not advertised to peers. When there are multiple routes with a common destination, the device uses the route with the highest weight value.

When a route matches the route map entry, the device sets its weight to the specified value.

Use the **no** variant of this command to remove the set clause.

Syntax `set weight <weight>`
`no set weight [<weight>]`

Parameter	Description
<weight>	<0-4294967295> The weight value.

Mode Route-map Configuration

Usage This command is valid for BGP routes only.

Example To use entry 3 of the route map called `rmap1` to give matching routes a weight of 60, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set weight 60
```

Related Commands [route-map](#)
[show route-map](#)

show route-map

Use this command to display information about one or all route maps.

Syntax `show route-map <map-name>`

Parameter	Description
<code><map-name></code>	A name to identify the route map.

Mode User Exec and Privileged Exec

Example To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

Output **Figure 47-1: Example output from the show route-map command**

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:
```

Multicast Introduction

Multicasting is a technique developed to send packets from one location in a network to many other locations without any unnecessary packet duplication. In multicasting, one packet is sent from a source and is replicated as needed in the network to reach as many end-users as necessary.

Multicasting is different from broadcasting; while broadcast packets are sent to every possible receiver, multicast packets need only be forwarded to receivers that want them. The benefit of this technique is bandwidth conservation - it is the most economical technique for sending a packet stream to many locations simultaneously.

The IPv4 and IPv6 addressing for multicast packets works differently from unicast and broadcast packets. A multicast stream sends packets out with a destination IPv4 or IPv6 address that identifies a specific multicast group. It does not at all specify an end host, like unicast; or a whole subnet, like broadcast.

This makes multicasting a connectionless process. The server simply sends out its multicast UDP packets, with no idea who will receive them, or whether they are successfully received. In an IPv4 network, IGMP allows hosts to tell the network that they wish to receive a multicast stream, using the Internet Group Management Protocol (IGMP). This is a Layer 3 protocol; however Layer 2 switches can also conserve bandwidth within their LAN by using IGMP snooping to track which hosts require the data stream. For more information about IGMP and IGMP snooping, see [Chapter 49, IGMP and IGMP Snooping Introduction](#).

Similar to IGMP for IPv4, Multicast Listener Discovery (MLD) for IPv6 is used to exchange membership status information between IPv6 routers that support multicasting and members of multicast groups on a network segment. Host membership in a multicast group is reported by individual member hosts, and membership status is periodically polled by multicast routers. For an overview of MLD and MLD command descriptions, see [Chapter 57, MLD and MLD Snooping Introduction and Commands](#).

Note  IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands. Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note  The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note  The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

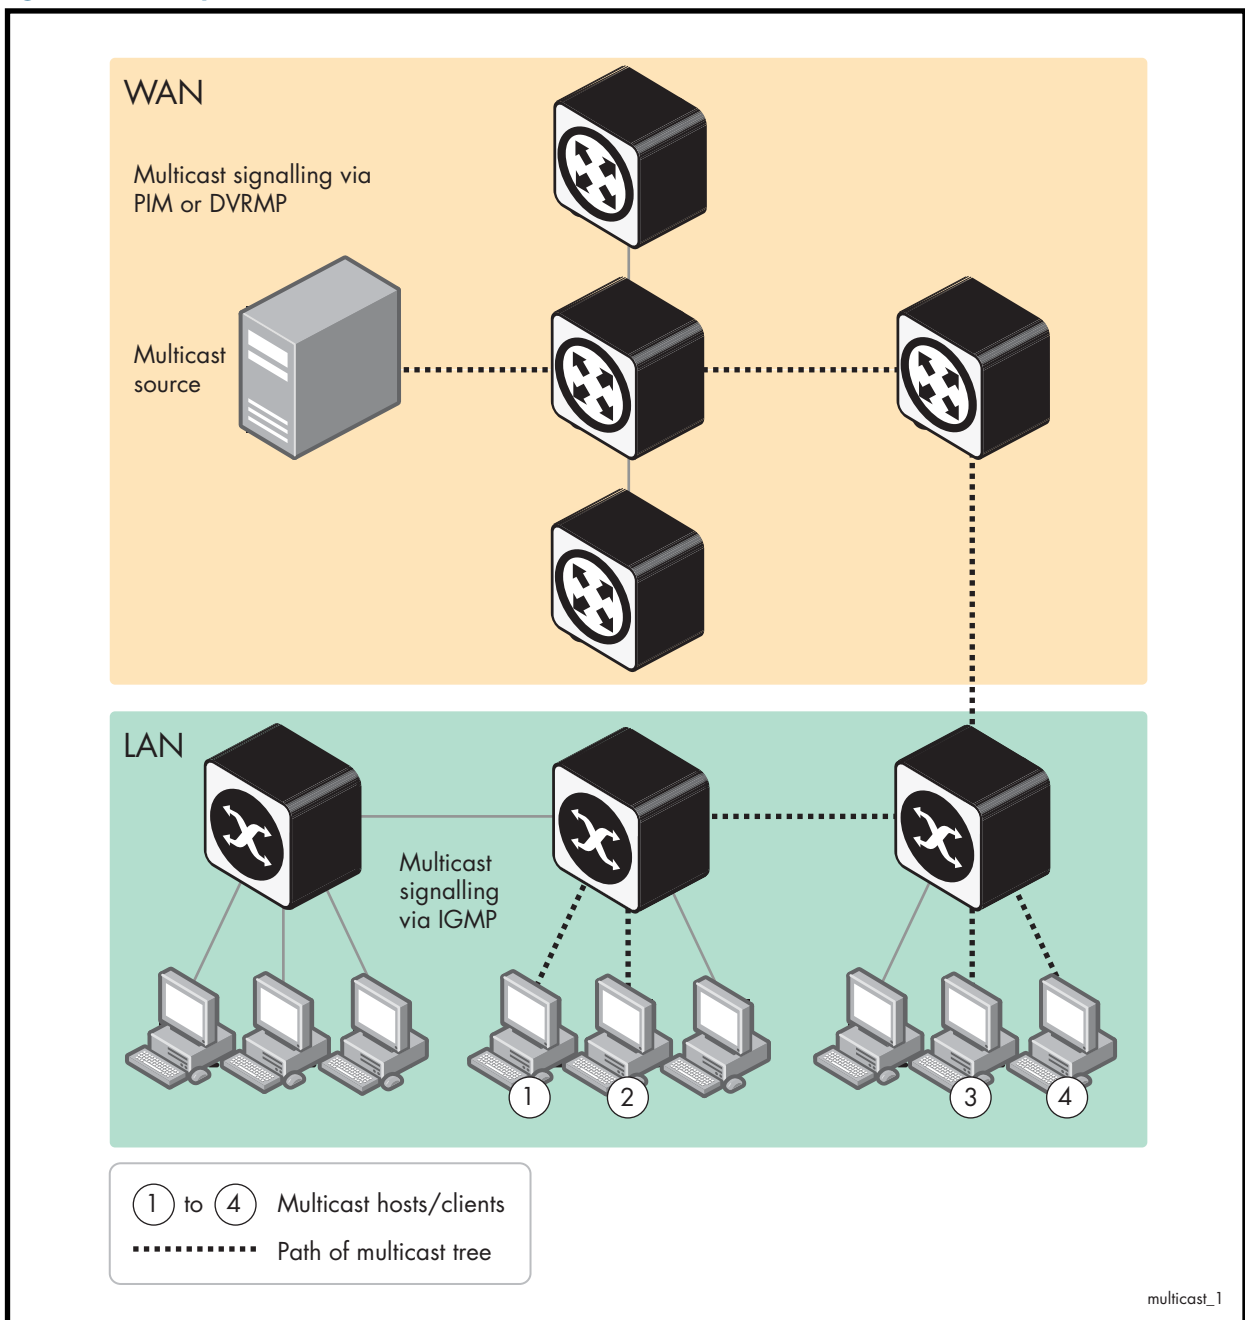

Multicast groups

The concept of a group is crucial to multicasting. A group is the set of hosts that wish to receive a particular multicast stream, and is identified by a multicast IP address at Layer 3 and matching multicast MAC address at Layer 2. The multicast sender transmits the stream to the group address, and only members of the group can receive the multicast data.

Components in a multicast network

There are several protocols and roles required in a multicast network, as shown in [Figure 48-1 on page 48.3](#). This section describes the end-to-end process of transporting multicast data through a network.

Figure 48-1: Components in a multicast network

At the two ends of a multicast data transmission are:

- **the source**

This is typically a server or video encoder. It sends the stream of multicast data out through its network interface. It is unaware of where the recipients of the stream are, or if there are any recipients.

- **the recipients**

These are storage or display devices, such as PCs, set-top boxes, or security video archivers. The recipients signal their desire to receive a particular multicast stream by sending out IGMP messages requesting the stream.

The role of the network in-between is to deliver the multicast stream to the recipients as efficiently as possible. The devices achieve this by exchanging signalling information between themselves in order to establish a forwarding path along which the multicast stream will flow. Each node informs the next node up the chain that it needs to receive the multicast stream. Once this series of requests reaches the router nearest the multicast source, then that router will start to forward the stream. All the nodes between the source and the recipients are ready to forward the stream, due to their having received the signalled requests. In this way, the stream is efficiently forwarded right through to the recipients.

The type of signalling that the network uses falls into two categories:

- in the local area network where the recipients are located, the signalling consists of the exchange of IGMP or MLD packets.
- as soon as the signalling needs to leave the VLAN containing the recipients and cross into other VLANs and subnets, then a Layer 3 multicasting protocol like PIM is used between the routers in the Layer 3 network.

In every Layer 2 multicast network, there needs to be a device that is sending IGMP or MLD queries into the network. This is essential to maintain multicast flows once they have been established (see **“Staying in the multicast group (Query message)”** on page 49.4 for more information). Typically, the device that is configured to send the queries is the router that is the gateway from the local network into a Layer 3 network.

Command List

This chapter provides an alphabetical reference of multicast commands common to PIM Sparse Mode and PIM Dense Mode. See also [Chapter 57, MLD and MLD Snooping Introduction and Commands](#), [Chapter 56, PIM-DM Commands](#), [Chapter 52, PIM-SM Commands](#) and [Chapter 50, IGMP and IGMP Snooping Commands](#).

Note  IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands. Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note  The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note  The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ip mroute

Use this command to delete entries from the IPv4 multicast routing table.

Note If you use this command, you should also use the [clear ip igmp group](#) command to clear IGMP group membership records.

Syntax `clear ip mroute {*|<ipv4-group-address> [<ipv4-source-address>]}`
`[pim sparse-mode]`

Parameter	Description
*	Deletes all multicast routes.
<ipv4-group-address>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-address>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
pim sparse-mode	Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.

Mode Privileged Exec

Usage When this command is used, the Multicast Routing Information Base (MRIB) clears the IPv4 multicast route entries in its IPv4 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a “clear” message to the multicast protocols. Each multicast protocol has its own “clear” multicast route command. The protocol-specific “clear” command clears multicast routes from PIM Sparse Mode, and also clears the routes from the MRIB.

Examples

```
awplus# clear ip mroute 225.1.1.1 192.168.3.3
```

```
awplus# clear ip mroute *
```

Related Commands [ip multicast route](#)
[show ip mroute](#)

clear ip mroute statistics

Use this command to delete multicast route statistics entries from the IP multicast routing table.

Syntax `clear ip mroute statistics {*|<ipv4-group-addr> [<ipv4-source-addr>]}`

Parameter	Description
*	All multicast route entries.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

Mode Privileged Exec

Example

```
awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4
```

```
awplus# clear ip mroute statistics *
```

clear ipv6 mroute

Use this command to delete entries from the IPv6 multicast routing table.

Note  Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 mroute {*|<ipv6-group-address> [<ipv6-source-address>]}`

Parameter	Description
*	Deletes all IPv6 multicast routes.
<ipv6-group-address>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-address>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.

Mode Privileged Exec

Usage When this command is used, the Multicast Routing Information Base (MRIB) clears the IPv6 multicast route entries in its IPv6 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a “clear” message to the multicast protocols. Each multicast protocol has its own “clear” multicast route command.

Example

```
awplus# clear ipv6 mroute 2001::2 ff08::1
```

Related Commands [ipv6 multicast route](#)
[show ipv6 mroute](#)

clear ipv6 mroute statistics

Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

Note  Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 mroute statistics {*|<ipv6-group-address> [<ipv6-source-address>]}`

Parameter	Description
*	All multicast route entries.
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.

Mode Privileged Exec

Examples

```
awplus# clear ipv6 mroute statistics 2001::2 ff08::1
```

```
awplus# clear ipv6 mroute statistics *
```

clear ipv6 multicast route

Use this command to delete all IPv6 static multicast routes from the IPv6 multicast routing table configured with the **ipv6 multicast route** command.

 **Note** Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 multicast route *`

Parameter	Description
*	Deletes all IPv6 static multicast routes.

Mode Privileged Exec

Usage When this command is used, the Multicast Routing Information Base (MRIB) clears the IPv6 multicast route entries in its IPv6 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a “clear” message to the multicast protocols. Each multicast protocol has its own “clear” multicast route command.

Example

```
awplus# clear ipv6 multicast route *
```

Related Commands [ipv6 multicast route](#)

debug nsm mcast

Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

Syntax `debug nsm mcast`
`{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}`

Parameter	Description
all	All IPv4 multicast debugging.
fib-msg	Forwarding Information Base (FIB) messages.
mrt	Multicast routes.
mtrace	Multicast traceroute.
mtrace-detail	Multicast traceroute detailed debugging.
register	Multicast PIM register messages.
stats	Multicast statistics.
vif	Multicast interface.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# debug nsm mcast all
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast fib-msg
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast mrt
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast mtrace
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast mtrace-detail
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast register
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast stat
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast vif
```

debug nsm mcast6

Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

Syntax `debug nsm mcast6`
`{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}`

Parameter	Description
all	All IPv4 multicast debugging.
fib-msg	Forwarding Information Base (FIB) messages.
mif	Multicast interfaces.
mrt	Multicast routes.
register	Multicast PIM register messages.
stats	Multicast statistics.

Mode Privileged Exec and Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 all
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 fib-msg
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 mif
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 mrt
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 register
```

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 stats
```

ip mroute

Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

Syntax

```
ip mroute <ipv4-source-address/mask-length>
    [bgp|ospf|rip|static] <rpf-address> [<admin-distance>]

no ip mroute <ipv4-source-address/mask-length>
    [bgp|ospf|rip|static]
```

Parameter	Description
<i><ipv4-source-address/mask-length></i>	A multicast source IPv4 address and mask length, in dotted decimal notation in the format A . B . C . D / M.
bgp	BGP unicast routing protocol.
ospf	OSPF unicast routing protocol.
rip	RIP unicast routing protocol.
static	Specifies a static route.
<i><rpf-address></i>	A . B . C . D The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host.
<i><admin-distance></i>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0–255.

Mode Global Configuration

Usage Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples The following example creates a static multicast IPv4 route back to the sources in the 10.10.3.0/24 subnet. The multicast route is via the host 192.168.2.3, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the 192.168.3.0/24 subnet. The multicast route is via the host 10.10.10.50. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

**Validation
Commands** **show ip rpf**

ip multicast forward-first-packet

Use this command to enable multicast to forward the first multicast packets coming to the device.

Use the **no** variant of this command to disable this feature.

Syntax `ip multicast forward-first-packet`
`no ip multicast forward-first-packet`

Default By default, this feature is disabled.

Mode Global Configuration

Usage If this command is enabled, the device will forward the first packets in a multicast stream that create the multicast route, possibly causing degradation in the quality of the multicast stream, such as the pixilation of video and audio data.

 **Note** If you use this command, ensure that the [ip igmp snooping](#) command is enabled, the default setting, otherwise the device will not process the first packets of the multicast stream correctly.

Examples To enable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-first-packet
```

To disable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast forward-first-packet
```

ip multicast route

Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingress on an upstream VLAN to a single or range of downstream VLANs.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

Syntax

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
    <upstream-vlan-id> [<downstream-vlan-id>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
    [<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A . B . C . D.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A . B . C . D.
<upstream-vlan-id>	Upstream VLAN interface on which the multicast packets ingress.
<downstream-vlan-id>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

Default By default, this feature is disabled.

Mode Global Configuration

Usage Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with same source IPv4 address, group IPv4 address, upstream VLAN and downstream VLANs. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the **clear ip mroute** command.

To update an existing static multicast route entry with more or a new set of downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than forwarded, do not specify the optional <downstream-vlan-id> parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the `<downstream-vlan-id>` parameter when entering the **no** variant of this command.

Examples To create a static multicast route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
                vlan20
```

To create a blackhole route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
```

To create an IPv4 static multicast route for the multicast source IPv4 address `2.2.2.2` and group IP address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
                vlan20-25
```

To remove the downstream VLAN `23` from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
                vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address `2.2.2.2` and group IP address `224.9.10.11`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

Related Commands [clear ip mroute](#)
[show ip mroute](#)

ip multicast route-limit

Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

Syntax `ip multicast route-limit <limit> [<threshold>]`
`no ip multicast route-limit`

Parameter	Description
<code><limit></code>	<code><1-2147483647></code> Number of routes.
<code><threshold></code>	<code><1-2147483647></code> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ip multicast route-limit 34 24

awplus# configure terminal
awplus(config)# no ip multicast route-limit
```

ip multicast wrong-vif-suppression

Use this command to prevent unwanted multicast packets received on an unexpected VLAN being trapped to the CPU.

Use the **no** variant of this command to disable wrong VIF suppression.

Syntax `ip ip multicast wrong-vif-suppression`
`no ip multicast wrong-vif-suppression`

Default By default, this feature is disabled.

Mode Global Configuration

Usage Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the **debug nsm mcast6** command.

Examples To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

ip multicast-routing

Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

Syntax `ip multicast-routing`
`no ip multicast-routing`

Default By default, IPv4 multicast routing is off.

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Example

```
awplus# configure terminal
awplus(config)# ip multicast-routing
```

Validation Commands `show running-config`

ipv6 multicast route

Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

Syntax

```
ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
  <upstream-vlan-id> [<downstream-vlan-id>]

no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
  [<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
<ipv6-source-addr>	Source IPv6 address, in dotted decimal notation in the format X.X:X.X.
<ipv6-group-addr>	Group IP address, in dotted decimal notation in the format X.X:X.X.
<upstream-vlan-id>	Upstream VLAN interface on which the multicast packets ingress.
<downstream-vlan-id>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

Default By default, this feature is disabled.

Mode Global Configuration

Usage Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with same source IPv6 address, group IPv6 address, upstream VLAN and downstream VLANs. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the **clear ipv6 multicast route** command.

To update an existing IPv6 static multicast route entry with more or a new set of downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than forwarded, do not specify the optional <downstream-vlan-id> parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the `<downstream-vlan-id>` parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if `port1.0.1` and `port1.0.14` are ports on an EPSR data VLAN `vlan101`, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Output **Figure 48-2: Example ipv6 mld snooping mrouter commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:**

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.14
```

See [ipv6 mld snooping mrouter](#) for a command description and command examples.

Examples To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address `2001::1` and group IP address `ff08::1`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
```

To create an IPv6 static multicast route for the multicast source IPv6 address `2001::1` and group IPv6 address `ff08::1`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

Related Commands [clear ipv6 multicast route](#)
[ipv6 mld snooping mrouter](#)
[show ipv6 mroute](#)

ipv6 multicast route-limit

Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the **no** variant of this command to return the IPv6 route limit to the default.

Syntax `ipv6 multicast route-limit <limit> [<threshold>]`
`no ipv6 multicast route-limit`

Parameter	Description
<code><limit></code>	<code><1-2147483647></code> Number of routes.
<code><threshold></code>	<code><1-2147483647></code> Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24

awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

ipv6 multicast-routing

Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

Syntax `ipv6 multicast-routing`
`no ipv6 multicast-routing`

Default By default, IPv6 multicast routing is off.

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 multicast-routing

awplus# configure terminal
awplus(config)# no ipv6 multicast-routing
```

Validation Commands `show running-config`

multicast

Use this command to enable a switch port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the switch port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

Syntax multicast
no multicast

Default By default, all switch ports route multicast packets.

Mode Interface Configuration

Examples

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# multicast
```

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no multicast
```

Validation Commands [show running-config](#)

show ip mroute

Use this command to display the contents of the IPv4 multicast routing (mroute) table.

Syntax `show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>] [{dense|sparse}] [{count|summary}]`

Parameter	Description
<code><ipv4-group-addr></code>	Group IPv4 address, in dotted decimal notation in the format A . B . C . D.
<code><ipv4-source-addr></code>	Source IPv4 address, in dotted decimal notation in the format A . B . C . D.
<code>dense</code>	Display dense IPv4 multicast routes.
<code>sparse</code>	Display sparse IPv4 multicast routes.
<code>count</code>	Display the route and packet count from the IPv4 multicast routing (mroute) table.
<code>summary</code>	Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip mroute 10.10.3.34 224.1.4.3
```

```
awplus# show ip mroute 10.10.5.24 225.2.2.2 count
```

```
awplus# show ip mroute 10.10.1.34 summary
```

Output The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 48-3: Example output from the show ip mroute command

```
awplus# show ip mroute
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed

```

show ip mvif

Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

Syntax `show ip mvif [<interface>]`

Parameter	Description
<interface>	The interface to display information about.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip mvif vlan2
```

Output **Figure 48-7: Example output from the show ip mvif command**

Interface	Vif Idx	Owner Module	TTL	Local Address	Remote Address	Uptime
vlan2	0	PIM-SM	1	192.168.1.53	0.0.0.0	00:04:26
Register	1		1	192.168.1.53	0.0.0.0	00:04:26
vlan3	2	PIM-SM	1	192.168.10.53	0.0.0.0	00:04:25

Figure 48-8: Example output from the show ip mvif command with the interface parameter vlan2 specified

Interface	Vif Idx	Owner Module	TTL	Local Address	Remote Address	Uptime
vlan2	0	PIM-SM	1	192.168.1.53	0.0.0.0	00:05:17

show ip rpf

Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

Syntax `show ip rpf <source-addr>`

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rpf 10.10.10.50
```

show ipv6 mroute

Use this command to display the contents of the IPv6 multicast routing (mroute) table.

Syntax `show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>]
[{count | summary}]`

Parameter	Description
<code><ipv6-group-addr></code>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<code><ipv6-source-addr></code>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
<code>count</code>	Display the route and packet count from the IPv6 multicast routing (mroute) table.
<code>summary</code>	Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 mroute

awplus# show ipv6 mroute count

awplus# show ipv6 mroute summary

awplus# show ipv6 mroute 2001::2 ff08::1 count

awplus# show ipv6 mroute 2001::2 ff08::1

awplus# show ipv6 mroute 2001::2 summary
```

Output The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 48-9: Example output from the show ipv6 mroute command

```
awplus#show ipv6 mroute
IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed

Speeding up IGMP convergence in a non-looped topology	49.12
Enabling Query Solicitation on multiple switches in a looped topology	49.12

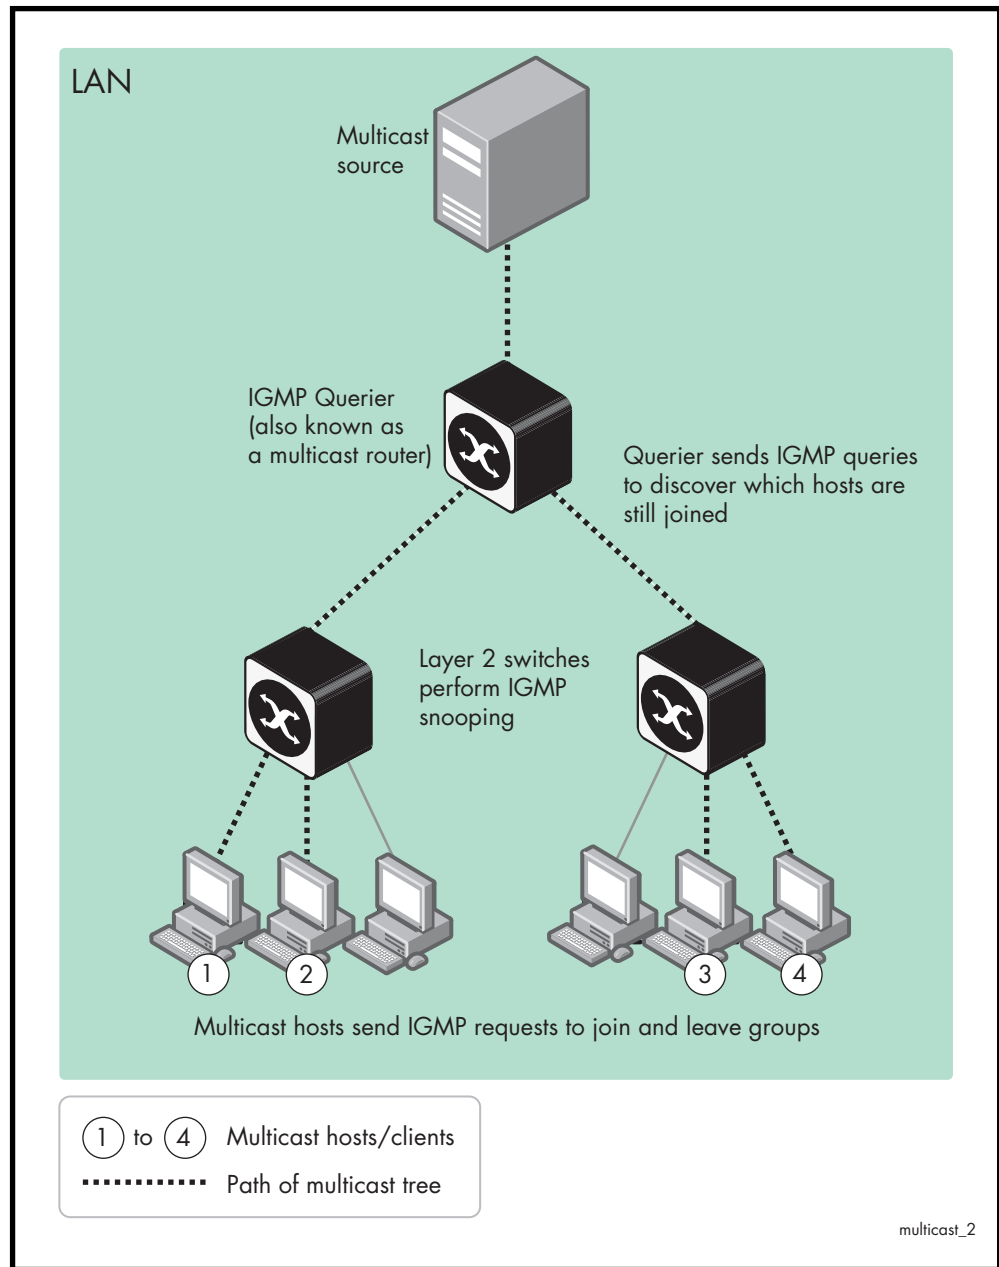

Introduction

This chapter provides information about Internet Group Management Protocol (IGMP), IGMP Snooping, and an introduction to the Query Solicitation feature when used with IGMP Snooping. To see details on the commands used in this example, or to see the outputs of the validation commands, refer to [Chapter 50, IGMP and IGMP Snooping Commands](#). For a general overview of multicasting, see [Chapter 48, Multicast Introduction and Commands](#).

IGMP

Internet Group Management Protocol (IGMP) is the protocol that hosts use to indicate that they are interested in receiving a particular multicast stream. An example of a multicast system within a single Layer 2 LAN is shown in [Figure 49-1](#).

Figure 49-1: Multicast system within a single LAN

Joining a multicast group (Membership report)

When a host wants to receive a stream, referred to as “joining a group”, it sends out an IGMP packet containing the address of the group it wants to join. This packet is called an IGMP Membership report, often referred to as a “join packet”. This packet is forwarded through the LAN to the local IGMP querier, which is typically a router. Once the querier has received an IGMP join message, it knows to forward the multicast stream to the host. If it is not already receiving the stream, it must tell the devices between itself and the multicast source, which may be some hops away from the querier, that it wishes to receive the stream. This might involve a process of using Layer 3 multicast protocols to signal across a WAN, or it might be as simple as receiving a stream from a locally connected multicast server.

Staying in the multicast group (Query message)

The Query message is used by a querier to determine whether hosts are still interested in an IGMP group. At certain time intervals (the default is 125 seconds), the querier sends an IGMP query message onto the local LAN. The destination address of the query message is a special "all multicast groups" address. The purpose of this query is to ask "Are there any hosts on the LAN that wish to remain members of multicast groups?" After receiving an IGMP query, any host that wants to remain in a multicast group must send a new join packet for that group. If a host is a member of more than one group, then it sends a join message for each group it wants to remain a member of. The querier looks at the responses it receives to its query, and compares these to the list of multicast streams that it is currently registered to forward. If there are any items in that list for which it has not received query responses, it will stop forwarding those streams. Additionally, if it is receiving those streams through a Layer 3 network, it will send a Layer 3 routing protocol message upstream, asking to no longer receive that stream.

Leaving the multicast group (Leave message)

How a host leaves a group depends on the IGMP version that it is using. Under IGMP version 1, when a host has finished with a data stream, the local querier continues to send the stream to the host until it sends out the next query message and receives no reply back from the host. IGMP version 2 introduced the Leave message. This allows a host to explicitly inform its querier that it wants to leave a particular multicast group. When the querier receives the Leave message, it sends out a group specific query asking whether any hosts still want to remain members of that specific group. If no hosts respond with join messages for that group, then the querier knows that there are no hosts on its LAN that are still members of that group. This means that for that specific group, it can ask to be pruned from the multicast tree. IGMP version 3 removed the Leave message. Instead a host leaves a group by sending a join message with no source specified.

IGMP Snooping

IGMP Snooping is a way for Layer 2 switches to reduce the amount of multicast traffic on a LAN. The AlliedWare Plus implementation of IGMP Snooping is compatible with networks running all IGMP versions.

Without IGMP Snooping, Layer 2 switches handle IP multicast traffic in the same manner as broadcast traffic and forward multicast frames received on one port to all other ports in the same VLAN. IGMP Snooping allows switches to monitor network traffic, and determine hosts to receive multicast traffic, by looking into IGMP packets to learn which attached hosts need to receive which multicast groups. This allows the switch to forward multicast traffic only out the appropriate ports. If it sees multiple reports sent for one group, it will forward only one of them.

How IGMP Snooping operates

IGMP Snooping operates similarly to the multicast protocols. When a switch hears an IGMP report from a host for a given multicast group, the switch adds the host's port number to the list of ports that are listening to the multicast group. When the switch hears an IGMP leave, it removes the host's port from the list, after the completion of the leave process as described in [“Leaving the multicast group \(Leave message\)” on page 49.4](#). When there are no hosts listening to a group, the switch informs the local querier to stop sending that group's multicast stream.

IGMP Snooping allows query messages to be forwarded to all ports. The hosts that still require the stream respond to the queries by sending reports. The switch intercepts these. Depending on configuration settings, the switch may just forward the reports directly on to the querier, or it may proxy report on behalf of the group, only forwarding on one consolidated report for each group.

By default, IGMP Snooping is enabled both globally and on all VLANs.

Note IGMP Snooping cannot be disabled on an interface if IGMP Snooping has already been disabled globally. IGMP Snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.

To disable IGMP Snooping either

```
1.                               awplus#
                               configure terminal  Enter Global Configuration mode.
```

```
2.                               awplus(config)#
                               no ip igmp snooping  Disable IGMP Snooping globally.
```

or

```
1.                               awplus#
                               configure terminal  Enter Global Configuration mode.
```

```
2.                               awplus(config)#
                               interface <vlan-name>  Enter Interface Configuration mode for a specific VLAN.
```

```
3.                               awplus(config-if)#
                               no ip igmp snooping  Disable IGMP Snooping for a specific VLAN.
```

IGMP Snooping and Querier configuration example

This example describes the configuration of IGMP Snooping on an Allied Telesis managed Layer 3 switch (Switch 1) and the configuration of IGMP Querier (Switch 2). The interface port1.1.12 is configured as a multicast router port. Host A and Host B are both members of the same multicast group.

To enable IGMP Snooping on an interface:

- Enable IGMP Snooping globally, if necessary. IGMP Snooping is enabled by default.
- Enable IGMP Snooping on the desired interfaces, if necessary. IGMP Snooping is enabled on all interfaces by default.
- Statically configure ports that are connected to routers if necessary.

Figure 49-2: IGMP Snooping configuration example

As a result of this configuration:

- Membership reports are generated by hosts. The IGMP Snooping switch will forward the membership reports to its router port. Queries received by the IGMP Snooping switch from the IGMP Querier on port1.1.12 are forwarded by the IGMP Snooping switch.
- Because Host A and Host B are members of the same multicast group, the switch does not notify the IP IGMP routing device (IGMP Querier) when Host A leaves the group, because the group still has another member Host B remaining. When Host B also leaves the group, the switch forwards the leave message to the IP IGMP Querier.
- The addition of a static mrouter port is only required when there is no upstream IGMP querier or an upstream router does not send topology discovery or maintenance messages (like IGMP General Queries or OSPF Hello packets).
- In this example, the configuration of a static mrouter port on port1.1.12 is provided to illustrate the `ip igmp snooping mrouter` command. However, this command would probably not be necessary, since the switch should dynamically set port1.1.12 to be an mrouter port as it receives IGMP Queries arriving from the IGMP Querier attached to port1.1.12.

- In this example, it is not necessary to explicitly configure the switch to work with IGMPv2 or IGMPv3. When the IGMP version is not configured then the switch will work with both versions of IGMP.

Table 49-1: Configuring IGMP Snooping on Switch 1 and IGMP Querier on Switch 2

Configure IGMP Snooping (Switch 1)		
1.	<code>awplus# configure terminal</code>	Enter Global Configuration mode.
2.	<code>awplus(config)# ip igmp snooping</code>	Enable IGMP Snooping globally. Snooping is enabled by default. Use this command only if you have previously disabled it.
3.	<code>awplus(config)# ip igmp snooping</code>	Enter Interface Configuration mode for VLAN 1.
4.	<code>awplus(config-if)# ip igmp snooping mrouter interface port1.1.12</code>	Configure port1.1.12 as a multicast router port to the IGMP Querier.
5.	<code>awplus(config-if)# exit</code>	Return to Global Configuration mode.
Validate the configuration		
6.	<code>awplus# exit</code>	Return to Privileged Exec mode.
7.	<code>awplus# show ip igmp interface vlan1</code>	Display the state of IGMP Snooping for VLAN 1.
8.	<code>awplus# show ip igmp groups</code>	Display the multicast groups with receivers directly connected to the router.
9.	<code>awplus# show ip igmp snooping mrouter interface vlan1</code>	Display the multicast router ports, both static and dynamic, in VLAN 1.
Configure IGMP Querier (Switch 2)		
1.	<code>awplus# configure terminal</code>	Enter Global Configuration mode.
2.	<code>awplus(config)# interface vlan1</code>	Enter Interface Configuration mode for VLAN 1.
3.	<code>awplus(config-if)# ip igmp</code>	Enable IGMP on VLAN 1 and configure the switch as an IGMP Querier.
Validate the configuration		
4.	<code>awplus# exit</code>	Return to Privileged Exec mode.
5.	<code>awplus# show ip igmp interface vlan1</code>	Display the state of IGMP Querier for VLAN 1.

Table 49-1: Configuring IGMP Snooping on Switch 1 and IGMP Querier on Switch 2

6.	<pre>awplus# show running-config</pre>	Display the current dynamic configuration of Switch 2.

Query Solicitation

Query Solicitation minimizes the loss of multicast data after a topology change on networks that use EPSR or spanning tree (STP, RSTP, or MSTP) for loop protection. Without Query Solicitation, when the underlying link layer topology changes, multicast data flow can stop for up to several minutes, depending on which port goes down and how much of the IGMP query interval remained at the time of the topology change. Query Solicitation greatly reduces this disruption.

Query Solicitation operates without configuration in AlliedWare Plus™ switches running STP, RSTP, MSTP or EPSR. However, you may find it useful to manually enable Query Solicitation in loop-free networks running IGMP (see [Speeding up IGMP convergence in a non-looped topology](#)) and networks where not all switches support Query Solicitation (see [Enabling Query Solicitation on multiple switches in a looped topology](#)).

How Query Solicitation Works

Query Solicitation monitors STP, RSTP, MSTP and EPSR messages for topology changes. When it detects a change, it generates a special IGMP Leave message called a Query Solicit. The switch floods the Query Solicit message to all ports in every VLAN that Query Solicitation is enabled on. When the Querier receives the Query Solicit message, it sends out a General Query and waits for clients to respond with Membership Reports. These Reports update the snooping information throughout the network.

Query Solicit messages have a group address of 0.0.0.0.

Query Solicitation works by default (without you enabling it) on all VLANs on the root bridge in an STP instance and on all data VLANs on the master node in an EPSR instance. By default, the root bridge or master node always sends a Query Solicit message when any of the following events occur:

- an STP BPDU packet with the Topology Change (TC) flag arrives at the root bridge
- an STP port on a switch goes from a Discarding to Forwarding state
- the FDB gets flushed by EPSR

If necessary, you can make clients respond more quickly to the General Query by tuning the IGMP timers, especially the maximum response time advertised in IGMP queries using the `ip igmp query-max-response-time` command.

Query Solicitation Operation

When IGMP Snooping is enabled and EPSR or Spanning Tree changes the underlying link layer topology, this can interrupt multicast data flow for a significant length of time. This is because there is no way for switches in a network with interested clients to know where the traffic is available, due to the change in network topology. This change in network topology may take up to two IGMP Query intervals from the IGMP Querier, until the switches will know where to forward membership reports received by client hosts. During this time, those hosts will not receive multicast traffic.

Query solicitation prevents this by monitoring for any topology changes. When it detects a change, it generates a special IGMP Leave message known as a Query Solicit, and floods the Query Solicit message to all ports in every VLAN that query solicitation is enabled on. When the IGMP Querier receives the message, it responds by sending a General Query, which all IGMP listeners respond to. This refreshes snooped group membership information in the network.

Query solicitation reduces downtime to a negligible amount by triggering on topology

changes. The generation of query solicitation messages in the network causes the IGMP Querier to send an IGMP Query immediately following a topology change. This enables the switches to know where to look for the traffic and thus to send reports to the correct switch upstream. This allows the multicast data traffic to be recovered instantly.

Query solicitation functions by default (without you enabling it) on all VLANs on the root bridge in an STP instance and on all data VLANs on the master node in an EPSR instance. By default, the root bridge or master node always sends a Query Solicit message when the topology changes.

If you have multiple STP or EPSR instances, query solicitation only sends Query Solicit messages on VLANs in the instance that experienced a topology change.

In switches other than the STP root bridge or EPSR master node, query solicitation is disabled by default, but you can enable it by using the **ip igmp snooping tcn query solicit** command.

If you enable query solicitation on a switch other than the STP root bridge or EPSR master node, both that switch and the root or master send a Query Solicit message.

Once the Querier receives the Query Solicit message, it sends out a General Query and waits for responses, which update the snooping information throughout the network.

The **ip igmp query-holdtime** command can be configured on the IGMP Querier. This command introduces a brief delay between when the IGMP Querier receives the query solicit, and when it sends out the general query. Although this slightly reduces the speed with which the network recovers from the topology change, it does guard against a DoS (Denial of Service) attack. Without this delay, a malign host sending a stream of query solicits could cause the IGMP Querier to flood the network with IGMP Queries.

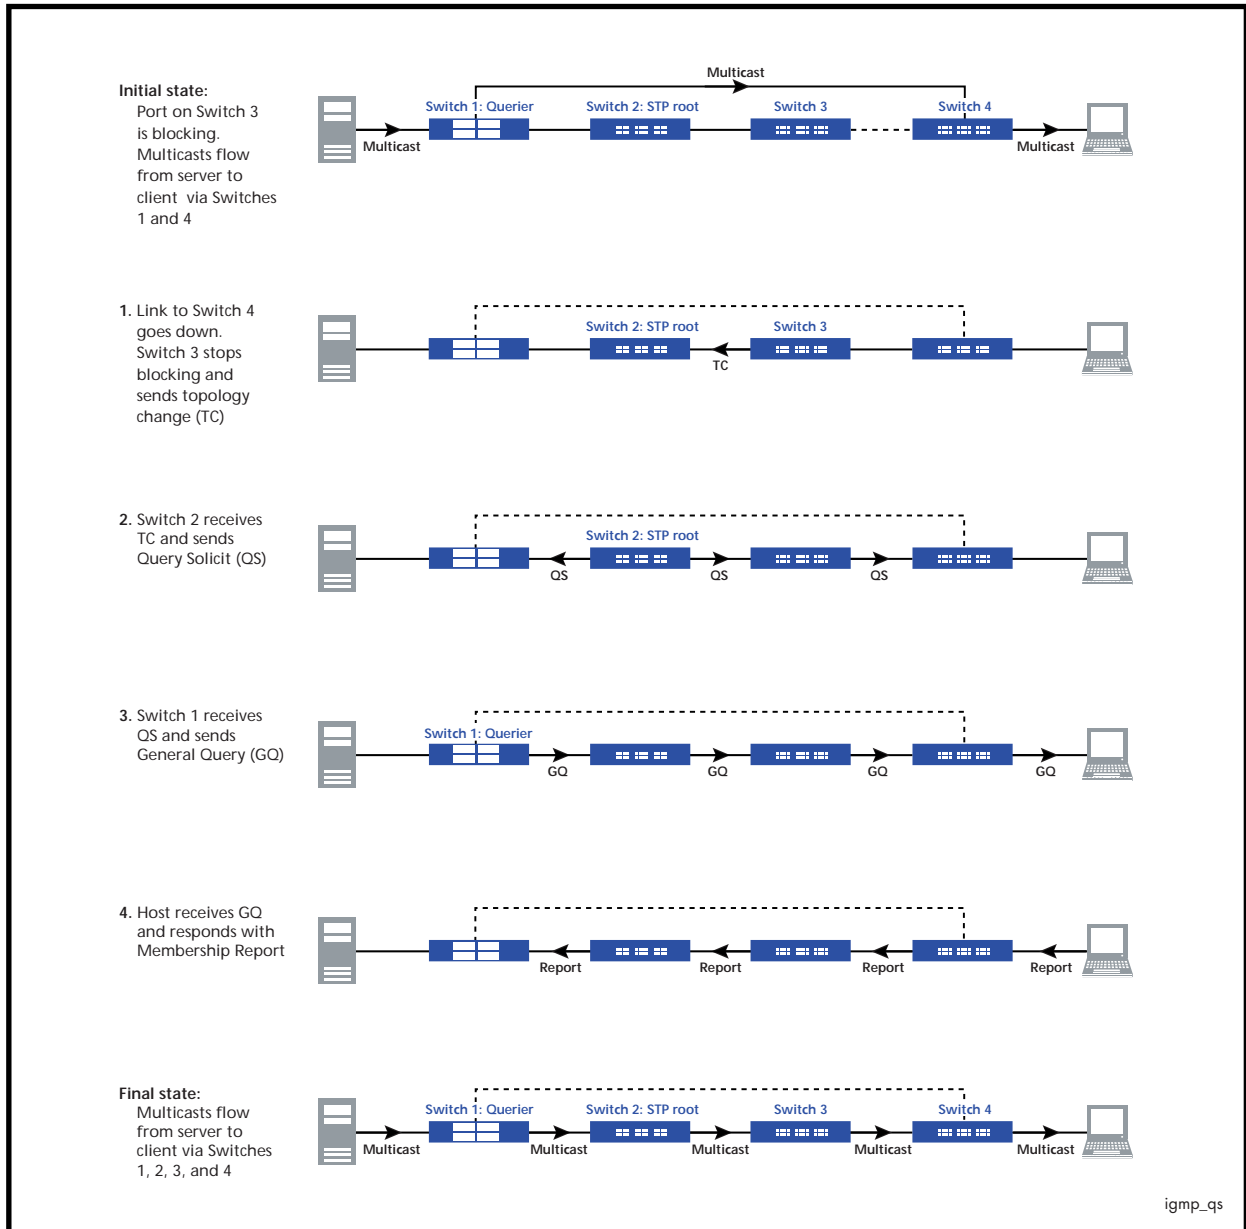

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries

On switches other than the STP root bridge or the EPSR master node, you can disable query solicitation by using the no variant of the **ip igmp snooping tcn query solicit** command. In addition, on all switches, you can disable query solicitation on a per-vlan basis using the no variant of the **ip igmp snooping tcn query solicit** command in Interface Configuration mode, after specifying a VLAN first in Interface Configuration mode.

To see whether query solicitation is on or off, check the Query Solicitation field in output of the **show ip igmp interface** command. You can view running and startup configurations with **show running-config** and **show startup-config** commands to see if Query Solicitation is enabled.

The following figure shows how Query Solicitation works when a port goes down.

Figure 49-3: Query Solicitation when a port goes down

Speeding up IGMP convergence in a non-looped topology

For loop-free networks running IGMP, where it may take up to two minutes for multicasting to recover in a non-looped topology after a port comes back up, you can speed up convergence by enabling RSTP using the **spanning-tree mode** and **spanning-tree enable** commands.

RSTP enables the network to use Query Solicitation by default, and means that multicasting should resume within seconds, not minutes, of the link coming up.

Enabling Query Solicitation on multiple switches in a looped topology

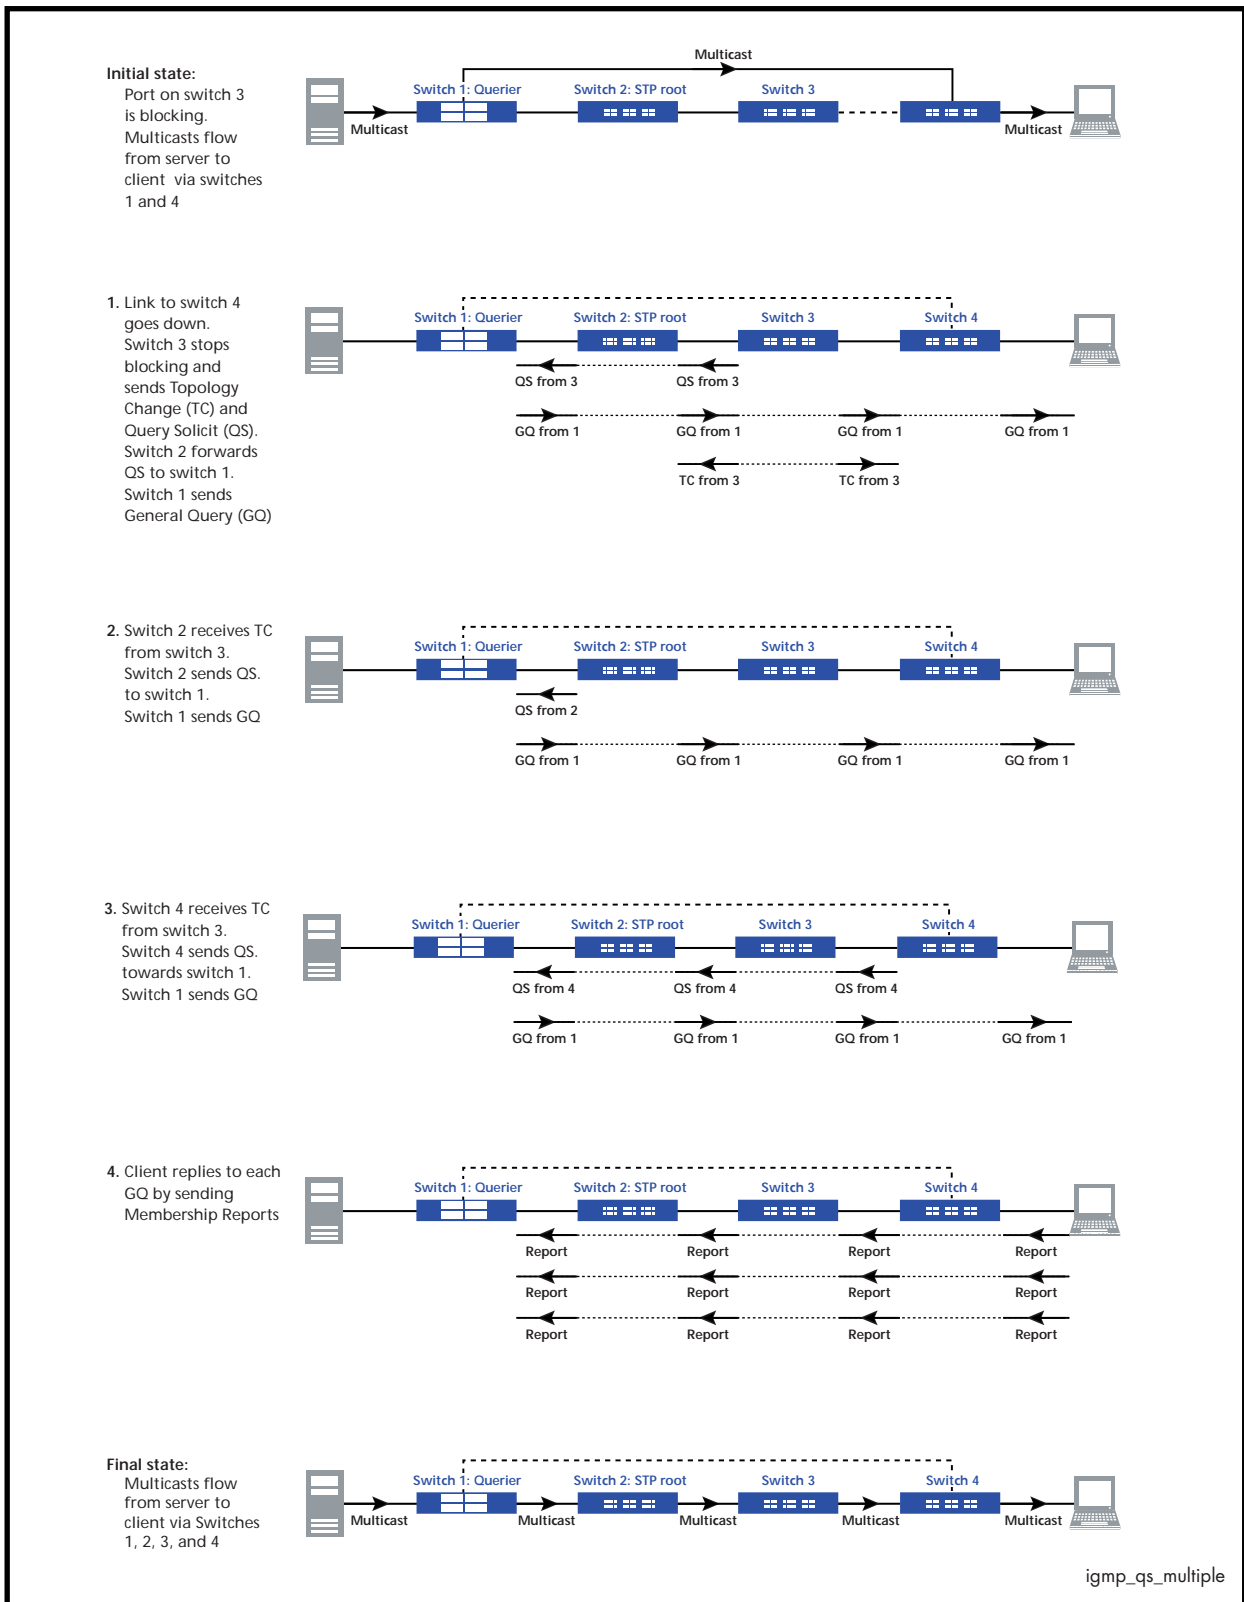

On networks that use spanning tree or EPSR, Query Solicitation is not normally required on switches other than the STP root bridge or EPSR master node. Therefore, it is only enabled by default on the root bridge and the master node.

However, in some networks you may need to turn on Query Solicitation on all switches - for example, if the network includes other switches that do not support Query Solicitation and therefore the STP root bridge may be a switch that does not send Query Solicit messages. To enable Query Solicitation, use the **ip igmp snooping tcn query solicit** command.

Every switch that has Query Solicitation enabled sends a Query Solicit message when it detects a topology change. Enabling it on multiple switches means you get multiple messages, but has no other disadvantage.

The following figure shows the packet flow for a four-switch network with Query Solicitation enabled on all the switches.

Figure 49-4: Packet flow for a four switch network with Query Solicitation enabled

Chapter 50: IGMP and IGMP Snooping Commands

Introduction

The Internet Group Management Protocol (IGMP) module includes the IGMP Proxy service and IGMP Snooping functionality. Some of the following commands may have commonalities and restrictions. These are described under the Usage section for each command.

Command List

This chapter provides an alphabetical reference of configure, clear, and show commands related to Internet Group Management Protocol (IGMP).

clear ip igmp

Use this command to clear all IGMP group membership records on all VLAN interfaces.

Syntax `clear ip igmp`

Mode Privileged Exec

Usage This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# clear ip igmp
```

Validation Commands `show ip igmp interface`
`show running-config`

Related Commands `clear ip igmp group`
`clear ip igmp interface`

clear ip igmp group

Use this command to clear IGMP group membership records for a specific group on either all VLAN interfaces, a single VLAN interface, or for a range of VLAN interfaces.

Syntax `clear ip igmp group *`
`clear ip igmp group <ip-address> <interface>`

Parameter	Description
*	Clears all groups on all VLAN interfaces. This is an alias to the clear ip igmp command.
<ip-address>	Specifies the group whose membership records will be cleared from all VLAN interfaces, entered in the form A.B.C.D.
<interface>	Specifies the name of the VLAN interface; all groups learned on this VLAN interface are deleted.

Mode Privileged Exec

Usage This command applies to groups learned by IGMP, IGMP Snooping, or IGMP Proxy.

In addition to the group a VLAN interface can be specified. Specifying this will mean that only entries with the group learnt on the interface will be deleted.

Examples

```
awplus# clear ip igmp group *
awplus# clear ip igmp group 224.1.1.1 vlan1
```

Validation Commands `show ip igmp interface`
`show running-config`

Related Commands `clear ip igmp`
`clear ip igmp interface`

clear ip igmp interface

Use this command to clear IGMP group membership records on a particular VLAN interface.

Syntax `clear ip igmp interface <interface>`

Parameter	Description
<interface>	Specifies the name of the VLAN interface. All groups learned on this VLAN interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# clear ip igmp interface vlan1
```

Validation Commands `show ip igmp interface`
`show running-config`

Related Commands `clear ip igmp`
`clear ip igmp group`

debug igmp

Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

Syntax `debug igmp {all|decode|encode|events|fsm|tib}`
`no debug igmp {all|decode|encode|events|fsm|tib}`

Parameter	Description
all	Enable or disable all debug options for IGMP
decode	Debug of IGMP packets that have been received
encode	Debug of IGMP packets that have been sent
events	Debug IGMP events
fsm	Debug IGMP Finite State Machine (FSM)
tib	Debug IGMP Tree Information Base (TIB)

Modes Privileged Exec and Global Configuration

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example

```
awplus# configure terminal
awplus(config)# debug igmp all
```

Related Commands [show debugging igmp](#)
[undebug igmp](#)

ip igmp

Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

Syntax ip igmp
no ip igmp

Default Disabled

Mode Interface Configuration for a VLAN interface.

Usage This command can only be configured on VLAN interfaces, and will have no effect on IGMP Proxy or IGMP Snooping configuration.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Note An IP address must be assigned to the VLAN first, before this command will work.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

Validation Commands [show ip igmp interface](#)
[show running-config](#)

ip igmp access-group

This command adds an access control list to a VLAN interface configured for IGMP, IGMP Snooping, or IGMP Proxy. The access control list is used to control and filter the multicast groups learnt on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

Syntax `ip igmp access-group {<access-list-number>|<access-list-name>}`
`no ip igmp access-group`

Parameter	Description
<code><access-list-number></code>	Standard IP access-list number, in the range <1-99>.
<code><access-list-name></code>	Standard IP access-list name.

Default By default there are no access lists configured on any interface.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

This command applies to VLAN interfaces configured for IGMP or IGMP Snooping.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example In the following example, hosts serviced by VLAN interface `vlan2` can only join the group `225.2.2.2`:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

ip igmp immediate-leave

In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

Syntax `ip igmp immediate-leave group-list {<access-list-number> | <access-list-number-expanded> | <access-list-name>}`

`no ip igmp immediate-leave`

Parameter	Description
<code><access-list-number></code>	Access-list number, in the range <1-99>.
<code><access-list-number-expanded></code>	Access-list number (expanded range), in the range <1300-1999>.
<code><access-list-name></code>	Standard IP access-list name.

Default Disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy. Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example The following example shows how to enable the immediate-leave feature on the VLAN interface `vlan2` for a specific range of multicast groups

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp immediate-leave group-list 34
awplus(config-if)# exit
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

Related Commands [ip igmp last-member-query-interval](#)

ip igmp last-member-query-count

Use this command to set the last-member query-count value for an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax ip igmp last-member-query-count <2-7>
no ip igmp last-member-query-count

Parameter	Description
<2-7>	Last member query count value.

Default The default last member query count value is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy. Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

Validation Commands show ip igmp interface
show running-config

Related Commands ip igmp last-member-query-interval
ip igmp startup-query-count

ip igmp last-member-query-interval

Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax `ip igmp last-member-query-interval <interval>`
`no ip igmp last-member-query-interval`

Parameter	Description
<interval>	The frequency in milliseconds, in the range <1000-25500>, at which IGMP group-specific host query messages are sent.

Default 1000 milliseconds

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy. Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example The following example changes the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) for VLAN interface `vlan1`:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp last-member-query-interval 2000
```

Validation Commands `show ip igmp interface`
`show running-config`

Related Commands `ip igmp immediate-leave`
`ip igmp last-member-query-count`

ip igmp limit

Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored. Optionally, you can configure an access-list to stop certain address(es) from being subject to the limit.

The limit is dependent on the MTU (Maximum Transmission Unit) of the interface, which is the size in bytes of the largest packet that a network protocol can transmit. Typically for an ethernet channel with an MTU of 1500 the igmp group membership limit will be 183 groups, because each igmp group membership is 8 bytes.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax

```
ip igmp limit <limitvalue> [except {<access-list-number>|<access-list-number-expanded>|<access-list-name>}]
no ip igmp limit
```

Parameter	Description
<limitvalue>	<2-1024> Maximum number of group membership entries.
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.

Default The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ip igmp limit** command.

The default limit of group membership entries that can be learned is 1024 entries.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy. Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples The following example configures an IGMP limit of 100 group membership entries across all interfaces on which IGMP is enabled, and excludes group 224.1.1.1 from this limitation:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp limit 100 except 1
```

The following example configures an IGMP limit of 100 group membership entries on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp limit 100
```

ip igmp mroute-proxy

Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

Syntax `ip igmp mroute-proxy <interface>`
`no ip igmp mroute-proxy`

Parameter	Description
<code><interface></code>	The name of the VLAN interface.

Mode Interface Configuration for a VLAN interface.

Usage You must also enable the IGMP proxy service on the upstream interface, using the **ip igmp proxy-service** command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM. This command applies to interfaces configured for IGMP Proxy.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example The following example configures the VLAN interface `vlan2` interface as the upstream proxy-service interface for the downstream interface, VLAN interface `vlan3`.

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp mroute-proxy vlan2
```

Related Commands [ip igmp proxy-service](#)

ip igmp proxy-service

Use this command to enable the VLAN interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the VLAN interface as an upstream proxy-service interface.

Syntax `ip igmp proxy-service`
`no ip igmp proxy-service`

Mode Interface Configuration for a VLAN interface.

Usage This command is used with the **ip igmp mroute-proxy** command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command **ip igmp mroute-proxy**.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example The following example designates the VLAN interface `vlan2` interface as the upstream proxy-service interface.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp proxy-service
```

Related Commands [ip igmp mroute-proxy](#)

ip igmp querier-timeout

Use this command to configure the timeout period before the device takes over as the querier for the VLAN interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax `ip igmp querier-timeout <timeout>`
`no ip igmp querier-timeout`

Parameter	Description
<code><timeout></code>	IGMP querier timeout interval value in seconds, in the range <1-65535>.

Default The default timeout interval is 255 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP. The timeout value should not be less than the current active querier's general query interval.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example The following example configures the device to wait 130 seconds from the time it received the last query before it takes over as the querier for the VLAN interface `vlan20`:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp querier-timeout 130
```

Validation Commands `show ip igmp interface`
`show running-config`

Related Commands `ip igmp query-interval`

ip igmp query-holdtime

This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

Syntax `ip igmp query-holdtime <interval>`
`no ip igmp query-holdtime`

Parameter	Description
<code><interval></code>	Query interval value in milliseconds, in the range <100-5000>.

Default By default the delay before sending IGMP General Query messages is 500 milliseconds.

Mode Interface Configuration for a VLAN interface.

Usage Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the switch is acting as an IGMP Querier.

Use the **ip igmp query-interval** command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See **“Query Solicitation” on page 49.9** for introductory information about the Query Solicitation feature.

Ensure your VLAN is configured first, see **Chapter 16, Configuring VLANs**.

Examples To set the IGMP query holdtime to 900 ms for `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for `vlan10`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

**Validation
Commands** **show ip igmp interface**
 show running-config

Related Commands **ip igmp query-interval**
 ip igmp snooping tcn query solicit

ip igmp query-interval

Use this command to configure the period for sending IGMP General Query messages. The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

Note  The IGMP query interval must be greater than IGMP query maximum response time.

Syntax `ip igmp query-interval <interval>`
`no ip igmp query-interval`

Parameter	Description
<code><interval></code>	Query interval value in seconds, in the range <2-18000>.

Default The default IGMP query interval is 125 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the **ip igmp query-max-response-time** command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The **ip igmp query-holdtime** command can occasionally delay the sending of IGMP Queries.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples The following example changes the period between IGMP host-query messages to 3 minutes (180 seconds) for VLAN interface `vlan20`:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

The following example resets the period between sending IGMP host-query messages to the default (125 seconds) for VLAN interface `vlan20`:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# no ip igmp query-interval
```

**Validation
Commands** **show ip igmp interface**
 show running-config

Related Commands **ip igmp query-holdtime**
 ip igmp query-max-response-time
 ip igmp startup-query-interval

ip igmp query-max-response-time

Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

Note  The IGMP query maximum response time must be less than the IGMP query interval.

Syntax `ip igmp query-max-response-time <response-time>`

`no ip igmp query-max-response-time`

Parameter	Description
<code><response-time></code>	Response time value in seconds, in the range <1-3180>.

Default The default IGMP query maximum response time is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the **ip igmp query-interval** command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples The following example configures a maximum response time of 8 seconds for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-max-response-time 8
```

The following example restores the default maximum response time of 10 seconds for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp query-max-response-time
```

**Validation
Commands** **show ip igmp interface**
 show running-config

Related Commands **ip igmp query-interval**

ip igmp ra-option (Router Alert)

Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Syntax ip igmp ra-option
no ip igmp ra-option

Default The default state of RA validation is unset.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP and IGMP Snooping. Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

ip igmp robustness-variable

Use this command to change the robustness variable value on a VLAN interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax `ip igmp robustness-variable <1-7>`
`no ip igmp robustness-variable`

Parameter	Description
<1-7>	The robustness variable value.

Default The default robustness variable value is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for IGMP and IGMP Snooping. Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# no ip igmp robustness-variable 3
```

Validation Commands `show ip igmp interface`
`show running-config`

ip igmp snooping

Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the switch level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

 **Note** IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.

Syntax `ip igmp snooping`
`no ip igmp snooping`

Default By default, IGMP Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default.)

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples

```
awplus# configure terminal
awplus(config)# ip igmp snooping

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

Related Commands [show ip igmp interface](#)
[show running-config](#)

ip igmp snooping fast-leave

Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax ip igmp snooping fast-leave
no ip igmp snooping fast-leave

Default IGMP Snooping fast-leave processing is disabled.

Mode Interface Configuration for a VLAN interface.

Usage This IGMP Snooping command can only be configured on VLAN interfaces. Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example This example shows how to enable fast-leave processing on the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

Validation Commands show ip igmp interface
show running-config

ip igmp snooping mrouter

Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

Syntax `ip igmp snooping mrouter interface <port>`
`no ip igmp snooping mrouter interface <port>`

Parameter	Description
<port>	The port may be a switch port (e.g. <code>port1.1.4</code>), a static channel group (e.g. <code>sa3</code>), or a dynamic (LACP) channel group (e.g. <code>po4</code>).

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example This example shows the switch port interface `port1.1.2` statically configured to be a multicast router interface for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.1.2
```

Related Commands [show ip igmp snooping mrouter](#)

ip igmp snooping querier

Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

Syntax `ip igmp snooping querier`
`no ip igmp snooping querier`

Usage The IGMP Snooping querier uses the 0 . 0 . 0 . 0 Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Note Do not enable the IGMP Snooping Querier feature on a Layer 2 switch when there is an operational IGMP Querier in the network.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

Validation Commands `show ip igmp interface`
`show running-config`

ip igmp snooping report-suppression

Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

Syntax `ip igmp snooping report-suppression`
`no ip igmp snooping report-suppression`

Default Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example This example shows how to enable report suppression for IGMPv2 reports for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

Validation Commands `show ip igmp interface`
`show running-config`

ip igmp snooping routermode

Use this command to set the destination IP addresses as a router multicast address, according to the routermode (all multicast addresses, default multicast addresses, specified multicast addresses).

Use the **no** variant of this command to the default. You can also remove a specified IP address from a custom list of multicast addresses.

Syntax `ip igmp snooping routermode {all|default|ip|multicastrouter|address <ip-address>}`
`no ip igmp snooping routermode [address <ip-address>]`

Parameter	Description
all	All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are set as routers.
default	Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are set as routers.
ip	Custom reserved multicast addresses. Custom IP address in the 224.0.0.x range are set as router multicast addresses using the ip igmp snooping routermode address command.
multicastrouter	DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are set as routers.
address	Specify the multicast address in the 224.0.0.x range for use after issuing an ip igmp snooping routermode ip command
<ip-address>	IPv4 multicast address (224.0.0.x)

Default The default routermode is **default** not **all** and shows the below reserved multicast addresses:

```
Router mode.....Def
Reserved multicast address
    224.0.0.1
    224.0.0.2
    224.0.0.4
    224.0.0.5
    224.0.0.6
    224.0.0.9
    224.0.0.13
    224.0.0.15
    224.0.0.24
```

Mode Global Configuration

Examples To set **ip igmp snooping routermode** for all default reserved addresses enter:.

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:.

```
awplus(config)# no ip igmp snooping routermode address  
224.0.0.5
```

Related commands [show ip igmp snooping routermode](#)

ip igmp snooping tcn query solicit

Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the no variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

Syntax `ip igmp snooping tcn query solicit`
`no ip igmp snooping tcn query solicit`

Default IGMP Snooping TCN Query Solicitation is disabled by default on the switch, unless the switch is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the switch is the Master Node in an EPSR ring, or the switch is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified VLANs using this command from the Interface Configuration mode. Select the VLAN you want to disable in Interface Configuration mode then issue the no variant of this command to disable the specified VLAN without disabling this feature for other VLANs.

Usage Once enabled, if the switch is not an IGMP Querier, on detecting a topology change, the switch generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the switch.

On a switch that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the switch that detects a topology change is an IGMP Querier then the switch will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a switch that is the Master Node in an EPSR ring or on a switch that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the switch these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the below state table that shows when Query Solicit messages are sent in these instances:

Command issued from Global Configuration	Switch is STP Root Bridge or the EPSR Master Node	Command issued from Interface Configuration	IGMP Query Solicit message sent on VLAN
No	Yes	Yes	Yes
Yes	Yes	No	No
Yes	Yes	Yes	Yes

See [“Query Solicitation” on page 49.9](#) for introductory information about the Query Solicitation feature.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples This example shows how to enable IGMP Snooping TCN Query Solicitation on a switch:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

This example shows how to disable IGMP Snooping TCN Query Solicitation on a switch:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

This example shows how to enable IGMP Snooping TCN Query Solicitation for the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

This example shows how to disable IGMP Snooping TCN Query Solicitation for the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

Validation Commands **show ip igmp interface**
show running-config

Related Commands **ip igmp query-holdtime**

ip igmp source-address-check

This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

Syntax `ip igmp source-address-check`
`no ip igmp source-address-check`

Default Source address checking for IGMP Reports is enabled by default.

Usage This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The **no** variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples To deny IGMP Reports from outside the current subnet for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp source-address-check
```

Validation Commands `show ip igmp interface`
`show running-config`

ip igmp ssm

Use this command to define a non-default Source Specific Multicast (SSM) range of IP multicast addresses in IGMP. Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, use one of the access-list parameter options.

Use the **no** variant of this command to change the SSM range in IGMP back to the default.

Syntax `ip igmp ssm range {<access-list-number>|<access-list-name>}`
`no ip igmp ssm`

Parameter	Description
<code><access-list-number></code>	Access-list number, in the range <1-99>.
<code><access-list-name></code>	Standard IP access-list name.

Default By default the SSM range is 232/8.

Mode Global Configuration

Examples To configure a non-default SSM range to be used in IGMP enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.0 0.0.0.255
awplus(config)# ip igmp ssm range 10
```

To return to the default configuration enter the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp ssm
```

Related Commands [access-list \(standard numbered\)](#)
[ip pim ssm](#)

ip igmp ssm-map enable

Use this command to enable Source Specific Multicast (SSM) mapping on the device.

Use the **no** variant of this command to disable SSM mapping.

Syntax `ip igmp ssm-map enable`
`no ip igmp ssm-map enable`

Mode Global Configuration

Usage This command applies to VLAN interfaces configured for IGMP.

Example To enable SSM on the switch enter the commands:

```
awplus# configure terminal
awplus(config)# ip igmp ssm-map enable
```

Related Commands [ip igmp ssm-map static](#)

ip igmp ssm-map static

Use this command to specify the static mode of defining Source Specific Multicast (SSM) mapping. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

Syntax

```
ip igmp ssm-map static {<access-list-number>|<access-list-number-expanded>|<access-list-name>} <ip-address>
no ip igmp ssm-map static {<access-list-number>|<access-list-number-expanded>|<access-list-name>} <ip-address>
```

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.
<ip-address>	Source address to use for static map group, entered in the form A.B.C.D.

Mode Global Configuration

Usage This command applies to VLAN interfaces configured for IGMP. You can use Standard numbered and Standard named ACLs plus Expanded Numbered ACLs.

Examples This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard numbered ACL shown as 10:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 10 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using an expanded numbered ACL shown as 1301:

```
awplus# configure terminal
awplus(config)# access-list 1301 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 1301 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address 224.1.1.1, using a standard named ACL shown as sales:

```
awplus# configure terminal
awplus(config)# access-list sales permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static sales 1.2.3.4
```

Related Commands **ip igmp ssm-map enable**

ip igmp static-group

Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

To use Source Specific Multicast mapping to determine the source IP address of the multicast server use the **ssm-map** parameter instead of specifying the source IP address.

Use the **no** variant of this command to delete static group membership entries.

Syntax `ip igmp static-group <ip-address> [source {<ip-source-addr>|ssm-map}] [interface <port>]`
`no ip igmp static-group <ip-address> [source {<ip-source-addr>|ssm-map}] [interface <port>]`

Parameter	Description
<code><ip-address></code>	Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.
<code>source</code>	Optional.
<code><ip-source-addr></code>	Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.
<code>ssm-map</code>	This parameter uses Source Specific Multicast (SSM) Mapping to determine the source IP address associated with the specified IP Multicast group address. SSM mappings are configured using the ip igmp ssm-map static command.
<code>interface</code>	Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN.
<code><port></code>	The port or port range to statically forward the group out of. The port may be a switch port (e.g. port1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

Mode Interface Configuration for a VLAN interface.

Usage This command applies to IGMP operation on a specific interface to statically add group and/or source records, or to IGMP Snooping on a VLAN interface to statically add group and/or source records.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example The following example show how to statically add group and source records for IGMP on the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp static-group 226.1.2.4 source
10.2.3.4
```

ip igmp startup-query-count

Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

Syntax `ip igmp startup-query-count <startup-query-count>`
`no ip igmp startup-query-count`

Parameter	Description
<code><startup-query-count></code>	Specify the IGMP startup query count for a VLAN interface in the range <2-10> where 2 is the default IGMP query count.

Default The default IGMP startup query count is 2.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples The following example shows how to configure the IGMP startup query count to 4 for the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp startup-query-count 4
```

The following example shows how to remove the IGMP startup query count for the VLAN interface `vlan3`:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# no ip igmp startup-query-count
```

Related Commands [ip igmp last-member-query-count](#)
[ip igmp startup-query-interval](#)

ip igmp startup-query-interval

Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

Syntax `ip igmp startup-query-interval <startup-query-interval>`
`no ip igmp startup-query-interval`

Parameter	Description
<code><startup-query-interval></code>	Specify the IGMP startup query interval for a VLAN interface in Interface Configuration mode in the range of <2-1800> seconds to be one quarter of the IGMP query interval value.

Default The default IGMP startup query interval is one quarter of the IGMP query interval value.

Note The IGMP startup query interval must be one quarter of the IGMP query interval.

Mode Interface Configuration for a VLAN interface.

Usage Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Examples The following example shows how to configure the IGMP startup query interval to 15 seconds for the VLAN interface `vlan2` to be one quarter of the IGMP query interval value of 60 seconds:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-interval 15
awplus(config-if)# ip igmp query-interval 60
```

The following example shows how to remove the IGMP startup query interval for the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp startup-query-interval
```

Related Commands [ip igmp last-member-query-interval](#)
[ip igmp query-interval](#)
[ip igmp startup-query-count](#)

ip igmp version

Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

Syntax `ip igmp version <1-3>`

`no ip igmp version`

Parameter	Description
<1-3>	IGMP protocol version number

Default The default IGMP protocol version number is 3.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to VLAN interfaces configured for IGMP.

Ensure your VLAN is configured first, see [Chapter 16, Configuring VLANs](#).

Example

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip igmp version 2
```

Validation Commands `show ip igmp interface`

show debugging igmp

Use this command to display the IGMP debugging options set.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show debugging igmp

Mode User Exec and Privileged Exec

Example To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

Output **Figure 50-1: Example output from the show debugging igmp command**

```
IGMP Debugging status:
  IGMP Decoder debugging is on
  IGMP Encoder debugging is on
  IGMP Events debugging is on
  IGMP FSM debugging is on
  IGMP Tree-Info-Base (TIB) debugging is on
```

Related Commands [debug igmp](#)

show ip igmp groups

Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ip igmp groups [<ip-address>|<interface> detail]`

Parameter	Description
<code><ip-address></code>	Address of the multicast group, entered in the form A.B.C.D.
<code><interface></code>	Interface name for which to display local information.

Mode User Exec and Privileged Exec

Example The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

Output **Figure 50-2: Example output from the show ip igmp groups command**

IGMP Connected Group Address	Interface	Uptime	Expires	Last Reporter
224.0.1.1	port1.1.1	00:00:09	00:04:17	10.10.0.82
224.0.1.24	port1.1.2	00:00:06	00:04:14	10.10.0.84
224.0.1.40	port1.1.3	00:00:09	00:04:15	10.10.0.91
224.0.1.60	port1.1.3	00:00:05	00:04:15	10.10.0.7
224.100.100.100	port1.1.1	00:00:11	00:04:13	10.10.0.91
228.5.16.8	port1.1.3	00:00:11	00:04:16	10.10.0.91
228.81.16.8	port1.1.7	00:00:05	00:04:15	10.10.0.91
228.249.13.8	port1.1.3	00:00:08	00:04:17	10.10.0.91
235.80.68.83	port1.1.11	00:00:12	00:04:15	10.10.0.40
239.255.255.250	port1.1.3	00:00:12	00:04:15	10.10.0.228
239.255.255.254	port1.1.12	00:00:08	00:04:13	10.10.0.84

Table 50-1: Parameters in the output of the show ip igmp groups command

Parameter	Description
Group Address	Address of the multicast group.
Interface	Port through which the group is reachable.
Uptime	The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device.
Expires	Time (in hours, minutes, and seconds) until the entry expires.
Last Reporter	Last host to report being a member of the multicast group.

show ip igmp interface

Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax show ip igmp interface [*<interface>*]

Parameter	Description
<i><interface></i>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Examples The following output shows IGMP interface status for **vlan2** (with IGMP Snooping enabled):

```
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#interface vlan2
awplus(config-if)#ip igmp snooping
awplus(config-if)#exit
awplus(config)#exit
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
awplus#
```

The following output shows IGMP interface status for **vlan2** (with IGMP Snooping disabled):

```
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#interface vlan2
awplus(config-if)#no ip igmp snooping
awplus(config-if)#exit
awplus(config)#exit
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
IGMP Snooping is not enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
awplus#
```

The following command displays the IGMP interface status and Query Solicitation for **vlan3**:

```
awplus#show ip igmp interface vlan3
Interface vlan3 (Index 203)
  IGMP Enabled, Active, Querier, Version 3 (default)
  Internet address is 192.168.9.1
  IGMP interface has 256 group-record states
  IGMP activity: 51840 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds
  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 250 seconds
  IGMP max query response time is 1 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 251 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  IGMP Snooping is globally enabled
IGMP Snooping query solicitation is globally enabled
  Num. query-solicit packets: 1 sent, 10 recvd
IGMP Snooping is enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
awplus#
```

Note  Query Solicitation status information is highlighted in **bold** in the above output.
Use the **show ip igmp interface** command to validate that Query Solicitation is enabled and to show the number of query-solicit message packets sent and received on a VLAN.

show ip igmp proxy

Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax

```
show ip igmp proxy
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

Parameter	Description
groups	Specify IGMP proxy group membership information.
detail	Specify detailed IGMPv3 source information.
<vlan>	Specify the name of a single VLAN interface, for example vlan1 .
<multicast-group>	Specify the IPv4 address in of the multicast group, in the format A.B.C.D.

Mode User Exec and Privileged Exec

Example To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

To display the state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1
```

To display the detailed state of IGMP Proxy services for VLAN interface **vlan1**, enter the command:

```
awplus# show ip igmp proxy groups vlan1 detail
```

Related Commands [ip igmp proxy-service](#)

show ip igmp snooping mrouter

Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ip igmp snooping mrouter [interface <interface>]`

Parameter	Description
interface	A specific interface.
<interface>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in vlan1, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

Output **Figure 50-3: Example output from the show ip igmp snooping mrouter command**

```
VLAN    Interface    Static/Dynamic
1       port1.1.5    Statically configured
200     port1.1.2    Statically configured
```

Figure 50-4: Example output from the show ip igmp snooping mrouter interface vlan1 command

```
VLAN    Interface    Static/Dynamic
1       port1.1.5    Statically configured
```

Related Commands [ip igmp snooping mrouter](#)

show ip igmp snooping routermode

Use this command to display the current routermode and the list of IP addresses set as router multicast addresses from the **ip igmp snooping routermode** command.

For information on output options, see **“Controlling “show” Command Output” on page 1.35**.

Syntax show ip igmp snooping routermode

Mode User Exec and Privileged Exec

Example To show the routermode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

Output **Figure 50-5: Example output from the show ip igmp snooping routermode command**

```
Router mode.....Def
Reserved multicast address
    224.0.0.1
    224.0.0.2
    224.0.0.4
    224.0.0.5
    224.0.0.6
    224.0.0.9
    224.0.0.13
    224.0.0.15
    224.0.0.24
```

Related Commands **ip igmp snooping routermode**

show ip igmp snooping statistics

Use this command to display IGMP Snooping statistics data.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ip igmp snooping statistics interface <interface-range>
[group [<ip-address>]]`

Parameter	Description
<ip-address>	Optionally specify the address of the multicast group, entered in the form A.B.C.D.
<interface>	Specify the name of the VLAN interface or interface range.

Mode User Exec and Privileged Exec

Example To display IGMP statistical information for `vlan1` and `vlan2`, use the command:

```
awplus# show ip igmp snooping statistics interface
vlan1-vlan2
```

Output **Figure 50-6: Example output from the show ip igmp snooping statistics command**

```
IGMP Snooping statistics for vlan1
Interface:    port1.1.3
Group:       224.1.1.1
Uptime:      00:00:09
Group mode:  Exclude (Expires: 00:04:10)
Last reporter: 10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:    port1.1.4
Group:       224.1.1.2
Uptime:      00:00:19
Group mode:  Exclude (Expires: 00:05:10)
Last reporter: 10.4.4.6
Source list is empty
```

undebg igmp

This command applies the functionality of the `no debug igmp` command on [page 50.5.](#)

Introduction

This chapter provides information about Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Source Specific Multicast (PIM-SSM).

PIM-SM

Protocol Independent Multicast - Sparse Mode (PIM-SM) provides efficient communication between members of sparsely distributed groups - the type of groups that are most common in wide-area internetworks.

For details of the commands used to configure PIM-SM, see [Chapter 52, PIM-SM Commands](#). For a general overview of multicasting, see [Chapter 48, Multicast Introduction and Commands](#).

Characteristics of PIM-SM

PIM Sparse Mode (PIM-SM) is designed on the principle that several hosts wishing to participate in a multicast conference does not justify flooding the entire internetwork with periodic multicast traffic. PIM-SM is designed to limit multicast traffic so that only those switches interested in receiving traffic for a particular group receive the traffic.

Switches with directly attached or downstream members are required to join a Sparse Mode distribution tree by transmitting explicit join messages. If a switch does not become part of the predefined distribution tree, it does not receive multicast traffic addressed to the group. In contrast, dense mode multicast routing protocols assume downstream group membership and continue to forward multicast traffic on downstream links until explicit prune messages are received. The default forwarding action of a sparse mode multicast routing protocol is to block traffic unless it is explicitly requested, while the default action of the dense mode multicast routing protocols is to forward traffic.

PIM-SM employs the concept of a Rendezvous Point (RP) where receivers “meet” sources. The initiator of each multicast group selects a primary RP and a small ordered set of alternative RPs, known as the RP-list. For each multicast group, there is only a single active RP. Each receiver wishing to join a multicast group contacts its directly attached switch, which in turn joins the multicast distribution tree by sending an explicit join message to the group’s primary RP. A source uses the RP to announce its presence and to find a path to members that have joined the group. This model requires Sparse Mode switches to maintain some state information (the RP-list) prior to the arrival of data packets. In contrast, Dense Mode multicast routing protocols are data driven, since they do not define any state for a multicast group until the first data packet arrives.

Roles in PIM-SM

A multicast sender does not need to know the addresses of the members of the group in order to send to them, and the members of the group need not know the address of the sender. Group membership can change at any time. When PIM is enabled on the switch, and before the switch can route multicast traffic, it must establish which of the PIM routers in the network are performing some key roles:

- Designated Router.
- Rendezvous Point.
- Bootstrap Router.

Designated Router

There must be one PIM Designated Router (DR) in the subnetwork to which the IP hosts are connected. Any PIM-SM interfaces on the subnetwork elect the DR with the highest DR priority. If there is more than one router with the same priority, or no priority, they choose the interface with the highest IP address number. The DR performs all the PIM functionality for the subnetwork. If the current DR becomes unavailable, the remaining switches elect a new DR on the interface by DR priority or IP address.

Rendezvous Point

Each multicast group must have a Rendezvous Point (RP). The RP forms the root of the group's distribution tree. The DR for a multicast sender sends multicast packets towards the RP. DRs with group members connected to them send join messages towards the group's RP. The RP candidate with the lowest priority is elected from all the RP candidates for a group. If the RP becomes unavailable, the remaining RP candidates elect a new RP.

Bootstrap Router

Each PIM-SM network must have at least one Bootstrap Router (BSR) candidate, unless all switches in the domain are configured statically with information about all RPs in the domain. Every switch that is a BSR candidate periodically sends a Bootstrap Candidate Advertisement message to advertise that it is available as a BSR candidate. The BSR candidates in the network elect the switches with the highest preference value to be the BSR. The elected BSR listens to PIM Candidate RP Advertisement messages specifying RP candidates for multicast groups. It maintains a list of RP candidates and sends a bootstrap message every BSM interval, specifying all the multicast groups in the PIM network, and their RP candidates. Each switch uses this information and a standardized hash mechanism to determine the RP for each group.

In summary:

- Each multicast group must have at least one RP candidate
- Each PIM-SM domain must have at least one BSR candidate, unless all routers in the domain are configured statically with information about all RPs in the domain
- Each subnetwork must have at least one DR candidate.

PIM hello messages

When PIM is enabled on a switch, it sends out a PIM Hello message on all its PIM enabled interfaces, and listens for Hello messages from its PIM neighbors. When a switch receives a Hello message, it records the interface, IP address, priority for becoming a DR, and the timeout for the neighbor's information. The switch sends Hello messages regularly at the Hello Time interval.

Operation of PIM-SM

Once roles are established, multicast routing follows specific phases:

1. **Rendezvous Point Tree**
2. **Register stop**
3. **Shortest Path Tree**

While multicast routing always begins with phase 1, the Designated Router (DR) for a receiver determines whether and when to move on to phases 2 and 3, depending on the amount of traffic from the source.

Rendezvous Point Tree

Phase 1 establishes and uses a shared tree rooted at the Rendezvous Point (RP) to forward all multicast data to group members.

When an IP host sends an IGMP join message to the local PIM DR, which is not the RP for the group, the DR sends a PIM join message towards the RP for the group ("upstream"). The DR determines which switch is the RP for the group from the most recent bootstrap message. Every switch the join message passes through records that there is a group member on the incoming interface. Eventually, the join message reaches either the RP, or another switch that already knows that it has a group member downstream. If the group has many members, the join messages converge on the RP to form a Rendezvous Point Tree (RPT). This is called a shared tree because multicast data that is sent to the group by any sender shares the tree. The multicast receiver's DR sends join messages periodically according to the upstream join timer as long as the IP host is a member of the group. When the last receiver on a subnetwork leaves the group, the join messages stop, and their entries timeout on routers that are closer to the RP.

The sender's DR encapsulates the multicast data in a unicast packet in a process called **registering**, and sends these register packets to the group's RP. When the RP receives the data, it decapsulates them, and forwards them onto the shared tree.

Register stop

Phase 2 improves efficiency and performance by using register stop. In this phase the RP joins the shortest path tree between the source and receiver. This allows the original (unencapsulated) packets to be forwarded from the sender, instead of encapsulated packets. It also allows shorter paths to receivers that are close to the sender, making it more efficient in some circumstances.

When the RP for a group receives the first encapsulated data packet from a source, it joins the shortest path tree towards the sender. Once data is able to flow along the shortest path from the sender to the RP, packets do not need to be registered. The RP sends a register stop message in reply to the next encapsulated message. When the sender's DR receives the register stop message, it stops registering. The DR sends a null register message to the RP to find whether the RP still does not need to receive registered packets. If it receives another register stop message, the DR continues to forward only the native data packets. If the DR does not receive another register stop message within the register probe time, it resumes registering the data packets and sending them to the RP.

When the RP starts receiving native data packets from the source, it starts to discard the encapsulated packets, and starts forwarding native packets on the shared tree to all the group members. If the path from the source to the RP intersects the shared RP tree for the group, then the packets also take a short-cut onto the shared tree for delivery to the group members down its branches.

Shortest Path Tree This phase further optimizes routing by using Shortest Path Trees (SPT). In phase 3 the receiver joins the shortest path tree between the source and receiver. This allows a multicast group member to receive multicast data by the shortest path from the sender, instead of from the shared RP tree. When the receiver's DR receives multicast data from a particular sender, it sends a join message towards the sender. When this message reaches the sender's DR, the DR starts forwarding the multicast data directly towards the receiver. As several receivers all initiate shortest paths to the sender, these paths converge, creating a SPT.

When the multicast packets start arriving from the SPT at the receiver's DR or an upstream router common to the SPT and the RPT, it starts discarding the packets from the RPT, and sends a prune message towards the RP. The prune message travels up the RPT until it reaches the RP or a switch that still needs to forward multicast packets from this sender to other receivers. Every time a switch receives a prune message, it waits a short time so that other switches on the LAN have the opportunity to override the prune message.

Multi-Access LANs If the PIM-SM network includes multi-access LAN links for transit, as well as point-to-point links, then a mechanism is needed to prevent multiple trees forwarding the same data to the same group member. Two or more switches on a LAN may have different information about how to reach the RP or the multicast sender. They could each send a join message to two different switches closer to the RP for an RPT or the sender for an SPT. This could potentially cause two copies of all the multicast traffic towards the receiver.

When PIM switches notice duplicate data packets on the LAN, they elect a single switch to forward the data packets, by each sending PIM Assert messages. If one of the upstream switches is on an SPT and the other is on an RPT, the switch on the SPT has the shortest path to the sender, and wins the Assert election. If both switches are on RPTs the switch with the shortest path to the RP (the lowest sum of metrics to the RP) wins the Assert. If both switches are on an SPT, then the switch with the shortest path to the sender (the lowest sum of metrics to the sender's DR) wins the Assert.

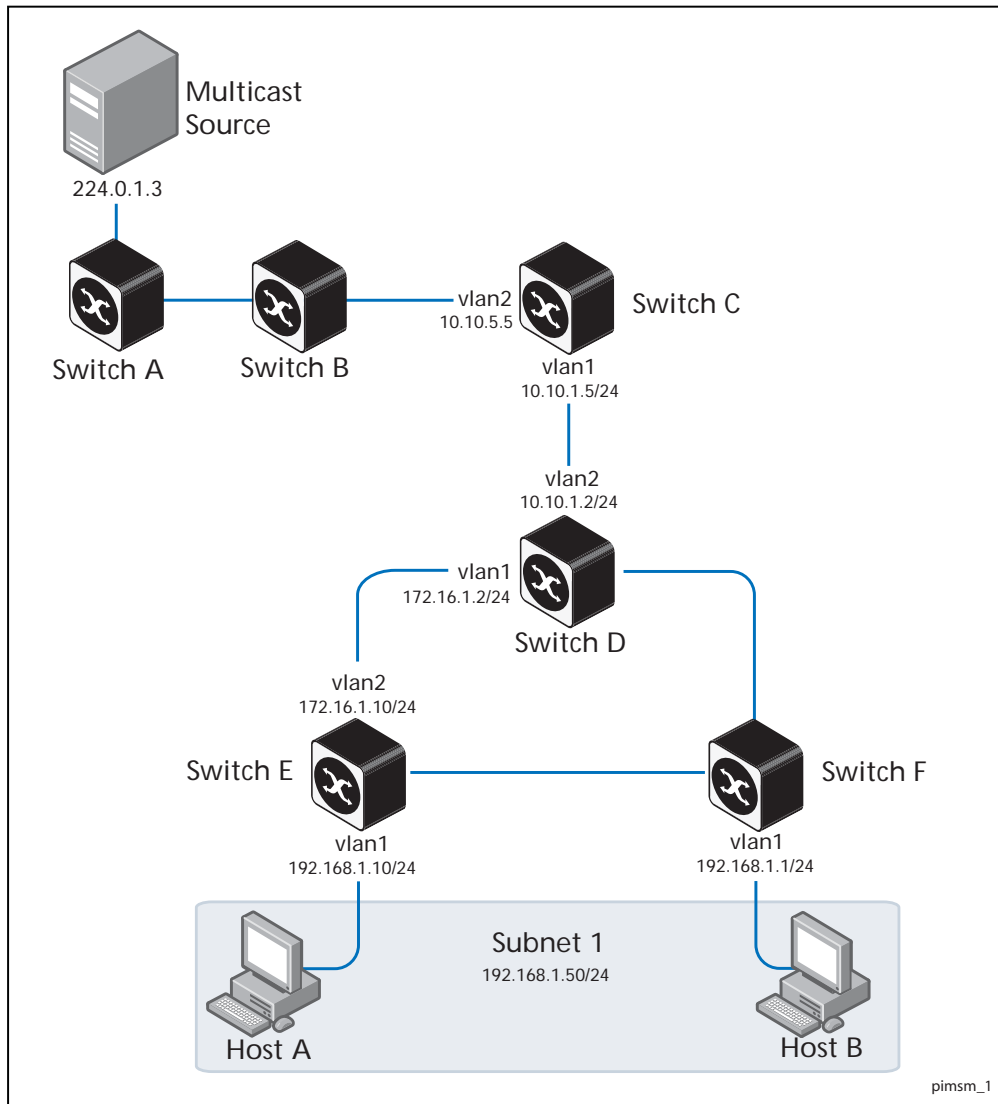

The switch that won the Assert election forwards these data packets, and acts as the local Designated Router for any IGMP members on the LAN. The downstream switches on the LAN also receive the Assert messages, and send all their join messages to the Assert winner. The result of an Assert election will timeout after the Assert Time. As long as the situation causing the duplication remains unchanged, the Assert winner sends an Assert message at a the Assert time interval, before the previous Assert messages time out. When the last downstream switch leaves the SPT, the Assert winner sends an Assert Cancel message saying that it is about to stop forwarding data on the SPT. Any RPT downstream switches then switch back to the RP tree.

PIM-SM Configuration

This section provides three PIM-SM configuration examples:

- **Static Rendezvous Point configuration**
- **Dynamic Rendezvous Point configuration**
- **Bootstrap Router configuration**

Both Rendezvous Point (RP) configuration examples refer to the network topology in the following graphic and use Allied Telesis managed Layer 3 Switches as the PIM routers. For details on the commands used in the following examples, refer to **Chapter 52, PIM-SM Commands**.

Static Rendezvous Point configuration

In this example using the above network topology, Switch C is the Rendezvous Point (RP) and all switches are statically configured with RP information. Host A and Host B join group 224.0.1.3 for all the sources. They send the IGMP membership report to Subnet 1. Two switches are attached to Subnet 1, Switch E and Switch F. Both of these switches have default Designated Router (DR) priority on `vlan1`. Because Switch E has a higher IP address on `vlan1`, Switch E becomes the DR and is responsible for sending Join messages to the RP (Switch C).

While configuring the RP, ensure that:

- Every switch includes the `ip pim rp-address 10.10.1.5` statement, even if it does not have any source or group member attached to it.
- There is only one RP address for the whole multicast group.
- All interfaces running PIM-SM must have sparse-mode enabled. In the configuration sample output below, both `vlan1` and `vlan2` are pim sparse-mode enabled.

See the following configuration output for **Switch D**:

```
hostname Switch D
!!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
!
!
ip multicast-routing
ip pim rp-address 10.10.1.5
!
```

Configure all the switches with the same `ip pim rp-address 10.10.1.5` statement as shown above.

Verifying configuration

Use the following commands to verify the RP configuration, interface details, and the multicast routing table.

RP details For **Switch D**, the `show ip pim sparse-mode rp mapping` command shows that 10.10.1.5 is the RP for all multicast groups 224.0.0.0/4, and is statically configured. All other switches will have a similar output.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4, Static
RP: 10.10.1.5
Uptime: 5d02h15m
```

For **Switch D**, the **show ip pim sparse-mode rp-hash** command displays the selected RP for the specified group, in this example 224.0.1.3.

```
awplus#show ip pim sparse-mode rp-hash 224.0.1.3
RP: 10.10.1.5
```

Interface details For **Switch E**, the **show ip pim sparse-mode interface** command displays the interface details and shows that Switch E is the DR on Subnet 1.

```
awplus#show ip pim sparse-mode interface
Total configured interfaces: 16   Maximum allowed: 31
Total active interfaces:      12

Address      Interface VIFindex Ver/   Nbr    DR   DR
              v2/S     1      v2/S   Mode  Count Prior
192.168.1.10  vlan2    0      v2/S   1      1    192.168.1.10
172.16.1.10   vlan3    2      v2/S   1      1    172.16.1.10
```

IP multicast routing table

Note that the multicast routing table displayed for an RP switch is different to that displayed for other switches. For **Switch C**, because this switch is the RP and the root of this multicast tree, the **show ip pim sparse-mode mroute** command shows **RPF nbr** (next-hop to reach RP) as **0.0.0.0** and **RPF idx** (incoming interface for this (*, G) state) as **None**.

```
awplus#show ip pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)
RP: 10.10.1.5
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: JOINED
Local      .....
Joined     j.....
Asserted   .....
Outgoing   o.....
```

For **Switch E**, the `show ip pim sparse-mode mroute` command displays the IP multicast routing table.

```
awplus#show ip pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)
RP: 10.10.1.5
RPF nbr: 172.16.1.2
RPF idx: port1.1.2
Upstream State: JOINED
Local      .....
Joined     j.....
Asserted   .....
Outgoing   o.....
```

On **Switch E**, `port1.1.2` is the incoming interface of the `(*, G)` entry, and `port1.1.1` is on the outgoing interface list of the `(*, G)` entry. This means that there is a group member through `port1.1.1`, and RP is reachable through `port1.1.2`.

Dynamic Rendezvous Point configuration

A static RP configuration works for a small, stable PIM domain. However, it is not practical for a large and not so stable internetwork. In such a network, if the RP fails, the network administrator may have to change the static configurations on all PIM switches. An additional reason for choosing dynamic configuration high routing traffic leading to a change in the RP.

The Bootstrap Router (BSR) mechanism is used to dynamically maintain the RP information. To configure the RP dynamically in the above network topology, **Switch C** on `port1.1.1` and **Switch D** on `vlan1` are configured as RP candidates using the `ip pim rp-candidate` command. **Switch D** on `vlan1` is also configured as the BSR candidate. Since no other device has been configured as a BSR candidate, **Switch D** becomes the BSR router and is responsible for sending group-to-RP mapping information to all other PIM switches in this PIM domain.

The following output displays the complete configuration at **Switch C**.

```
awplus#show run
!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
ip multicast-routing
ip pim rp-candidate vlan1
```

The following output displays the complete configuration at **Switch D**.

```
awplus#show run
!
interface vlan1
 ip pim sparse-mode
!
interface vlan2
 ip pim sparse-mode
!
interface lo
!
ip multicast-routing
ip pim bsr-candidate vlan1
ip pim rp-candidate vlan1 priority 2
!
```

The highest priority switch is chosen as the RP. If two or more switches have the same priority, a hash function in the BSR mechanism is used to choose the RP to make sure that all devices in the PIM domain have the same RP for the same multicast group.

Use the `<interface> [priority <priority>]` parameters of the `ip pim rp-candidate` command to change the default priority of any RP candidate.

PIM group-to-RP mappings

The `show ip pim sparse-mode rp mapping` command displays the group-to-RP mapping details. The output shows information about RP candidates. There are two RP candidates for the group range 224.0.0.0/4. RP candidate 10.10.1.5 has a default priority of 192, whereas RP candidate 172.16.1.2 has been configured to have a priority of 2. Since RP candidate 172.16.1.2 has a higher priority, it is selected as the RP for the multicast group 224.0.0.0/4.

See the following configuration output for **Switch D**.

```
awplus#show ip pim sparse-mode rp mapping
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
  RP: 10.10.1.5
    Info source: 172.16.1.2, via bootstrap, priority 192
    Uptime: 00:00:13, expires: 00:02:29
  RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap, priority 2
    Uptime: 00:34:42, expires: 00:01:49
```

RP details

The `show ip pim sparse-mode rp-hash` command displays information about the RP router for a particular group. See the following configuration output for **Switch D**. This output shows that 172.16.1.2 has been chosen as the RP for the multicast group 224.0.1.3.

```
awplus#show ip pim sparse-mode rp-hash 224.0.1.3
Group(s): 224.0.0.0/4
RP: 172.16.1.2
Info source: 172.16.1.2, via bootstrap
```

After RP information reaches all PIM switches in the domain, various state machines maintain all routing states as the result of Join/Prune messages from members of the multicast group.

Bootstrap Router configuration

Every PIM multicast group needs to be associated with the IP address of a Rendezvous Point (RP). This address is used as the root of a group-specific distribution tree, whose branches extend to all nodes in the domain that want to receive traffic sent to the group. For all senders to reach all receivers, all devices in the domain use the same mappings of group addresses to RP addresses. In order to determine the RP for a multicast group, a PIM device maintains a collection of group-to-RP mappings, called the RP-Set.

The Bootstrap Router (BSR) mechanism for the class of multicast routing protocols in the PIM domain uses the concept of an RP as a means for receivers to discover the sources that send to a particular multicast group. The BSR mechanism is one way that a multicast router can learn the set of group-to-RP mappings required in order to function.

Some of the PIM devices within a PIM domain are configured as RP candidates. A subset of the RP candidates will eventually be used as the actual RPs for the domain. An RP configured with a lower value in the priority field has higher a priority.

Some of the PIM devices in the domain are configured to be BSR candidates. One of these BSR candidates is elected to be the BSR for the domain, and all PIM devices in the domain learn the result of this election through Bootstrap messages (BSM). The BSR candidate with highest value in the priority field is the elected BSR.

The RP candidates then report their candidacy to the elected BSR, which chooses a subset of the RP candidates, and distributes corresponding group-to-RP mappings to all the devices in the domain through Bootstrap messages.

Switch A Enter the following commands to configure `vlan1` on Switch A as the BSR candidate. The default priority is 64.

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan1
awplus(config)# exit
```

Switch B Enter the following commands to configure `vlan1` on Switch B as the BSR candidate with a hash mask length of 10 and a priority of 25 and to configure `vlan1` as the RP candidate with a priority of 0.

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan1 10 25
awplus(config)# ip pim rp-candidate vlan1 priority 0
awplus(config)# exit
```

Validation Commands

Use the `show ip pim sparse-mode bsr-router` command to verify the BSR candidate state on **Switch A**.

```
awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
BSR address: 20.0.1.21
Uptime:      00:37:12, BSR Priority: 64, Hash mask length: 10
Expires:     00:01:32
Role: Candidate BSR
State: Elected BSR
```

Use the **show ip pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch B**. The initial state of the BSR candidate is pending before transitioning to BSR candidate.

```
awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
  BSR address: 20.0.1.21
  Uptime:      00:02:39, BSR Priority: 64, Hash mask length: 10
  Expires:     00:00:03
  Role: Candidate BSR
  State: Pending BSR

awplus#show ip pim sparse-mode bsr-router
PIMv2 Bootstrap information
  BSR address: 20.0.1.21
  Uptime:      00:40:20, BSR Priority: 64, Hash mask length: 10
  Expires:     00:02:07
  Role: Candidate BSR
  State: Candidate BSR
```

Use the **show ip pim sparse-mode rp mapping** command to verify RP-set information on **Switch A**.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
RP: 20.0.1.11
Info source: 20.0.1.11, via bootstrap, priority 0
Uptime: 00:00:30, expires: 00:02:04
```

Use the **show ip pim sparse-mode rp mapping** command to verify RP-set information on **Switch B**.

```
awplus#show ip pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
RP: 20.0.1.11
Info source: 20.0.1.21, via bootstrap, priority 0
Uptime: 00:00:12, expires: 00:02:18
```

PIM-SSM

Protocol Independent Multicast - Source Specific Multicast (PIM-SSM) is derived from Protocol Independent Multicast - Sparse Mode (PIM-SM) and is a simplified version of PIM-SM.

For details of the commands used to configure PIM-SSM, see [Chapter 52, PIM-SM Commands](#) and [Chapter 50, IGMP and IGMP Snooping Commands](#).

Characteristics of PIM-SSM

While PIM-SM supports both a “many-to-many” and a “one-to-many” model, PIM-SSM only supports the “one-to-many” model, also known as a “broadcast application”. It is possible for devices in a network to support both PIM-SM and PIM-SSM at the same time, even on the same interfaces.

Instead of multicast groups being initially sent to a Rendezvous Point (RP), PIM-SSM builds shortest path trees (SPT) that are directly rooted at the source. This is because PIM-SSM relies on the multicast client informing the closest multicast router of the source IP address of the multicast server, as well as the multicast group IP address for the group it wants to join.

This approach removes some of the complexity in the multicast routing process and also improves security. Because a multicast client sends a join that includes the specific source IP address of the server it is no longer possible for an attacker to broadcast to the same group IP address from a different source IP address and cause a Denial of Service (DoS) attack. With PIM-SSM the attacker's traffic is discarded at the edge of the PIM domain.

PIM-SSM IP Address Range

The Internet Assigned Numbers Authority (IANA) has reserved the address range 232.0.0.0 through 232.255.255.255 for SSM applications. Although PIM-SSM can technically be configured to use the entire 224/4 multicast address range, PIM-SSM operation is guaranteed only in the 232/8 range (232.0.0/24 is reserved).

IGMPv3 and SSM-Mapping

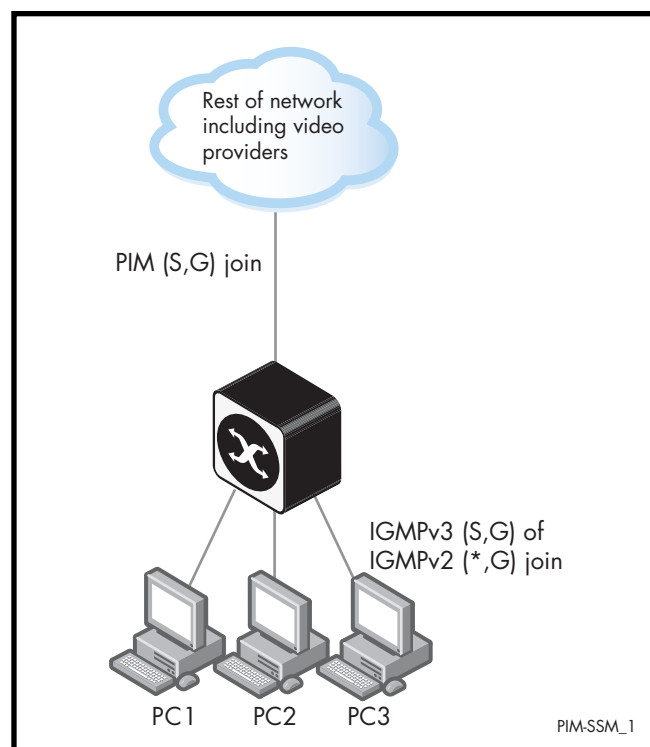

A restriction of PIM-SSM is that it requires a “Source, Group” (S,G) join and only IGMPv3 supports this. Source Specific Multicast Mapping is required to use PIM-SSM when you have older multicast client devices that do not support IGMPv3. This additional feature allows you to statically map IGMPv1/v2 (*,G) joins into PIM (S,G) joins, which in turn allows the device to talk to an upstream PIM-SSM network.

Note that IGMPv3 (*,G) joins cannot be mapped by SSM-Mapping.

How PIM-SSM Works

To join multicast group 232 . 1 . 1 . 1 each PC must send an IGMPv3 join with the source IP address specified. The join will be a (S,G) join, for example (85 . 1 . 1 . 1 , 232 . 1 . 1 . 1). The router will receive the IGMP join and check if the group address is in the SSM range. Then:

- If the group address is in the SSM range, the router will verify that a specific source or sources have been included in the IGMP join.
- If a specific source or sources has been included in the IGMP join, then the router will forward a PIM (S,G) join towards the source IP address.
- If the source IP address is not specified, then the router will discard the IGMP join and the PC will not join the group.
- If an IGMPv2 join is received for the SSM range then by default the join is discarded because no source IP address is specified. IGMP joins for group addresses that are not in the SSM range do not need to specify a specific source IP address.

How IGMP SSM-Mapping Works

In the example above (“**How PIM-SSM Works**”), if an IGMPv2 join is sent it is discarded because IGMPv2 only supports (*,G) joins. To resolve this issue, IGMP SSM-Mapping allows the router to be statically configured with source IP addresses for each group address or range of group addresses. This allows the router to receive a (*,G) join, match the group address via a software ACL, and based on this, insert the matching source IP address. The router then treats the join as a normal (S,G) join. If no match is found then the (*,G) is used. If the group address is in the SSM range then the join is discarded.

Configure PIM-SSM

Table 51-1: General configuration procedure for PIM-SSM

To enable SSM on the device

<pre>awplus# configure terminal</pre>	Enter Global Configuration mode.
<pre>awplus(config)# ip igmp ssm-map enable</pre>	This command applies to VLAN interfaces configured for IGMP.

To specify the static mode of defining SSM

<pre>awplus# configure terminal</pre>	Enter Global Configuration mode.
<pre>awplus(config)# access-list {<1-99> <1300-1999>} permit <source></pre>	Configure either a Standard Numbered ACL, Expanded Numbered ACL, or Standard Named ACL. Specify a multicast group address range and wildcard mask with the <i>source</i> parameter.
OR	
<pre>access-list standard <standard-access- list-name> permit <source></pre>	
<pre>awplus(config)# ip igmp ssm-map static {<access-list- number> <access-list-number-expanded> <access-list-name>} <ip-address></pre>	This command applies to VLAN interfaces configured for IGMP. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

To define a non-default SSM range of IP multicast addresses in IGMP

<pre>awplus# configure terminal</pre>	Enter Global Configuration mode.
<pre>awplus(config)# access-list {<1-99>} permit <source></pre>	Configure either a Standard Numbered ACL or Standard Named ACL.
OR	
<pre>access-list standard <standard-access- list-name> permit <source></pre>	

Table 51-1: General configuration procedure for PIM-SSM(cont.)

<pre>awplus(config)# ip igmp ssm range {<access-list- number> <access-list-name>}</pre>	<p>Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses.</p> <p>By default, the SSM range is 232/8.</p> <p>To define the SSM range to be other than the default, specify either an access-list name or and access-list number.</p>
---	---

To define the Source Specific Multicast (SSM) range of IP multicast addresses

<pre>awplus#</pre>	<p>Enter Global Configuration mode.</p>
<pre>awplus(config)# ip pim ssm default</pre>	<p>The default keyword defines the SSM range as 232/8.</p> <p>OR</p>
<pre>awplus(config)# ip pim ssm range {<access-list> <named- access-list>}</pre>	<p>To define the SSM range to be other than the default, use the access-list parameter option.</p>

Chapter 52: PIM-SM Commands

Command List

This chapter provides an alphabetical reference of PIM-SM commands. For commands common to PIM-SM and PIM-DM, see [Chapter 48, Multicast Introduction and Commands](#).

clear ip pim sparse-mode bsr rp-set *

Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

Syntax `clear ip pim sparse-mode bsr rp-set *`

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ip pim sparse-mode bsr rp-set *
```

clear ip mroute pim sparse-mode

Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

Syntax `clear ip mroute <Group-IP-address> pim sparse-mode`
`clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode`

Parameter	Description
<code><Group-IP-address></code>	Specify a multicast group IPv6 address, entered in the form A.B.C.D.
<code><Source-IP-address></code>	Specify a source group IP address, entered in the form A.B.C.D.

Mode Privileged Exec

Example

```
awplus# clear ip mroute 224.0.0.0 pim sparse-mode
```

```
awplus# clear ip mroute 224.0.0.0 192.168.7.1 pim sparse-mode
```

debug pim sparse-mode

Use this command to activate/de-activate all PIM-SM debugging.

Syntax `debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`
`no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [packet] [state] [mtrace]`

Parameter	Description
all	Activates/deactivates all PIM-SM debugging.
events	Activates debug printing of events.
mfc	Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates.
mib	Activates debug printing of PIM-SM MIBs.
nexthop	Activates debug printing of PIM-SM nexthop communications.
nsm	Activates debugging of PIM-SM Network Services Module communications.
packet	Activates debug printing of incoming and/or outgoing packets.
state	Activates debug printing of state transition on all PIM-SM FSMs.
mtrace	Activates debug printing of multicast traceroute.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim sparse-mode all
```

Related Commands [show debugging pim sparse-mode](#)
[undebug all pim sparse-mode](#)

debug pim sparse-mode timer

Use this command to enable debugging for the specified PIM-SM timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

Syntax

```

debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]

```

Parameter	Description
assert	Enable or disable debugging for the Assert timers.
at	Enable or disable debugging for the Assert Timer.
bsr	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
bst	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
crp	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
hello	Enable or disable debugging for the specified Hello timer, or all Hello timers.
ht	Enable or disable debugging for the Hello timer: Hello Timer.
nlt	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
tht	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
joinprune	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
jt	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
et	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
ppt	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.
kat	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.

Parameter	Description
<code>ot</code>	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
<code>register</code>	Enable or disable debugging for the Register timers.
<code>rst</code>	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

Related Commands [show debugging pim sparse-mode](#)

ip pim accept-register list

Use this command to configure the ability to filter out multicast sources specified by the given access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

Syntax `ip pim accept-register list {<simpplerange> | <exprange> | <access-list>}`
`no ip pim accept-register`

Parameter	Description
<code><simpplerange></code>	<100-199> IP extended access-list.
<code><exprange></code>	<2000-2699> IP extended access list (expanded range).
<code><access-list></code>	IP Named Standard Access list.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim accept-register list 121
awplus(config)# access-list 121 permit ip 100.1.1.1 0.0.0.0 any
```

ip pim anycast-rp

Use this command to configure Anycast RP (Rendezvous Point) in a RP set.

Use the **no** variant of this command to remove the configuration.

Syntax `ip pim anycast-rp <anycast-rp-address> <member-rp-address>`
`no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]`

Parameter	Description
<code><anycast-rp-address></code>	<A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set.
<code><member-rp-address></code>	<A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

ip pim bsr-border

Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

Syntax `ip pim bsr-border`
`no ip pim bsr-border`

Mode Interface Configuration for a VLAN interface.

Usage When this command is configured on a VLAN interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

Examples The following example configures the VLAN interface `vlan2` to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

ip pim bsr-candidate

Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax `ip pim bsr-candidate <interface> [<hash>] [<priority>]`
`no ip pim bsr-candidate [<interface>]`

Parameter	Description
<interface>	The interface. For instance, <code>vlan2</code> .
<hash>	<0-32> configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 10 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

ip pim cisco-register-checksum

Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax ip pim cisco-register-checksum
no ip pim cisco-register-checksum

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum
```

ip pim cisco-register-checksum group-list

Use this command to configure the option to calculate the Register checksum over the whole packet on multicast groups specified by the access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax ip pim cisco-register-checksum group-list
[<simplesrange> | <exprange> | <access-list>]
no ip pim cisco-register-checksum group-list
[<simplesrange> | <exprange> | <access-list>]

Parameter	Description
<simplesrange>	<1-99> Simple access-list.
<exprange>	<1300-1999> Simple access-list (expanded range).
<access-list>	IP Named Standard Access list.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum group-list 34
awplus(config)# access-list 34 permit 224.0.1.3
```

ip pim crp-cisco-prefix

Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

Use the **no** variant of this command to revert to the default settings.

Syntax `ip pim crp-cisco-prefix`
`no ip pim crp-cisco-prefix`

Mode Global Configuration

Usage Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ip pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

Example

```
awplus# configure terminal
awplus(config)# ip pim crp-cisco-prefix

awplus# configure terminal
awplus(config)# no ip pim crp-cisco-prefix
```

Related Commands [ip pim rp-candidate](#)

ip pim dr-priority

Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax `ip pim dr-priority <priority>`
`no ip pim dr-priority [<priority>]`

Parameter	Description
<code><priority></code>	<code><0-4294967294></code> The Designated Router priority value. A higher value has a higher preference.

Default The default is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to 11234 for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

Related Commands [ip pim ignore-rp-set-priority](#)

ip pim exclude-genid

Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax ip pim exclude-genid
no ip pim exclude-genid

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
```

ip pim ext-srcs-directly-connected (PIM-SM)

Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

Syntax ip pim ext-srcs-directly-connected
no ip pim ext-srcs-directly-connected

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

ip pim hello-holdtime (PIM-SM)

This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax `ip pim hello-holdtime <holdtime>`
`no ip pim hello-holdtime`

Parameter	Description
<code><holdtime></code>	<code><1-65535></code> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello interval). Otherwise, it retains the configured value.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-SM)

This command configures a hello-interval value.

Use the **no** variant of this command to reset the hello-interval to the default.

Syntax `ip pim hello-interval <interval>`
`no ip pim hello-interval`

Parameter	Description
<code><interval></code>	<code><1-65535></code> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello interval). Otherwise, the hello-holdtime value is the configured value.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim ignore-rp-set-priority

Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

Syntax ip pim ignore-rp-set-priority
no ip pim ignore-rp-set-priority

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim ignore-rp-set-priority
```

Use this command to set the PIM-SM join/prune timer. Note that the value set by the join/prune timer is the value that the switch puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 210 seconds.

Syntax ip pim jp-timer <1-65535>
no ip pim jp-timer [<1-65535>]

Parameter	Description
<1-65535>	Specifies the join/prune timer value. The default value is 210 seconds.

Default The default join/prune timer value is 210 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim jp-timer 300

awplus# configure terminal
awplus(config)# no ip pim jp-timer
```

ip pim neighbor-filter (PIM-SM)

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax `ip pim neighbor-filter {<number>|<accesslist>}`
`no ip pim neighbor-filter {<number>|<accesslist>}`

Parameter	Description
<code><number></code>	<1-99> Standard IP access-list number.
<code><accesslist></code>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

ip pim register-rate-limit

Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

Syntax `ip pim register-rate-limit <1-65535>`
`no ip pim register-rate-limit`

Parameter	Description
<code><1-65535></code>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-rate-limit 3444
```

ip pim register-rp-reachability

Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax `ip pim register-rp-reachability`
`no ip pim register-rp-reachability`

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-rp-reachability
```

ip pim register-source

Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

Syntax `ip pim register-source [<sourceaddress>|<interface>]`
`no ip pim register-source`

Parameter	Description
<code><sourceaddress></code>	The IP address, entered in the form A . B . C . D, to be used as the source of the register packets.
<code><interface></code>	The name of the interface to be used as the source of the register packets.

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-source 10.10.1.3
```

ip pim register-suppression

Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ip pim rp-register-kat](#) command on page 52.24 is not used.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax `ip pim register-suppression <1-65535>`
`no ip pim register-suppression`

Parameter	Description
<1-65535>	Register suppression on time in seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-suppression 192
```

ip pim rp-address

Use this command to statically configure RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for multicast groups.

Syntax

```
ip pim rp-address <ip-address>
    [<simplerange> | <expandedrange> | <accesslist>] [<override>]

no ip pim rp-address <ip-address>
    [<simplerange> | <expandedrange> | <accesslist>] [<override>]
```

Parameter	Description
<ip-address>	IP address of Rendezvous Point, entered in the form A . B . C . D.
<simplerange>	<1-99> IP Standard Access-list.
<expandedrange>	<1300-1999> IP Standard Access-list (expanded range).
<accesslist>	IP extended Access-list name.
<override>	Enables statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage The AlliedWare Plus™ PIM-SM implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

A single static-RP can be configured for multiple group ranges using Access Lists. However, configuring multiple static RPs (using **ip pim rp-address** command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range 224 . 0 . 0 . 0 / 4 (without ACL) or for specific group ranges (using ACL).

For example, configuring **ip pim rp-address 192.168.3.4** will configure static-RP 192.168.3.4 for the default group range 224.0.0.0/4. Configuring **ip pim rp-address 192.168.7.8 grp-list** will configure static-RP 192.168.7.8 for all the group ranges represented by permit filters in grp-list ACL.

If multiple static-RPs are available for a group range, then one with the highest IP address is chosen.

Only `Permit` filters in ACL are considered as valid group ranges. The default `Permit` filter 0 . 0 . 0 . 0 / 0 is converted to the default multicast filter 224 . 0 . 0 . 0 / 4.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IP address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the **ip pim rp-address** command. Commands with the **override** keyword take precedence over dynamically learned mappings.

Example

```
awplus# configure terminal
awplus(config)# ip pim rp-address 192.168.3.4 4
```

Related Commands **ip pim rp-candidate**
 ip pim rp-register-kat

ip pim rp-candidate

Use this command to give the router the candidate RP (Rendezvous Point) status using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

Syntax

```
ip pim rp-candidate <interface>
    [priority <priority>|interval <interval>| grouplist <grouplist>]
no ip pim rp-candidate [<interface>]
```

Parameter	Description
<interface>	Interface name
<priority>	<0-255> configure priority for an RP candidate.
<interval>	advertisement interval specified in the range <1-16383> (in seconds).
<grouplist>	IP access list specifier for standard, expanded or named access lists in their respective ranges: [<1-99> WORD]

Default The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage Note that issuing the command **ip pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

Examples

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3

awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
group-list 3

awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

Related Commands [ip pim rp-address](#)
[ip pim rp-register-kat](#)

ip pim rp-register-kat

Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

Syntax `ip pim rp-register-kat <1-65535>`
`no ip pim rp-register-kat`

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SM KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ip pim rp-register-kat 3454

awplus# configure terminal
awplus(config)# no ip pim rp-register-kat
```

Related Commands [ip pim rp-address](#)
[ip pim rp-candidate](#)

ip pim sparse-mode

Use this command to enable PIM-SM on the VLAN interface.

Use the **no** variant of this command to disable PIM-SM on the VLAN interface.

Syntax ip pim sparse-mode
no ip pim sparse-mode

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
```

ip pim sparse-mode passive

Use this command to enable and disable passive mode operation for local members on the VLAN interface.

Use the **no** variant of this command to disable passive mode operation for local members on the VLAN interface.

Syntax ip pim sparse-mode passive
no ip pim sparse-mode passive

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the **ip pim sparse-mode** command. To turn off PIM activities on the VLAN interface, use the **no ip pim sparse-mode** command.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
```

ip pim spt-threshold

This command turns on the ability for the last-hop PIM router to switch to SPT.

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

Note  The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax ip pim spt-threshold
no ip pim spt-threshold

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold
```

```
awplus# configure terminal
awplus(config)# no ip pim spt-threshold
```

ip pim spt-threshold group-list

Use this command to turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Use the **no** variant of this command to turn off switching to the SPT.

Syntax

```
ip pim spt-threshold group-list {<simplerange>|<expandedrange>|
<named-accesslist>}
no ip pim spt-threshold group-list [<simplerange>|<expandedrange>|
<named-accesslist>]
```

Parameter	Description
<simplerange>	<1-99> IP Standard Access-list.
<expandedrange>	<1300-1999> IP Standard Access-list (expanded range).
<named-accesslist>	IP Access-list name.

Mode Global Configuration

Usage Turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

Example

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold group-list 1
awplus(config)# access-list 1 permit 224.0.1.3
```

ip pim ssm

Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8. To define the SSM range to be other than the default, use the access-list parameter option.

Use the **no** variant of this command to disable the SSM range.

Syntax

```
ip pim ssm default
ip pim ssm range {<access-list>|<named-access-list>}
no ip pim ssm
```

Parameter	Description
<access-list>	<1-99> Simple access-list.
<named-access-list>	Named Standard Access List.

Default By default, the command is disabled.

Mode Global Configuration

Usage When an SSM range of IP multicast addresses is defined by the ip pim ssm command, the no (*,G) or (S,G,rpt) state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

Examples The following commands show how to configure SSM service for the IP address range defined by access list 10:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 225.1.1.1
awplus(config)# ip pim ssm range 10
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

show debugging pim sparse-mode

This command displays the status of the debugging of the system.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show debugging pim sparse-mode

Mode User Exec and Privileged Exec

Example To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 52-1: output from the show debugging pim sparse-mode command

```
Debugging status:
 PIM event debugging is on
 PIM Hello THT timer debugging is on
 PIM event debugging is on
 PIM MFC debugging is on
 PIM state debugging is on
 PIM packet debugging is on
 PIM incoming packet debugging is on
 PIM outgoing packet debugging is on
```

Related Commands [debug pim sparse-mode](#)

show ip pim sparse-mode bsr-router

Use this command to show the Bootstrap Router (BSR) (v2) address.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ip pim sparse-mode bsr-router

Mode User Exec and Privileged Exec

Output **Figure 52-2: output from the show ip pim sparse-mode bsr-router command**

```
PIMv2 Bootstrap information
 BSR address: 10.10.11.35 (?)
 Uptime:      00:00:38, BSR Priority: 0, Hash mask length: 10
 Expires:     00:01:32
 Role: Non-candidate BSR
 State: Accept Preferred
```

Related Commands [show ip pim sparse-mode rp mapping](#)
[show ip pim sparse-mode neighbor](#)

show ip pim sparse-mode interface

Use this command to show PIM-SM interface information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ip pim sparse-mode interface`

Mode User Exec and Privileged Exec

Example To display information about PIM-SM interfaces, use the command:

```
awplus# show ip pim sparse-mode interface
```

Figure 52-3:

Total configured interfaces: 16		Maximum allowed: 31				
Total active interfaces: 12						
Address	Interface	VIFindex	Ver/ Mode	Nbr Count	DR Prior	DR
192.168.1.53	vlan2	0	v2/S	2	2	192.168.1.53
192.168.10.53	vlan3	2	v2/S	0	2	192.168.10.53
.						
.						

1. Only the top entries output by this command are shown in this example.

Table 52-1: Parameters in the output from the show ip pim sparse-mode interface command

Parameters	Description
Total configured interfaces	The number of configured PIM Sparse Mode interfaces.
Maximum allowed	The maximum number of PIM Sparse Mode interfaces that can be configured.
Total active interfaces	The number of active PIM Sparse Mode interfaces.
Address	Primary PIM-SM address.
Interface	Name of the PIM-SM interface.
VIF Index	The Virtual Interface index of the VLAN.
Ver/Mode	PIM version/Sparse mode.
Nbr Count	Neighbor count of the PIM-SM interface.
DR Priority	Designated Router priority.
DR	The IP address of the Designated Router.

show ip pim sparse-mode interface detail

Use this command to show detailed information on a PIM-SM interface.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ip pim sparse-mode interface detail

Mode User Exec and Privileged Exec

Output **Figure 52-4: s Example output from the show ip pim sparse-mode interface detail command**

```
vlan3 (vif 3):
  Address 192.168.1.149, DR 192.168.1.149
  Hello period 30 seconds, Next Hello in 15 seconds
  Triggered Hello period 5 seconds
  Neighbors:
    192.168.1.22

vlan2 (vif 0):
  Address 10.10.11.149, DR 10.10.11.149
  Hello period 30 seconds, Next Hello in 18 seconds
  Triggered Hello period 5 seconds
  Neighbors:
    10.10.11.4
```

show ip pim sparse-mode local-members

Use this command to show detailed local member information on a VLAN interface configured for PIM-SM. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SM.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ipv6 pim sparse-mode local-members [<interface>]`

Parameter	Description
<interface>	Optional Specify the interface. For instance, VLAN interface <code>vlan2</code> .

Mode User Exec and Privileged Exec

Example To show detailed PIM-SM information for all PIM-SM configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output **Figure 52-5: Example output from the show ip pim sparse-mode local-members command**

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:

    (*, 224.0.0.4) : Include

vlan203:

    (*, 223.0.0.3) : Include
```

Example To show detailed PIM-SMv6 information for the PIM-SM configured interface `vlan1`, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

Output **Figure 52-6: Example output from the show ip pim sparse-mode local-members vlan1 command**

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

    (*, 224.0.0.4) : Include
```

show ip pim sparse-mode mroute

This command displays the IP multicast routing table, or the IP multicast routing table based on the specified address or addresses.

Two group addresses cannot be used simultaneously; two source addresses cannot be used simultaneously.

Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

For information on output options, see **“Controlling “show” Command Output” on page 1.35.**

Syntax

```
show ip pim sparse-mode mroute [<group-address>|<source-address>]
show ip pim sparse-mode mroute [<source-address> <group-address>]
show ip pim sparse-mode mroute [<group-address> <source-address>]
```

Parameter	Description
<i><group-address></i>	Group IP address, entered in the form A.B.C.D. Based on the group and source address, the output is the selected route if present in the multicast route tree.
<i><source-address></i>	Source IP address, entered in the form A.B.C.D. Based on the source and group address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Usage Note that when a feature license is enabled, the output for **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

Examples

```
awplus# show ip pim sparse-mode mroute
awplus# show ip pim sparse-mode mroute 40.40.40.11
awplus# show ip pim sparse-mode mroute 235.0.0.1
awplus# show ip pim sparse-mode mroute 235.0.0.1 40.40.40.11
```

Figure 52-7: Example output from the show ip pim sparse-mode mroute command

```

IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1

show ip pim sparse-mode mroute detail

This command displays detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

Two group addresses cannot be used simultaneously; two source addresses cannot be used simultaneously.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax

```
show ip pim sparse-mode mroute [<group-address>|<source-address>]
detail

show ip pim sparse-mode mroute [<group-address> <source-address>]
detail

show ip pim sparse-mode mroute [<source-address> <group-address>]
detail
```

Parameter	Description
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.
detail	Show detailed information.

Usage Based on the group and source address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip pim sparse-mode mroute detail

awplus# show ip pim sparse-mode mroute 40.40.40.11 detail

awplus# show ip pim sparse-mode mroute 224.1.1.1 detail

awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
detail
```

show ip pim sparse-mode neighbor

Use this command to show the PIM-SM neighbor information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ip pim sparse-mode neighbor [<interface>] [<ip-address>]
[detail]`

Parameter	Description
<interface>	Interface name (e.g. vlan2). Show neighbors on an interface.
<ip-address>	Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D.
detail	Show detailed information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip pim sparse-mode neighbor
```

```
awplus# show ip pim sparse-mode neighbor vlan5 detail
```

Figure 52-9: Example output from the show ip pim sparse-mode neighbor command

Neighbor Address Mode	Interface	Uptime/Expires	Ver	DR Priority/
10.10.0.9	vlan2	00:55:33/00:01:44	v2	1 /

show ip pim sparse-mode nexthop

Use this command to see the nexthop information as used by PIM-SM.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ip pim sparse-mode nexthop`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode nexthop
```

Figure 52-11: Example output from the show ip pim sparse-mode nexthop command

Flags: N = New, R = RP, S = Source, U = Unreachable							
Destination	Type	Nexthop Num	Nexthop Addr	Nexthop	Nexthop Ifindex	Metric Name	Pref Refcnt
10.10.0.9	.RS.	1	0.0.0.0	4	0	0	1

Table 52-2: Parameters in output of the show ip pim sparse-mode nexthop command

Parameter	Description
Destination	The destination address for which PIM-SM requires nexthop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of nexthops to the destination. PIM-SM always uses only 1 nexthop.
Nexthop Addr	The address of the primary nexthop gateway.
Nexthop IfIndex	The interface on which the nexthop gateway can be reached.
Nexthop Name	The name of nexthop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

show ip pim sparse-mode rp-hash

Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ip pim sparse-mode rp-hash <group-addr>`

Parameter	Description
<code><group-addr></code>	The group address for which to find the RP, entered in the form A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode rp-hash 224.0.1.3
```

Figure 52-12: output from the show ip pim sparse-mode rp-hash command

```
RP: 10.10.11.35
Info source: 10.10.11.35, via bootstrap
```

Related Commands [show ip pim sparse-mode rp mapping](#)

show ip pim sparse-mode rp mapping

Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ip pim sparse-mode rp mapping`

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode rp mapping
```

Figure 52-13: output from the show ip pim sparse-mode rp mapping command

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
  RP: 10.10.0.9
    Info source: 10.10.0.9, via bootstrap, priority 0
    Uptime: 16:52:39, expires: 00:02:50
```

Related Commands [show ip pim sparse-mode rp-hash](#)

undebg all pim sparse-mode

Use this command to disable all PIM-SM debugging.

Syntax `undebg all pim sparse-mode`

Mode Privileged Exec

Example

```
awplus# undebg all pim sparse-mode
```

Introduction

This chapter provides information about Protocol Independent Multicast - Sparse Mode for IPv6 (PIM-SMv6).

PIM-SMv6

Protocol Independent Multicast - Sparse Mode for IPv6 (PIM-SMv6) provides efficient communication between members of sparsely distributed groups - the type of groups that are most common in wide-area internetworks.

PIM-SMv6 helps geographically dispersed network nodes to conserve bandwidth and reduce traffic by simultaneously delivering a single stream of information to multiple locations. PIM-SMv6 uses the IPv6 multicast model of receiver-initiated membership, supporting both shared and shorted-path trees and uses mechanisms to adapt to changing network conditions. PIM-SMv6 uses a topology gathering approach to populate a multicast routing table with routes.

Note  IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands. Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Note  The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note  The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

For details of the commands used to configure PIM-SMv6, see [Chapter 54, PIM-SMv6 Commands](#). For an overview of multicasting and multicasting commands, see [Chapter 48, Multicast Introduction and Commands](#). For an overview of MLD and MLD commands, see [Chapter 57, MLD and MLD Snooping Introduction and Commands](#).

Characteristics of PIM-SMv6

PIM Sparse Mode for IPv6 (PIM-SMv6) is designed on the principle that several hosts wishing to participate in a multicast conference does not justify flooding the entire internetwork with periodic multicast traffic. PIM-SMv6 is designed to limit multicast traffic so that only those switches interested in receiving traffic for a particular group receive the traffic.

Switches with directly attached or downstream members are required to join a Sparse Mode distribution tree by transmitting explicit join messages. If a switch does not become part of the predefined distribution tree, it does not receive multicast traffic addressed to the group. The default forwarding action of a sparse mode multicast routing protocol is to block traffic unless it is explicitly requested.

PIM-SMv6 employs the concept of a Rendezvous Point (RP) where receivers “meet” sources. The initiator of each multicast group selects a primary RP and a small ordered set of alternative RPs, known as the RP-list. For each multicast group, there is only a single active RP. Each receiver wishing to join a multicast group contacts its directly attached switch, which in turn joins the multicast distribution tree by sending an explicit join message to the group’s primary RP.

A source uses the RP to announce its presence and to find a path to members that have joined the group. This model requires Sparse Mode switches to maintain some state information (the RP-list) prior to the arrival of data packets..

Roles in PIM-SMv6

A multicast sender does not need to know the addresses of the members of the group in order to send to them, and the members of the group need not know the address of the sender. Group membership can change at any time. When PIM-SMv6 is enabled on the switch, and before the switch can route multicast traffic, it must establish which of the PIM-SMv6 routers in the network are performing some key roles:

- Designated Router.
- Rendezvous Point.
- Bootstrap Router.

Designated Router There must be one PIM-SMv6 Designated Router (DR) in the subnetwork to which the IPv6 hosts are connected. Any PIM-SMv6 interfaces on the subnetwork elect the DR with the highest DR priority. If there is more than one router with the same priority, or no priority, they choose the interface with the highest IPv6 address number.

The DR performs all the PIM-SMv6 functionality for the subnetwork. If the current DR becomes unavailable, the remaining switches elect a new DR on the interface by DR priority or IPv6 address.

Rendezvous Point Each multicast group must have a Rendezvous Point (RP). The RP forms the root of the group's distribution tree. The DR for a multicast sender sends multicast packets towards the RP.

DRs with group members connected to them send join messages towards the group's RP. The RP candidate with the lowest priority is elected from all the RP candidates for a group. If the RP becomes unavailable, the remaining RP candidates elect a new RP.

An RP router is configured as the root of the non-source-specific distribution tree for a multicast group. Join messages from receivers for a group are sent towards the RP. Data from senders is sent to the RP so that receivers can discover who the senders are, and receive traffic destined for the group.

Bootstrap Router Each PIM-SMv6 network must have at least one Bootstrap Router (BSR) candidate, unless all switches in the domain are configured statically with information about all RPs in the domain. Every switch that is a BSR candidate periodically sends a Bootstrap Candidate Advertisement message to advertise that it is available as a BSR candidate.

The BSR candidates in the network elect the switches with the highest preference value to be the BSR. The elected BSR listens to PIM-SMv6 Candidate RP Advertisement messages specifying RP candidates for multicast groups. It maintains a list of RP candidates and sends a bootstrap message every BSM interval, specifying all the multicast groups in the PIM-SMv6 network, and their RP candidates. Each switch uses this information and a standardized hash mechanism to determine the RP for each group. In summary:

- Each multicast group must have at least one RP candidate
- Each PIM-SMv6 domain must have at least one BSR candidate, unless all routers in the domain are configured statically with information about all RPs in the domain
- Each subnetwork must have at least one DR candidate.

PIM-SMv6 Terminology

PIM-SMv6 hello messages When PIM-SMv6 is enabled on a switch, it sends out a PIM-SMv6 Hello message on all its PIM-SMv6 enabled interfaces, and listens for Hello messages from its PIM-SMv6 neighbors. When a switch receives a Hello message, it records the interface, IPv6 address, priority for becoming a DR, and the timeout for the neighbor's information. The switch sends Hello messages regularly at the Hello Time interval.

Multicast Routing Information Base (MRIB) The MRIB is a multicast topology table derived from the unicast routing table. In PIM-SMv6, the MRIB decides where to send Join/Prune messages. It also provides routing metrics for destination addresses. These metrics are used when sending and processing Assert messages.

Tree Information Base (TIB) The TIB is the collection of states at a PIM-SMv6 router storing the state of all multicast distribution trees at that PIM-SMv6 router. It is created by receiving Join/Prune messages, Assert messages, and MLD information from local hosts.

Upstream Upstream specifies when traffic is going towards the root of the tree. The root of the tree may be either the Source or the RP (Rendezvous Point).

Downstream Downstream specifies when traffic is going away from the root of the tree. The root of the tree may be either the Source or the RP (Rendezvous Point).

Source-Based Trees In the Source-Based Trees concept, the forwarding paths are based on the shortest unicast path to the source. If the unicast routing metric is the hop count, then the branches of the multicast Source-Based Trees are the minimum hop. If the routing metric is the delay, then the branches of the multicast Source-Based Trees are the minimum delay.

A corresponding multicast tree directly connects the source to all receivers for every multicast source. All traffic to the members of an associated group passes along the tree made for their source. Source-Based Trees has two entries with a list of outgoing interfaces - the source address and the multicast group.

Shared Trees Shared Trees, or RP trees (RPT), rely on a central router called the Rendezvous Point (RP) that receives all traffic from the sources, and forwards that traffic to the receivers. Not all hosts may be receivers.

There is a single tree for each multicast group, regardless of the number of sources. Only the routers on the tree know about the group, and information is only sent to interested receivers. With an RP, receivers have a place to join, even if no source exists. The shared tree is unidirectional, and information flows only from the RP to the receivers. If a host other than the RP has to send data on the tree, then the data must first be tunneled to the RP, then multicast to the members. This means that even if a receiver is also a source, it can only use the tree to receive packets from the RP, and to send packets to the RP (unless the source is located between the RP and the receivers).

(* ,G) A 'star G entry' is a PIM-SMv6 or MLD join message that is requesting to join group G (e.g ff0e::1) from any (*) source IPv6 address.

(S,G) An 'S G entry' is a PIM-SMv6 or MLD join message that is requesting to join group G (e.g ff0e::1) from source IPv6 address (e.g. 2001::1), where S is the source IPv6 address that is generating the multicast data for G. Note that PIM-SMv6 supports (S,G) entries, but MLDv1 does not support (S,G) entries.

BSM Boot Strap Messages, as issued by the BSR (Boot Strap Router), which is an elected router that distributes information about the RP (Rendezvous Point), where an RP is a router in a multicast network domain that acts as a shared route for a multicast shared tree.

MLD Multicast Listener Discovery. There are two versions: MLDv1 and MLDv2. MLDv1 is used by an IPv6 router to discover the presence of multicast listeners. MLDv2 provides additional features such as the ability to specify a source IPv6 address when sending a join.

Once roles are established, multicast routing follows specific phases:

1. **Rendezvous Point Tree**
2. **Register Stop**
3. **Shortest Path Tree**

While multicast routing always begins with phase 1, the Designated Router (DR) for a receiver determines whether and when to move on to phases 2 and 3, depending on the amount of traffic from the source.

Rendezvous Point Tree Phase 1 establishes and uses a shared tree rooted at the Rendezvous Point (RP) to forward all multicast data to group members.

When an IPv6 host sends an MLD join message to the local PIM DR, which is not the RP for the group, the DR sends a PIM-SMv6 join message towards the RP for the group ("upstream"). The DR determines which switch is the RP for the group from the most recent bootstrap message. Every switch the join message passes through records that there is a group member on the incoming interface.

Eventually, the join message reaches either the RP, or another switch that already knows that it has a group member downstream. If the group has many members, the join messages converge on the RP to form a Rendezvous Point Tree (RPT). This is called a shared tree because multicast data that is sent to the group by any sender shares the tree.

The multicast receiver's DR sends join messages periodically according to the upstream join timer as long as the IPv6 host is a member of the group. When the last receiver on a subnetwork leaves the group, the join messages stop, and their entries timeout on routers that are closer to the RP.

The sender's DR encapsulates the multicast data in a unicast packet in a process called **registering**, and sends these register packets to the group's RP. When the RP receives the data, it decapsulates them, and forwards them onto the shared tree.

Register Stop Phase 2 improves efficiency and performance by using register stop. In this phase the RP joins the shortest path tree between the source and receiver. This allows the original (unencapsulated) packets to be forwarded from the sender, instead of encapsulated packets. It also allows shorter paths to receivers that are close to the sender, making it more efficient in some circumstances.

When the RP for a group receives the first encapsulated data packet from a source, it joins the shortest path tree towards the sender. Once data is able to flow along the shortest path from the sender to the RP, packets do not need to be registered. The RP sends a register stop message in reply to the next encapsulated message. When the sender's DR receives the register stop message, it stops registering.

The DR sends a null register message to the RP to find whether the RP still does not need to receive registered packets. If it receives another register stop message, the DR continues to forward only the native data packets. If the DR does not receive another register stop message within the register probe time, it resumes registering the data packets and sending them to the RP.

When the RP starts receiving native data packets from the source, it starts to discard the encapsulated packets, and starts forwarding native packets on the shared tree to all the group members. If the path from the source to the RP intersects the shared RP tree for the group, then the packets also take a short-cut onto the shared tree for delivery to the group members down its branches.

Shortest Path Tree This phase further optimizes routing by using Shortest Path Trees (SPT). In phase 3 the receiver joins the shortest path tree between the source and receiver. This allows a multicast group member to receive multicast data by the shortest path from the sender, instead of from the shared RP tree. When the receiver's DR receives multicast data from a particular sender, it sends a join message towards the sender. When this message reaches the sender's DR, the DR starts forwarding the multicast data directly towards the receiver. As several receivers all initiate shortest paths to the sender, these paths converge, creating a SPT.

When the multicast packets start arriving from the SPT at the receiver's DR or an upstream router common to the SPT and the RPT, it starts discarding the packets from the RPT, and sends a prune message towards the RP. The prune message travels up the RPT until it reaches the RP or a switch that still needs to forward multicast packets from this sender to other receivers. Every time a switch receives a prune message, it waits a short time so that other switches on the LAN have the opportunity to override the prune message.

Multi-Access LANs If the PIM-SMv6 network includes multi-access LAN links for transit, as well as point-to-point links, then a mechanism is needed to prevent multiple trees forwarding the same data to the same group member. Two or more switches on a LAN may have different information about how to reach the RP or the multicast sender. They could each send a join message to two different switches closer to the RP for an RPT or the sender for an SPT. This could potentially cause two copies of all the multicast traffic towards the receiver.

When PIM -SMv6 switches notice duplicate data packets on the LAN, they elect a single switch to forward the data packets, by each sending PIM-SMv6 Assert messages. If one of the upstream switches is on an SPT and the other is on an RPT, the switch on the SPT has the shortest path to the sender, and wins the Assert election. If both switches are on RPTs the switch with the shortest path to the RP (the lowest sum of metrics to the RP) wins the Assert. If both switches are on an SPT, then the switch with the shortest path to the sender (the lowest sum of metrics to the sender's DR) wins the Assert.

The switch that won the Assert election forwards these data packets, and acts as the local Designated Router for any MLD members on the LAN. The downstream switches on the LAN also receive the Assert messages, and send all their join messages to the Assert winner. The result of an Assert election will timeout after the Assert Time. As long as the situation causing the duplication remains unchanged, the Assert winner sends an Assert message at a the Assert time interval, before the previous Assert messages time out. When the last downstream switch leaves the SPT, the Assert winner sends an Assert Cancel message saying that it is about to stop forwarding data on the SPT. Any RPT downstream switches then switch back to the RP tree.

Packet Types See the below list of PIM-SMv6 IPv6 packet types:

- **Register Packets** - unicast encapsulated multicast packets sent to the RP.
- **Hello Messages** - periodic messages sent by PIM-SMv6 routers.
- **Register-Stop Messages** - send to stop the flow of register encapsulated packets to the RP from a source.
- **Join/Prune Messages** - sent when a client joins/leaves a group to maintain PIM-SMv6.
- **Assert Messages** - sent to resolve route conflicts.

RFCs PIM-SMv6 implements the service model from **RFC 1112** to route packets from sources to receivers with either the source or the receiver knowing of each other. This is done in three phases, which may be done at the same time. Clients join or leave multicast groups using MLD protocols. See **Chapter 57, MLD and MLD Snooping Introduction and Commands**

The operation of PIM-SMv4 and PIM-SMv6 protocols is the same. Only the addresses change from IPv4 to IPv6. See **RFC 4601** for further details about the operation of PIM-SM.

Data Flow from Source to Receivers for PIM-SMv6

See the details below for the data flow from Source to Receivers to establish the phases of the Rendezvous Point Tree, Register Stop and Shortest Path Tree as described previously:

1. **Sending out Hello Messages**
2. **Electing a Designated Router**
3. **Determining the RP**
4. **Joining the Shared Tree**
5. **Registering with the RP**
6. **Sending Register-Stop Messages**
7. **Pruning the Interface**
8. **Forwarding Multicast Packets**

Sending out Hello Messages

PIM-SMv6 router periodically send Hello messages to discover neighboring PIM-SMv6 routers. PIM-SMv6 routers do not send any acknowledgement that a Hello message was received. A holdtime value determines the length of time for which the information is valid. In PIM-SMv6, a downstream receiver must join a group before traffic is forwarded on the interface.

Electing a Designated Router

In a multi-access network with multiple PIM-SMv6 routers connected, one of the PIM-SMv6 routers is selected to act as a Designated Router (DR) for a given period. The DR is responsible for sending Join/Prune messages to the RP for local members.

Determining the RP

PIM-SMv6 uses a Bootstrap Router (BSR) to originate Bootstrap Messages (BSM, and to disseminate RP information.

The BSM messages are multicast to the group on each link. If the BSR is not apparent, then the router flood the domain with advertisements. The router with the highest priority (if priorities are the same, the the highest IPv6 address is applied) is selected to be the RP. PIM-SMv6 routers receive and store BSM messages originated by the BSR.

When a DR gets a membership indication from MLD for (or a data packet from) a directly connected host, for a group for which it has no entry, the DR maps the group address to one of the candidate RPs that can service that group. The DR then sends a Join/Prune message towards that RP. In a small domain, the RP can also be configured statically.

Joining the Shared Tree

To join a multicast group, a host sends an MLD message to its upstream PIM-SMv6 router, after which the PIM-SMv6 router can accept multicast traffic for that group. The PIM-SMv6 router sends a Join message to its upstream PIM-SMv6 neighbor in the direction of the RP.

When a PIM-SMv6 router receive a Join message from a downstream PIM-SMv6 router, it checks to see if a state exists for the group in its multicast routing table.

If a state already exists, the Join message has reached the shared tree, and the interface from which the message was received is entered in the Outgoing Interface list.

If no state exists, an entry is created, the interface is entered in the Outgoing Interface lists, and the Join message is again sent towards the RP.

Registering with the RP

A DR can begin receiving traffic from a source without having a Source or Group state for that source. In this case, the DR has no information on how to get multicast traffic to the RP through a tree. When the source DR receives the initial multicast packet, it encapsulates it in a Register message, and unicasts it to the RP for that group. The RP de-encapsulates each Register message, and forwards the extracted data packet to downstream members on the RPT.

Once the path is established from the source to the RP, the DR begins sending traffic to the RP as standard IP multicast packets, as well as encapsulated within Register messages. The RP temporarily receives packets twice. The RP detects the normal multicast packets, it sends a Register-Stop message to the source DR, meaning it should stop sending register packets.

Sending Register-Stop Messages

When the RP begins receiving traffic from the source, both as Register messages and as unencapsulated IPv6 packets, it sends a Register-Stop message to the DR. This notifies the DR that the traffic is now being received as standard IPv6 multicast packets on the SPT. When the DR receives this message, it stops encapsulating traffic in Register messages.

Pruning the Interface

PIM-SMv6 Routers attached to receivers send Prune messages to the RP to disassociate the source from the RP. When an RP receives a Prune message, it no longer forwards traffic from the source indicated in the Prune message.

If all members of a multicast group are pruned, then the MLD state of the DR is deleted, and the interface is removed from the Source and Group lists of the group.

Forwarding Multicast Packets

PIM-SMv6 routers forward multicast traffic onto all interfaces that lead to receivers that have explicitly joined a multicast group. Messages are sent to a group address in the local subnetwork, and have a Time to Live (TTL) of 1. The PIM-SMv6 router performs an RPF check, and forwards the packet.

If a downstream PIM-SMv6 router has sent a join to this PIM-SMv6 router, or is a member of this group, then traffic that arrives on the correct interface is sent to all outgoing interfaces that lead to downstream receivers.

PIM-SMv6 Embedded RP, RP and BSR Candidate Configurations

This section provides two PIM-SMv6 configuration examples:

- **Embedded RP Configuration**
- **RP and BSR Candidate Configuration**

For details on the commands used in the following examples, refer to **Chapter 54, PIM-SMv6 Commands**.

Embedded RP Configuration

RFC 3956 describes a multicast address allocation policy, in which the address of the Rendezvous Point (RP) is encoded in the IPv6 multicast group address, and specifies a PIM-SMv6 group-to-RP mapping to use the encoding, leveraging and extending unicast-prefix-based addressing.

Embedded RP Multicast Group Address Format

RFC 3956 specifies a modification to the unicast-prefix-based address format by specifying the second high-order bit (R-bit) as follows:

Table 53-1: RFC3956 modification to the unicast-prefix-based IPv6 address format

11111111	flgs	scop	rsvd	RIID	plen	network prefix	group ID
8 bits	4 bits	4 bits	4 bits	4 bits	8 bits	64 bits	32 bits

Note: **flgs** is a set of four flags - **0 - R - P - T**

flgs the highest-order bit is 0, flag R is 1. This indicates a multicast address that embeds the address on the RP. In this case, the **P** flag must be set to 1 and the **T** flag must be set to 1. In effect, this implies the prefix **ff70::/12**. This means that the last 4 bits of the previously reserved field are interpreted as the embedded RP interface ID.

RP Address in Embedded RP Multicast Address

The address of the RP can only be embedded in unicast-prefix-based Any Source Multicast (ASM) addresses. To identify whether it is an embedded RP multicast address, and to be processed any further, an IPv6 address must satisfy all of the following criteria:

- It must be an IPv6 multicast address with **flgs** set to **0111** to be of the prefix **ff70::/12**, or with **flgs** set to **1111** to be of the prefix **fff0::/12**
- **plen** must not be set to 0 and **plen** must not be set to greater than 64.

Enable Embedded RP

Enter the following commands to enable embedded-RP to group mapping (ipv6 pim rp embedded) then configure an access-list to permit a multicast group (ipv6 access-list) and use this access-list to limit valid groups with a configured static RP (ipv6 pim rp-address):

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
awplus(config)# ipv6 access-list embedrp1 permit
ff70:2:2001:0db8:12::2::/96
awplus(config)# ipv6 pim rp-address ff70:2001:0db8:12::2/12
embedrp1
awplus(config)# exit
```

Disable Embedded RP

Enter the following commands to disable embedded-RP to group mapping (no ipv6 pim rp embedded) after enabling embedded RP (as shown in the previous example above):

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
awplus(config)# exit
```

PIM-SMv6 Commands Used

ipv6 pim rp-address
ipv6 pim rp embedded

Verify Embedded RP Configuration

Use the following commands to verify the embedded-RP configuration. Note that the group-to-RP mapping for embedded-RP addresses is created when the group is first seen at a PIM-SMv6 router. This can be due to the MLD local receiver report, Join/Prune and Register message processing.

Verify RP-mapping in RP:

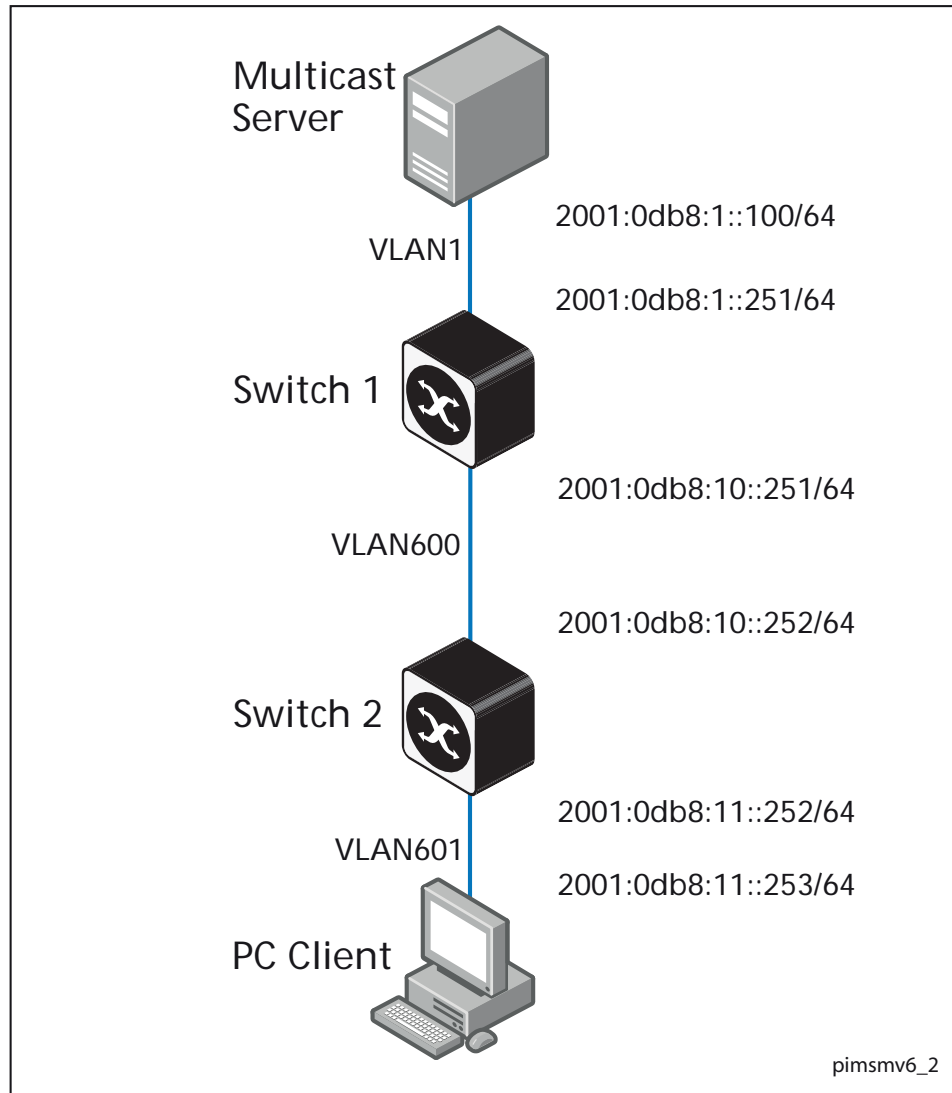

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff7e:240:3ffe:172:31:12::/96, Static
  RP: 3ffe:172:31:12::2
  Uptime: 00:04:12
Embedded RP Groups:
Group(s): ff7e:240:3ffe:172:31:12::/96
  RP: 3ffe:172:31:12::2, Uptime: 00:00:33
```

Verify RP-mapping in non-RP:

```
mv66#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Embedded RP Groups:
Group(s): ff7e:240:3ffe:172:31:12::/96
  RP: 3ffe:172:31:12::2, Uptime: 00:00:27
```

RP and BSR Candidate Configuration

Apply the configurations for **Switch 1** and **Switch 2** shown following the topology to configure **Switch 1** and **Switch 2** as RP and BSR candidates.

Note the **Multicast Server** serves multiple streams on addresses **ff01:1::3** and **ff03:1::4**. Also note **Switch 1** and **Switch 2** are configured as BSR Candidates with **Switch 2** elected.

Switch 1 Enter this configuration to configure **Switch 1** as an RP candidate and a BSR candidate:

```

!
no ip multicast-routing
!
ipv6 multicast-routing
!
vlan database
  vlan 600 state enable
!
ipv6 pim bsr-candidate vlan600
ipv6 pim rp-candidate vlan600
!
!
interface port3.0.17
  switchport
  switchport mode access
  switchport access vlan 1
!
interface port3.0.31
  switchport
  switchport mode access
  switchport access vlan 600
!
interface vlan1
  ip address 192.168.1.101/24
  ipv6 address 2001:0db8:1::251/64
  ipv6 enable
  ipv6 router rip
  ipv6 pim sparse-mode passive
!
interface vlan600
  ipv6 address 2001:0db8:10::251/64
  ipv6 enable
  ipv6 router rip
  ipv6 pim sparse-mode
!
ipv6 forwarding
!

```

Switch 2 Enter this configuration to configure **Switch 2** as an RP candidate and a BSR candidate:

```

!
ipv6 access-list standard testacl permit ff0e:1::3/128
!
no ip multicast-routing
!
ipv6 multicast-routing
!
vlan database
  vlan 600-601 state enable
!
ipv6 pim bsr-candidate vlan600
ipv6 pim rp-candidate vlan601 group-list testacl
!
interface port1.0.11
  switchport
  switchport mode access
  switchport access vlan 600
!
interface port1.0.13-1.0.14
  switchport
  switchport mode access
  switchport access vlan 603
!
interface port1.0.15-1.0.19
  switchport
  switchport mode access
!
interface port1.0.20
  switchport
  switchport mode access
  switchport access vlan 601
!
interface port1.0.21-1.0.24
  switchport
  switchport mode access
!
interface vlan600
  ipv6 address 2001:0db8:10::252/64
  ipv6 enable
  ipv6 router rip
  ipv6 pim sparse-mode
!
interface vlan601
  ipv6 address 2001:0db8:11::252/64
  ipv6 enable
  ipv6 mld
  ipv6 router rip
  ipv6 pim sparse-mode
!
ipv6 forwarding
!

```

Verify RP and RP Candidate Configuration

Use the following commands to verify the RP candidate configuration for **Switch 1** and **Switch 2**. Note both **Switch 1** and **Switch 2** are BSR candidates and **Switch 2** is elected.

Also note **Switch 1** is a candidate RP for all multicast groups, while **Switch 2** is a candidate for only the multicast group **ff0e:1::3/128**. Therefore, **Switch 1** and **Switch 2** overlap and **Switch 1** has become the RP for **ff0e:1::4** while Switch 2 is now the RP for **ff0e:1::3**.

Verify Switch 1 Configuration:

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:0db8:10::252 (?)
  Uptime:      01:09:46, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:44
  Role: Candidate BSR
  State: Candidate BSR

  Candidate RP: 2001:0db8:10::251(vlan600)
  Advertisement interval 60 seconds
  Next C-RP advertisement in 00:00:21

awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 2001:0db8:10::251
  Info source: 2001:0db8:10::252, via bootstrap, priority 192
  Uptime: 01:24:33, expires: 00:02:24
Group(s): ff0e:1::3/128
  RP: 2001:11::252
  Info source: 2001:0db8:10::252, via bootstrap, priority 192
  Uptime: 00:34:06, expires: 00:02:24
Embedded RP Groups:

awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3
  RP: 2001:0db8:11::252
  Info source: 2001:0db8:10::252, via bootstrap
```

Verify Switch 2 Configuration (Switch 2 is the elected BSR):

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 2001:0db8:10::252 (?)
  Uptime:      01:08:31, BSR Priority: 64, Hash mask length: 126
  Next bootstrap message in 00:00:49
  Role: Candidate BSR
  State: Elected BSR

  Candidate RP: 2001:0db8:11::252(vlan601)
  Advertisement interval 60 seconds
  Next C-RP advertisement in 00:00:44

awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): ff00::/8
  RP: 2001:0db8:10::251
  Info source: 2001:0db8:10::251, via bootstrap, priority 192
  Uptime: 01:17:06, expires: 00:01:46
Group(s): ff0e:1::3/128
  RP: 2001:11::252
  Info source: 2001:0db8:10::252, via bootstrap, priority 192
  Uptime: 00:37:41, expires: 00:01:54
Embedded RP Groups:

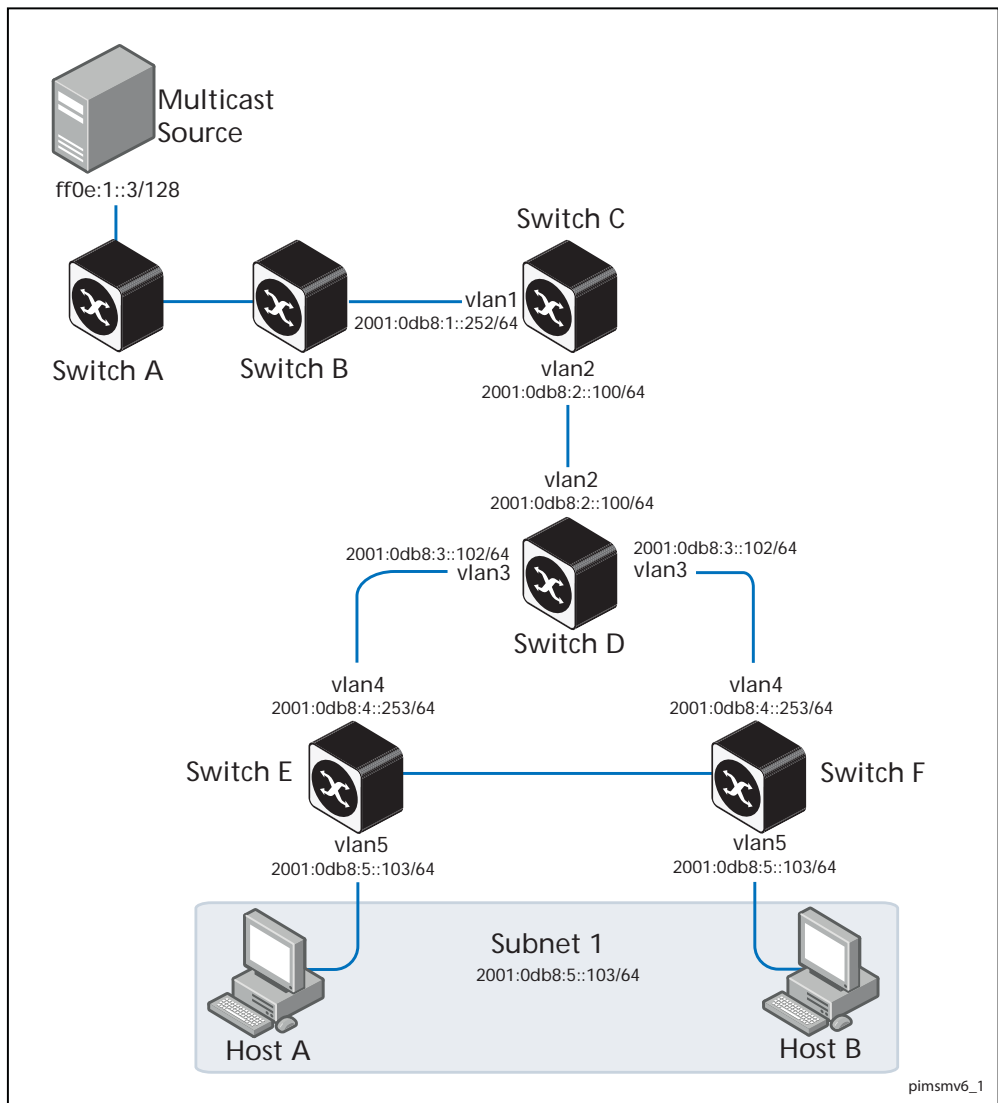

awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::4
  RP: 2001:0db8:10::251
  Info source: 2001:0db8:10::252, via bootstrap
```

PIM-SMv6 Static RP, DR, BSR Configurations

This section provides three PIM-SMv6 configuration examples:

- **Static Rendezvous Point Configuration**
- **Dynamic Rendezvous Point Configuration**
- **Boot Strap Router Configuration**

Both Rendezvous Point (RP) configuration examples refer to the network topology in the following graphic and use Allied Telesis managed Layer 3 Switches as the PIM routers. For details on the commands used in the following examples, refer to [Chapter 54, PIM-SMv6 Commands](#).

Static Rendezvous Point Configuration

In this example using the above network topology, Switch C is the Rendezvous Point (RP) and all switches are statically configured with RP information. Host A and Host B join group `ff0e:1::3/128` for all the sources. They send the MLD membership report to Subnet 1. Two switches are attached to Subnet 1, Switch E and Switch F. Both of these switches have default Designated Router (DR) priority on `vlan1`. Because Switch E has a higher IP address on `vlan1`, Switch E becomes the DR and is responsible for sending Join messages to the RP (Switch C).

While configuring the RP, ensure that:

- Every switch includes the `ipv6 pim rp-address 2001:0db8:1::100/64` statement, even if it does not have any source or group member attached to it.
- There is only one RP address for the whole multicast group.
- All interfaces running PIM-SMv6 must have sparse-mode enabled. In the configuration sample output below, both `vlan1` and `vlan2` are pim sparse-mode enabled.

See the following configuration output for **Switch D**:

```
hostname Switch D
!
interface vlan2
  ipv6 enable
  ipv6 pim sparse-mode
  ipv6 address 2001:0db8:2::100/64
!
interface vlan3
  ipv6 enable
  ipv6 pim sparse-mode
  ipv6 address 2001:0db8:3::102/64
!
interface lo
!
!
ipv6 multicast-routing
ipv6 pim rp-address 2001:0db8:1::100/64
!
ipv6 forwarding
!
```

Configure all the switches with the same `ipv6 pim rp-address 2001:0db8:1::100/64` statement as shown above.

Verify Static Rendezvous Point Configuration

Use the following commands to verify the RP configuration, interface details, and the multicast routing table.

RP details For **Switch D**, the **show ipv6 pim sparse-mode rp mapping** command shows that 2001:0db8:1::100/64 is the RP for all multicast groups ff0e:1::3/128, and is statically configured. All other switches will have a similar output.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff0e:1::3/128, Static
RP: 2001:0db8:1::100/64
Uptime: 5d02h15m
```

For **Switch D**, the **show ipv6 pim sparse-mode rp-hash** command displays the selected RP for the specified group, in this example ff0e:1::3/128.

```
awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3/128
RP: 2001:0db8:1::100/64
```

Interface details For **Switch E**, the **show ipv6 pim sparse-mode interface** command displays the interface details and shows that Switch E is the DR on Subnet 1.

```
awplus#show ipv6 pim sparse-mode interface
Total configured interfaces: 16   Maximum allowed: 31
Total active interfaces:      12

Address                Interface VIFindex Ver/   Nbr    DR      DR
                    Mode     Count   Prior
2001:0db8:1::251      vlan2    0       v2/S   1       1       2001:0db8:1::100
```

IP multicast routing table Note that the multicast routing table displayed for an RP switch is different to that displayed for other switches. For **Switch C**, because this switch is the RP and the root of this multicast tree, the **show ipv6 pim sparse-mode mroute** command shows **RPF nbr** (next-hop to reach RP) as **0.0.0.0** and **RPF idx** (incoming interface for this (*, G) state) as **None**.

```
awplus#show ipv6 pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, ff0e:1::3/128)
RP: 2001:0db8:1::100/64
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: JOINED
Local      .....
Joined     j.....
Asserted   .....
Outgoing   o.....
```

For Switch E, the `show ipv6 pim sparse-mode mroute` command displays the IP multicast routing table.

```
awplus#show ipv6 pim sparse-mode mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, ff0e:1::3/128)
RP: 2001:0db8:1::100/64
RPF nbr: 2001:0db8:1::100/64
RPF idx: port1.1.2
Upstream State: JOINED
Local      .....
Joined     j.....
Asserted   .....
Outgoing   o.....
```

On Switch E, `port1.0.2` is the incoming interface of the `(*, G)` entry, and `port1.0.1` is on the outgoing interface list of the `(*, G)` entry. This means that there is a group member through `port1.0.1`, and RP is reachable through `port1.0.2`.

On Switch E, `port1.1.2` is the incoming interface of the `(*, G)` entry, and `port1.1.1` is on the outgoing interface list of the `(*, G)` entry. This means that there is a group member through `port1.1.1`, and RP is reachable through `port1.1.2`.

Dynamic Rendezvous Point Configuration

A static RP configuration works for a small, stable PIM domain. However, it is not practical for a large and not so stable internetwork. In such a network, if the RP fails, the network administrator may have to change the static configurations on all PIM switches. An additional reason for choosing dynamic configuration high routing traffic leading to a change in the RP.

The Bootstrap Router (BSR) mechanism is used to dynamically maintain the RP information. To configure the RP dynamically in the above network topology, Switch C on `port1.0.1` and Switch D on `vlan1` are configured as RP candidates using the `ipv6 pim rp-candidate` command. Switch D on `vlan1` is also configured as the BSR candidate. Since no other device has been configured as a BSR candidate, Switch D becomes the BSR router and is responsible for sending group-to-RP mapping information to all other PIM switches in this PIM domain.

The Bootstrap Router (BSR) mechanism is used to dynamically maintain the RP information. To configure the RP dynamically in the above network topology, Switch C on `port1.1.1` and Switch D on `vlan1` are configured as RP candidates using the `ipv6 pim rp-candidate` command. Switch D on `vlan1` is also configured as the BSR candidate. Since no other device has been configured as a BSR candidate, Switch D becomes the BSR router and is responsible for sending group-to-RP mapping information to all other PIM switches in this PIM domain.

The following output displays the complete configuration at **Switch C**.

```
awplus#show run
!
interface vlan1
  ipv6 enable
  ipv6 pim sparse-mode
  ipv6 address 2001:0db8:1::252/64
!
interface vlan2
  ipv6 enable
  ipv6 pim sparse-mode
  ipv6 address 2001:0db8:2::100/64
!
interface lo
!
ipv6 multicast-routing
ipv6 pim rp-candidate vlan1
```

The following output displays the complete configuration at **Switch D**.

```
awplus#show run
!
interface vlan2
  ipv6 enable
  ipv6 pim sparse-mode
  ipv6 address 2001:0db8:2::100/64
!
interface vlan3
  ipv6 enable
  ipv6 pim sparse-mode
  ipv6 address 2001:0db8:3::102/64
!
interface lo
!
ipv6 multicast-routing
ipv6 pim bsr-candidate vlan1
ipv6 pim rp-candidate vlan1 priority 2
!
```

The highest priority switch is chosen as the RP. If two or more switches have the same priority, a hash function in the BSR mechanism is used to choose the RP to make sure that all devices in the PIM domain have the same RP for the same multicast group.

Use the `<interface> [priority <priority>]` parameters of the **ipv6 pim rp-candidate** command to change the default priority of any RP candidate.

Verify PIM group-to-RP mappings

The `show ipv6 pim sparse-mode rp mapping` command displays the group-to-RP mapping details. The output shows information about RP candidates. There are two RP candidates for the group range `ff0e:1::3/128`. RP candidate `2001:1::100/64` has a default priority of 192, whereas RP candidate `2001:1::251/64` has been configured to have a priority of 2. Since RP candidate `2001:1::251/64` has a higher priority, it is selected as the RP for the multicast group `ff0e:1::3/128`.

See the following configuration output for **Switch D**.

```
awplus#show ipv6 pim sparse-mode rp mapping
This system is the Bootstrap Router (v2)
Group(s): ff0e:1::3/128
  RP: 2001:0db8:1::100/64
    Info source: 2001:0db8:1::251/64, via bootstrap, priority 192
    Uptime: 00:00:13, expires: 00:02:29
```

Verify RP details

The `show ipv6 pim sparse-mode rp-hash` command displays information about the RP router for a particular group. See the following configuration output for **Switch D**. This output shows that `2001:0db8:1::251/64` has been chosen as the RP for the multicast group `ff0e:1::3/128`.

```
awplus#show ipv6 pim sparse-mode rp-hash ff0e:1::3/128
Group(s): ff0e:1::3/128
  RP: 2001:0db8:1::251/64
  Info source: 2001:0db8:1::251/64, via bootstrap
```

After RP information reaches all PIM switches in the domain, various state machines maintain all routing states as the result of Join/Prune messages from members of the multicast group.

Boot Strap Router Configuration

Every PIM multicast group needs to be associated with the IP address of a Rendezvous Point (RP). This address is used as the root of a group-specific distribution tree, whose branches extend to all nodes in the domain that want to receive traffic sent to the group. For all senders to reach all receivers, all devices in the domain use the same mappings of group addresses to RP addresses. In order to determine the RP for a multicast group, a PIM device maintains a collection of group-to-RP mappings, called the RP-Set.

The Boot Strap Router (BSR) mechanism for the class of multicast routing protocols in the PIM domain uses the concept of an RP as a means for receivers to discover the sources that send to a particular multicast group. The BSR mechanism is one way that a multicast router can learn the set of group-to-RP mappings required in order to function.

Some of the PIM devices within a PIM domain are configured as RP candidates. A subset of the RP candidates will eventually be used as the actual RPs for the domain. An RP configured with a lower value in the priority field has higher a priority.

Some of the PIM devices in the domain are configured to be BSR candidates. One of these BSR candidates is elected to be the BSR for the domain, and all PIM devices in the domain learn the result of this election through Bootstrap messages (BSM). The BSR candidate with highest value in the priority field is the elected BSR.

The RP candidates then report their candidacy to the elected BSR, which chooses a subset of the RP candidates, and distributes corresponding group-to-RP mappings to all the devices in the domain through Bootstrap messages.

Switch A Enter the following commands to configure `vlan1` on Switch A as the BSR candidate. The default priority is 64.

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan1
awplus(config)# exit
```

Switch B Enter the following commands to configure `vlan1` on Switch B as the BSR candidate with a hash mask length of 10 and a priority of 25 and to configure `vlan1` as the RP candidate with a priority of 0.

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan1 10 25
awplus(config)# ipv6 pim rp-candidate vlan1 priority 0
awplus(config)# exit
```

Verify Boot Strap Router Configuration

Use the **show ipv6 pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch A**.

```
awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 2001:0db8:1::251/64
  Uptime:      00:37:12, BSR Priority: 64, Hash mask length: 10
  Expires:     00:01:32
  Role: Candidate BSR
  State: Elected BSR
```

Use the **show ipv6 pim sparse-mode bsr-router** command to verify the BSR candidate state on **Switch B**. The initial state of the BSR candidate is pending before transitioning to BSR candidate.

```
awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
  BSR address: 2001:0db8:1::251/64
  Uptime:      00:02:39, BSR Priority: 64, Hash mask length: 10
  Expires:     00:00:03
  Role: Candidate BSR
  State: Pending BSR

awplus#show ipv6 pim sparse-mode bsr-router
PIMv2 Bootstrap information
  BSR address: 2001:0db8:1::251/64
  Uptime:      00:40:20, BSR Priority: 64, Hash mask length: 10
  Expires:     00:02:07
  Role: Candidate BSR
  State: Candidate BSR
```

Use the **show ipv6 pim sparse-mode rp mapping** command to verify RP-set information on **Switch A**.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): ff0e:1::3/128
  RP: 2001:db8:1::251/64
  Info source: 2001:db8:1::251/64, via bootstrap, priority 0
  Uptime: 00:00:30, expires: 00:02:04
```

Use the **show ipv6 pim sparse-mode rp mapping** command to verify RP-set information on **Switch B**.

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff0e:1::3/128
  RP: 2001:db8:1::251/64
  Info source: 2001:db8:1::251/64, via bootstrap, priority 0
  Uptime: 00:00:12, expires: 00:02:18
```

Chapter 54: PIM-SMv6 Commands

Command List	54.3

Command List

This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see [Chapter 48, Multicast Introduction and Commands](#). For an overview of PIM-SMv6, see [Chapter 53, PIM-SMv6 Introduction and Configuration](#).

 **Note** IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands. Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

 **Note** The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

 **Note** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ipv6 mroute pim

Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

Note  Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 mroute [*] pim sparse-mode`

Parameter	Description
*	Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries.

Mode Privileged Exec

Example

```
awplus# clear ipv6 mroute pim sparse-mode
```

```
awplus# clear ipv6 mroute * pim sparse-mode
```

clear ipv6 pim sparse-mode bsr rp-set *

Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

 **Note** Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 pim sparse-mode bsr rp-set *`

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ipv6 pim sparse-mode bsr rp-set *
```

clear ipv6 mroute pim sparse-mode

Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

 **Note** Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the **clear ipv6 mroute** command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

Syntax `clear ipv6 mroute <Group-IPv6-add> pim sparse-mode`

`clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim sparse-mode`

Parameter	Description
<code><Group-IPv6-add></code>	Specify a multicast group IPv6 address, entered in the form X:X::X:X.
<code><Source-IPv6-add></code>	Specify a source group IPv6 address, entered in the form X:X::X:X.

Mode Privileged Exec

Example

```
awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode
```

```
awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim
sparse-mode
```

debug ipv6 pim sparse-mode

Use this command to activate PIM-SMv6 debugging.

Use the **no** variant of this command to deactivate PIMv6 debugging. Note that the **undebug ipv6 pim sparse-mode** command is an alias of the **no** variant of this command.

Syntax

```
debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
[state] [timer]

no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
[nsm] [state] [timer]
```

Parameter	Description
all	Activates/deactivates all PIM-SMv6 debugging.
events	Activates debug printing of PIM-SMv6 events.
mfc	Activates debug printing of MFC (Multicast Forwarding Cache).
mib	Activates debug printing of PIM-SMv6 MIBs.
nexthop	Activates debug printing of PIM-SMv6 nexthop communications.
nsm	Activates debugging of PIM-SMv6 NSM (Network Services Module) communications.
state	Activates debug printing of state transition on all PIM-SMv6 FSMs.
timer	Activates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode all

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode events

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode nexthop
```

Validation Output **Figure 54-1: Example output from the show debugging ipv6 pim sparse-mode command after issuing multiple debug ipv6 pim sparse-mode commands**

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is on
  PIM MFC debugging is off
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is off
  PIM Hello NLT timer debugging is off
  PIM Hello THT timer debugging is off
  PIM Join/Prune JT timer debugging is off
  PIM Join/Prune ET timer debugging is off
  PIM Join/Prune PPT timer debugging is off
  PIM Join/Prune KAT timer debugging is off
  PIM Join/Prune OT timer debugging is off
  PIM Assert AT timer debugging is off
  PIM Register RST timer debugging is off
  PIM Bootstrap BST timer debugging is off
  PIM Bootstrap CRP timer debugging is off
  PIM mib debugging is off
  PIM nsm debugging is off
  PIM nexthop debugging is off
```

Related Commands **show debugging ipv6 pim sparse-mode**
undebug all ipv6 pim sparse-mode
undebug ipv6 pim sparse-mode

debug ipv6 pim sparse-mode packet

Use this command to activate PIM-SMv6 packet debugging.

Use the **no** variant of this command to deactivate PIMv6 packet debugging.

Syntax `debug ipv6 pim sparse-mode packet {in|out}`
`no debug ipv6 pim sparse-mode packet {in|out}`

Parameter	Description
packet	Activates debug printing of incoming and/or outgoing IPv6 packets.
in	Specify incoming packet debugging.
out	Specify outgoing packet debugging.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

Related Commands [show debugging ipv6 pim sparse-mode](#)
[undebug all ipv6 pim sparse-mode](#)

debug ipv6 pim sparse-mode timer

Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

Syntax

```

debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]

```

Parameter	Description
assert	Enable or disable debugging for the Assert timers.
at	Enable or disable debugging for the Assert Timer.
bsr	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
bst	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
crp	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
hello	Enable or disable debugging for the specified Hello timer, or all Hello timers.
ht	Enable or disable debugging for the Hello timer: Hello Timer.
nlt	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
tht	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
joinprune	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
jt	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
et	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
ppt	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.
kat	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.

Parameter	Description
ot	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
register	Enable or disable debugging for the Register timers.
rst	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

Related Commands [show debugging ipv6 pim sparse-mode](#)

ipv6 pim accept-register

Use this command to configure the ability to filter out multicast sources specified by the given software IPv6 access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

Syntax `ipv6 pim accept-register list{<access-list>}`
`no ipv6 pim accept-register`

Parameter	Description
<code><access-list></code>	Specify a Standard or an Extended software IPv6 Access list. See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim accept-register list G2
awplus(config)# ipv6 access-list standard G2 permit 2001:db8::/
128

awplus# configure terminal
awplus(config)# no ipv6 pim accept-register
```

ipv6 pim anycast-rp

Use this command to configure Anycast RP (Rendezvous Point) in an RP set.

Use the **no** variant of this command to remove the configuration.

Syntax `ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>`
`no ipv6 pim anycast-rp <anycast-rp-address> [<member-rp-address>]`

Parameter	Description
<code><anycast-rp-address></code>	<code><X:X::X:X></code> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.
<code><member-rp-address></code>	<code><A:B::C:D></code> Specify an Anycast RP (Rendezvous Point)IPv6 address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IPv6 address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IPv6 address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

ipv6 pim bsr-border

Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

Syntax `ipv6 pim bsr-border`
`no ipv6 pim bsr-border`

Mode Interface Configuration for a VLAN interface.

Usage When this command is configured on a VLAN interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM-SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

Examples The following example configures the VLAN interface `vlan2` to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface `vlan2` from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

ipv6 pim bsr-candidate

Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax `ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]`
`no ipv6 pim bsr-candidate [<interface>]`

Parameter	Description
<interface>	Specify the interface. For instance, VLAN interface <code>vlan2</code> .
<hash>	<0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the <hash> (mask length) when specifying the <priority>. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 126 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface `vlan2`, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of `vlan2` from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

ipv6 pim cisco-register-checksum

Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax `ipv6 pim cisco-register-checksum`
`no ipv6 pim cisco-register-checksum`

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum

awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

ipv6 pim cisco-register-checksum group-list

Use this command to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by the software IPv6 access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax `ipv6 pim cisco-register-checksum group-list <IPv6-access-list>`
`no ipv6 pim cisco-register-checksum group-list <IPv6-access-list>`

Parameter	Description
<code><IPv6-access-list></code>	<p>Optional. Specify a Standard or Extended software IPv6 access list.</p> <p>See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.</p> <p>Use this parameter to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by an IPv6 access list entered after this command.</p>

Mode Global Configuration

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum group-list G1
awplus(config)# ipv6 access-list standard G1 permit
                ff0x::db8:0:0/96
```

ipv6 pim crp-cisco-prefix

Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

Syntax `ipv6 pim crp-cisco-prefix`
 `no ipv6 pim crp-cisco-prefix`

Mode Global Configuration

Usage Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ipv6 pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix

awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

Related Commands [ipv6 pim rp-candidate](#)

ipv6 pim dr-priority

Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax `ipv6 pim dr-priority <priority>`
`no ipv6 pim dr-priority [<priority>]`

Parameter	Description
<code><priority></code>	<code><0-4294967294></code> Specify the Designated Router priority value. Note that a higher value has a higher preference or higher priority.

Default The default value is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to 11234 for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface `vlan2`, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

Related Commands [ipv6 pim ignore-rp-set-priority](#)

ipv6 pim exclude-genid

Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax `ipv6 pim exclude-genid`
 `no ipv6 pim exclude-genid`

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

ipv6 pim ext-sracs-directly-connected

Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

Syntax `ipv6 pim ext-sracs-directly-connected`
`no ipv6 pim ext-sracs-directly-connected`

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-sracs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-sracs-directly-connected
```

ipv6 pim hello-holdtime

This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax `ipv6 pim hello-holdtime <holdtime>`
`no ipv6 pim hello-holdtime`

Parameter	Description
<code><holdtime></code>	<code><1-65535></code> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello interval). Otherwise, it retains the configured value.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
```

ipv6 pim hello-interval

This command configures a hello-interval value for PIM-SMv6.

Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

Syntax `ipv6 pim hello-interval <interval>`
`no ipv6 pim hello-interval`

Parameter	Description
<code><interval></code>	<code><1-65535></code> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello interval). Otherwise, the hello-holdtime value is the configured value.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
```

ipv6 pim ignore-rp-set-priority

Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

Syntax `ipv6 pim ignore-rp-set-priority`
`no ipv6 pim ignore-rp-set-priority`

Mode Global Configuration

Usage This command is used to inter-operate with older Cisco IOS versions.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority

awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

ipv6 pim jp-timer

Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the switch puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

Syntax `ipv6 pim jp-timer <1-65535>`
`no ipv6 pim jp-timer [<1-65535>]`

Parameter	Description
<1-65535>	Specifies the Join/Prune timer value. The default value is 210 seconds.

Default The default PIM-SMv6 join/prune timer value is 210 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300

awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

ipv6 pim neighbor-filter

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

Syntax `ipv6 pim neighbor-filter <IPv6-accesslist>`
`no ipv6 pim neighbor-filter <IPv6-accesslist>`

Parameter	Description
<code><IPv6-accesslist></code>	Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter. See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default By default, there is no neighbor filtering applied to an interface.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config)# ipv6 enable
awplus(config-if)# ipv6 pim neighbor-filter filter1
awplus(config-if)# ipv6 access-list standard filter1 deny
                    fe80:20e:cff:fe01:facc
awplus(config-if)# ipv6 access-list standard filter1 permit
                    any
awplus(config-if)# exit
```

ipv6 pim register-rate-limit

Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit and reset to the default rate limit.

Syntax `ipv6 pim register-rate-limit <1-65535>`
`no ipv6 pim register-rate-limit`

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Default The default is 0, as reset with the **no** variant, which also specifies an unlimited rate limit.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444

awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit 3444
```

ipv6 pim register-rp-reachability

Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax `ipv6 pim register-rp-reachability`
`no ipv6 pim register-rp-reachability`

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability

awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

ipv6 pim register-source

Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

Syntax `ipv6 pim register-source [<source-IPv6-address>|<interface>]`

`no ipv6 pim register-source`

Parameter	Description
<code><source-IPv6-address></code>	The IPv6 address, entered in the form <code>X:X::X:X</code> , to be used as the source of the register packets.
<code><interface></code>	The name of the VLAN interface to be used as the source of the register packets.

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
```

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
```

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

ipv6 pim register-suppression

Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax `ipv6 pim register-suppression <1-65535>`
`no ipv6 pim register-suppression`

Parameter	Description
<1-65535>	Register suppression on time in seconds.

Mode Global Configuration

Default The default PIM-SMv6 register suppression time is 60 seconds, and is restored with the **no** variant of this command.

Usage Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the [ipv6 pim rp-register-kat command on page 54.35](#) is not used.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192

awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

ipv6 pim rp-address

Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

Syntax `ipv6 pimv6 rp-address <IPv6-address> [<IPv6-access-list>] [override]`
`no ipv6 pim rp-address <IPv6-address> [<IPv6-access-list>] [override]`

Parameter	Description
<code><IPv6-address></code>	Specify the IPv6 address of the Rendezvous Point, entered in the form X:X::X:X.
<code><IPv6-access-list></code>	Specify a Standard or an Extended software IPv6 access-list name. See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.
<code>override</code>	Specify this optional parameter keyword to enable any statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ipv6 pim rp-address** command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

A single static-RP can be configured for multiple group ranges using software IPv6 access-lists (ACLs). However, configuring multiple static RPs (using **ipv6 pim rp-address** command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range `ff00::/8` (without using IPv6 ACLs) or for specific group ranges (when using IPv6 ACLs).

For example, configuring **ipv6 pim rp-address 3ffe:10:10:5::153** will configure static-RP `3ffe:10:10:5::153` for the default group range `ff00::/8`. Configuring **ipv6 pim rp-address 3fee:20:20:5::153 grp-list** will configure static-RP `3fee:10:10:5::153` for all the group ranges represented by permit filters in the defined named **grp-list** ACL.

If multiple static-RPs are available for a group range, then one with the highest IPv6 address is chosen.

Only `permit` filters in IPv6 ACL are considered as valid group ranges. The default `permit` filter `::/0` is converted to the default multicast filter `ff00::/8`.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IPv6 address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the **ipv6 pim rp-address** command. Commands with the **override** keyword take precedence over dynamically learned mappings.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
                2001:db8::/128
awplus(config)# ipv6 pim rp-address 3ffe:30:30:5::153 G2

awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

Related Commands [ipv6 pim rp-candidate](#)
[ipv6 pim rp-register-kat](#)

ipv6 pim rp-candidate

Use this command to give the switch the candidate RP (Rendezvous Point) status using the IPv6 address of the specified VLAN interface.

Use the **no** variant of this command to remove the RP status set using the **ipv6 pim rp-candidate** command.

Syntax `ipv6 pim rp-candidate <interface>`
 `[priority <priority>|interval <interval>| grouplist <accesslist>]`
`no ipv6 pim rp-candidate [<interface>]`

Parameter	Description
<code><interface></code>	Specify a VLAN interface name.
<code><priority></code>	<0-255> Specify this to configure the priority for an RP candidate.
<code><interval></code>	Specify a candidate RP advertisement interval in the range <1-16383> (seconds).
<code><accesslist></code>	Specify a Standard or an Extended software IPv6 access list name. See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default The priority value for a candidate RP is 0 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage Note that issuing the command **ipv6 pim rp-candidate <interface>** without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 0.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3

awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit 2001:db8::/128
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3 group-list G2
```

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

Related Commands [ipv6 pim rp-address](#)
[ipv6 pim rp-register-kat](#)

ipv6 pim rp embedded

Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

Note: This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

Syntax `ipv6 pim rp embedded`
`no ipv6 pim rp embedded`

Mode Global Configuration

Default Embedded RP is enabled by default in the AlliedWare Plus implementation of PIM-SMv6.

Examples The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

ipv6 pim rp-register-kat

Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

Syntax `ipv6 pim rp-register-kat <1-65535>`
`no ipv6 pim rp-register-kat`

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SMv6 KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454

awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

Related Commands [ipv6 pim rp-address](#)
[ipv6 pim rp-candidate](#)

ipv6 pim sparse-mode

Use this command to enable PIM-SMv6 on a VLAN interface.

Use the **no** variant of this command to disable PIM-SMv6 on a VLAN interface.

Syntax `ipv6 pim sparse-mode`
`no ipv6 pim sparse-mode`

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
```

ipv6 pim sparse-mode passive

Use this command to enable and disable PIM-SMv6 passive mode operation for local members on a VLAN interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on a VLAN interface.

Syntax `ipv6 pim sparse-mode passive`
`no ipv6 pim sparse-mode passive`

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
```

ipv6 pim spt-threshold

This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT.

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

Note  The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax `ipv6 pim spt-threshold`
`no ipv6 pim spt-threshold`

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

ipv6 pim spt-threshold group-list

Use this command to turn on/off the ability for the last-hop PIM-SMv6 router to switch to SPT for multicast group addresses as specified by the given software IPv6 access-list.

Use the **no** variant of this command to turn off switching to the SPT.

Note The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Syntax `ipv6 pim spt-threshold group-list <IPv6-access-list>`
`no ipv6 pim spt-threshold group-list <IPv6-access-list>`

Parameter	Description
<code><IPv6-access-list></code>	Specify a Standard or an Extended software IPv6 access-list name. See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold group-list G1
awplus(config)# ipv6 access-list standard G1 permit
                2001:db8::/128

awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold group-list G1
```

ipv6 pim unicast-bsm

Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on a VLAN interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on a VLAN interface.

Syntax `ipv6 pim unicast-bsm`
`no ipv6 pim unicast-bsm`

Mode Interface Configuration for a VLAN interface.

Default Unicast BSM is disabled by default on an interface.

Usage This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

show debugging ipv6 pim sparse-mode

This command displays the status of the PIM-SMv6 debugging on your switch.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show debugging ipv6 pim sparse-mode

Mode User Exec and Privileged Exec

Example To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 54-2: Example output from the show debugging ipv6 pim sparse-mode command

```
awplus#show debugging ipv6 pim sparse-mode
Debugging status:

show ipv6 pim sparse-mode bsr-router

Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ipv6 pim sparse-mode bsr-router

Mode User Exec and Privileged Exec

Example To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

Output **Figure 54-3: Example output from the show ipv6 pim sparse-mode bsr-router command**

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:203::213 (?)
  Uptime:      00:36:25, BSR Priority: 64, Hash mask length: 126
  Expires:    00:01:46
  Role: Candidate BSR
  State: Candidate BSR

Candidate RP: 2001:5::211(vlan5)
  Advertisement interval 60 seconds
  Next C-RP advertisement in 00:00:43
```

```

Table 54-1: Parameters in the output from the show ipv6 pim sparse-mode interface command

Parameters	Description
Address	Primary PIM-SMv6 address.
Interface	Name of the PIM-SMv6 interface.
VIF Index	The Virtual Interface index of the VLAN.
Ver/Mode	PIMv6 version/Sparse mode.
Nbr Count	Neighbor count of the PIM-SMv6 interface.
DR Priority	Designated Router priority.
DR	The IPv6 address of the Designated Router.

show ipv6 pim sparse-mode local-members

Use this command to show detailed local member information on a VLAN interface configured for PIM-SMv6. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SMv6.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ipv6 pim sparse-mode local-members [<interface>]

Parameter	Description
<interface>	Optional Specify the interface. For instance, VLAN interface vlan2.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SMv6 information for all PIM-SMv6 configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output **Figure 54-6: Example output from the show ipv6 pim sparse-mode local-members command**

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include

vlan203:

  (*, ff0e:1::4) : Include
```

Example To show detailed PIM-SMv6 information for the PIM-SMv6 configured interface `vlan1`, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

Output **Figure 54-7: Example output from the show ipv6 pim sparse-mode local-members vlan1 command**

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include
```

show ipv6 pim sparse-mode mroute

This command displays the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two source IPv6 addresses cannot be used simultaneously.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ipv6 pim sparse-mode mroute [<group-IPv6-address>|<source-IPv6-address>]`

`show ipv6 pim sparse-mode mroute [<group-IPv6-address> <source-IPv6-address>]`

`show ipv6 pim sparse-mode mroute [<source-IPv6-address> <group-IPv6-address>]`

Parameter	Description
<code><group-IPv6-address></code>	Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.
<code><source-IPv6-address></code>	Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Usage Note that when a feature license is enabled, the output for the `show ipv6 pim sparse-mode mroute` command will only show 100 interfaces because of the terminal display width limit. Use the `show ipv6 pim sparse-mode mroute detail` command to display detailed entries of the IPv6 multicast routing table.

Examples

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
2002:db8::
```

show ipv6 pim sparse-mode mroute detail

This command displays detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax

```
show ipv6 pim sparse-mode mroute [<group-IPv6-address>|<source-IPv6-address>] detail
show ipv6 pim sparse-mode mroute [<group-IPv6-address> <source-IPv6-address>] detail
show ipv6 pim sparse-mode mroute [<source-IPv6-address> <group-IPv6-address>] detail
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X::X::X. Output is all multicast entries belonging to that group.
<source-IPv6-address>	Source IPv6 address, entered in the form X::X::X. Output is all multicast entries belonging to that source.
detail	Show detailed information.

Usage Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode mroute detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
2002:db8:: detail
```

show ipv6 pim sparse-mode neighbor

Use this command to show the PIM-SMv6 neighbor information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ipv6 pim sparse-mode neighbor [<interface>] [<IPv6-address>] [detail]`

Parameter	Description
<interface>	Interface name (e.g. vlan2). Show neighbors on an interface.
<IPv6-address>	Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X.
detail	Show detailed information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode neighbor
```

```
awplus# show ipv6 pim sparse-mode neighbor vlan5 detail
```

Figure 54-10: Example output from the show ipv6 pim sparse-mode neighbor command

```
awplus#show ipv6 pim sparse-mode neighbor

```

show ipv6 pim sparse-mode nexthop

Use this command to see the nexthop information as used by PIM-SMv6.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax show ipv6 pim sparse-mode nexthop

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode nexthop
```

Figure 54-12: Example output from the show ipv6 pim sparse-mode nexthop command

```
awplus#show ipv6 pim sparse-mode nexthop
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination          Type  Nexthop Nexthop Nexthop  Nexthop Metric   Pref  Refcnt
                Num   Addr    Ifindex Name
-----
3ffe:10:10:5::153   .RS.  1       fe80::20e:cff:fe01:facc  2    30    110    1
```

Table 54-2: Parameters in output of the show ipv6 pim sparse-mode nexthop command

Parameter	Description
Destination	The destination address for which PIM-SMv6 requires nexthop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of nexthops to the destination. PIM-SMv6 always uses only 1 nexthop.
Nexthop Addr	The address of the primary nexthop gateway.
Nexthop IfIndex	The interface on which the nexthop gateway can be reached.
Nexthop Name	The name of nexthop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

show ipv6 pim sparse-mode rp-hash

Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>`

Parameter	Description
<code><IPv6-group-addr></code>	The IPv6 group address used to find the RP, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp-hash ff04:10
```

Figure 54-13: output from the show ipv6 pim sparse-mode rp-hash command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
RP: 3ffe:10:10:5::153
Info source: 3ffe:10:10:5::153, via bootstrap
```

Related Commands [show ipv6 pim sparse-mode rp mapping](#)

show ipv6 pim sparse-mode rp mapping

Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ipv6 pim sparse-mode rp mapping`

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp mapping
```

Figure 54-14: output from the show ipv6 pim sparse-mode rp mapping command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
    Uptime: 05:36:40
```

Related Commands [show ipv6 pim sparse-mode rp-hash](#)

show ipv6 pim sparse-mode rp nexthop

Use this command to display the RP (Rendezvous Point) nexthop information used by PIM-SMv6.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax show ipv6 pim sparse-mode rp nexthop <RP-group-addr>

Parameter	Description
<RP-group-addr>	Specify the RP group address used to display nexthop RP information, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
```

Figure 54-15: Example output from the show ipv6 pim sparse-mode rp nexthop command

```
awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination          Type  Nexthop Nexthop Nexthop  Nexthop Metric   Pref  Refcnt
                   Num   Addr    Ifindex Name
-----
3ffe:10:10:5::153  .RS.  1       fe80::20e:cff:fe01:facc  2     30    110    1
```

Table 54-3: Parameters in output of the show ipv6 pim sparse-mode rp nexthop command

Parameter	Description
Destination	The destination address for which PIM-SMv6 requires nexthop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of nexthops to the destination. PIM-SMv6 always uses only 1 nexthop.
Nexthop Addr	The address of the primary nexthop gateway.
Nexthop IfIndex	The interface on which the nexthop gateway can be reached.
Nexthop Name	The name of nexthop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

undebg all ipv6 pim sparse-mode

Use this command to disable all PIM-SMv6 debugging.

Syntax `undebg all ipv6 pim sparse-mode`

Mode Privileged Exec

Example

```
awplus# undebg all ipv6 pim sparse-mode
```

Related Commands [debug ipv6 pim sparse-mode](#)

undebg ipv6 pim sparse-mode

Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the **no** variant of the **debug ipv6 pim sparse-mode** command.

Syntax `undebg ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm] [state] [timer]`

Parameter	Description
all	Deactivates all PIM-SMv6 debugging.
events	Deactivates debug printing of PIM-SMv6 events.
mfc	Deactivates debug printing of MFC (Multicast Forwarding Cache).
mib	Deactivates debug printing of PIM-SMv6 MIBs.
nexthop	Deactivates debug printing of PIM-SMv6 nexthop communications.
nsm	Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications.
state	Deactivates debug printing of state transition on all PIM-SMv6 FSMs.
timer	Deactivates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode all

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode events

awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebg ipv6 pim sparse-mode nexthop
```

Validation Output **Figure 54-16: Example output from the show debugging ipv6 pim sparse-mode command after issuing the undebug ipv6 pim sparse-mode all command**

```
awplus#undebug ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode

Chapter 55: PIM-DM Introduction and Configuration

Introduction	55.2
Characteristics of PIM-DM.....	55.2
PIM-DM Terminology.....	55.3
PIM-DM Configuration	55.4
Configuration Example.....	55.4
Verifying Configuration	55.6

Introduction

Protocol Independent Multicast - Dense Mode (PIM-DM) is a data-driven multicast routing protocol, which builds source-based multicast distribution trees that operate on the Flood-and-Prune principle. It requires unicast-reachability information, but does not depend on a specific unicast routing protocol.

For details of the commands used to configure PIM-DM, see [Chapter 56, PIM-DM Commands](#). For a general overview of multicasting, see [Chapter 48, Multicast Introduction and Commands](#).

Characteristics of PIM-DM

PIM Dense Mode (PIM-DM) is a significantly less complex protocol than PIM Sparse Mode (PIM-SM). PIM-DM works on the principle that it is probable that any given multicast stream will have at least one downstream listener. PIM-DM is ideal where many hosts subscribe to receive multicast packets, so most of the PIM Routers receive and forward all multicast packets.

Where PIM-SM only forwards a multicast stream when requested, PIM-DM always floods any new multicast stream that arrives at the PIM Router and only stops flooding the multicast stream on a given link if it is explicitly told to, by receiving a Prune message from the downstream PIM Router.

PIM-DM does not include the concepts of Rendezvous Points, which are used in PIM-SM. PIM-SM explicitly builds unidirectional shared trees rooted at a Rendezvous Point (RP) per group. PIM-DM implicitly builds shortest-path trees by flooding multicast traffic domain wide, then Prunes back branches of the tree where no receivers are available. As with PIM-SM, so does PIM-DM also use Reverse Path Forwarding (RPF) to stop loops for packet forwarding for PIM Routers receiving multicast packets.

PIM-DM Terminology

See the below descriptions of the terms and concepts used to describe the PIM-DM protocol:

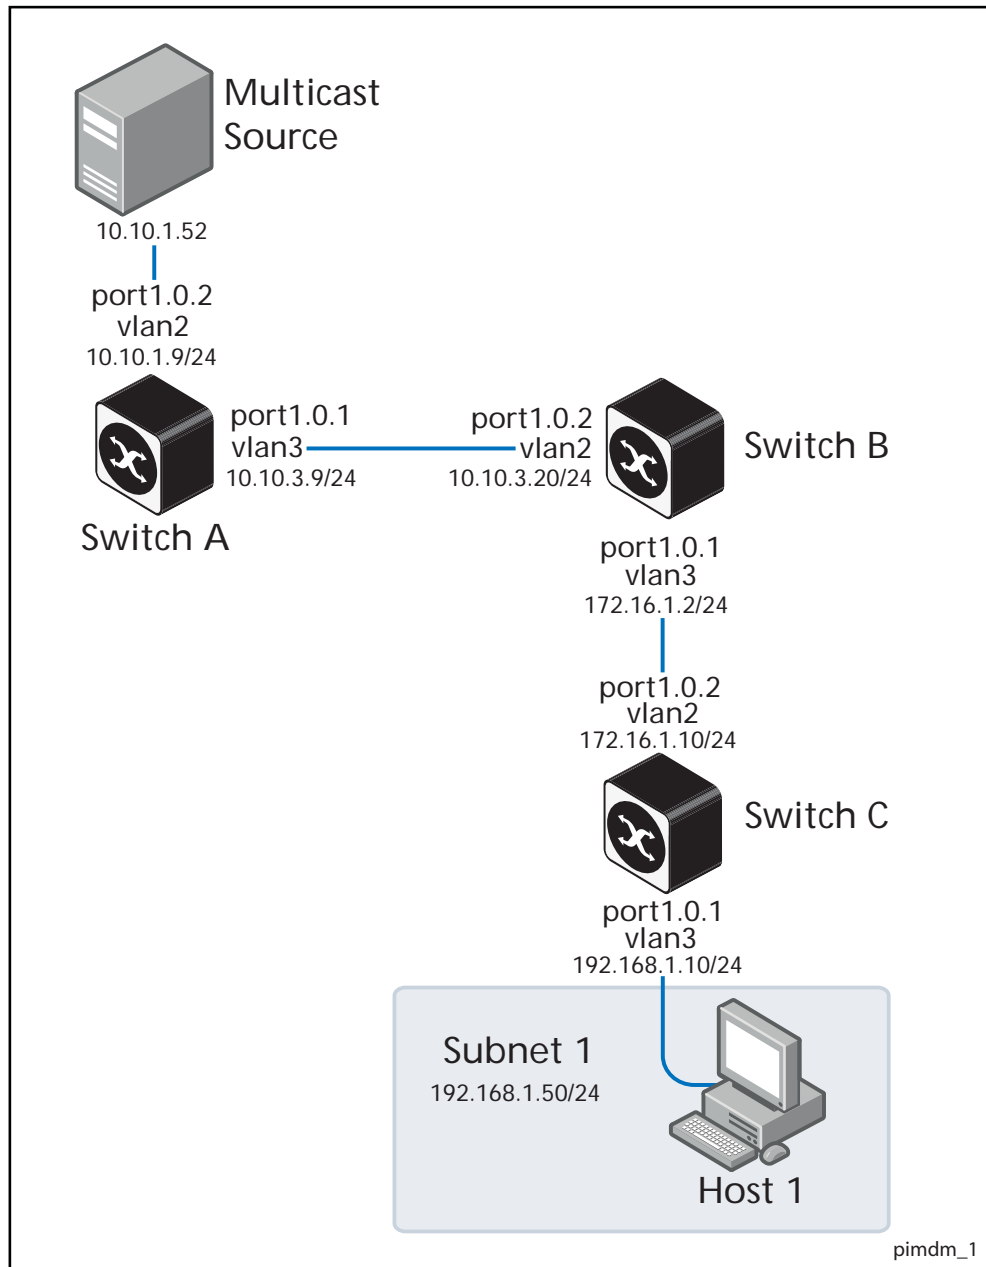

- PIM Router** Any Layer 3 routing device that is running PIM, such as an Allied Telesis managed Layer 3 switch or Allied Telesis router.
- Reverse Path Forwarding** Reverse Path Forwarding (RPF) is the mechanism that PIM uses to make sure it does not forward multicast streams around in loops. If a set of PIM Routers are connected in a loop, and each PIM Router is forwarding a given multicast stream, then eventually the multicast stream would be forwarded right around the loop.
- To prevent this from happening, PIM makes use of the fact that the unicast routing tables in a set of PIM Routers should converge into a loop-free tree of paths to any given destination.
- When a PIM Router receives a multicast stream from source address *SourceA* through an interface *IF1*, it checks whether *IF1* is the interface the PIM Router would use to reach *SourceA*. The PIM Router will only forward the multicast stream if *IF1* is the interface the PIM Router would use to reach *SourceA*.
- RPF determines whether the interface is correct by consulting unicast routing tables. This ensure that the multicast stream is forwarded in a loop-free manner back up the tree of unicast paths that lead to the source.
- Forwarding Multicast Packets** PIM Routers forward a given multicast stream onto all PIM enabled IP interfaces that have not received a Prune for the given multicast stream. As with unicast routing, the PIM Router decrements the TTL (Time To Live) in each packet that the PIM Router forwards. The packet is discarded if the TTL is decremented to 0.
- However, unlike unicast routing, the destination MAC addresses of the packets are not altered as they are forwarded by the PIM Router. The destination MAC addresses remain set to the multicast MAC addresses that correspond to the destination group address of the multicast stream.
- Upstream** Towards the Source.
- Downstream** Anything other than the upstream interface for that group.

PIM-DM Configuration

The main requirement is to enable PIM-DM on the desired interfaces. This section provides a PIM-DM configuration example for a relevant scenario. The configuration uses Allied Telesis managed Layer 3 Switches as the PIM Routers. Three PIM Routers are connected in a chain, and a multicast client is attached to the third PIM Router.

Configuration Example

In this example, the address of the multicast source is 10.10.1.52. The following figure displays the network topology used in this example:

The steps involved in the forwarding of the multicast streams for this sample configuration are:

- Switch A**
1. When the PIM Routers start, they use the exchange of PIM Hello packets for PIM neighbor relationships with each other. Then each PIM Router becomes aware of the location of its PIM neighbors.
 2. As a multicast stream arrives from the source to **Switch A**, it performs an RPF check on the source IP address of the multicast stream. **Switch A** determines the best route to the source IP address (10.10.1.52) is the receiving interface, so it forwards the multicast stream to its only PIM neighbor.
 3. **Switch A** creates an (S, G) (Source, Group) entry in its PIM-DM forwarding table. Any further packets from the same source, which are destined to be forwarded to the same group, will be automatically forwarded without an RFP (Reverse Path Forwarding) check.
- Switch B**
4. When the multicast stream arrives at **Switch B**, it performs the same steps (2 and 3) as **Switch A**. This results in **Switch B** also having an (S, G) entry for the multicast stream in its PIM forwarding table, and the multicast stream is forwarded to **Switch C**.
- Switch C**
5. When the multicast stream arrives at **Switch C**, it will perform an RPF check on the multicast stream as it arrives, and accept it.

This PIM Router does not have any downstream PIM Routers, but if **Switch C** has received an IGMP report from the client to request this multicast stream, **Switch C** will forward the multicast stream out port1.0.1, but no other ports.

If the client leaves the group, and **Switch C** has no other attached clients requesting the group, then **Switch C** will send a Prune message upstream, resulting in **Switch A** and **Switch B** stopping forwarding the multicast stream to **Switch C**.

Switch A Configuration Output

See the following configuration output for **Switch A**:

```
hostname Switch A
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 10.10.1.9/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 10.10.3.9/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Switch B Configuration Output

See the following configuration output for Switch B:

```
hostname Switch B
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 10.10.3.20/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 172.16.1.2/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Switch C Configuration Output

See the following configuration output for Switch C:

```
hostname Switch C
vlan database
vlan 2 state enable
vlan 3 state enable
interface vlan2
ip address 172.16.1.10/24
ip igmp
ip pim dense-mode
!
interface vlan3
ip address 192.168.1.10/24
ip igmp
ip pim dense-mode
!
interface port1.0.1
switchport access vlan 3
!
interface port1.0.2
switchport access vlan 2
!
ip multicast-routing
!
```

Verifying Configuration

Use the following commands to verify the interface details and multicast routing table.

Interface Details

The `show ip pim dense-mode interface` command displays the interface details for Switch C.

Address	Interface	VIFindex	Ver/ Mode	Nbr Count
192.168.1.10	port1.0.1	0	v2/D	0
172.16.1.10	port1.0.2	2	v2/D	1

IP Multicast Routing Table

The **show ip mroute** command displays the IP multicast routing table (for Switch C).

```
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:00:15
Owner PIM-DM, Flags: F
  Incoming interface: port1.0.2
  Outgoing interface list:
    port1.0.1 (1)
```

IP PIM-DM Multicast Routing Table

The **show ip pim dense-mode mroute** command displays the IP PIM-DM multicast routing table (for Switch C).

```
PIM-DM Multicast Routing Table
(10.10.1.52, 224.0.1.3)
  RPF Neighbor: 172.16.1.2, Nexthop: 172.16.1.2, port1.0.2
  Upstream IF: port1.0.2
  Upstream State: Forwarding
  Assert State: NoInfo
  Downstream IF List:
    port1.0.1, in 'olist':
      Downstream State: NoInfo
      Assert State: NoInfo
```

Command List

This chapter provides an alphabetical reference of PIM-DM commands. For commands common to PIM-SM and PIM-DM, see [Chapter 48, Multicast Introduction and Commands](#).

debug pim dense-mode all

This command enables PIM-DM debugging.

The **no** variant of this command disables PIM-DM debugging.

Syntax `debug pim dense-mode all`
`no debug pim dense-mode all`

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode all
```

Output **Figure 56-1: Example output from the debug pim dense-mode all command**

```
PIM event debugging is on
PIM MFC debugging is on
PIM state debugging is on
PIM packet debugging is on
PIM incoming packet debugging is on
PIM outgoing packet debugging is on
```

Validation Commands `show debugging pim dense-mode`

Related Commands `debug pim dense-mode context`
`debug pim dense-mode decode`
`debug pim dense-mode encode`
`debug pim dense-mode fsm`
`debug pim dense-mode mrt`
`debug pim dense-mode nexthop`
`debug pim dense-mode nsm`
`debug pim dense-mode vif`

debug pim dense-mode context

This command enables debugging of general configuration context.

The **no** variant of this command disables debugging of general configuration context.

Syntax debug pim dense-mode context
no debug pim dense-mode context

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode context
```

Related Commands debug pim dense-mode all
debug pim dense-mode decode
debug pim dense-mode encode
debug pim dense-mode fsm
debug pim dense-mode mrt
debug pim dense-mode nexthop
debug pim dense-mode nsm
debug pim dense-mode vif

debug pim dense-mode decode

This command enables debugging of the PIM-DM message decoder.

The **no** variant of this command disables debugging of the PIM-DM message decoder.

Syntax `debug pim dense-mode decode`

`no debug pim dense-mode decode`

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode decoder
```

Related Commands

- `debug pim dense-mode nexthop`
- `debug pim dense-mode nsm`
- `debug pim dense-mode vif`

debug pim dense-mode encode

This command enables debugging of the PIM-DM message encoder.

The **no** variant of this command disables debugging of the PIM-DM message encoder.

Syntax `debug pim dense-mode encode`
`no debug pim dense-mode encode`

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode encoder
```

ip pim dense-mode

This command enables or disables PIM-DM operation from Interface mode on the current VLAN interface. This command also disables passive mode on the VLAN interface if passive mode has been enabled using an **ip pim dense-mode passive** command.

The **no** variant of this command disables all PIM-DM activities on the interface.

Syntax ip pim dense-mode
no ip pim dense-mode

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode
```

ip pim dense-mode passive

This command enables PIM-DM passive mode operation from Interface mode on the current VLAN interface.

The **no** variant of this command disables passive mode.

Syntax ip pim dense-mode passive
no ip pim dense-mode passive

Mode Interface Configuration for a VLAN interface.

Usage Configuring a VLAN interface as a passive PIM-DM interface indicates that the VLAN interface is connected to a stub network (i.e. a network that does not contain any PIM Routers). So, multicast streams that arrive on other PIM-DM interfaces can be routed to hosts on the passive PIM-DM interface, but no PIM neighbor relationships will be formed on the passive PIM-DM interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode passive
```

ip pim ext-srcs-directly-connected (PIM-DM)

Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

This is an alias entry and provides a brief description to the main [Chapter 52, PIM-SM Commands - ip pim ext-srcs-directly-connected \(PIM-SM\)](#) command on page 52.14.

ip pim hello-holdtime (PIM-DM)

This command configures a **hello-holdtime**. The PIM **hello-holdtime** on a VLAN interface is the period which the router will wait to receive a hello from neighbors on that interface. If the router does not receive a hello from a given neighbor within that period, then it will decide that the neighbor is no longer an active PIM Router, and will terminate the neighbor relationship.

You cannot configure a **hello-holdtime** value that is less than the current **hello-interval**. Each time the **hello-interval** is updated, the **hello-holdtime** is also updated, according to the following rules:

- If the **hello-holdtime** is not configured; or if the hello holdtime is configured and less than the current **hello-interval** value, it is modified to 3.5 times the **hello-interval** value.
- Otherwise, it retains the configured value.

Use the **no** variant of this command to return the hello-holdtime value to its default of 3.5 times the current hello-interval value.

Syntax

```
ip pim hello-holdtime <holdtime>
no ip pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-DM)

This command configures a PIM **hello-interval** value. The PIM **hello-interval** on a VLAN interface is the period at which the router will transmit PIM hello messages on that interface.

When the **hello-interval** is configured, and the **hello-holdtime** is not configured, or when the configured **hello-holdtime** value is less than the new **hello-interval** value; the **hello-holdtime** value is modified to 3.5 times the **hello-interval** value. Otherwise, the **hello-holdtime** value is the configured value. The default is 30 seconds.

Use the **no** variant of this command to reset the **hello-interval** to the default.

Syntax

```
ip pim hello-interval <interval>
no ip pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim max-graft-retries

This command configures PIM-DM to send a limited number of Graft message retries, after which time the device will remove all information regarding the particular (Source, Group), or until the device receives an acknowledgment, whichever occurs first.

The **no** variant of this command configures PIM-DM to send Graft message retries until the device receives an acknowledgment, which is the default behavior.

Syntax

```
ip pim max-graft-retries <1-65535>
no pim max-graft-retries
```

Parameter	Description
no	Negate a command or set its defaults.
ip	Internet Protocol (IP).
pim	PIM Interface commands.
max-graft-retries	PIM Graft message retries.
<1-65535>	Graft message retries before ceasing Graft message retries.

Default By default, Graft retries are sent by PIM-DM until the device receives an acknowledgement.

Mode Interface Configuration for a VLAN interface.

Usage Graft messages are used to reduce the join latency when a previously pruned branch of the source tree must be grafted back, when a member joins the group after the PIM-DM device has sent a Prune message to prune unwanted traffic. Graft messages are the only PIM-DM messages that receive an acknowledgement.

If Graft messages were not used, then the member waiting for pruned off traffic would have to wait up to 3 minutes for the periodic re-flooding to occur to begin receiving multicast traffic again. By using Grafts, the Prune can be reversed much faster than waiting for periodic re-flooding to begin receiving multicast traffic again.

Examples To configure PIM-DM on the VLAN interface `vlan2` to send a maximum of 10 Graft message retries, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim max-graft-retries 10
```

To configure PIM-DM on the VLAN interface `vlan2` to send Graft message retries forever, which is the default behavior, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim max-graft-retries
```

Validation **show ip mroute**
Commands **show ip pim dense-mode mroute**
 show running-config

ip pim neighbor-filter (PIM-DM)

Enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-DM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax `ip pim neighbor-filter [<number>|<accesslist>]`
`no ip pim neighbor-filter [<number>|<accesslist>]`

Parameter	Description
<number>	<1-99> Standard IP access list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

ip pim propagation-delay

This command configures the PIM **propagation-delay** value. The PIM **propagation-delay** is the expected delay in the transfer of PIM messages across the VLAN interface that it is attached to.

Use the **no** variant of this command to return the **propagation-delay** to the default (1000 milliseconds).

Syntax ip pim propagation-delay <delay>
no ip pim propagation-delay

Parameter	Description
<delay>	<1000-5000> The value in milliseconds. The default is 1000 milliseconds.

Default The propagation-delay is set to 1000 milliseconds by default.

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim propagation-delay 2000

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim propagation-delay
```

ip pim state-refresh origination-interval

This command configures a PIM **state-refresh origination-interval** value. The origination interval is the number of seconds between PIM state refresh control messages. The default is 60 seconds.

Use the **no** variant of this command to return the origination interval to the default.

Syntax ip pim state-refresh origination-interval *<interval>*
no ip pim state-refresh origination-interval

Parameter	Description
<i><interval></i>	<i><1-100></i> The integer value in seconds (no fractional seconds accepted). The default state-refresh origination-interval value is 60.

Default The state-refresh origination-interval is set to 60 seconds by default, and is reset using negation.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim state-refresh origination-interval 65
```

show debugging pim dense-mode

This command displays the status of the debugging of the system.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show debugging pim dense-mode

Mode User Exec and Privileged Exec

Output **Figure 56-2: Example output from the show debugging pim dense-mode command**

```
PIM-DM Debugging status:
  PIM-DM Decoder debugging is off
  PIM-DM Encoder debugging is off
  PIM-DM FSM debugging is off
  PIM-DM MRT debugging is off
  PIM-DM NHOP debugging is off
  PIM-DM NSM debugging is off
  PIM-DM VIF debugging is off
```

Related Commands [debug pim dense-mode all](#)

show ip pim dense-mode interface

This command displays the PIM-DM interface information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ip pim dense-mode interface

Mode User Exec and Privileged Exec

Example To display information about the PIM-DM interfaces, use the command:

```
awplus# show ip pim dense-mode interface
```

Output

Figure 56-3:

Total configured interfaces: 24		Maximum allowed: 32		
Total active interfaces: 22				
Address	Interface	VIFIndex	Ver/ Mode	Nbr Count
192.168.1.53/24	vlan2	0	v2/D	2
192.168.2.1	vlan3	2	v2/D	0
.				
.				

1. Only the top entries output by this command are shown in this example.

Table 56-1: Parameters in the output of the show ip pim dense-mode interface command

Parameter	Description
Total configured interfaces	The number of configured PIM Dense Mode interfaces.
Maximum allowed	The maximum number of PIM Dense Mode interfaces that can be configured.
Total active interfaces	The number of active PIM Dense Mode interfaces.
Address	Primary PIM-DM address.
Interface	Name of the PIM-DM interface.
VIF Index	The Virtual Interface index of the VLAN.
Ver/Mode	PIM version/Dense mode.
Nbr Count	Neighbor count of the PIM-DM interface.

Related Commands [ip pim dense-mode](#)
[show ip pim dense-mode neighbor](#)

show ip pim dense-mode interface detail

This command displays detailed information on a PIM-DM interface.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ip pim dense-mode interface detail

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode interface detail
```

Output **Figure 56-4: Example output from the show ip pim dense-mode interface detail command**

```
vlan2 (vif-id: 0):
  Address 192.168.1.53/24
  Hello period 30 seconds, Next Hello in 30 seconds
  Neighbors:
    192.168.1.152/32
    192.168.1.149/32
vlan3 (vif-id: 2):
  Address 192.168.10.53/24
  Hello period 30 seconds, Next Hello in 8 seconds
  Neighbors: none
```

show ip pim dense-mode mroute

This command displays the IP PIM-DM multicast routing table.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ip pim dense-mode mroute

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode mroute
```

Output **Figure 56-5: Example output from the show ip pim dense-mode mroute command**

```
PIM-DM Multicast Routing Table
(192.168.10.52, 224.1.1.1)
  Source directly connected on vlan3
  State-Refresh Originator State: Originator
  Upstream IF: vlan3, State: Forwarding
  Downstream IF List:
    vlan2, in 'olist':
      Downstream State: NoInfo
      Assert State: NoInfo
```

show ip pim dense-mode neighbor

This command displays PIM-DM neighbor information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ip pim dense-mode neighbor

Mode User Exec and Privileged Exec

Usage The total number of PIM-DM neighbors is restricted to 500 PIM-DM neighbors.

When the 500 PIM-DM neighbor limit is reached, as a result of receiving hello packets from new PIM-DM neighbors, a log entry will be issued to the log file in the below format:

```
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
-----
2008 Dec 10 00:58:39 user.err x900 PIM-DM[1150]: [VIF] Nbr
Create: Cannot create more than 500 neighbours - ignoring
neighbour 100.0.1.247/32 on vlan100
```

Example

```
awplus# show ip pim dense-mode neighbor
```

Output **Figure 56-6: Example output from the show ip pim dense-mode neighbor command**

```
Total number of neighbors: 500
Neighbor-Address  Interface          Uptime/Expires    Ver
192.168.1.152    vlan2              17:15:42/00:01:28 v2
192.168.1.149    vlan2              17:15:34/00:01:34 v2
```

show ip pim dense-mode neighbor detail

This command displays detailed PIM-DM neighbor information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ip pim dense-mode neighbor detail

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode neighbor detail
```

Output **Figure 56-7: Example output from the show ip pim dense-mode neighbor detail command**

```
Neighbor 192.168.1.152 (vlan2)
  Up since 17:16:20, Expires in 00:01:20
Neighbor 192.168.1.149 (vlan2)
  Up since 17:16:12, Expires in 00:01:26
```

show ip pim dense-mode nexthop

This command displays the nexthop information as used by PIM-DM. In the context of PIM-DM, the term ‘**nexthop**’ refers to the nexthop router on the path back to the source address of a multicast stream.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax show ip pim dense-mode nexthop

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode nexthop
```

Output **Figure 56-8: Example output from the show ip pim dense-mode neighbor nexthop command**

Destination	Nexthop Num	Nexthop Addr	Nexthop Interface	Metric	Pref
192.168.10.52	1	0.0.0.0	vlan2	3	1

Table 56-2: Parameters in the output of the show ip pim dense-mode neighbor nexthop command

Parameter	Description
Destination	Destination address for which PIM-DM requires nexthop information.
Nexthop Num	Number of nexthops to the destination. PIM can only use one nexthop.
Nexthop Addr	Address of the current nexthop gateway.
Nexthop Interface	Name of the nexthop interface.
Metric	Metric of the route towards the destination.
Preference	Preference of the route towards the destination.

undebg all pim dense-mode

Use this command from the Global Configuration mode to disable all PIM-DM debugging.

Syntax undebg all pim dense-mode

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# undebg all pim dense-mode
```

MLD Introduction

Multicast Listener Discovery (MLD) is used to exchange membership status information between IPv6 routers that support multicasting and members of multicast groups on a network segment. Host membership in a multicast group is reported by individual member hosts, and membership status is periodically polled by multicast routers. For a general overview of multicasting, see [Chapter 48, Multicast Introduction and Commands](#).

MLD is defined in RFC 2710, "Multicast Listener Discovery (MLD) for IPv6." and MLDv2 is defined in RFC 3810, "Multicast Listener Discovery Version 2 (MLDv2) for IPv6." AlliedWare Plus supports both RFC 2710 and RFC 3810 for MLD and MLDv2 respectively.

 **Note** There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. x8100 switches have a 256 MLD group limit for (*, G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Sample running-config showing MLD configuration on interface vlan2

```
!
ipv6 forwarding
!
ipv6 multicast-routing
!
interface vlan2
  ipv6 address 2001:0db8::12:252/64
  ipv6 enable
  ipv6 mld
!
```

 **Note** IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

 **Note** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

**Note**

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

MLD Snooping

MLD Snooping is a feature whereby a Layer 2 switch listens to or "snoops" the MLD messages passing through the switch or from member hosts and multicast routers. The purpose of MLD Snooping is to provide efficient Layer 2 multicast forwarding, by sending only to hosts that have expressed an interest in receiving the multicast data.

Hosts express an interest in receiving multicast data for a given multicast group by sending an MLD join message. Without MLD Snooping, if one host expresses an interest in getting multicast data for a given group, by sending an MLD join for the multicast group, then all hosts connected to the same VLAN will also receive the multicast data. This wastes bandwidth on the switch ports connected to the host that are not interested in receiving the multicast data. Snooping takes note of exactly which ports have received joins for a given group, and send that group only to those ports.

MLD Snooping is enabled by default globally for the switch. It can be enabled and disabled on a per-VLAN basis.

MLD Snooping makes a distinction between Member ports, which are ports connected to members hosts, and Router ports, which are ports connected to, or directed towards, a Layer 3 router or a Layer 3 switch.

Figure 57-1: Sample running-config showing an MLD Snooping Querier set on vlan2

```
!  
ipv6 forwarding  
!  
ipv6 mld snooping  
!  
interface vlan2  
  ipv6 address 2001:0db8::12:252/64  
  ipv6 enable  
  ipv6 mld snooping querier  
!
```

MLD Snooping Configuration Examples

For detailed information about the commands used to configure MLD Snooping, see [Chapter 57, MLD and MLD Snooping Introduction and Commands](#).

The following examples configure MLD Snooping:

- [Enabling the MLD Snooping Querier on an interface](#)
- [Enabling MLD Snooping globally and on an interface](#)
- [Configuring a Multicast Router statically on an interface](#)
- [Enabling MLD Snooping Fast-Leave Processing on an interface](#)
- [Configuring MLD Snooping Report Suppression on an interface](#)

Enabling the MLD Snooping Querier on an interface

Use the MLD Snooping querier to support MLD Snooping in a VLAN where PIM-SMv6 and MLD are not configured and whenever you do not need to route IPv6 multicast traffic.

You can configure the switch to generate MLD queries on a VLAN interface if multicast routing is not enabled. For each VLAN that is connected to switches that use MLD Snooping to report multicast traffic, configure one switch as the MLD Snooping Querier.

To enable and show MLD Snooping Querier on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address 2001:0db8::1/128
awplus(config-if)# ipv6 mld snooping querier
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note that the MLD Snooping Querier is configured in Interface Configuration mode only. You cannot configure MLD Snooping Querier globally for all VLAN interfaces on a switch.

Enabling MLD Snooping globally and on an interface

To globally enable and show MLD Snooping on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 mld snooping
awplus(config)# exit
awplus# show ipv6 mld interface
```

Note that entering `show ipv6 mld interface` without an optional interface parameter displays MLD information for all configured interfaces globally on the switch.

To enable and show MLD Snooping on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note that entering `show ipv6 mld interface vlan2` with the optional interface parameter displays MLD information for that specified configured interface on the switch.

Configuring a Multicast Router statically on an interface

To configure and show a static connection to a Multicast Router for VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping mrouter
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Note the VLAN interface to the Multicast Router must be administratively up and the line protocol must be up to configure a static connection to a Multicast Router on the VLAN.

Enabling MLD Snooping Fast-Leave Processing on an interface

To enable and show MLD Snooping Fast-Leave Processing on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping fast-leave
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Configuring MLD Snooping Report Suppression on an interface

To enable and show MLD Snooping Report Suppression on VLAN interface `vlan2`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping report-suppression
awplus(config-if)# exit
awplus(config)# exit
awplus# show ipv6 mld interface vlan2
```

Command List

This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

Note  IPv6 must be enabled on an interface with the **ipv6 enable** command, IPv6 forwarding must be enabled globally for routing IPv6 with the **ipv6 forwarding** command, and IPv6 multicasting must be enabled globally with the **ipv6 multicast-routing** command before using PIM-SMv6 commands.

Note  The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPv6 multicast addresses allocated for documentation purposes are ff0x::0db8:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.

Note  The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ipv6 mld

Use this command to clear all MLD local memberships on all interfaces.

Syntax `clear ipv6 mld`

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example

```
awplus# clear ipv6 mld
```

Related Commands [clear ipv6 mld group](#)
[clear ipv6 mld interface](#)

clear ipv6 mld group

Use this command to clear MLD specific local-membership(s) on all interfaces, for a particular group.

Syntax `clear ipv6 mld group {*|<ipv6-address>}`

Parameter	Description
*	Clears all groups on all interfaces. This is an alias to the clear ipv6 mld command.
<ipv6-address>	Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X.

Mode Privileged Exec

Usage This command applies to groups learned by MLD Layer-3 multicast protocols and by MLD Snooping.

Example

```
awplus# clear ipv6 mld group *
```

Related Commands [clear ipv6 mld](#)
[clear ipv6 mld interface](#)

clear ipv6 mld interface

Use this command to clear MLD interface entries.

Syntax `clear ipv6 mld interface <interface>`

Parameter	Description
<interface>	Specifies name of the interface; all groups learned from this interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example

```
awplus# clear ipv6 mld interface vlan2
```

Related Commands [clear ipv6 mld](#)
[clear ipv6 mld group](#)

debug mld

Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

Syntax `debug mld {all|decode|encode|events|fsm|tib}`
`no debug mld {all|decode|encode|events|fsm|tib}`

Parameter	Description
all	Debug all MLD.
decode	Debug MLD decoding.
encode	Debug MLD encoding.
events	Debug MLD events.
fsm	Debug MLD Finite State Machine (FSM).
tib	Debug MLD Tree Information Base (TIB).

Mode Privileged Exec and Global Configuration

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Examples

```
awplus# configure terminal
awplus(config)# debug mld all

awplus# configure terminal
awplus(config)# debug mld decode

awplus# configure terminal
awplus(config)# debug mld encode

awplus# configure terminal
awplus(config)# debug mld events
```

Output

```

Related Commands [show debugging mld](#)

ipv6 mld

Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

 **Note** There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. SBx8100 switches have a 256 MLD group limit for (*, G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

Syntax `ipv6 mld`

`no ipv6 mld`

Default MLD is disabled by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

ipv6 mld access-group

Use this command to control the multicast local-membership groups learned on an interface.

Use the **no** variant of this command to disable this access control.

Syntax `ipv6 mld access-group <IPv6-access-list-name>`
`no ipv6 mld access-group`

Parameter	Description
<code><IPv6-access-list-name></code>	Specify a Standard or an Extended software IPv6 access-list name. See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default No access list is configured by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Examples In the following example, the VLAN interface `vlan2` will only accept MLD joins for groups in the range `ffe:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
                   ffe:0db8:0001::/64
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

In the following example, the VLAN interfaces `vlan2-vlan4` will only accept MLD joins for groups in the range `ffe:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
                   ffe:0db8:0001::/64
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

ipv6 mld immediate-leave

Use this command to minimize the leave latency of MLD memberships.

Use the **no** variant of this command to disable this feature.

Syntax `ipv6 mld immediate-leave group-list <IPv6-access-list-name>`
`no ipv6 mld immediate-leave`

Parameter	Description
<code><IPv6-access-list-name></code>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled. See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default Disabled

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

Related Commands [ipv6 mld last-member-query-interval](#)

ipv6 mld last-member-query-count

Use this command to set the last-member query-count value.

Use the **no** variant of this command to return to the default on an interface.

Syntax `ipv6 mld last-member-query-count <value>`
`no ipv6 mld last-member-query-count`

Parameter	Description
<code><value></code>	Count value. Valid values are from 2 to 7.

Default The default last-member query-count value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

ipv6 mld last-member-query-interval

Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax `ipv6 mld last-member-query-interval <milliseconds>`
`no ipv6 mld last-member-query-interval`

Parameter	Description
<code><milliseconds></code>	The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds.

Default 1000 milliseconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example changes the MLD group-specific host query message interval to 2 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

Related Commands [ipv6 mld immediate-leave](#)

ipv6 mld limit

Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the switch as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax `ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]`
`no ipv6 mld limit`

Parameter	Description
<code><limitvalue></code>	<code><2-512></code> Maximum number of group membership states.
<code><IPv6-access-list-name></code>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit. See Chapter 62, IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Examples The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range `ff1e:0db8:0001::/64` from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

Related Commands [show ipv6 mld groups](#)

ipv6 mld querier-timeout

Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax `ipv6 mld querier-timeout <seconds>`
`no ipv6 mld querier-timeout`

Parameter	Description
<code><seconds></code>	Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds.

Default 255 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

Related Commands [ipv6 mld query-interval](#)

ipv6 mld query-interval

Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

Syntax `ipv6 mld query-interval <seconds>`

`no ipv6 mld query-interval`

Parameter	Description
<code><seconds></code>	Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from 1 to 18000 seconds.

Default The default query interval is 125 seconds.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

Related Commands [ipv6 mld querier-timeout](#)

ipv6 mld query-max-response-time

Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

Syntax `ipv6 mld query-max-response-time <seconds>`
`no ipv6 mld query-max-response-time`

Parameter	Description
<code><seconds></code>	Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds.

Default 10 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

ipv6 mld robustness-variable

Use this command to change the robustness variable value on an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax `ipv6 mld robustness-variable <value>`
`no ipv6 mld robustness-variable`

Parameter	Description
<code><value></code>	Valid values are from 1 to 7.

Default The default robustness variable value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

ipv6 mld snooping

Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the switch. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

 **Note** There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing. x8100 switches have a 256 MLD group limit for (*, G) entries. See the limits for MLD interfaces depending on the number of VLANs, ports, static and dynamic groups as shown in the relevant product data sheet for your switch.

Syntax `ipv6 mld snooping`

`no ipv6 mld snooping`

Default By default, MLD Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (Both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Examples To configure MLD Snooping on the VLAN interface `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping
```

To configure MLD Snooping on the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interface `vlan2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config)# no ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the switch, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the switch, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

ipv6 mld snooping fast-leave

Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax `ipv6 mld snooping fast-leave`
`no ipv6 mld snooping fast-leave`

Default MLD Snooping fast-leave processing is disabled.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

Examples This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping fast-leave
```

ipv6 mld snooping mrouter

Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

Syntax `ipv6 mld snooping mrouter interface <port>`
`no ipv6 mld snooping mrouter interface <port>`

Parameter	Description
<port>	Specify the name of the port.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if `port1.0.1` and `port1.0.14` are ports on an EPSR data VLAN `vlan101`, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Output **Figure 57-2: Example ipv6 mld snooping mrouter commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:**

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.14
```

Examples This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

Related Commands [ipv6 multicast route](#)

ipv6 mld snooping querier

Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

Syntax `ipv6 mld snooping querier`
`no ipv6 mld snooping querier`

Mode Interface Configuration for a specified VLAN interface.

Usage This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device. Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping querier
```

ipv6 mld snooping report-suppression

Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

Syntax `ipv6 mld snooping report-suppression`
`no ipv6 mld snooping report-suppression`

Default Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

MLDv1 Snooping may be configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping switch. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping switch to prevent 'flooding' of query responses.

Examples This example shows how to enable report suppression for MLD reports on VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces vlan2-vlan4:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces vlan2-vlan4:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

ipv6 mld static-group

Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```

ipv6 mld static-group <ipv6-group-address>
    [source <ipv6-source-address>|ssm-map] [interface <port>]

no ipv6 mld static-group <ipv6-group-address>
    [source <ipv6-source-address>|ssm-map] [interface <port>]

```

Parameter	Description
<ipv6-group-address>	Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.
<ipv6-source-address>	Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.
ssm-map	Mode of defining SSM mapping. SSM mapping statically assigns sources to MLDv1 groups to translate these (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.
<port>	Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just to that physical interface. If this parameter is not used, the static configuration is applied on all ports in the VLAN.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

Examples The following examples show how to statically add group and/or source records for MLD:

```

awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10

```

```

awplus # configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10 source
fe80::2fd:6cff:fe1c:b

```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10 source
                    ssm-map
```

The following examples show how to statically add group and/or source records for MLD Snooping on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10 source
                    fe80::2fd:6cff:felc:b
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10 source
                    ssm-map
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10 interface
                    port1.0.8
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10 source
                    fe80::2fd:6cff:felc:b interface port1.0.8
```

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ffile::10 source
                    ssm-map interface port1.0.8
```

ipv6 mld version

Use this command to set the current MLD protocol version on an interface.

Use the **no** variant of this command to return to the default version on an interface.

Syntax `ipv6 mld version <version>`
`no ipv6 mld version`

Parameter	Description
<code><version></code>	MLD protocol version number. Valid version numbers are 1 and 2

Default The default MLD protocol version number is 2.

Mode Interface Configuration for a VLAN interface.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols, MLD Snooping. Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

show debugging mld

Use this command to display the MLD debugging modes enabled with the **debug mld** command.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show debugging mld

Mode Privileged Exec

Example

```
awplus# show debugging mld
```

Output

```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

Related Commands [debug mld](#)

show ipv6 mld groups

Use this command to display the multicast groups with receivers directly connected to the router, and learned through MLD.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ipv6 mld groups [<ipv6-address> |<interface>] [detail]`

Parameter	Description
<ipv6-address>	Optional. Specify Address of the multicast group in format X:X::X:X.
<interface>	Optional. Specify the Interface name for which to display local information.

Mode User Exec and Privileged Exec

Examples The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

Output

```
MLD Connected Group Membership
Group Address Interface Uptime Expires Last Reporter
ff08::1 port2.0.1 00:00:24 stopped fe80::eecd:6dff:fe6b:4783
```

The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

Output

```
MLD Connected Group Membership Details for port2.0.1
Interface: port2.0.1
Group: ff08::1
Uptime: 00:00:13
Group mode: Include ( )
Last reporter: fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
Source Address Uptime v2 Exp Fwd Flags
2001:db8::1 00:00:13 00:04:07 Yes R
2002:db8::3 00:00:13 00:04:07 Yes R
```

show ipv6 mld interface

Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax show ipv6 mld interface [*<interface>*]

Parameter	Description
<i><interface></i>	Interface name.

Mode User Exec and Privileged Exec

Example The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

Output

```
awplus#show ipv6 mld interface
Interface vlan1 (Index 301)
  MLD Enabled, Active, Querier, Version 2 (default)
  Internet address is fe80::215:77ff:fec9:7468
  MLD interface has 0 group-record states
  MLD activity: 0 joins, 0 leaves
  MLD robustness variable is 2
  MLD last member query count is 2
  MLD query interval is 125 seconds
  MLD querier timeout is 255 seconds
  MLD max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  MLD Snooping is globally enabled
  MLD Snooping is enabled on this interface
  MLD Snooping fast-leave is not enabled
  MLD Snooping querier is enabled
  MLD Snooping report suppression is enabled
```

show ipv6 mld snooping mrouter

Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ipv6 mld snooping mrouter [<interface>]`

Parameter	Description
<interface>	Optional. Specify the name of the VLAN interface. Note: If you do not specify a single VLAN interface, then all VLAN interfaces are shown.

Mode User Exec and Privileged Exec

Examples The following command displays the multicast router interfaces in `vlan2`:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

Output

```
awplus#show ipv6 mld snooping mrouter vlan2
VLAN      Interface      Static/Dynamic
2         port1.0.2     Dynamically Learned
2         port1.0.3     Dynamically Learned
```

The following command displays the multicast router interfaces for all VLAN interfaces:

```
awplus# show ipv6 mld snooping mrouter
```

Output

```
awplus#show ipv6 mld snooping mrouter
VLAN      Interface      Static/Dynamic
2         port1.0.2     Dynamically Learned
2         port1.0.3     Dynamically Learned
3         port1.0.4     Statically Assigned
3         port1.0.5     Statically Assigned
```

show ipv6 mld snooping statistics

Use this command to display MLD Snooping statistics data.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ipv6 mld snooping statistics interface <interface>`

Parameter	Description
<code><interface></code>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example The following command displays MLDv2 statistical information for vlan1:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

Output

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port2.0.1
Group:         ff08::1
Uptime:        00:02:18
Group mode:    Include ( )
Last reporter: fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address      Uptime    v2 Exp   Fwd  Flags
  2001:db8::1         00:02:18  00:02:02 Yes  R
  2001:db8::3         00:02:18  00:02:02 Yes  R
```

Introduction

This chapter describes Access Control Lists (ACLs), and general ACL configuration information.

See [Chapter 59, IPv4 Hardware Access Control List \(ACL\) Commands](#) for detailed command information and command examples about IPv4 hardware ACLs that are applied directly to interfaces.

See [Chapter 60, IPv4 Software Access Control List \(ACL\) Commands](#) for detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting.

See all relevant Routing commands and configurations in [“Layer Three, Switching and Routing”](#) and all relevant Multicast commands and configurations in [“Multicast Applications”](#).

Overview

An Access Control List (ACL) is one filter, or a sequence of filters, that are applied to an interface to either block, pass, or when using QoS, apply priority to, packets that match the filter definitions. ACLs are used to restrict network access by hosts and devices and to limit network traffic.

An ACL contains an ordered list of filters. Each filter specifies either permit or deny and a set of conditions the packet must satisfy in order to match the filter. The meaning of permit or deny entries depends on the context in which the ACL is used - either on an inbound or an outbound interface.

When a packet is received on an interface, the switch compares fields in the packet against filters in the ACL to check whether the packet has permission to be forwarded, based on the filter properties. The first match determines whether the switch accepts or rejects the packets. If no entries match, the switch rejects the packets. If there are no restrictions, the switch forwards the packets.

Because filters in an ACL are applied sequentially and their action stops at the first match, it is very important that you apply the filters in the correct order. For example you might want to pass all traffic from VLAN 4 except for that arriving from two selected addresses A and B. Setting up a filter that first passes all traffic from VLAN 4 then denies traffic from addresses A and B will not filter out traffic from A and B if they are members VLAN 4. To ensure that the traffic from A and B is always blocked you should first apply the filter to block traffic from A and B, then apply the filter to allow all traffic from VLAN 4.

You can assign sequence numbers to filters. See [“ACL Filter Sequence Numbers” on page 58.15](#) for more information.

ACL Rules

- The source or destination address or the protocol of each packet being filtered are tested against the filters in the ACL, one condition at a time (for a permit or a deny filter).
- If a packet does not match a filter then the packet is checked against the next filter in the ACL.
- If a packet and a filter match, the subsequent filters in the ACL are not checked and the packet is permitted or denied as specified in the matched filter.
- The first filter that the packet matches determines whether the packet is permitted or denied. After the first match, no subsequent filters are considered.
- If the ACL denies the address or protocol then the software discards the packet.
- For software ACLs, if no filters match then the packet is dropped.
- For hardware ACLs, if no filters match then the packet is forwarded.
- Checking stops after the first match, so the order of the filters in the ACL is critical. The same permit or deny filter specified in a different order could result in a packet being passed in one situation and denied in another situation.
- One ACL per interface, per protocol, per direction is allowed. However, each ACL assigned per interface, per protocol, per direction may also have multiple filters.
- For inbound ACLs, a permit filter continues to process the packet after receiving it on an inbound interface, and a deny filter discards the packet.

ACL Source and Destination Addresses

Configure source addresses in ACL filters to filter packets coming **from** specified networking devices or hosts. Configure destination addresses in ACL filters to filter packets going **to** specified networking devices or hosts.

ACL Reverse Masking

ACLs use reverse masking, also referred to as wildcard masking, to indicate to the switch whether to check or ignore corresponding IP address bits when comparing the address bits in an ACL filter to a packet being submitted to the ACL.

Reverse masking for IP address bits specifies how the switch treats the corresponding IP address bits. A reverse mask is also called an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet or a network mask.

- A reverse mask bit 0 means check the corresponding bit value.
- A reverse mask bit 1 means ignore the corresponding bit value.

Hardware and Software ACL Types

Access Control Lists (ACLs) used in AlliedWare Plus™ are separated into two different types, **Software ACLs** and **Hardware ACLs**. You can define both types as either named or numbered.

Note  The filtering principles applied to software ACLs (those in the range 1 to 2699) are different to those applied to hardware ACLs (those in the range 3000 to 4699).
Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.
Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Numbered ACLs (for Hardware and Software ACLs)

Numbered ACLs are assigned an ACL number within the range 1 to 4699. ACL numbers are grouped into ranges, where each range denotes a specific functionality. The following table shows the number ranges and functionality that your switch supports.

Table 58-1: ACL Numeric Ranges and Functionality

ACL Number Range	Function
1 to 99	IP standard ACL ¹
100 to 199	IP extended ACL ¹
1300 to 1999	IP standard expanded ACL ¹
2000 to 2699	IP extended expanded ACL ¹
3000 to 3699	Hardware IP ACL
4000 to 4699	Hardware MAC ACL

- Software ACLs that use either the ranges 1-99, 100-199, 1300-1999, 2000-2699, or are named ACLs (that use the standard or extended keyword followed by a text string), are used in features such as SNMP, IGMP and OSPF.**

Hardware ACLs

These ACL types are applied directly to an interface, or are used for QoS classifications. They use the following ranges:

- 3000-3699 for Hardware IP ACLs
- 4000-4699 for Hardware MAC ACLs
- named hardware IPv4 ACLs

See [Chapter 59, IPv4 Hardware Access Control List \(ACL\) Commands](#) for detailed command information and command examples about IPv4 hardware ACLs that are applied directly to interfaces.

Software ACLs

These ACLs types can be either named ACLs, using the standard or extended keyword followed by a text string, or they can use the following ranges:

- 1-99 (IP standard ACL range)
- 100-199 (IP extended ACL range)
- 1300-1999 (IP standard expanded ACL range)
- 2000-2699 (IP extended expanded ACL range)
- named standard IPv4 ACLs
- named extended IPv4 ACLs
- named standard IPv6 ACLs
- named extended IPv6 ACLs

Software ACLs are used in features such as SNMP, PIM, IGMP and OSPF.

See [Chapter 60, IPv4 Software Access Control List \(ACL\) Commands](#) and [Chapter 62, IPv6 Software Access Control List \(ACL\) Commands](#) for detailed command information and command examples about IPv4 and IPv6 software ACLs as applied to Routing and Multicasting. See all relevant Routing commands and configurations in [“Layer Three, Switching and Routing”](#) and all relevant Multicast commands and configurations in [“Multicast Applications”](#).

Defining Hardware MAC ACLs

These are used to filter traffic based on specific source or destination MAC addresses contained within the data frames. They can be applied to ports in the form of access groups.

A MAC access list requires the following components:

- an ACL number in the range 4000-4699
- an action, permit, deny etc. See [“Actions for Hardware ACLs” on page 58.7](#)
- a source MAC address. You can use the format, HHHH.HHHH.HHHH to filter on a specific MAC address (where H is a hexadecimal number), or you can filter on any source MAC address by entering the word “any”.
- a source MAC mask. This mask determines which portion of the source MAC address header will be compared with that found in the incoming packets. The mask is configured in the format <HHHH.HHHH.HHHH> where each H is a hexadecimal number. In practice each hex number will normally be either 0 (to represent a match) or F (to represent a don't care condition). A mask is not required if the source address is specified as “any”.
- a destination MAC address. You can use the format, HHHH.HHHH.HHHH to filter on a specific MAC address (where H is a hexadecimal number), or you can filter on any destination MAC address by entering the word “any”.
- a destination MAC mask. This mask determines which portion of the destination MAC address header will be compared with that found in the incoming packets. The mask is configured in the format <HHHH.HHHH.HHHH> where each H is a hexadecimal number. In practice each hex number will normally be either 0 (to represent a match) or F (to represent a don't care condition). A mask is not required if the source address is specified as “any”.

Example To permit packets coming from a specific MAC address of 0030.841A.1234 and with any destination address:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0030.841A.1234
0000.0000.0000 any
```

Defining Hardware IP ACLs

These are used to filter traffic based on specific source or destination IP addresses contained within the data frames. They can be applied to ports in the form of access groups.

An IP access list requires the following components:

- an ACL number in the range 3000-3699
- an action, see [“Actions for Hardware ACLs” on page 58.7](#)
- a packet type:
 - « IP: This matches any type of IP packet. A source and destination address must also be specified, although they can be “any”.
 - « ICMP: This matches ICMP packets. A source and destination address must also be specified, although they can be “any”. An ICMP type can optionally be specified after the destination address.
 - « TCP: This matches TCP packets. A source and destination address must also be specified, although they can be “any”. After the source address, a source port can optionally be specified and after the destination address a destination port can optionally be specified. The port matching can be done using **eq** (equal to), **gt** (greater than), **lt** (less than), **ne** (not equal to), or **range** (for a range of ports, which requires a start port and an end port).
 - « UDP: This matches UDP packets and has the same options as TCP.
 - « proto: This allows any IP protocol type to be specified (e.g. 89 for OSPF). A source and destination address must be also specified, although they can be “any”.

For example, to match (and permit) any type of IP packet containing a destination address of 192.168.1.1

```
awplus(config)# access-list 3000 permit ip any 192.168.1.1/32
```

To match (and permit) an ICMP packet with a source address of 192.168.x.x and an ICMP code of 4

```
awplus(config)# access-list 3001 permit icmp 192.168.0.0/16
any icmp-type 4
```

To match a TCP packet with a source address of 192.168.x.x, source port of 80 and a destination port from 100 to 150:

```
awplus(config)# access-list 3002 permit tcp 192.168.0.0/16 eq
80 any range 100 150
```

To match a UDP packet with a source address of 192.168.x.x, a destination address of 192.168.1.x, and a destination port greater than 80:

```
awplus(config)# access-list 3003 permit udp 192.168.0.0/16
192.168.1.0/24 gt 80
```

To match to any OSPF packet:

```
awplus(config)# access-list 3004 permit proto 89 any any
```

Note that an IP address mask can be specified using either of the following notations:

- "A.B.C.D/M": This is the most common; e.g. 192.168.1.0/24
- "A.B.C.D A.B.C.D": 192.168.1.1 0.0.0.0 is the same as 192.168.1.1/32 and 192.168.1.1 255.255.255.255 is the same as "any"
- "host A.B.C.D": This is the same as A.B.C.D/32

Actions for Hardware ACLs

The following actions are available for Hardware ACLs:

- deny: Discard the packet.
- permit: Allow the packet.
- copy-to-cpu: Send a copy of the packet to the CPU and forward it as well. This is the same as copy,forward in AW hardware filters.
- send-to-cpu: Send the packet to the CPU and does not forward it. Note that specifying this action could result in EPSR healthcheck messages and other control packets being dropped.
- copy-to-mirror: Send a copy of the packet to the mirror port and forward it as well.

Attaching hardware ACLs to interfaces

A hardware ACL is attached directly to a switchport using the **access-group** command. For example, to permit traffic from 192.168.1.x, but discard from 192.168.x.x:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.1.0/24
any
awplus(config)# access-list 3001 deny ip 192.168.0.0/24 any
awplus(config)# interface port1.1.1
awplus(config-if)# access-group 3000
awplus(config-if)# access-group 3001
```

Hardware ACLs and QoS classifications

Interface ACLs and QoS policies can both be attached to the same port. Where this is done, packets received on the port will be matched against the ACLs first.

The interface ACLs and QoS classifications are implemented by taking the first matching filter and applying the action defined for that filter. All subsequent matches in the table are then ignored. Thus, because ACLs are also matched first, if the matching ACL has a permit action, the packet is forwarded due to that rule's action and any subsequent QoS rules are bypassed.

You can also apply permit rules using QoS.

For example, you might want to permit a source IP address of 192.168.1.x, but block everything else on 192.168.x.x.

In this case you could create both the permit and deny rules using QoS.

Classifying Your Traffic

Classification is the process of **filtering** and **marking**. Filtering involves sorting your data into appropriate traffic types. Marking involves tagging the data so that downstream ports and routers can apply appropriate service policy rules.

There are two reasons to classify data:

1. To provide network security (Security ACLs)
2. To apply service quality criteria QoS.

Security ACLs

The main application of security ACLs is to block undesired traffic. Other applications include:

- copy-to-cpu
- copy-to-mirror
- send-to-cpu

For more information on these applications see [“Actions for Hardware ACLs” on page 58.7](#)

QoS ACLs

When using ACLs though QoS, the same classification and action abilities are available, but QoS has some additional fields that it can match on (see Match Commands) and also provides the ability to perform metering, marking and remarking on packets that match the filter definitions.

The action used by a QoS class-map is determined by the ACL that is attached to it. If no ACL is attached, it uses the permit action. If an ACL is not required by the class-map (for example, only matching on the VLAN) and a deny action is required, a MAC ACL should be added with `any` for source address and `any` for destination address.

The following example creates a class-map with will deny all traffic on vlan 2:

```
awplus(config)# access-list 4000 deny any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 4000
awplus(config-cmap)# match vlan 2
```

The default class-map matches to all traffic and so cannot have any match or ACL commands applied to it. The action for this class-map is set via the `default-action` command and is `permit` by default. It can be changed to `deny` by using the following commands:

```
awplus(config)# policy-map pmap1
awplus(config-pmap)# default-action deny
```

For more information on applying QoS filtering, see [“Classifying your Data” on page 63.7](#).

Filter Limitations

Typically, for each ACL or class-map one filter goes into hardware. The exceptions are when:

- TCP and UDP port ranges are specified. For example, with the `lt`, `gt`, `ne`, and `range` parameters of the [access-list \(hardware IP numbered\)](#) command ([Syntax \[tcp|udp\] section](#)).
- a rule is neither IPv6 nor non-IPv6 specific, in which case two filters are added to hardware, one for IPv6 and another for non-IPv6. An example of this is the [access-list \(hardware MAC numbered\)](#) command which only matches on MAC address.

A filter is comprised of standard and optional fields. The standard fields, such as source and destination IP and MAC addresses, are “permanent” in that they are always generated from the packet, whereas the optional fields must share a pool of six defined offsets within the packet. The offset types are displayed in the output from the [show platform classifier statistics utilization brief](#) command, as shown in [Figure 58-1](#). The optional fields are shown in the [Table 58-2](#) and these optional fields share a limited pool of 6 bytes. Note that all the configured filters share the same offset bytes. However, each offset type can be used in many ACLs.

Figure 58-1: Example output from the show platform classifier statistics utilization brief command

```

.
.
Card 2:

[Instance 1]
 [port1.2.1-port1.2.24]                Used / Total
-----
MLD Snooping          0
DHCP Snooping         0
Web Auth              0
Loop Detection        0
EPSR                  0
IPv6 Global ACL       0
IPv6 ACL              0
Global ACL            0
ACL                   0
QoS                   0
RA Guard              0
Total                  0 / 1536 (0.00%)

UDB Usage:
Legend of Offset Type) 1:Ether 2:IP 3:TCP/UDP
UDB Set      Offset Type      Used / Total
-----
Non IPv6     100000                0 / 6
IPv6 L2      220000                0 / 6
.
.

```

Different fields in the filter are set and active depending on the settings of the class-map or hardware ACL it represents. Each filter is matched against the fields, standard and optional, taken from each ingressing packet. The first matching filter determines the action taken on the packet.

Table 58-2: The user defined optional fields of a filter

Protocol Component	Bytes Used in the Filter
IP precedence value	1
Tag Protocol Identifier (TPID)	2
ICMP packet type	1
ICMPv6 packet type	1
inner VLAN ID	2
inner CoS	1
inner Tag Protocol Identifier (TPID)	2
SNAP tagged and untagged packets	2 or 3, depending on line card ¹

1. For SBx81GP24 and SBx81GT24 line cards, 2 bytes are used in the filter.
For SBx81XZ4, SBx81GS24a, and SBx81XS6 line cards, 3 bytes are used in the filter.

Note  For SBx81XZ4, SBx81GS24a, and SBx81XS6 line cards, a maximum of 1536 filters can be created per line card.
For SBx81GP24 and SBx81GT24 line cards, a maximum of 4096 filters can be created per line card.

Attaching hardware ACLs using QoS

The same functionality can be achieved using QoS, by attaching the ACL to a class-map, attaching the class-map to a policy-map and attaching the policy-map to a port:

Step 1: Enable QoS on the switch

```
awplus(config)# mls qos enable
```

Step 2: Create access lists

Create ACL 3000 to permit all packets from the 192.168.1 subnet:

```
awplus(config)# access-list 3000 permit ip 192.168.1.0/24 any
```

Create ACL 3001 to deny all packets from the 192.168.0 subnet:

```
awplus(config)# access-list 3001 deny ip 192.168.0.0/24 any
```

Step 3: Attach access-groups to class-maps

Attach ACL 3000 to the class-map cmap1:

```
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3000
awplus(config-cmap)# exit
```

Attach ACL 3001 to the same class-map (cmap2):

```
awplus(config-cmap)# match access-group 3001
awplus(config-cmap)# exit
```

Step 4: Attach class-maps to policy-maps

Attach the class-map cmap1 to policy-map pmap1:

```
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# exit
```

Add the class-map cmap2 to the policy-map pmap1:

```
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# exit
```

Return to Global Configuration mode:

```
awplus(config-pmap)# exit
```

Step 5: Add policy-maps to ports

Add policy-map pmap1 to port1.1.1:

```
awplus(config)# interface port1.1.1
awplus(config-if)# service-policy input pmap1
```

Note that multiple interface ACLs can be attached to the same port, or either type and can be interleaved. The order of matching is based on the order in which the ACLs were attached to the port. Only one ACL can be attached to a class-map, but multiple class-maps can be attached to a policy-map. Interface ACLs can be attached to the same port as a QoS policy, with the interface ACLs being matched first as described at the beginning of the Classification section.

Filtering hardware ACLs with QoS

Another reason for using QoS rather than interface ACLs is that QoS provides a lot more fields on which to match. These are accessed through the match commands in config-cmap mode.

Config-cmap mode describes the fields that can be matched on. Only one of each type can be matched, with the exception of tcp-flags (see below for classification). If multiple matches are specified, they are ANDed together.

The following example shows how you can match a packet on vlan 2, that has a source IP address of 192.168.x.x and a DSCP of 12:

Create ACL 3000 to permit all packets from the 192.168 subnet.:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.0.0/16 any
```

Apply ACL 3000 to the class-map cmap1 and add the matching criteria of vlan 2 and DSCP 12:

```
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3000
awplus(config-cmap)# match vlan 2
awplus(config-cmap)# match dscp 12
awplus(config-cmap)# exit
```

Using QoS Match Commands with TCP Flags

Usually, if multiple matches of the same type are specified, the matching process will apply to the last match that you specified. For TCP flags however, the arguments are ANDed together. For example, the following series of commands will match on a packet that has ack, syn and fin set:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tcp-flags ack
awplus(config-cmap)# match tcp-flags syn
awplus(config-cmap)# match tcp-flags fin
awplus(config-cmap)# exit
```

The following commands will achieve the same result:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tcp-flags ack syn fin
awplus(config-cmap)# exit
```

Note that the matching is looking to see whether “any” of the specified flags are set. There is no checking for whether any of these flags are unset. Therefore the following commands will match on a packet in any of the following combinations of syn and ack status flags as shown in the following table:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tcp-flags syn
awplus(config-cmap)# exit
```

Syn	Ack	Match on Packet
Set	Set	Yes
Set	Unset	Yes
Unset	Set	No
Unset	Unset	No

If you want to drop packets with syn only, but not with ack and syn, the following two class-maps can be used (note that ACL 4000 is used to apply a drop action as described in [“Actions for Hardware ACLs” on page 58.7](#)):

Step 1: Create access lists

Create ACL 4000 to deny all packets with any source or destination address:

```
awplus# configure terminal
awplus(config)# access-list 4000 deny any any
```

Step 2: Create class-maps

Create the class-map cmap1 and configure it to match on the TCP flags, ack and syn:

```
awplus(config)# class-map cmap1
awplus(config-cmap)# match tcp-flags ack syn
awplus(config-cmap)# exit
```

Create the class-map cmap2 and configure it to match on the TCP flag, syn:

```
awplus(config)# class-map cmap2
awplus(config-cmap)# match tcp-flags syn
```

Step 3: Apply access-groups to class-maps

Apply ACL 4000 to this class-map (i.e. to cmap2):

```
awplus(config-cmap)# match access-group 4000
awplus(config-cmap)# exit
```

Step 4: Create policy-maps

Create the policy-map pmap1 and associate it with cmap1:

```
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# exit
```

Step 5: Associate class-maps with policy-maps

Associate cmap2 with this policy-map (pmap1):

```
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# exit
```

ACL Filter Sequence Numbers

To help you manage ACLs you can apply sequence numbers to filters. This allows you to remove filters from named and numbered ACLs without having to reconfigure an ACL.

The ability to add sequence numbers to filters simplifies updates through the ability to position a filter within an ACL. When you add a new filter, you can specify a sequence number to position the filter in the ACL and you can also remove a current filter in an ACL by specifying a sequence number.

ACL Filter Sequence Number Behavior

- If filters with no sequence numbers are applied then the first filter is assigned a sequence number of 10, and successive filters are incremented by 10. Sequence numbers are generated automatically if they are not specified at entry.
- The maximum filter sequence number is 65535. If the sequence number exceeds this maximum, the command will not be recognized and will show the error message:
`% Unrecognized command`
- If you enter a filter without a sequence number it is assigned a sequence number that is 10 greater than the last sequence number and is placed at the end of the ACL.
- If you enter a filter that matches an already existing filter then the first filter is overwritten with the subsequent filter.
- ACL sequence numbers determine the order of execution of filters in an ACL. Filters in a ACL with a lower value sequence number are executed before filters with a higher value.
- Output from **show running-config** displays ACL entries without filter sequence numbers. Output from relevant **show** commands displays ACL entries with their sequence numbers.
- ACL sequence numbers are re-numbered upon switch restart following a **reload** command, or after powering off and powering on the switch. ACL sequence numbers are renumbered starting from 10 and increment by 10 for each filter. See the sample output in the configuration section that follows for an illustration of this behavior. No ACL sequence number re-number command is available to perform this action.
- The ACL sequence number feature works with numbered and named standard and extended IPv4 and IPv6 access lists, plus named hardware IPv4 and IPv6 access lists
- The name of an access list can be designated as a number. Number in named ACLs must not exist within the range of designated numbered ACLs. (where <1-99> and <1300-1999> are standard numbered ACLs, <100-199> and <2000-2699> are extended numbered ACLs, <3000-3699> and <4000-4699> are hardware numbered ACLs).

ACL Filter Sequence Number Applicability

The ACL sequence number support feature is available with numbered and named standard and extended IPv4 and IPv6 ACLs, and the named hardware IPv4 and IPv6 ACLs.

Numbered standard ACLs are available in the range <1-99> and <1300-1999>, which permit or deny source addresses to control packets coming from network devices or hosts, in software.

Numbered extended ACLs are available in the range <100–199> and <2000–2699>, which permit or deny source addresses and destination addresses (plus ICMP, TCP, UDP messages) to control packets coming from and going to network devices or hosts.

Named hardware IPv4 and IPv6 ACLs are available which permit or deny IP and MAC source and destination addresses plus VLAN IDs to control packets coming from and going to network device and hosts. Named hardware IPv4 and IPv6 ACLs use the ACL sequence number support feature for ACL revision.

The ACL sequence number support feature is available for use with named hardware IPv4 and IPv6 ACLs, but this feature is not available for use with the numbered hardware IPv4 ACLs.

Numbered hardware ACLs are available in the range <3000–3699>, which permit or deny IP source addresses, IP destination addresses, and VLAN IDs to control packets coming from and going to network devices and hosts, in hardware.

Numbered hardware ACLs are available in the range <4000–4699>, which permit or deny MAC source addresses, MAC destination addresses, and VLAN IDs to control packets coming from and going to network devices and hosts, in hardware.

ACL Filter Sequence Number Types

There are ACL filter sequence numbers available for the following types of ACLs:

ACL Type	ACL Command Syntax
IPv4 Standard Numbered ACLs	<code>access-list <1-99></code> <code>access-list <1300-1999></code>
IPv4 Extended Numbered ACLs	<code>access-list <100-199></code> <code>access-list <2000-2699></code>
IPv4 Standard Named ACLs	<code>access-list standard <name></code>
IPv4 Extended Named ACLs	<code>access-list extended <name></code>
IPv4 Hardware Named ACLs	<code>access-list hardware <name></code>
IPv6 Standard Named ACLs	<code>ipv6 access-list standard <name></code>
IPv6 Extended Named ACLs	<code>ipv6 access-list extended <name></code>
IPv6 Hardware Named ACLs	<code>ipv6 access-list <name></code>

Note that ACL sequence number support for these ACL commands is optional not required. An ACL sequence number will be added automatically, starting at 10 and incrementing by 10.

ACL Commands Without ACL Filter Sequence Numbers

ACL filter sequence numbers are not available for numbered hardware ACL commands:

```
access-list <3000-3699>
```

```
access-list <4000-4699>
```

ACL Filter Sequence Number Entry Examples

See the below CLI entry examples for prompt sub-modes for ACL filters after ACL commands:

- To create an IPv4 Standard ACL and then define ACL filters at the IPv4 Standard ACL Configuration mode prompt **awplus(config-ip-std-acl)#**, enter the following commands:

```
awplus(config)# access-list 1
awplus(config-ip-std-acl)# permit 192.168.1.0 0.0.0.255

awplus(config)# access-list standard std_name
awplus(config-ip-std-acl)# permit 192.168.1.0/24
```

- To create an IPv4 Extended ACL and then define ACL filters at the IPv4 Extended ACL Configuration mode prompt **awplus(config-ip-ext-acl)#**, enter the following commands:

```
awplus(config)# access-list 100
awplus(config-ip-ext-acl)# permit ip 192.168.1.0 0.0.0.255
192.168.2.0 0.0.0.255

awplus(config)# access-list extended ext_name
awplus(config-ip-ext-acl)# permit ip 192.168.1.0 0.0.0.255
192.168.2.0 0.0.0.255
```

- To create an IPv4 Hardware ACL and then define ACL filters at the IPv4 Hardware ACL Configuration mode prompt **awplus(config-ip-hw-acl)#**, enter the following commands:

```
awplus(config)# access-list hardware hw_name
awplus(config-ip-hw-acl)# permit ip 192.168.1.0 0.0.0.255
192.168.2.0 0.0.0.255
```

- To create an IPv6 Standard ACL and then define ACL filters at the IPv6 Standard ACL Configuration mode prompt **awplus(config-ipv6-std-acl)#**, enter the following commands:

```
awplus(config)# ipv6 access-list standard
ipv6_std_name
awplus(config-ipv6-std-acl)# permit 2001:db8::/64
```

- To create an IPv6 Extended ACL and then define ACL filters at the IPv6 Extended Configuration mode prompt **awplus(config-ipv6-ext-acl)#**, enter the following commands:

```
awplus(config)# ipv6 access-list extended
                 ipv6_ext_name

awplus(config-ipv6-ext-acl)# permit ip 2001:db8::/64
                             2001:db9::/64
```

ACL Filter Sequence Configuration

First create a named or numbered ACL to enter ACL filters in the ACL sub-modes available:

Step 1: Create a new ACL and add a new filter

Create ACL 10 and then add a new filter to the access-list to permit all packets from the 192.168.1 subnet:

```
awplus# configure terminal
awplus(config)# access-list 10
awplus(config-ip-std-acl)# permit 192.168.1.0 0.0.0.255
awplus(config-ip-std-acl)# end
awplus# show access-list 10
```

```
Standard IP access list 10
 10 permit 192.168.1.0, wildcard bits 0.0.0.255
```

Step 2: Add another filter to the ACL

Append to, or add at the end of, ACL 10 a new filter to deny all packets from the 192.168.2 subnet:

```
awplus# configure terminal
awplus(config)# access-list 10
awplus(config-ip-std-acl)# deny 192.168.2.0 0.0.0.255
awplus(config-ip-std-acl)# end
awplus# show access-list 10
```

```
Standard IP access list 10
 10 permit 192.168.1.0, wildcard bits 0.0.0.255
 20 deny    192.168.2.0, wildcard bits 0.0.0.255
```

Note that if you add a filter to an ACL without specifying a sequence number the new filter is automatically assigned a sequence number. Sequence numbers are assigned in multiples of ten from the sequence number of the last filter.

Step 3: Insert a filter into the ACL

Insert a new filter with the sequence number 15 into ACL 10 to permit packets from the 192.168.3 subnet:

```
awplus# configure terminal
awplus(config)# access-list 10
awplus(config-ip-std-acl)# 15 permit 192.168.3.0 0.0.0.255
awplus(config-ip-std-acl)# end
awplus# show access-list 10
```

```
Standard IP access list 10
 10 permit 192.168.1.0, wildcard bits 0.0.0.255
 15 permit 192.168.3.0, wildcard bits 0.0.0.255
 20 deny 192.168.2.0, wildcard bits 0.0.0.255
```

The new filter has precedence over the filter with the sequence number 20.

Step 4: Remove a filter from the ACL by specifying a filter pattern

Remove the filter with the IP address 192.168.2 from ACL 10:

```
awplus# configure terminal
awplus(config)# access-list 10
awplus(config-ip-std-acl)# no deny 192.168.2.0 0.0.0.255
awplus(config-ip-std-acl)# end
awplus# show access-list 10
```

```
Standard IP access list 10
 10 permit 192.168.1.0, wildcard bits 0.0.0.255
 15 permit 192.168.3.0, wildcard bits 0.0.0.255
```

Step 5: Remove a filter from the ACL by specifying a sequence number

Remove the filter with the sequence number 10 from ACL 10:

```
awplus# configure terminal
awplus(config)# access-list 10
awplus(config-ip-std-acl)# no 10
awplus(config-ip-std-acl)# end
awplus# show access-list
```

```
Standard IP access list 10
 15 permit 192.168.3.0, wildcard bits 0.0.0.255
```

Creating ACLs in Global Configuration Mode

You can add new filters in **Global Configuration** mode with the **access-list (standard numbered)** command on page 60.30. In this mode the filters are assigned a sequence number corresponding to the order in which they are entered, i.e. the first filter entered has higher precedence in the ACL.

Step 1: Add filters with the access-list command

Add filters to ACL 10 using the **access-list** command:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 192.168.1.0 0.0.0.255
awplus(config)# access-list 10 deny 192.168.2.0 0.0.0.255
awplus(config)# end
awplus# show access-list 10
```

```
Standard IP access list 10
 15 permit 192.168.3.0, wildcard bits 0.0.0.255
 20 permit 192.168.1.0, wildcard bits 0.0.0.255
 30 deny 192.168.2.0, wildcard bits 0.0.0.255
```

You can then enter the **IPv4 Standard ACL Configuration** mode and use the **(access-list standard numbered filter)** command on page 60.34 to specify sequence numbers to reorder the filters.

Step 2: Reorder the filters

Reorder the filters in ACL 10 by specifying a sequence number for each filter. The specified sequence number will overwrite the previous sequence number assigned to the filter:

```
awplus# configure terminal
awplus(config)# access-list 10
awplus(config-ip-std-acl)# 1021 permit 192.168.1.0 0.0.0.255
awplus(config-ip-std-acl)# 3333 permit 192.168.3.0 0.0.0.255
awplus(config-ip-std-acl)# 2772 deny 192.168.2.0 0.0.0.255
awplus(config-ip-std-acl)# end
awplus# show access-list 10
```

```
Standard IP access list 10
1021 permit 192.168.1.0, wildcard bits 0.0.0.255
2772 deny 192.168.2.0, wildcard bits 0.0.0.255
3333 permit 192.168.3.0, wildcard bits 0.0.0.255
```

Step 3: Copy the running-config file into the startup-config file

Copy the running-config into the file set as the current startup-config file and then reload the device. Before the reload occurs, you will receive a confirmation request saying: "reboot system? (y/n):".

When the device has reboot you can then enter **Global Configuration** mode and use the **show access-list (IPv4 Software ACLs)** command to display ACL 10:

```
awplus(config)# exit
awplus# copy running-config startup-config
awplus# reload
awplus# show access-list 10
```

```
Standard IP access list 10
10 permit 192.168.1.0, wildcard bits 0.0.0.255
20 deny 192.168.2.0, wildcard bits 0.0.0.255
30 permit 192.168.3.0, wildcard bits 0.0.0.255
```

After the device has reboot the sequence numbers of the filters in the ACL have been reassigned incrementing from 10.

Display the ACL configuration details

Display the running system status and configuration details for ACLs:

```
awplus# show running-config access-list
```

```
!  
access-list 1 deny 10.1.1.0 0.0.0.255  
access-list 1 permit any  
access-list 2  
access-list 5  
access-list 10 permit 192.168.1.0 0.0.0.255  
access-list 10 deny 192.168.2.0 0.0.0.255  
access-list 10 permit 192.168.3.0 0.0.0.255  
access-list 20  
access-list 25 permit 10.1.2.0 0.0.0.255  
access-list 25 deny 192.168.1.0 0.0.0.255  
access-list 50  
access-list 95 permit any  
access-list 100  
access-list 1300  
access-list 2000  
access-list extended acl  
access-list extended my-list  
access-list extended name  
access-list extended name1  
access-list standard name3  
ipv6 access-list extended ipv6_acl  
ipv6 access-list standard ipv6_acl2  
ipv6 access-list extended my-ipv6-list  
ipv6 access-list extended my-list  
ipv6 access-list standard my-new-list  
ipv6 access-list standard name  
ipv6 access-list standard name1 deny any  
ipv6 access-list extended name5  
ipv6 access-list standard name6  
access-list hw_acl  
access-list icmp  
access-list my-hw-list  
access-list name2  
access-list name4  
!
```

For more information see [show running-config access-list](#) command on page 7.34.

Chapter 59: IPv4 Hardware Access Control List (ACL) Commands

show access-list (IPv4 Hardware ACLs)	59.39
show interface access-group	59.41

Introduction

This chapter provides an alphabetical reference for the IPv4 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 hardware ACLs, which are applied directly to interfaces using the **access-group** command.

-
-  **Note** See [Chapter 58, Access Control Lists Introduction](#) for descriptions of ACLs, and for further information about rules when applying ACLs see the [ACL Rules](#) section.
- See [ACL Filter Sequence Numbers](#) and [ACL Filter Sequence Number Behavior](#) sections in [Chapter 58, Access Control Lists Introduction](#) about ACL Filters.
-

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see [Chapter 20, Link Aggregation Introduction and Configuration](#), and [Chapter 21, Link Aggregation Commands](#).

-
-  **Note** Text in parenthesis in command names indicates usage not keyword entry. For example, **access-list hardware (named)** indicates named IPv4 hardware ACLs entered as `access-list hardware <name>` where `<name>` is a placeholder not a keyword.
-

-
-  **Note** Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(access-list standard numbered filter)** represents command entry in the format shown in the syntax `[<sequence-number>] {deny|permit} {<source>|host <host-address>|any}`.
-

-
-  **Note** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.
-

IPv4 Hardware Access List Commands and Prompts

Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The table “**IPv4 Hardware Access List Commands and Prompts**” shows the CLI prompts at which ACL commands are entered.

Table 59-1: IPv4 Hardware Access List Commands and Prompts

Command Name	Command Mode	Prompt
show interface access-group	Privileged Exec	awplus#
show access-group	Privileged Exec	awplus#
show access-list (IPv4 Hardware ACLs)	Privileged Exec	awplus#
show interface access-group	Privileged Exec	awplus#
access-group	Global Configuration	awplus(config)#
access-list (hardware IP numbered)	Global Configuration	awplus(config)#
access-list (hardware MAC numbered)	Global Configuration	awplus(config)#
access-list hardware (named)	Global Configuration	awplus(config)#
access-group	Interface Configuration	awplus(config-if)#
(access-list hardware ICMP filter)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
(access-list hardware IP protocol filter)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
(access-list hardware MAC filter)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
(access-list hardware TCP UDP filter)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
commit (IPv4)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#

Command List

access-group

This command adds or removes a hardware-based access-list to a switch port interface. The number of hardware numbered and named access-lists that can be added to a switch port interface is determined by the available memory in hardware-based packet classification tables.

This command works in both Global Configuration and Interface Configuration modes to apply hardware access-lists to all switch port interfaces or selected switch port interfaces respectively.

The **no** variant of this command removes the selected access-list from an interface.

Syntax `access-group [<3000-3699> | <4000-4699> | <hardware-access-list-name>]`
`no access-group [<3000-3699> | <4000-4699> | <hardware-access-list-name>]`

Parameter	Description
<code><3000-3699></code>	Hardware IP access-list.
<code><4000-4699></code>	Hardware MAC access-list.
<code><hardware-access-list-name></code>	The hardware access-list name.

Mode Interface Configuration or Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create an IP access-list that applies the appropriate permit, deny requirements etc with the **access-list (hardware IP numbered)** command on page 59.6, the **access-list (hardware MAC numbered)** command on page 59.17 or the **access-list hardware (named)** command on page 59.20. Then use this command to apply this hardware access-list to a specific port or port range. Note that this command will apply the access-list only to incoming data packets.

To apply ACLs to an LACP aggregated link, apply it to all the individual switch ports in the aggregated group. To apply ACLs to a static channel group, apply it to the static channel group itself. An ACL can even be applied to a static aggregated link that spans more than one switch instance (**Chapter 21, Link Aggregation Commands**).

Note that you cannot apply software standard and extended numbered ACLs to switch port interfaces with the access-group command. This command will only apply hardware ACLs.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To add the numbered hardware access-list 3005 to all switch ports, enter the following

commands:

```
awplus# configure terminal
awplus(config)# access-group 3005
```

To add the numbered hardware access-list 3005 to switch port interface `port1.1.1`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# access-group 3005
```

To add the named hardware access-list `hw-acl` to switch port interface `port1.1.2`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# access-group hw-acl
```

To apply an ACL to static channel group 2 containing switch `port1.1.5` and `port1.1.6`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.5-1.1.6
awplus(config-if)# static-channel-group 2
awplus(config)# interface sa2
awplus(config-if)# access-group 3000
```

Related Commands [access-list hardware \(named\)](#)
[access-list \(hardware IP numbered\)](#)
[access-list \(hardware MAC numbered\)](#)
[show interface access-group](#)

access-list (hardware IP numbered)

This command creates an access-list for use with hardware classification, such as QoS. The access-list will match on either TCP or UDP type packets that have the specified source and destination IP addresses and Layer 4 port values or ranges. The parameter **any** may be specified if an address does not matter and the port values are optional.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The optional **vlan** parameter can be applied to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Syntax [ip] `access-list <3000-3699> {deny|permit|copy-to-cpu|copy-to-mirror|send-to-cpu} ip <source> <destination> [vlan <1-4094>]`

Syntax [icmp] `access-list <3000-3699> {deny|permit|copy-to-cpu|copy-to-mirror|send-to-cpu} icmp <source> <destination> [icmp-type <type-number>] [vlan <1-4094>]`

`no access-list <3000-3699>`

Table 59-2: Parameters in the access-list (hardware IP numbered) command - ip|icmp

Parameter	Description
<3000-3699>	Hardware IP access-list number.
deny	Access-list rejects packets that match the source and destination filtering specified with this command.
permit	Access-list permits packets that match the source and destination filtering specified with this command.
copy-to-cpu	Specify packets to copy to the CPU.
copy-to-mirror	Specify packets to copy to the mirror port.
send-to-cpu	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
icmp	ICMP packet.
ip	IP packet.

Table 59-2: Parameters in the access-list (hardware IP numbered) command - ip|

Parameter(cont.)	Description(cont.)
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
any	Matches any source IP address.
host <i><ip-addr></i>	Matches a single source host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/<prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<i><ip-addr><reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
any	Matches any destination IP address.
host <i><ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/<prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr><reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.
icmp-type	Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.

Table 59-2: Parameters in the access-list (hardware IP numbered) command - ip|

Parameter(cont.)	Description(cont.)
<i><type-number></i>	The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:
0	Echo replies.
3	Destination unreachable messages.
4	Source quench messages.
5	Redirect (change route) messages.
8	Echo requests.
11	Time exceeded messages.
12	Parameter problem messages.
13	Timestamp requests.
14	Timestamp replies.
15	Information requests.
16	Information replies.
17	Address mask requests.
18	Address mask replies.
<i>vlan</i>	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<i><1-4094></i>	The VLAN VID.

Syntax `access-list <3000-3699>`
[tcp|udp] `{copy-to-cpu|copy-to-mirror|deny|permit|send-to-cpu} {tcp|udp}`
`<source>`
`{eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>|`
`[range <start-range> <end-range>}`
`<destination>`
`[eq <destport>|lt <destport>|gt <destport>|ne <destport>]`
`[range <start-range> <end-range>]`

`no access-list <3000-3699>`

Table 59-3: Parameters in the access-list (hardware IP numbered) command - tcp|udp

Parameter	Description
<code><3000-3699></code>	Hardware IP access-list.
<code>copy-to-cpu</code>	Specify packets to copy to the CPU.
<code>copy-to-mirror</code>	Specify packets to copy to the mirror port.
<code>deny</code>	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
<code>permit</code>	The access-list permits packets that match the type, source, and destination filtering specified with this command.
<code>send-to-cpu</code>	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
<code>tcp</code>	The access-list matches only TCP packets.
<code>udp</code>	The access-list matches only UDP packets.
<code><source></code>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<code>any</code>	Matches any source IP address.
<code>host <ip-addr></code>	Matches a single source host with the IP address given by <code><ip-addr></code> in dotted decimal notation.
<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<code><ip-addr></code> <code><reverse-mask></code>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.1 0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .

Table 59-3: Parameters in the access-list (hardware IP numbered) command - tcp|

Parameter(cont.)	Description(cont.)
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
any	Matches any destination IP address.
host <i><ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/<prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr></i> <i><reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.
<i><sourceport></i>	The source (TCP or UDP) port number, specified as an integer between 0 and 65535.
range	Range of port numbers.
<i><start-range></i>	Port number at start of range <i><0-65535></i> .
<i><end-range></i>	Port number at end of range <i><0-65535></i> .
<i><destport></i>	The destination (TCP or UDP) port number, specified as an integer between 0 and 65535.
eq	Matches port numbers that are equal to the port number specified immediately after this parameter.
lt	Matches port numbers that are less than the port number specified immediately after this parameter.
gt	Matches port numbers that are greater than the port number specified immediately after this parameter.
ne	Matches port numbers that are not equal to the port number specified immediately after this parameter.
range	Range of port numbers.
<i><start-range></i>	Port number at start of range <i><0-65535></i> .
<i><end-range></i>	Port number at end of range <i><0-65535></i> .
vlan	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<i><1-4094></i>	The VLAN VID.

Syntax `access-list <3000-3699>`
[proto] `{copy-to-cpu|copy-to-mirror|deny|permit|send-to-cpu} proto <ip-protocol> <source> <destination>`
`no access-list <3000-3699>`

Table 59-4: Parameters in the access-list (hardware IP numbered) command - proto

Parameter	Description
<code><3000-3699></code>	Hardware IP access-list.
<code>copy-to-cpu</code>	Specify packets to copy to the CPU.
<code>copy-to-mirror</code>	Specify packets to copy to the mirror port.
<code>deny</code>	Access-list rejects packets that match the source and destination filtering specified with this command.
<code>permit</code>	Access-list permits packets that match the source and destination filtering specified with this command.
<code>send-to-cpu</code>	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
<code><source></code>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<code>any</code>	Matches any source IP address.
<code>host <ip-addr></code>	Matches a single source host with the IP address given by <code><ip-addr></code> in dotted decimal notation.
<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<code><ip-addr><reverse-mask></code>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.10.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .

Table 59-4: Parameters in the access-list (hardware IP numbered) command - proto

	253 Use for experimentation and testing / RFC3692
	254 Use for experimentation and testing / RFC3692
	255 Reserved / IANA
<i>vlan</i>	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<i><1-4094></i>	The VLAN VID.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage This command creates an access-list for use with hardware classification, such as when applying QoS. This command can be used to match ICMP packets, IP protocols, or TCP/UDP packets.

For ICMP packets, the <3000-3699> range IP hardware access-list will match any ICMP packet that has the specified source and destination IP addresses and ICMP type.

You may apply the **any** parameter if the source or destination IP address is not important. The ICMP type is an optional parameter.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples Follow the below example commands to configure access-lists for ICMP, IP protocol and TCP.

ICMP Example To create an access-list that will permit ICMP packets with a source address of 192.168.1.0/24 with any destination address and an ICMP type of 5 enter the below commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit icmp 192.168.1.0/24
any icmp-type 5
```

To destroy the access-list with an access-list identity of 3000 enter the below commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

IP Example To create an access-list that will permit any type of IP packet with a source address of 192.168.1.1 and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.1.1/32 any
```

To create an access-list that will deny all IGMP packets (IP protocol 2) from the 192.168.0.0 network, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 deny proto 2 192.168.0.0/16
any
```

TCP Example To create an access-list that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80 and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit tcp any 192.168.1.1/32
eq 80
```

copy-to-mirror Example To create an access-list that will copy-to-mirror TCP packets with a destination address of 192.168.1.1, a destination port of 80 and any source address and source port for use with the **mirror interface** command, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 copy-to-mirror tcp any
192.168.1.1/32 eq 80
```

Related Commands [access-group](#)

[show access-list \(IPv4 Hardware ACLs\)](#)

access-list (hardware MAC numbered)

This command creates an access-list for use with hardware classification, such as QoS. The access-list will match on packets that have the specified source and destination MAC addresses. The parameter **any** may be specified if an address does not matter.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

Optionally, the **vlan** and **inner-vlan** parameters can be matched for tagged (802.1q) packets.

The **no** variant of this command removes the specified MAC hardware filter access-list.

Syntax

```
access-list <4000-4699>
    {copy-to-cpu|copy-to-mirror|deny|permit|send-to-cpu}
    {<source-mac-address> <source-mac-mask>|any}
    {<destination-mac-address> <destination-mac-mask>|any}
    [vlan <1-4094> [inner-vlan <1-4094>]]
```

```
no access-list <4000-4699>
```

Parameter	Description
<4000-4699>	Hardware MAC access-list.
copy-to-cpu	Specify packets to copy to the CPU.
copy-to-mirror	Specify packets to copy to the mirror port.
deny	Access-list rejects packets that match the source and destination filtering.
permit	Access-list permits packets that match the source and destination filtering.
send-to-cpu	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
<source-mac-address>	The source MAC address of the packets. Enter this in the format <HHHH.HHHH.HHHH> Where each <i>H</i> is a hexadecimal number that represents a 4 bit binary number.
<source-mac-mask	The mask that will be applied to the source MAC addresses. Enter this in the format <HHHH.HHHH.HHHH> Where each <i>H</i> is a hexadecimal number that represents a 4 bit binary number. For a mask, each value will be either 0 or F. Where Hex FF = Ignore, and Hex 00 = Match.
any	Any source MAC address.
<destination-mac-address>	The destination MAC address of the packets. Enter this in the format <HHHH.HHHH.HHHH> Where each <i>H</i> is a hexadecimal number that represents a 4 bit binary number.

Parameter(cont.)	Description(cont.)
<code><destination-mac-mask></code>	The mask that will be applied to the destination MAC addresses. Enter this in the format <code><HHHH.HHHH.HHHH></code> Where each H is a hexadecimal number that represents a 4 bit binary number. For a mask, each value will be either 0 or F. Where Hex FF = Ignore, and Hex 00 = Match.
<code>any</code>	Any destination MAC address.
<code>vlan</code>	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<code><1-4094></code>	The VLAN VID.
<code>inner-vlan</code>	This parameter is used within double-tagged VLANs. It is the inner VLAN tag (VID); sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).
<code><1-4094></code>	The inner VLAN VID.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage This command creates an access-list for use with hardware classification, such as when applying QoS. The `<4000-4699>` range MAC hardware access-list will match on packets that have the specified source and destination MAC addresses. You may apply the **any** parameter if the source or destination MAC host address is not important.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To create an access-list that will permit packets with a MAC address of 0000.00ab.1234 and any destination address enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0000.00ab.1234
0000.0000.0000 any
```

To create an access-list that will permit packets with an initial MAC address component of 0000.00ab and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit 0000.00ab.1234
0000.0000.FFFF any
```

To create an access-list that will copy-to-mirror packets with an initial MAC address component of 0000.00ab and any destination address for use with the **mirror interface** command, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 copy-to-mirror 0000.00ab.1234
0000.0000.FFFF any
```

To destroy the access-list with an access-list identity of 4000 enter the commands:

```
awplus# configure terminal
awplus(config)# no access-list 4000
```

access-list hardware (named)

This command creates a named hardware access-list that can be applied to a switch port interface. ACL filters for a named hardware ACL are created in the IPv4 Hardware ACL Configuration mode.

The **no** variant of this command removes the specified named hardware ACL.

Syntax `access-list hardware <hardware-access-list-name>`
`no access-list hardware <hardware-access-list-name>`

Parameter	Description
<code><hardware-access-list-name></code>	Specify the hardware ACL name to then define ACL filters for in the subsequent IPv4 Hardware ACL Configuration mode.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage Use this command to name a hardware ACL and enter the IPv4 Hardware ACL Configuration mode. If the named hardware ACL doesn't exist, it will be created after entry. If the named hardware ACL does exist, then you can enter IPv4 Hardware ACL Configuration mode for that existing ACL.

Entering this command with the hardware ACL name moves you to the `(config-ip-hw-acl)` prompt for the IPv4 Hardware ACL Configuration mode so you can enter ACL filters with sequence numbers. From this prompt, configure the filters for the ACL. See [Chapter 58, Access Control Lists Introduction](#) for complete examples of configured sequenced numbered ACLs.

See also the table “[IPv4 Hardware Access List Commands and Prompts](#)” in this chapter. This table shows the relevant prompts at which ACL commands and ACL filters are entered for sequenced ACLs.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Example To create the hardware access-list named `ACL-1` and enter the IPv4 Hardware ACL Configuration mode to specify the ACL filter entry, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware ACL-1
awplus(config-ip-hw-acl)#
```

To remove the hardware access-list named `ACL-1`, use the commands:

```
awplus# configure terminal
awplus(config)# no access-list hardware ACL-1
```

Related Commands **access-group**
 (access-list hardware ICMP filter)
 (access-list hardware IP protocol filter)
 (access-list hardware TCP UDP filter)
 (access-list standard named filter)
 show access-group
 show access-list (IPv4 Hardware ACLs)

(access-list hardware ICMP filter)

Use this ACL filter to add a new ICMP filter entry to the current hardware access-list. The filter will match on any ICMP packet that has the specified source and destination IP addresses and ICMP type. The parameter **any** may be specified if an address does not matter and the ICMP type is an optional parameter. If a sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The optional **vlan** parameter can be applied to match tagged (802.1q) packets.

The **no** variant of this command removes an ICMP filter entry from the current hardware access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the command, the [show access-list \(IPv4 Hardware ACLs\) command on page 59.40](#).

Syntax
[icmp] [*<sequence-number>*]
 {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
 icmp *<source>* *<destination>*
 [icmp *<icmp-value>*] [vlan *<1-4094>*]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
 icmp *<source>* *<destination>*
 [icmp *<icmp-value>*] [vlan *<1-4094>*]

no *<sequence-number>*

Parameter	Description
<i><sequence-number></i>	<i><1-65535></i> The sequence number for the filter entry of the selected access control list.
deny	Access-list rejects packets that match the source and destination filtering specified with this command.
permit	Access-list permits packets that match the source and destination filtering specified with this command.
send-to-cpu	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
copy-to-cpu	Specify packets to copy to the CPU.
copy-to-mirror	Specify packets to copy to the mirror port.
icmp	ICMP packet type.

Parameter(cont.)	Description(cont.)
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<i><ip-addr>/ <prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<i><ip-addr> <reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.
host <i><ip-addr></i>	Matches a single source host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
any	Matches any source IP address.
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<i><ip-addr>/ <prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr> <reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.
host <i><ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
any	Matches any destination IP address.
icmp-type	The ICMP type.
<i><icmp-value></i>	The value of the ICMP type.
vlan	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<i><1-4094></i>	The VLAN VID.

Mode IPv4 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create a named hardware access-list that applies the appropriate permit, deny requirements etc. Then use the **access-group** command on page 59.4 to apply this access-list to a specific port or range. Note that this command will apply the access-list only to **incoming** data packets.

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note  You must reach the prompt `awplus(config-ip-hw-acl)#` by running the **access-list hardware (named)** command on page 59.20, and entering an appropriate access-list name.

Note  Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Example To add an access-list filter entry with a sequence number of 100 to the access-list named `my-list` that will permit ICMP packets with a source address of `192.168.1.0/24`, any destination address and an icmp type of 5, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 100 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To remove an access-list filter entry with a sequence number of 100 in the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no 100
```

Related Commands **access-list hardware (named)**
show running-config
show access-list (IPv4 Hardware ACLs)

(access-list hardware IP protocol filter)

Use this ACL filter to add an IP protocol type filter entry to the current hardware access-list. The filter will match on any IP packet that has the specified source and destination IP addresses and IP protocol type, or has the optionally specified source and destination MAC addresses. The parameter **any** may be specified if an address does not matter. If a sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The optional **vlan** parameter can be applied to match tagged (802.1q) packets.

The **no** variant of this command removes an IP protocol type filter entry from the current hardware access-list. You can specify the IP protocol type filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its IP protocol type filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Hardware ACLs\) command on page 59.40](#).

Syntax [any|ip|proto]

```
[<sequence-number>]
  {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
  {any|ip|proto <ip-protocol>}
  {<source>|dhcpsnooping|any} {<destination>|any}
  [mac {<mac-source-address> <mac-source-mask>|any}
  {<mac-destination-address> <mac-destination-mask>|any}
  [vlan <1-4094>]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
  {any|ip|proto <ip-protocol>}
  {<source>|dhcpsnooping} {<destination>|any}
  [mac {<mac-source-address> <mac-source-mask>|any}
  {<mac-destination-address> <mac-destination-mask>|any}
  [vlan <1-4094>]

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Access-list rejects packets of the type specified.
permit	Access-list allows packets of the type specified
send to cpu	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
copy to cpu	Specify packets to copy to the CPU.
copy to mirror	Specify packets to copy to the mirror port.
ip	IP packets.
any	Any packet.

255	Reserved / IANA	
<i>dhcpsnooping</i>	The source address learned from the DHCP Snooping binding database.	

Parameter(cont.)	Description(cont.)
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<i>any</i>	Matches any source IP address.
<i>host <ip-addr></i>	Matches a single source host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/<prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<i><ip-addr><reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <i>192.168.1.1 0.0.0.255</i> is the same as entering <i>192.168.1.1/24</i> .
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<i>any</i>	Matches any destination IP address.
<i>host <ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/<prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr><reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <i>192.168.1.1 0.0.0.255</i> is the same as entering <i>192.168.1.1/24</i> .
<i>mac</i>	Signifies a MAC and based hardware access-list.
<i><mac-source-address></i>	The source host's MAC address, entered in HHHH.HHHH.HHHH format.
<i><mac-source-mask></i>	The source host's MAC wildcard mask entered in HHHH.HHHH.HHHH format. Where Hex FF = Ignore, and Hex 00 = Match.

Parameter(cont.)	Description(cont.)
any	Matches any source MAC address.
<mac-destination-address>	The destination host's MAC address, entered in HHHH.HHHH.HHHH format.
<mac-destination-mask>	The destination host's wildcard mask entered in HHHH.HHHH.HHHH format. Where Hex FF = Ignore, and Hex 00 = Match.
any	Matches any destination MAC address.
vlan	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<1-4094>	The VLAN VID.

Mode IPv4 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create a named hardware access-list that applies the appropriate permit, deny requirements etc. Then use the [access-group command on page 59.4](#) to apply this access-list to a specific port or range. Note that this command will apply the access-list only to **incoming** data packets.

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note  The access control list being configured is selected by running the [access-list hardware \(named\) command on page 59.20](#), with the required access control list number, or name, but with no further parameters selected.

Note  Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To add an access-list filter entry to the access-list named `my-list` that will permit any type of IP packet with a source address of `192.168.1.1` and any destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any
```

To add an access-list filter entry to the access-list named `my-list` that will permit any type of IP packet with a source address of `192.168.1.1` and a MAC source address of `ffee.ddcc.bbaa` with any IP and MAC destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any mac
ffee.ddcc.bbaa any
```

To add an access-list filter entry to the access-list named `my-list` a filter that will deny all IGMP packets (protocol 2) from the `192.168.0.0` network with sequence number 50 in access-list, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 50 deny proto 2 192.168.0.0/16 any
```

To add an access-list filter entry to the access-list named `my-list` that will deny all IP packets on vlan 2, use the commands:

```
awplus# enable
awplus(config)# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# deny ip any any vlan 2
```

Related Commands [access-list hardware \(named\)](#)
 [show running-config](#)
 [show access-list \(IPv4 Hardware ACLs\)](#)

(access-list hardware MAC filter)

Use this ACL filter to add a MAC filter entry to the current hardware access-list. The filter will match on any IP packet that has the specified source and destination MAC addresses. The parameter **any** may be specified if an address does not matter. If a sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

Optionally, the **vlan** and **inner-vlan** parameters can be matched for tagged (802.1q) packets.

The **no** variant of this command removes a MAC filter entry from the current hardware access-list. You can specify the MAC filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its MAC filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Hardware ACLs\) command on page 59.40](#).

Syntax [mac]

```
[<sequence-number>]
  {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
  mac {<source-mac-address> <source-mac-mask>|any}
      {<destination-mac-address> <destination-mac-mask>|any}
      [{vlan <1-4094>|inner-vlan <1-4094>}]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
   mac {<source-mac-address> <source-mac-mask>|any}
       {<destination-mac-address> <destination-mac-mask>|any}
       [{vlan <1-4094>|inner-vlan <1-4094>}]

no <sequence-number>
```

Parameter	Description
<code><sequence-number></code>	<code><1-65535></code> The sequence number for the filter entry of the selected access control list.
<code>deny</code>	Specify packets to reject.
<code>permit</code>	Specify packets to accept.
<code>send-to-cpu</code>	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
<code>copy-to-cpu</code>	Specify packets to copy to the CPU.
<code>copy-to-mirror</code>	Specify packets to copy to the CPU.
<code>mac</code>	MAC address.
<code><source-mac-address></code>	The source MAC address of the packets. Enter this in the format <code><HHHH.HHHH.HHHH></code> Where each H is a hexadecimal number that represents a 4 bit binary number.

Parameter(cont.)	Description(cont.)
<code><source-mac-mask</code>	The mask that will be applied to the source MAC addresses. Enter this in the format <code><HHHH.HHHH.HHHH></code> Where each H is a hexadecimal number that represents a 4 bit binary number. For a mask, each value will be either 0 or F. Where Hex FF = Ignore, and Hex 00 = Match.
any	Any source MAC host.
<code><destination-mac-address></code>	The destination MAC address of the packets. Enter this in the format <code><HHHH.HHHH.HHHH></code> Where each H is a hexadecimal number that represents a 4 bit binary number.
<code><destination-mac-mask></code>	The mask that will be applied to the destination MAC addresses. Enter this in the format <code><HHHH.HHHH.HHHH></code> Where each H is a hexadecimal number that represents a 4 bit binary number. For a mask, each value will be either 0 or F. Where Hex FF = Ignore, and Hex 00 = Match.
any	Any destination MAC host.
vlan	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<code><1-4094></code>	The VLAN VID.
inner-vlan	This parameter is used within double-tagged VLANs. It is the inner VLAN tag (VID); sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).
<code><1-4094></code>	The inner VLAN VID.

Mode IPv4 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create a named hardware access-list that applies the appropriate permit, deny requirements etc. Then use the **access-group command on page 59.4** to apply this access-list to a specific port or range. Note that this command will apply the access-list only to **incoming** data packets.

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number

Note  The access control list being configured is selected by running the **access-list hardware (named) command on page 59.20**, with the required access control list number, or name, but with no further parameters selected.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Example To add an access-list filter entry to the access-list named `my-list` that will permit packets with a source MAC address of `0000.00ab.1234` and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit mac 0000.00ab.1234
                                0000.0000.0000 any
```

Example To remove an access-list filter entry that permit packets with a source MAC address of `0000.00ab.1234` and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no permit mac 0000.00ab.1234
                                0000.0000.0000 any
```

Related Commands [access-group](#)
[access-list hardware \(named\)](#)
[show running-config](#)

(access-list hardware TCP UDP filter)

Use this ACL filter to add a TCP or UDP filter entry to the current hardware access-list. The filter will match on any TCP or UDP type packet that has the specified source and destination IP addresses. The parameter **any** may be specified if an address does not matter. If a sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The optional **vlan** parameter can be applied to match tagged (802.1q) packets.

The **no** variant of this command removes a TCP or UDP filter entry from the current hardware access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Hardware ACLs\) command on page 59.40](#).

Syntax
[tcp|udp]

```
[<sequence-number>]
 {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
 {tcp|udp}
 [<source>|
 eq <sourceport>|gt <sourceport>|lt <sourceport>|
 ne <sourceport>|range <start-range> <end-range>]
 [<destination>|
 eq <destport>|gt <destport>|lt <destport>|
 ne <destport>|range <start-range> <end-range>]
 [vlan <1-4094>]

no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
 {tcp|udp}
 [<source>|
 eq <sourceport>|gt <sourceport>|lt <sourceport>|
 ne <sourceport>|range <start-range> <end-range>]
 [<destination>|
 eq <destport>|gt <destport>|lt <destport>|
 ne <destport>|range <start-range> <end-range>]
 [vlan <1-4094>]

no <sequence-number>
```

Parameter	Description
<code><sequence-number></code>	<code><1-65535></code> The sequence number for the filter entry of the selected access control list.
<code>deny</code>	Access-list rejects packets that match the source and destination filtering specified with this command.
<code>permit</code>	Access-list permits packets that match the source and destination filtering specified with this command.
<code>send-to-cpu</code>	Specify packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.

Parameter(cont.)	Description(cont.)
<code>copy-to-cpu</code>	Specify packets to copy to the CPU.
<code>copy-to-mirror</code>	Specify packets to copy to the mirror port.
<code>tcp</code>	TCP packets.
<code>udp</code>	UDP packets.
<code><source></code>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<code>any</code>	Matches any source IP address.
<code>host <ip-addr></code>	Matches a single source host with the IP address given by <code><ip-addr></code> in dotted decimal notation.
<code><ip-addr>/ <prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<code><ip-addr> <reverse-mask></code>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.1 0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .
<code><sourceport></code>	The source TCP or UDP port number, specified as an integer between 0 and 65535.

Parameter(cont.)	Description(cont.)
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
any	Matches any destination IP address.
host <i><ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/<prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr><reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.
eq	Equal to.
lt	Less than.
gt	Greater than.
ne	Not equal to.
<i><destport></i>	The source TCP or UDP port number, specified as an integer between 0 and 65535.
range	Specify the range of port numbers between 0 and 65535.
<i><start-range></i>	The source or destination port number at the start of the range <i><0-65535></i> .
<i><end-range></i>	The source or destination port number at the end of the range <i><0-65535></i> .
vlan	Specifies that the ACL will match on the ID in the packet's VLAN tag.
<i><1-4094></i>	The VLAN VID.

Mode IPv4 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage First create a named hardware access-list that applies the appropriate permit, deny requirements etc. Then use the **access-group** command on page 59.4 to apply this access-list to a specific port or range. Note that this command will apply the access-list only to **incoming** data packets.

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note  The access control list being configured is selected by running the **access-list hardware (named)** command on page 59.20. with the required access control list number, or name, but with no further parameters selected.

Note  Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Related Commands **access-list hardware (named)**
show running-config
show access-list (IPv4 Hardware ACLs)

commit (IPv4)

Use this command to commit the IPv4 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv4 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv4 ACLs to synchronize.

Syntax `commit`

Mode IPv4 Hardware ACL Configuration

Usage Normally, when an IPv4 hardware ACL is edited, the new configuration state of the IPv4 ACL is not written to hardware until you exit IPv4 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the **exit** command to exit configuration modes, potentially leading to IPv4 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv4 hardware ACL filter ensures that it is updated in the hardware immediately.

Examples To update the hardware with the IPv4 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# access-list hardware my-hw-list
awplus(config-ip-hw-acl)# commit
```

Related Commands [access-list hardware \(named\)](#)

show access-group

Use this command to show the access-lists attached globally. If an access-list is specified, only that access-list will be displayed.

Syntax `show access-group [{<3000-3699> | <4000-4699> | <access-list-name> }]`

Parameter	Description
<code><3000-3699></code>	Specify a Hardware IP access-list.
<code><4000-4699></code>	Specify a Hardware MAC access-list.
<code><access-list-name></code>	Specify a Hardware IPv4 access-list name.

Mode User Exec and Privileged Exec

Example To show all access-lists attached globally:

```
awplus# show access-group
```

Output **Figure 59-1: Example output from the show access-group command**

```
Global access control list
access-group 3000
access-group 4000
```

Related Commands [ip prefix-list](#)

show access-list (IPv4 Hardware ACLs)

Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list.

Syntax `show access-list`
`[<1-99> | <100-199> | <1300-1999> | <2000-2699> | <3000-3699> |`
`<4000-4499> | <access-list-name>]`

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (standard - expanded range).
<2000-2699>	IP extended access-list (extended - expanded range).
<3000-3699>	Hardware IP access-list.
<4000-4499>	Hardware MAC access-list.
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Example To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
  deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
  permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
  permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

Example To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the below error message if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

Related Commands [access-list extended \(named\)](#)
[access-list \(hardware MAC numbered\)](#)
[access-list hardware \(named\)](#)

show interface access-group

Use this command to display the access groups attached to a port. If an access group is specified, then the output only includes the ports that the specified access group is attached to. If no access group is specified then this command displays all access groups that are attached to the ports that are specified with *<port-list>*.

Note that **access group** is the term given for an access-list when it is applied to an interface.

Syntax `show interface <port-list> access-group
[<3000-3699> | <4000-4699> | <access-list-name>]`

Parameter	Description
<i><port-list></i>	Specify the ports to display information. A port-list can be either: <ul style="list-style-type: none"> ■ a switch port (e.g. port1.1.12) a static channel group (e.g., sa3) or a dynamic (LACP) channel group (e.g., po3) ■ a continuous range of ports separated by a hyphen, e.g., port1.1.1-1.1.24 or port1.1.1-port1.1.24 or po1-po4 ■ a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.3-1.1.24. Do not mix switch ports, static channel groups, and LACP channel groups in the same list.
access group	Select the access group whose details you want to show.
<i><3000-3699></i>	Specifies the Hardware IP access-list.
<i><4000-4699></i>	Specifies the Hardware MAC access-list.
<i><access-list-name></i>	Specify the Hardware IPv4 access-list name.

Mode User Exec and Privileged Exec

Example To show all access-lists attached to port1.1.1, use the command:

```
awplus# show interface port1.1.1 access-group
```

Output **Figure 59-2: Example output from the show interface access-group command**

```
Interface port1.1.1
  access-group 3000
  access-group 3002
  access-group 3001
```

Introduction

This chapter provides an alphabetical reference for the IPv4 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

-
- Note** See [Chapter 58, Access Control Lists Introduction](#) for descriptions of ACLs, and for further information about rules when applying ACLs see the [ACL Rules](#) section.
-  See [ACL Filter Sequence Numbers](#) and [ACL Filter Sequence Number Behavior](#) sections in [Chapter 58, Access Control Lists Introduction](#) about ACL Filters.
-

See all relevant Routing commands and configurations in [“IPv4 Software Access Control List \(ACL\) Commands”](#) and all relevant Multicast commands and configurations in [“Multicast Applications”](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see [Chapter 20, Link Aggregation Introduction and Configuration](#), and [Chapter 21, Link Aggregation Commands](#).

-
- Note** Text in parenthesis in command names indicates usage not keyword entry. For example, **access-list hardware (named)** indicates named IPv4 hardware ACLs entered as `access-list hardware <name>` where `<name>` is a placeholder not a keyword.
-

-
- Note** Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(access-list standard numbered filter)** represents command entry in the format shown in the syntax `[<sequence-number>] {deny|permit} {<source>|host <host-address>|any}`.
-

-
- Note** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.
- 
-

IPv4 Software Access List Commands and Prompts

Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The table “IPv4 Software Access List Commands and Prompts” shows the CLI prompts at which ACL commands are entered.

Table 60-1: IPv4 Software Access List Commands and Prompts

Command Name	Command Mode	Prompt
clear ip prefix-list	Privileged Exec	awplus#
show ip access-list	Privileged Exec	awplus#
show ip prefix-list	Privileged Exec	awplus#
access-group	Global Configuration	awplus(config)#
access-list (extended numbered)	Global Configuration	awplus(config)#
access-list standard (named)	Global Configuration	awplus(config)#
access-list (standard numbered)	Global Configuration	awplus(config)#
ip prefix-list	Global Configuration	awplus(config)#

(access-list extended ICMP filter)	IPv4 Extended ACL Configuration	awplus(config-ip-ext-acl)#
(access-list extended IP filter)	IPv4 Extended ACL Configuration	awplus(config-ip-ext-acl)#
(access-list extended IP protocol filter)	IPv4 Extended ACL Configuration	awplus(config-ip-ext-acl)#
(access-list extended TCP UDP filter)	IPv4 Extended ACL Configuration	awplus(config-ip-ext-acl)#
(access-list standard named filter)	IPv4 Standard ACL Configuration	awplus(config-ip-std-acl)#
(access-list standard numbered filter)	IPv4 Standard ACL Configuration	awplus(config-ip-std-acl)#

Command List

access-list extended (named)

This command configures an extended named access-list that permits or denies packets from specific source and destination IP addresses. You can either create an extended named ACL together with an ACL filter entry in the Global Configuration mode, or you can use the IPv4 Extended ACL Configuration mode for sequenced ACL filter entry after entering a list name.

The **no** variant of this command removes a specified extended named access-list.

Syntax
[**list-name**]

```
access-list extended <list-name>
no access-list extended <list-name>
```

Parameter	Description
<list-name>	A user-defined name for the access-list

Syntax
[**icmp**]

```
access-list extended <list-name>
  {deny|permit}
  icmp <source> <destination>
  [icmp-type <type-number>]
  [log]

no access-list extended <list-name>
  {deny|permit}
  icmp <source> <destination>
  [icmp-type <type-number>]
  [log]
```

Table 60-2: Parameters in the access-list extended (named) command - icmp

Parameter	Description
<list-name>	A user-defined name for the access-list.
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.
icmp	The access-list matches only ICMP packets.
icmp-type	Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.

Table 60-2: Parameters in the access-list extended (named) command - icmp(cont.)

Parameter(cont.)	Description(cont.)
<i><source></i>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<i>any</i>	Matches any source IP address.
<i>host <ip-addr></i>	Matches a single source host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/ <prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<i><ip-addr> <reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<i>any</i>	Matches any destination IP address.
<i>host <ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/ <prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr> <reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.

Table 60-2: Parameters in the access-list extended (named) command - icmp(cont.)

Parameter(cont.)	Description(cont.)
<i><type-number></i>	The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:
0	Echo replies.
3	Destination unreachable messages.
4	Source quench messages.
5	Redirect (change route) messages.
8	Echo requests.
11	Time exceeded messages.
12	Parameter problem messages.
13	Timestamp requests.
14	Timestamp replies.
15	Information requests.
16	Information replies.
17	Address mask requests.
18	Address mask replies.
log	Logs the results.

```

Syntax access-list extended <list-name>
[tcp|udp]    {deny|permit}
              {tcp|udp}
              <source>
              [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>]
              <destination>
              [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
              [log]]

no access-list extended <list-name>
    {deny|permit}
    {tcp|udp}
    <source>
    [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>]
    <destination>
    [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
    [log]]
    
```

Table 60-3: Parameters in the access-list extended (named) command - tcp|udp

Parameter	Description								
<list-name>	A user-defined name for the access-list.								
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.								
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.								
tcp	The access-list matches only TCP packets.								
udp	The access-list matches only UDP packets.								
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="667 1272 1425 1765"> <tbody> <tr> <td>any</td> <td>Matches any source IP address.</td> </tr> <tr> <td>host <ip-addr></td> <td>Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.</td> </tr> <tr> <td><ip-addr>/<prefix></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td> </tr> <tr> <td><ip-addr><reverse-mask></td> <td>Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.</td> </tr> </tbody> </table>	any	Matches any source IP address.	host <ip-addr>	Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.	<ip-addr><reverse-mask>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.
any	Matches any source IP address.								
host <ip-addr>	Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.								
<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.								
<ip-addr><reverse-mask>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.								

Table 60-3: Parameters in the access-list extended (named) command - tcp|

Parameter(cont.)	Description(cont.)
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
any	Matches any destination IP address.
host <i><ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/ <prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr> <reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24.
<i><sourceport></i>	The source port number, specified as an integer between 0 and 65535.
<i><destport></i>	The destination port number, specified as an integer between 0 and 65535.
eq	Matches port numbers equal to the port number specified immediately after this parameter.
lt	Matches port numbers less than the port number specified immediately after this parameter.
gt	Matches port numbers greater than the port number specified immediately after this parameter.
ne	Matches port numbers not equal to the port number specified immediately after this parameter.
log	Log the results.

Syntax `access-list extended <list-name>`
[proto|any|ip] `{deny|permit}`
`{proto <ip-protocol>|any|ip}`
`{<source>}`
`{<destination>}`
`[log]`

`no access-list extended <list-name>`
`{deny|permit}`
`{proto <ip-protocol>|any|ip}`
`{<source>}`
`{<destination>}`
`[log]`

Table 60-4: Parameters in the access-list extended (named) command - proto|ip|any

Parameter	Description
<code><list-name></code>	A user-defined name for the access-list.
<code>deny</code>	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
<code>permit</code>	The access-list permits packets that match the type, source, and destination filtering specified with this command.
<code>proto</code>	Matches only a specified type of IP Protocol.
<code>any</code>	The access-list matches any type of IP packet.
<code>ip</code>	The access-list matches only IP packets.
<code><source></code>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<code>any</code>	Matches any source IP address.
<code>host <ip-addr></code>	Matches a single source host with the IP address given by <code><ip-addr></code> in dotted decimal notation.
<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<code><ip-addr><reverse-mask></code>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering <code>192.168.1.1 0.0.0.255</code> is the same as entering <code>192.168.1.1/24</code> .

Table 60-4: Parameters in the access-list extended (named) command - proto|ip|

Parameter(cont.)	Description(cont.)
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
any	Matches any destination IP address.
host <i><ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr>/ <prefix></i>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<i><ip-addr> <reverse-mask></i>	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.
log	Logs the results.
<i><ip-protocol></i>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority http://www.iana.org/assignments/protocol-numbers)
Protocol Number	Protocol Description [RFC Reference]
1	Internet Control Message [RFC792]
2	Internet Group Management [RFC1112]
3	Gateway-to-Gateway [RFC823]
4	IP in IP [RFC2003]
5	Stream [RFC1190] [RFC1819]
6	TCP (Transmission Control Protocol) [RFC793]
8	EGP (Exterior Gateway Protocol) [RFC888]
9	IGP (Interior Gateway Protocol) [IANA]
11	Network Voice Protocol [RFC741]
17	UDP (User Datagram Protocol) [RFC768]
20	Host monitoring [RFC869]
27	RDP (Reliable Data Protocol) [RFC908]
28	IRTP (Internet Reliable Transaction Protocol) [RFC938]
29	ISO-TP4 (ISO Transport Protocol Class 4) [RFC905]
30	Bulk Data Transfer Protocol [RFC969]

Table 60-4: Parameters in the access-list extended (named) command - proto[ip]

Parameter(cont.)	Description(cont.)	
<code><ip-protocol></code> (cont.)	Protocol Number	Protocol Description [RFC Reference]
	33	Datagram Congestion Control Protocol [RFC4340]
	48	DSR (Dynamic Source Routing Protocol) [RFC4728]
	50	ESP (Encap Security Payload) [RFC2406]
	51	AH (Authentication Header) [RFC2402]
	54	NARP (NBMA Address Resolution Protocol) [RFC1735]

	254	Use for experimentation and testing / RFC3692
	255	Reserved / IANA

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring access-list for filtering IP software packets. To enable backwards compatibility you can either create access-lists from within this command, or you can enter **access-list** followed by only the number. This latter method moves you to the IPv4 Extended ACL Configuration mode for the selected access-list number, and from here you can configure your access-lists by using the commands (**access-list extended ICMP filter**), (**access-list extended IP filter**), and (**access-list extended IP protocol filter**).

The table “**IPv4 Software Access List Commands and Prompts**” on page 60.3 shows the prompts at which ACL commands are entered. See the relevant links shown for the **Related Commands**.

Note that packets must match both the source and the destination details.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as in previous software releases as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK deny tcp 2.2.2.3/24 eq
14 3.3.3.4/24 lt 12 log
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK
awplus(config-ip-ext-acl)# deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24
lt 12 log
```

Related Commands (**access-list extended ICMP filter**)
(**access-list extended IP filter**)
(**access-list extended TCP UDP filter**)
show access-group
show running-config
show ip access-list

access-list (extended numbered)

This command configures an extended numbered access-list that permits or denies packets from specific source and destination IP addresses. You can either create an extended numbered ACL together with an ACL filter entry in the Global Configuration mode, or you can use the IPv4 Extended ACL Configuration mode for sequenced ACL filter entry after entering a list number.

The **no** variant of this command removes a specified extended named access-list.

Syntax [list-number]

```
access-list {<100-199>|<2000-2699>}
no access-list {<100-199>|<2000-2699>}
```

Parameter	Description
<100-199>	IP extended access-list.
<2000-2699>	IP extended access-list (expanded range).

Syntax [deny|permit]

```
access-list {<100-199>|<2000-2699>}
    {deny|permit}
    ip <source> <destination>
no access-list {<100-199>|<2000-2699>}
    {deny|permit}
    ip <source> <destination>
```

Parameter	Description
<100-199>	IP extended access-list.
<2000-2699>	IP extended access-list (expanded range).
deny	Access-list rejects packets that match the source and destination filtering specified with this command.
permit	Access-list permits packets that match the source and destination filtering specified with this command.
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
any	Matches any source IP address.
host <ip-addr>	Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.
<ip-addr> <reverse-mask>	An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24. This matches any source IP address within the specified subnet.

Parameter(cont.)	Description(cont.)
<i><destination></i>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
any	Matches any destination IP address.
host <i><ip-addr></i>	Matches a single destination host with the IP address given by <i><ip-addr></i> in dotted decimal notation.
<i><ip-addr></i> <i><reverse-mask></i>	An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.10.0.0.255 is the same as entering 192.168.1.1/24. This matches any destination IP address within the specified subnet.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring access-list for filtering IP software packets. To enable backwards compatibility you can either create access-lists from within this command, or you can enter **access-list** followed by only the number. This latter method moves you to the IPv4 Extended ACL Configuration mode for the selected access-list number, and from here you can configure your access-lists by using the commands (**access-list extended ICMP filter**), (**access-list extended IP filter**), and (**access-list extended IP protocol filter**).

The table “**IPv4 Software Access List Commands and Prompts**” on page 60.3 shows the prompts at which ACL commands are entered. See the relevant links shown for the **Related Commands**.

Note that packets must match both the source and the destination details.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as in previous software releases as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101 deny ip 172.16.10.0 0.0.0.255
any
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# deny ip 172.16.10.0 0.0.0.255 any
```

Related Commands [\(access-list extended ICMP filter\)](#)

 [\(access-list extended TCP UDP filter\)](#)
[show access-group](#)
[show running-config](#)
[show ip access-list](#)

(access-list extended ICMP filter)

Use this ACL filter to add a new ICMP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current extended access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

Syntax
[icmp]

```
[<sequence-number>] {deny|permit}
  icmp <source> <destination>
  [icmp-type <icmp-value>] [log]

no {deny|permit} icmp <source> <destination>
  [icmp-type <icmp-value>] [log]

no <sequence-number>
```

Parameter	Description				
<code><sequence-number></code>	<1-65535> The sequence number for the filter entry of the selected access control list.				
<code>deny</code>	Access-list rejects packets that match the source and destination filtering specified with this command.				
<code>permit</code>	Access-list permits packets that match the source and destination filtering specified with this command.				
<code>icmp</code>	ICMP packet type.				
<code><source></code>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="667 1429 1423 1630"> <tbody> <tr> <td><code><ip-addr>/<prefix></code></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td> </tr> <tr> <td><code>any</code></td> <td>Matches any source IP address.</td> </tr> </tbody> </table>	<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.	<code>any</code>	Matches any source IP address.
<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.				
<code>any</code>	Matches any source IP address.				
<code><destination></code>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: <table border="1" data-bbox="667 1756 1423 1957"> <tbody> <tr> <td><code><ip-addr>/<prefix></code></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.</td> </tr> <tr> <td><code>any</code></td> <td>Matches any destination IP address.</td> </tr> </tbody> </table>	<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.	<code>any</code>	Matches any destination IP address.
<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.				
<code>any</code>	Matches any destination IP address.				
<code>icmp-type</code>	The ICMP type.				

Parameter(cont.)	Description(cont.)
<code><icmp-value></code>	The value of the ICMP type.
<code>log</code>	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note  The access control list being configured is selected by running the **access-list (extended numbered)** command or the **access-list extended (named)** command, with the required access control list number, or name - but with no further parameters selected.

Note  Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new entry in access-list called `my-list` that will reject ICMP packets from 10.0.0.1 to 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny icmp 10.0.0.1/32 192.168.1.1/32
```

Use the following commands to add a new filter at sequence number 5 position of the access-list called `my-list`. The filter will accept the ICMP type 8 packets from 10.1.1.0/24 network, to 192.168.1.0 network:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit icmp 10.1.1.0/24
192.168.1.0/24 icmp-type 8
```

Related Commands

- access-group**
- show access-group**
- show running-config**
- show ip access-list**

(access-list extended IP filter)

Use this ACL filter to add a new IP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax
[ip]

```
[<sequence-number>] {deny|permit} ip <source> <destination>
no {deny|permit} ip <source> <destination>
no <sequence-number>
```

Parameter	Description						
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.						
deny	Access-list rejects packets that match the source and destination filtering specified with this command.						
permit	Access-list permits packets that match the source and destination filtering specified with this command.						
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="657 1294 1423 1615"> <tbody> <tr> <td>any</td> <td>Matches any source IP address.</td> </tr> <tr> <td>host <ip-addr></td> <td>Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.</td> </tr> <tr> <td><ip-addr> <reverse-mask></td> <td>Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.</td> </tr> </tbody> </table>	any	Matches any source IP address.	host <ip-addr>	Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.	<ip-addr> <reverse-mask>	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.
any	Matches any source IP address.						
host <ip-addr>	Matches a single source host with the IP address given by <ip-addr> in dotted decimal notation.						
<ip-addr> <reverse-mask>	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.						
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination: <table border="1" data-bbox="657 1738 1423 2051"> <tbody> <tr> <td>any</td> <td>Matches any destination IP address.</td> </tr> <tr> <td>host <ip-addr></td> <td>Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.</td> </tr> <tr> <td><ip-addr> <reverse-mask></td> <td>Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.</td> </tr> </tbody> </table>	any	Matches any destination IP address.	host <ip-addr>	Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.	<ip-addr> <reverse-mask>	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.
any	Matches any destination IP address.						
host <ip-addr>	Matches a single destination host with the IP address given by <ip-addr> in dotted decimal notation.						
<ip-addr> <reverse-mask>	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter 192.168.1.1 0.0.0.255.						

Mode Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note  The access control list being configured is selected by running the **access-list (extended numbered)** command or the **access-list extended (named)** command, with the required access control list number, or name - but with no further parameters selected.

Note  Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 **[list-number]** First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a numbered extended access-list 101:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the numbered extended access-list 101 that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

Example 2 **[list-name]** First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a named access-list called `my-acl`:

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the named access-list `my-acl` that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

Example 3 Use the following commands to remove the access-list filter entry with sequence number
[list-number] 20 from extended numbered access-list 101.

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# no 20
```

Example 4 Use the following commands to remove the access-list filter entry with sequence number
[list-name] 20 from extended named access-list my-acl:

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)# no 20
```

Related Commands

(access-list extended IP protocol filter)

Use this ACL filter to add a new IP protocol type filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP protocol filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax [*<sequence-number>*] {deny|permit} proto *<ip-protocol>*
[proto] *<source>* *<destination>* [log]

no {deny|permit} proto *<ip-protocol>* *<source>* *<destination>* [log]
 no *<sequence-number>*

Parameter	Description

Parameter(cont.)	Description(cont.)
<code><source></code>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:
<code><ip-addr>/ <prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
<code>any</code>	Matches any source IP address.
<code><destination></code>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<code><ip-addr>/ <prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<code>any</code>	Matches any destination IP address.
<code>log</code>	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

 **Note** The access control list being configured is selected by running the **access-list (extended numbered)** command or the **access-list extended (named)** command, with the required access control list number, or name - but with no further parameters selected.

 **Note** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [creating a list]

Use the following commands to add a new access-list filter entry to the access-list named `my-list` that will reject IP packets from source address `10.10.1.1/32` to destination address `192.68.1.1/32`:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny ip 10.10.1.1/32 192.168.1.1/32
```

Example 2 Use the following commands to add a new access-list filter entry at sequence position 5 in the access-list named `my-list` that will accept packets from source address `10.10.1.1/24` to destination address `192.68.1.1/24`:
[adding to a list]

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit ip 10.10.1.1/24 192.168.1.1/24
```

Related Commands

- access-list extended (named)**
- access-list (extended numbered)**
- show access-group**
- show running-config**
- show ip access-list**

(access-list extended TCP UDP filter)

Use this ACL filter to add a new TCP or UDP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes a TCP or UDP filter entry from the current extended access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax
[tcp|udp]

```
[<sequence-number>] {deny|permit} {tcp|udp}
  <source>
    {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}
  <destination>
    [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
  [log]

no {deny|permit} {tcp|udp}
  <source>
    {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}
  <destination>
    [eq <destport>|lt <destport>|gt <destport>|ne <destport>]
  [log]

no <sequence-number>
```

Parameter	Description				
<code><sequence-number></code>	<1-65535> The sequence number for the filter entry of the selected access control list.				
<code>deny</code>	Access-list rejects packets that match the source and destination filtering specified with this command.				
<code>permit</code>	Access-list permits packets that match the source and destination filtering specified with this command.				
<code>tcp</code>	The access-list matches only TCP packets.				
<code>udp</code>	The access-list matches only UDP packets.				
<code><source></code>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="667 1697 1415 1899"> <tbody> <tr> <td><code><ip-addr>/<prefix></code></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td> </tr> <tr> <td><code>any</code></td> <td>Matches any source IP address.</td> </tr> </tbody> </table>	<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.	<code>any</code>	Matches any source IP address.
<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.				
<code>any</code>	Matches any source IP address.				
<code><sourceport></code>	The source port number, specified as an integer between 0 and 65535.				

Parameter(cont.)	Description(cont.)
<code><destination></code>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:
<code><ip-addr>/ <prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
<code>any</code>	Matches any destination IP address.
<code><destport></code>	The destination port number, specified as an integer between 0 and 65535.
<code>eq</code>	Matches port numbers equal to the port number specified immediately after this parameter.
<code>lt</code>	Matches port numbers less than the port number specified immediately after this parameter.
<code>gt</code>	Matches port numbers greater than the port number specified immediately after this parameter.
<code>ne</code>	Matches port numbers not equal to the port number specified immediately after this parameter.
<code>log</code>	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

 **Note** The access control list being configured is selected by running the **access-list (extended numbered)** command or the **access-list extended (named)** command, with the required access control list number, or name - but with no further parameters selected.

 **Note** Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 [creating a list]

To add a new entry to the access-list named `my-list` that will reject TCP packets from 10.0.0.1 on TCP port 10 to 192.168.1.1 on TCP port 20, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny tcp 10.0.0.1/32 eq 10
192.168.1.1/32 eq 20
```

Example 2 To insert a new entry with sequence number 5 of the access-list named `my-list` that will accept UDP packets from `10.1.1.0/24` network to `192.168.1.0/24` network on UDP port 80, use the commands:

[adding to a list]

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit udp 10.1.1.0/24
                             192.168.1.0/24 eq 80
```

Related Commands

- [access-list \(extended numbered\)](#)
- [show access-group](#)
- [show running-config](#)
- [show ip access-list](#)

access-list standard (named)

This command configures a standard named access-list that permits or denies packets from a specific source IP address. You can either create a standard named ACL together with an ACL filter entry in the Global Configuration mode, or you can use the IPv4 Standard ACL Configuration mode for sequenced ACL filter entry after first entering an access-list name.

The **no** variant of this command removes a specified standard named access-list.

Syntax [list-name]

```
access-list standard <standard-access-list-name>
```

```
no access-list standard <standard-access-list-name>
```

Parameter	Description
<standard-access-list-name>	Specify a name for the standard access-list.

Syntax [deny|permit]

```
access-list standard <standard-access-list-name> {deny|permit}
<source>
```

```
no access-list standard <standard-access-list-name> {deny|permit}
<source>
```

Parameter	Description				
<standard-access-list-name>	Specify a name for the standard access-list.				
deny	The access-list rejects packets that match the source filtering specified with this command.				
permit	The access-list permits packets that match the source filtering specified with this command.				
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="654 1366 1422 1599"> <tbody> <tr> <td><ip-addr>/<prefix></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.</td> </tr> <tr> <td>any</td> <td>Matches any source IP address.</td> </tr> </tbody> </table>	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.	any	Matches any source IP address.
<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.				
any	Matches any source IP address.				

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring a standard named access-list for filtering IP software packets. For backwards compatibility you can either create the access-list from within this command, or you can enter this command followed by only the standard access-list name then enter. This latter method moves you to the IPv4 Standard ACL Configuration mode for the selected standard named access-list, and from here you can configure the deny or permit filters for this selected standard named access-list.

See the table [“IPv4 Software Access List Commands and Prompts”](#) in this chapter which shows the prompts at which ACL commands are entered. See the relevant links shown for the **Related Commands**.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To define a standard access-list named `my-list` and deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list deny any
```

Alternatively, to define a standard access-list named `my-list` and enter the IPv4 Standard ACL Configuration mode to deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 5 deny any
```

Related Commands [\(access-list standard named filter\)](#)
[show access-group](#)
[show running-config](#)
[show ip access-list](#)

access-list (standard numbered)

This command configures a standard numbered access-list that permits or denies packets from a specific source IP address. You can either create a standard numbered ACL together with an ACL filter entry in the Global Configuration mode, or you can use the IPv4 Standard ACL Configuration mode for sequenced ACL filter entry after first entering an access-list number.

The **no** variant of this command removes a specified standard numbered access-list.

Syntax [list-number]

```
access-list {<1-99>|<1300-1999>}
no access-list {<1-99>|<1300-1999>}
```

Parameter	Description
<1-99>	IP standard access-list.
<1300-1999>	IP standard access-list (expanded range).

Syntax [deny|permit]

```
access-list {<1-99>|<1300-1999>} {deny|permit} <source>
no access-list {<1-99>|<1300-1999>} {deny|permit} <source>
```

Parameter	Description				
<1-99>	IP standard access-list.				
<1300-1999>	IP standard access-list (expanded range).				
deny	Access-list rejects packets from the specified source.				
permit	Access-list accepts packets from the specified source.				
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="630 1355 1426 1512"> <tbody> <tr> <td><ip-addr> <reverse-mask></td> <td>Enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.</td> </tr> <tr> <td>any</td> <td>Matches any source IP address.</td> </tr> </tbody> </table>	<ip-addr> <reverse-mask>	Enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.	any	Matches any source IP address.
<ip-addr> <reverse-mask>	Enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.				
any	Matches any source IP address.				

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring a standard numbered access-list for filtering IP software packets. For backwards compatibility you can either create the access-list from within this command, or you can enter this command followed by only the standard access-list name. This moves you to the IPv4 Standard ACL Configuration mode for the selected standard numbered access-list, and from here you can configure the deny or permit filters for this selected standard numbered access-list.

See the table **“IPv4 Software Access List Commands and Prompts”** in this chapter which shows the prompts at which ACL commands are entered. See the relevant links shown for the **Related Commands**.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example To create ACL number 67 that will deny packets from subnet 172.16.10, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67 deny 172.16.10.0 0.0.0.255
```

Alternatively, to enter the IPv4 Standard ACL Configuration mode to create the ACL filter and deny packets from subnet 172.16.10.0 for the standard numbered access-list 67, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67
awplus(config-ip-std-acl)# deny 172.16.10.0 0.0.0.255
```

Related Commands **(access-list standard named filter)**
show access-group
show running-config
show ip access-list

(access-list standard named filter)

This ACL filter adds a source IP address filter entry to a current named standard access-list. If the sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current named standard access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the [show access-list \(IPv4 Software ACLs\)](#) command.

Syntax [`<sequence-number>`] {deny|permit} {<source> [exact-match]|any}
 no {deny|permit} {<source> [exact-match]|any}
 no <sequence-number>

Parameter	Description				
<code><sequence-number></code>	<code><1-65535></code> The sequence number for the filter entry of the selected access control list.				
deny	Access-list rejects packets of the source filtering specified.				
permit	Access-list allows packets of the source filtering specified				
<code><source></code>	The source address of the packets. You can specify either a subnet or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="790 1254 1423 1523"> <tbody> <tr> <td><code><ip-addr>/<prefix></code></td> <td>An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.</td> </tr> <tr> <td><code><ip-addr></code></td> <td>An IPv4 address in a.b.c.d format.</td> </tr> </tbody> </table>	<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.	<code><ip-addr></code>	An IPv4 address in a.b.c.d format.
<code><ip-addr>/<prefix></code>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.				
<code><ip-addr></code>	An IPv4 address in a.b.c.d format.				
exact-match	Specify an exact IP prefix to match on.				
any	Matches any source IP address.				

Mode IPv4 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note  The access control list being configured is selected by running the **access-list standard (named)** command with the required access control list number, or name, but with no further parameters selected.

Note  Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example Use the following commands to add a new filter entry to access-list `my-list` that will reject IP address `10.1.1.1`:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# deny 10.1.1.1/32
```

Example Use the following commands to insert a new filter entry into access-list `my-list` at sequence position number 15 that will accept IP network `10.1.2.0`:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 15 permit 10.1.2.0/24
```

Related Commands

- access-list standard (named)**
- show access-group**
- show running-config**
- show ip access-list**

(access-list standard numbered filter)

This ACL filter adds a source IP address filter entry to a current standard numbered access-list. If a sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new filter entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current standard numbered access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. `no 10`), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the **show access-list (IPv4 Software ACLs)** command.

Syntax [*<sequence-number>*] {deny|permit} {<source>|host <host-address>|any}
 no {deny|permit} {<source>|host <host-address>|any}
 no <sequence-number>

Parameter	Description				
<i><sequence-number></i>	<i><1-65535></i> The sequence number for the filter entry of the selected access control list.				
deny	Access-list rejects packets of the type specified.				
permit	Access-list allows packets of the type specified				
<i><source></i>	The source address of the packets. You can specify either a subnet or all sources. The following are the valid formats for specifying the source: <table border="1" data-bbox="790 1220 1422 1512"> <tbody> <tr> <td><i><ip-addr></i> <i><reverse-mask></i></td> <td>Enter a reverse mask for the source address in dotted decimal format. For example, entering 192.168.1.10.0.255 is the same as entering 192.168.1.1/24.</td> </tr> <tr> <td><i><ip-addr></i></td> <td>An IPv4 address in a.b.c.d format.</td> </tr> </tbody> </table>	<i><ip-addr></i> <i><reverse-mask></i>	Enter a reverse mask for the source address in dotted decimal format. For example, entering 192.168.1.10.0.255 is the same as entering 192.168.1.1/24.	<i><ip-addr></i>	An IPv4 address in a.b.c.d format.
<i><ip-addr></i> <i><reverse-mask></i>	Enter a reverse mask for the source address in dotted decimal format. For example, entering 192.168.1.10.0.255 is the same as entering 192.168.1.1/24.				
<i><ip-addr></i>	An IPv4 address in a.b.c.d format.				
host	A single source host.				
<i><host-address></i>	Single source host address.				
any	Matches any source IP address.				

Mode IPv4 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 10 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

Note  The access control list being configured is selected by running the **access-list standard (named)** command with the required access control list number, or name, but with no further parameters selected.

Note  Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example To add a new entry accepting the IP network 10.1.1.0/24 at the sequence number 15 position, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 99
awplus(config-ip-std-acl)# 15 permit 10.1.2.0 0.0.0.255
```

Related Commands

- access-list (standard numbered)**
- show access-group**
- show running-config**
- show ip access-list**

clear ip prefix-list

Use this command to reset the hit count to zero in the prefix-list entries.

Syntax `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

Parameter	Description
<code><list-name></code>	The name of the prefix-list.
<code><ip-address>/<mask></code>	The IP prefix and length.

Mode Privileged Exec

Example To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

ip prefix-list

Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

Syntax

```
ip prefix-list <list-name> [seq <1-429496725>]
    {deny|permit}
    {any|<ip-prefix>}
    [ge <0-32>] [le <0-32>]

ip prefix-list <list-name> description <text>

ip prefix-list sequence-number

no ip prefix-list <list-name> [seq <1-429496725>]

no ip prefix-list <list-name> [description <text>]

no ip prefix-list sequence-number
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ip-prefix>	Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M.
any	Any prefix match. Same as 0.0.0.0/0 le 32 .
ge <0-32>	Specifies the minimum prefix length to be matched.
le <0-32>	Specifies the maximum prefix length to be matched.
description <text>	Text description of the prefix list.
sequence-number	Specify sequence numbers included or excluded in prefix list.

Mode Global Configuration

Usage When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example In the below sample configuration, the last `ip prefix-list` command in the below list matches all, and the first `ip prefix-list` command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit

awplus(config)# ip prefix-list mylist seq 5 deny
                        76.2.2.0/24

awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/
                        8 ge 14 le 22
```

Related Commands

- [match ip address](#)
- [neighbor prefix-list \(BGP and BGP4+\)](#)
- [area filter-list](#)

- [show access-group](#)
- [show ip prefix-list](#)

maximum-access-list

Sets the maximum number of filters that can be added to any access-list. These are access-lists within the ranges <1-199>, <1300-1999> and <2000-2699> and named standard and extended access-lists.

The **no** variant of this command removes the limit on the number of filters that can be added to a software access-list

Syntax `maximum-access-list <1-4294967294>`
`no maximum-access-list`

Parameter	Description
<1-4294967294>	Filter range.

Mode Global Configuration

Example To set the maximum number of software filters to 200:

```
awplus# configure terminal
awplus(config)# maximum-access-list 200
```

show access-list (IPv4 Software ACLs)

Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list

Syntax `show access-list`
`[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|`
`<4000-4499>|<access-list-name>]`

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (standard - expanded range).
<2000-2699>	IP extended access-list (extended - expanded range).
<3000-3699>	Hardware IP access-list.
<4000-4499>	Hardware MAC access-list.
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Example To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
  deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
  permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
  permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

Example To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
  deny 192.168.10.0, wildcard bits 0.0.0.255
  deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the below error message if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

Related Commands [access-list standard \(named\)](#)
 [access-list \(standard numbered\)](#)
 [access-list \(extended numbered\)](#)

show ip access-list

Use this command to display IP access-lists.

Syntax `show ip access-list [<1-99>|<100-199>|<1300-1999>|<2000-2699>|
<access-list-name>]`

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (expanded range).
<2000-2699>	IP extended access-list (expanded range).
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip access-list
```

Output **Figure 60-1: Example output from the show ip access-list command**

```
Standard IP access-list 1
  permit 172.168.6.0, wildcard bits 0.0.0.255
  permit 192.168.6.0, wildcard bits 0.0.0.255
```

show ip prefix-list

Use this command to display the IPv4 prefix-list entries. Note that this command is valid for RIP and BGP routing protocols only.

Syntax `show ip prefix-list [<name>|detail|summary]`

Parameter	Description
<code><name></code>	Specify the name of a prefix list in this placeholder.
<code>detail</code>	Specify this parameter to show detailed output for all IPv4 prefix lists.
<code>summary</code>	Specify this parameter to show summary output for all IPv4 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

(ipv6 access-list named TCP UDP filter).....	61.12
ipv6 traffic-filter	61.14
show ipv6 access-list (IPv6 Hardware ACLs).....	61.15

Introduction

This chapter provides an alphabetical reference for the IPv6 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 hardware ACLs, which are applied directly to interfaces using the **ipv6 traffic-filter** command.

Note See [Chapter 58, Access Control Lists Introduction](#) for descriptions of ACLs, and for further information about rules when applying ACLs see the [ACL Rules](#) section.

See [ACL Filter Sequence Numbers](#) and [ACL Filter Sequence Number Behavior](#) sections in [Chapter 58, Access Control Lists Introduction](#) about ACL Filters.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see [Chapter 20, Link Aggregation Introduction and Configuration](#), and [Chapter 21, Link Aggregation Commands](#).

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as `ipv6-access-list <name>` where `<name>` is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as **(ipv6 access-list standard IPv6 filter)** represents command entry in the format shown in the syntax `[<sequence-number>] {deny | permit} {<IPv6-source-address/prefix-length> | any}`.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

IPv6 Hardware Access List Commands and Prompts

Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The table “**IPv6 Hardware Access List Commands and Prompts**” shows the CLI prompts at which ACL commands are entered.

Table 61-1: IPv6 Hardware Access List Commands and Prompts

Command Name	Command Mode	Prompt
show ipv6 access-list (IPv6 Hardware ACLs)	Privileged Exec	
ipv6 access-list (named)	Global Configuration	awplus(config)#
(ipv6 access-list named ICMP filter)	Global Configuration	awplus(config)#
ipv6 traffic-filter	Interface Configuration	awplus(config-if)#
commit (IPv6)	IPv6 Hardware ACL Configuration	awplus(config-ipv6-hw-acl)#
(ipv6 access-list named ICMP filter)	IPv6 Hardware ACL Configuration	awplus(config-ipv6-hw-acl)#
(ipv6 access-list named protocol filter)	IPv6 Hardware ACL Configuration	awplus(config-ipv6-hw-acl)#
(ipv6 access-list named TCP UDP filter)	IPv6 Hardware ACL Configuration	awplus(config-ipv6-hw-acl)#

Command List

commit (IPv6)

Use this command to commit the IPv6 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv6 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv6 ACLs to synchronize.

Syntax commit

Mode IPv6 Hardware ACL Configuration

Usage Normally, when an IPv6 hardware ACL is edited, the new configuration state of the IPv6 ACL is not written to hardware until you exit IPv6 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the **exit** command to exit configuration modes, potentially leading to IPv6 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv6 hardware ACL filter ensures that it is updated in the hardware.

Examples To update the hardware with the IPv6 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)# commit
```

Related Commands [ipv6 access-list \(named\)](#)

ipv6 access-list (named)

Use this command to either create a new IPv6 hardware access-list, or to select an existing IPv6 hardware access-list in order to apply a filter entry to it.

Use the **no** variant of this command to delete an existing IPv6 hardware access-list.

Note Before you can delete an access-list, you must first remove it from any interface it is assigned to.

Syntax `ipv6 access-list <ipv6-access-list-name>`

`no ipv6 access-list <ipv6-access-list-name>`

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage Use IPv6 hardware named access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 hardware named access-list when a match is encountered.

For backwards compatibility you can either create IPv6 hardware named access-lists from within this command, or you can enter `ipv6 access-list` followed by only the IPv6 hardware named access-list name. This latter (and preferred) method moves you to the `(config-ipv6-hw-acl)` prompt for the selected IPv6 hardware named access-list number, and from here you can configure the filters for this selected IPv6 hardware named access-list.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To create an IPv6 access-list named `my-ipv6-acl`, use the commands:

To delete the IPv6 access-list named `my-ipv6-acl`, use the commands:

Validation Commands [show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

Related Commands [\(ipv6 access-list named ICMP filter\)](#)
[\(ipv6 access-list named protocol filter\)](#)
[\(ipv6 access-list named TCP UDP filter\)](#)
[ipv6 traffic-filter](#)
[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

(ipv6 access-list named ICMP filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with ICMP (Internet Control Message Protocol) packets, to the current named IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

As an optional parameter **vlan** can be matched for tagged (802.1q) packet.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with ICMP (Internet Control Message Protocol) packets, from the current named IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Syntax [ip|icmp]

```
[<sequence-number>
 {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
 {ipv6|icmp}
 [<ipv6-source-address/prefix-length>|
 <ipv6-source-address> <ipv6-source-wildcard>|
 host <ipv6-source-host>|any}
 [<ipv6-destination-address/prefix-length>|
 <ipv6-destination-address> <ipv6-destination-wildcard>|
 host <ipv6-destination-host-address>|any} [<icmp-type>]
 [vlan <1-4094>]
```

```
no [<sequence-number>]
 {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
 {ip|icmp}
 [<ipv6-source-address/prefix-length>|
 <ipv6-source-address> <ipv6-source-wildcard>|
 host <ipv6-source-host>|any}
 [<ipv6-destination-address/prefix-length>|
 <ipv6-destination-address> <ipv6-destination-wildcard>|
 host <ipv6-destination-host-address>|any} [<icmp-type>]
 [vlan <1-4094>]
```

```
no [<sequence-number>]
```

Mode IPv6 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Examples To specify a hardware IPv6 access-list named `my-acl1` and add an ACL filter entry that blocks all ICMP6 echo requests, enter the commands:

To specify a hardware IPv6 access-list named `my-acl2` and add an ACL filter entry that blocks all ICMP6 echo requests on the default VLAN (`vlan1`), enter the following commands:

To remove an ACL filter entry that blocks all ICMP6 echo requests from the hardware IPv6 access-list named `my-acl1`, enter the following commands:

Validation Commands `show ipv6 access-list (IPv6 Hardware ACLs)`

Related Commands `ipv6 access-list (named)`
`(ipv6 access-list named protocol filter)`
`(ipv6 access-list named TCP UDP filter)`
`ipv6 traffic-filter``show ipv6 access-list (IPv6 Hardware ACLs)`

(ipv6 access-list named protocol filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with an IP protocol type specified, to the current named IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with an IP protocol type specified, from the current named IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [<sequence-number>

```
{deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
{ipv6|proto <ip-protocol>}
{<ipv6-source-prefix/prefix-length>|<ipv6-source-address>
<ipv6-source-wildcard>|host <ipv6-source-host>|any}
{<ipv6-destination-prefix/prefix-length>|
<ipv6-destination-address> <ipv6-destination-wildcard>|
host <ipv6-destination-host>|any}
```

[<sequence-number>]

```
no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror}
{ipv6|proto <ip-protocol>}
{<ipv6-source-prefix/prefix-length>|<ipv6-source-address>
<ipv6-source-wildcard>|host <ipv6-source-host>|any}
{<ipv6-destination-prefix/prefix-length>|
<ipv6-destination-address> <ipv6-destination-wildcard>|
host <ipv6-destination-host>|any}
```

no [<sequence-number>]

Parameter	Description
<sequence-number>	<1-65535> <i>The sequence number for the filter entry of the selected access control list.</i>
deny	Specifies packets to reject.
permit	Specifies packets to permit.
send-to-cpu	Specifies packets to send to the CPU. Specifying this parameter could result in EPSR healthcheck messages and other control packets being dropped.
copy-to-cpu	Specifies packets to copy to the CPU.
copy-to-mirror	Specifies packets to copy to the mirror port.
ipv6	Specifies IPv6 packet.
proto <ip-protocol>	Specify IP protocol number <1-255>.

Parameter(cont.)	Description(cont.)

	139–252 Unassigned / IANA
	253 Use for experimentation and testing / RFC3692
	254 Use for experimentation and testing / RFC3692
	255 Reserved / IANA
<i><ipv6-source-prefix/prefix-length></i>	Specify source address and mask. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<i><ipv6-source-address></i>	Specifies the source address. The IPv6 address uses the format X:X::X.
<i><ipv6-source-wildcard></i>	Specifies the source wildcard bits, in IPv6 format X:X::X.X.
host <i><ipv6-source-host></i>	Specifies a single source host. The IPv6 address uses the format X:X::X.X.
any	Specifies any source host. An abbreviation for the IPv6 prefix ::/0
<i><ipv6-dest-prefix/prefix-length></i>	Specifies a destination address and mask. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<i><ipv6-destination-address></i>	Specify destination address. The IPv6 address uses the format X:X::X.X.
<i><ipv6-destination-wildcard></i>	Specify destination wildcard bits in IPv6 format X:X::X.X
host <i><ipv6-destination-host></i>	Specify a single destination host address. The IPv6 address uses the format X:X::X.X.
any	Specifies any destination host. An abbreviation for the IPv6 prefix ::/0

Parameter(cont.)	Description(cont.)
vlan	This parameter can be used in either single or double-tagged VLAN networks. It is the conventional VLAN tag (VID). In a double-tagged network it is sometimes referred to as the STAG.
<1-4094>	The VLAN VID.

Mode IPv6 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicate match a filter is permitted.

Usage This command adds a hardware classification filter (for use with features such as QoS), to a current standard IPv6 access-list. The filter will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter *any* may be specified if an address does not matter,

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To add an ACL filter entry to block IP traffic from network 2001:0db8::0/64 to the hardware IPv6 access-list named *my-acl*, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny ipv6 2001:0db8::0/64
```

To remove an ACL filter entry that blocks all IPv6 traffic from network 2001:0db8::0/64 from the hardware IPv6 access-list named *my-acl*, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny ipv6 2001:0db8::0/64
```

Validation Commands [show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

Related Commands [ipv6 access-list \(named\)](#)
[\(ipv6 access-list named ICMP filter\)](#)
[\(ipv6 access-list named TCP UDP filter\)](#)
[ipv6 traffic-filter](#)
[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

(ipv6 access-list named TCP UDP filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination ports specified, to the current named IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

Note that specifying the **send-to-cpu** parameter could result in EPSR healthcheck messages and other control packets being dropped.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with TCP or UDP source and destination ports specified, from the current named IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [<sequence-number>]

```
{deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror} {tcp|udp}
{<ipv6-source-prefix/prefix-length>|
<ipv6-source-address> <ipv6-source-wildcard>|
host <ipv6-source-host>|any}
{eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}|
[range <start-range> <end-range>]
{<ipv6-destination-prefix/prefix-length>|
<ipv6-destination-address> <ipv6-destination-wildcard>|
host <ipv6-destination-host>|any}
{[eq <destport>|lt <destport>|gt <destport>|ne <destport>]}
[range <start-range> <end-range>]
```

```
no {deny|permit|send-to-cpu|copy-to-cpu|copy-to-mirror} {tcp|udp}
{<ipv6-source-prefix/prefix-length>|
<ipv6-source-address> <ipv6-source-wildcard>|
host <ipv6-source-host>|any}
{eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}|
[range <start-range> <end-range>]
{<ipv6-destination-prefix/prefix-length>|
<ipv6-destination-address> <ipv6-destination-wildcard>|
host <ipv6-destination-host>|any}
{[eq <destport>|lt <destport>|gt <destport>|ne <destport>]}
[range <start-range> <end-range>]
```

```
no <sequence-number>
```

Mode IPv6 Hardware ACL Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage The filter entry will match on any TCP or UDP packet that has the specified source and destination IPv6 addresses and TCP or UDP type. The parameter **any** may be specified if an address does not matter.

Note Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Example To add an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/64 to the hardware IPv6 access-list named `my-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
```

To add an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/64 on the default VLAN (`vlan1`) to the hardware IPv6 access-list named `my-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
                             vlan 1
```

To remove an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/64 from the hardware IPv6 access-list named `my-acl`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny tcp 2001:0db8::0/64 any eq
                             22
```

Validation Commands [show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

Related Commands [ipv6 access-list \(named\)](#)
[\(ipv6 access-list named ICMP filter\)](#)
[\(ipv6 access-list named protocol filter\)](#)
[ipv6 traffic-filter](#)[show ipv6 access-list \(IPv6 Hardware ACLs\)](#)

ipv6 traffic-filter

This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables. You can apply an IPv6 hardware access-list to all ports or selected ports.

Use the **no** variant of this command to remove an IPv6 hardware-based access-list from an interface. You can remove an IPv6 hardware access-list from all ports or selected ports as required.

Syntax `ipv6 traffic-filter <ipv6-access-list-name>`
`no ipv6 traffic-filter <ipv6-access-list-name>`

Mode Interface Configuration (to apply an IPv6 hardware ACL to a specific switch port) and Global Configuration (to apply an IPv6 hardware ACL to all of the switch ports)

Usage This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

To apply the access-list to all ports on the switch, execute the command in the Global Configuration mode. To apply the access-list to a Layer 2 interface or Layer 2 interface range, apply the command in the Interface Configuration mode. See the examples for each mode below.

Examples To add access-list `acl1` as a traffic-filter to all ports on the switch, enter the commands:
To add access-list `acl1` as a traffic-filter to interface `port1.0.1`, enter the commands:
To remove access-list `acl1` as a traffic-filter from all ports on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 traffic-filter acl1
```

To remove access-list `acl1` as a traffic-filter from interface `port1.0.1`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no ipv6 traffic-filter acl1
```

show ipv6 access-list (IPv6 Hardware ACLs)

Use this command to display all configured hardware IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional access-list name parameter will display all IPv6 ACLs.

Use the **show ipv6 access-list standard** command to display the IPv6 access-list specified by name as defined from the **ipv6 access-list (named)** command.

Syntax `show ipv6 access-list [<access-list-name>]`
`show ipv6 access-list standard [<access-list-name>]`

Mode User Exec and Privileged Exec

Example To show the standard named ipv6 access-list acl_name use the following command:

Output **Figure 61-1: Example output from the show ipv6 access-list standard command**

```
Named Standard IPv6 access-list acl_name
deny any
```

Example To show all configured ipv6 access-lists use the command:

Output **Figure 61-2: Example output from the show ipv6 access-list command**

```
IPv6 access-list deny_icmp
deny icmp any any vlan 1

IPv6 access-list deny_ssh
deny tcp abcd::0/64 any eq 22
```

Related Commands **ipv6 access-list (named)**

Introduction

This chapter provides an alphabetical reference for the IPv6 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

Note See [Chapter 58, Access Control Lists Introduction](#) for descriptions of ACLs, and for further information about rules when applying ACLs see the [ACL Rules](#) section.

See [ACL Filter Sequence Numbers](#) and [ACL Filter Sequence Number Behavior](#) sections in [Chapter 58, Access Control Lists Introduction](#) about ACL Filters.

See all relevant Routing commands and configurations in [“Layer Three, Switching and Routing”](#) and all relevant Multicast commands and configurations in [“Multicast Applications”](#).

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see [Chapter 20, Link Aggregation Introduction and Configuration](#), and [Chapter 21, Link Aggregation Commands](#).

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as `ipv6-access-list <name>` where `<name>` is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI. For example, **(ipv6 access-list standard IPv6 filter)** represents command entry in the format:

```
[<sequence-number>] {deny|permit} {<IPv6-source-address/
prefix-length>|any}.
```

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

IPv6 Software Access List Commands and Prompts

Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The table “IPv6 Software Access List Commands and Prompts” shows the CLI prompts at which ACL commands are entered.

Table 62-1: IPv6 Software Access List Commands and Prompts

Command Name	Command Mode	Prompt
show ipv6 access-list (IPv6 Software ACLs)	Privileged Exec	awplus#
ipv6 access-list extended (named)	Global Configuration	awplus(config)#
ipv6 access-list standard (named)	Global Configuration	awplus(config)#
(ipv6 access-list extended IP protocol filter)	IPv6 Extended ACL Configuration	awplus(config-ipv6-ext-acl)#
(ipv6 access-list extended TCP UDP filter)	IPv6 Extended ACL Configuration	awplus(config-ipv6-ext-acl)#
(ipv6 access-list standard filter)	IPv6 Standard ACL Configuration	awplus(config-ipv6-std-acl)#

Command List

ipv6 access-list extended (named)

Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny IP, ICMP, TCP, UDP packets or ICMP packets with a specific value based on the source or destination.

The **no** variant of this command removes a specified IPv6 extended access-list.

Syntax
[list-name] `ipv6 access-list extended <list-name>`
`no ipv6 access-list extended <list-name>`

Parameter	Description
<code><list-name></code>	A user-defined name for the IPv6 software extended access-list.

Syntax
[any|icmp|ip] `ipv6 access-list extended <list-name>`
`{deny|permit} {any|icmp|ip}`
`{<ipv6-source-address/prefix-length>|any}`
`{<ipv6-destination-address/prefix-length>|any}`
`[<icmp-type <icmp-type>][log]`

`no ipv6 access-list extended <list-name>`
`{deny|permit} {any|icmp|ip}`
`{<ipv6-source-address/prefix-length>|any}`
`{<ipv6-destination-address/prefix-length>|any}`
`[<icmp-type <icmp-type>][log]`

Syntax
[tcp|udp] `ipv6 access-list extended <list-name>`
`{deny|permit} {tcp|udp}`
`{<ipv6-source-address/prefix-length>|any}`
`{eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}`
`{<ipv6-destination-address/prefix-length>|any}`
`{eq <destport>|lt <destport>|gt <destport>|ne <destport>}`
`[log]`

`no ipv6 access-list extended <list-name> {deny|permit} {tcp|udp}`
`{<ipv6-source-address/prefix-length>|any}`
`{eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}`
`{<ipv6-destination-addr/prefix-length>|any}`
`{eq <destport>|lt <destport>|gt <destport>|ne <destport>}`
`[log]`

Parameter	Description
<code><list-name></code>	A user-defined name for the IPv6 software extended access-list.
<code>deny</code>	The IPv6 software extended access-list rejects packets that match the type, source, and destination filtering specified with this command.
<code>permit</code>	The IPv6 software extended access-list permits packets that match the type, source, and destination filtering specified with this command.
<code>any</code>	For ICMP IP The IPv6 software extended access-list matches any type of packet.
<code>ip</code>	For ICMP IP The IPv6 software extended access-list matches only IP packets.

Parameter(cont.)	Description(cont.)
<code>icmp</code>	For ICMP IP The IPv6 software extended access-list matches only ICMP packets.
<code>tcp</code>	For TCP/UDP The IPv6 software extended access-list matches only TCP packets.
<code>udp</code>	For TCP/UDP The IPv6 software extended access-list matches only UDP packets.
<code><ipv6-source-address/prefix-length></code>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<code><ipv6-destination-address/prefix-length></code>	Specifies a destination address and prefix length. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>any</code>	Matches any IPv6 address.
<code><sourceport></code>	For TCP/UDP The source port number, specified as an integer between 0 and 65535.
<code><destport></code>	For TCP/UDP The destination port number, specified as an integer between 0 and 65535.
<code>icmp-type</code>	For ICMP IP Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.
<code>eq</code>	For TCP/UDP Matches port numbers equal to the port number specified immediately after this parameter.
<code>lt</code>	For TCP/UDP Matches port numbers less than the port number specified immediately after this parameter.
<code>gt</code>	For TCP/UDP Matches port numbers greater than the port number specified immediately after this parameter.
<code>ne</code>	For TCP/UDP Matches port numbers not equal to the port number specified immediately after this parameter.

Parameter(cont.)	Description(cont.)
<code><icmp-type></code>	For ICMP IP The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:
	0 Echo replies.
	3 Destination unreachable messages.
	4 Source quench messages.
	5 Redirect (change route) messages.
	8 Echo requests.
	11 Time exceeded messages.
	12 Parameter problem messages.
	13 Timestamp requests.
	14 Timestamp replies.
	15 Information requests.
	16 Information replies.
	17 Address mask requests.
	18 Address mask replies.
<code>log</code>	Logs the results.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

For backwards compatibility you can either create IPv6 extended access-lists from within this command, or you can enter `ipv6 access-list extended` followed by only the IPv6 extended access-list name. This latter (and preferred) method moves you to the `(config-ipv6-ext-acl)` prompt for the selected IPv6 extended access-list number, and from here you can configure the filters for this selected access-list.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example 1 To add a new filter to the access-list named `my-list` that will reject incoming ICMP packets from `2001:0db8::0/64` to `2001:0db8::f/64`, use the commands:

[creating a list]

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# icmp 2001:0db8::0/64 2001:0db8::f/64
```

Example 2 To insert a new filter at sequence number 5 of the access-list named `my-list` that will accept ICMP type 8 packets from the `2001:0db8::0/64` network to the `2001:0db8::f/64` network, use the commands:

[adding to a list]

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 icmp 2001:0db8::0/64
2001:0db8::f/64
```

Example 3 To create the access-list named `TK` to deny TCP protocols, use the commands:

[list with filter]

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended TK deny tcp any eq
14 any lt 12 log
```

ipv6 access-list extended proto

Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny packets with a specific value based on the IP protocol number specified.

The **no** variant of this command removes a specified IPv6 extended access-list with an IP protocol number.

Syntax

```

ipv6 access-list extended <list-name>
  {deny|permit} proto <ip-protocol>
  {<ipv6-source-address/prefix>|any}
  {<ipv6-destination-address/prefix>|any} [log]

no ipv6 access-list extended <list-name>
  {deny|permit} proto <ip-protocol>
  {<ipv6-source-address/prefix>|any}
  {<ipv6-destination-address/prefix>|any} [log]

```

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access-list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
proto	The IP Protocol type specified by its protocol number <1-255>.
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority http://www.iana.org/assignments/protocol-numbers).
Protocol Number

<i><ipv6-source-address/prefix></i>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
<i><ipv6-destination-address/prefix></i>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Parameter(cont.)	Description(cont.)
any	Any destination address or remote address.
log	Log the results.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter any may be specified if an address does not matter.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To create the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# ipv6 access-list extended ACL-1 deny proto 9
2001:0db8:1::1/128 2001:0db8:f::1/128
```

To remove the IPv6 access-list named ACL-1 to deny IP protocol 9 packets from 2001:0db8:1::1/128 to 2001:0db8:f::1/128, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ipv6 access-list extended ACL-1 deny proto
10 2001:0db8:1::1/128 2001:0db8:f::1/128
```

(ipv6 access-list extended IP protocol filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol specified, to the current extended IPv6 access-list. If a sequence is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol filter entry, from the current extended IPv6 access-list. You can specify the ACL filter entry by entering either its sequence number, or its filter entry profile.

Syntax
[ip|proto] [*<sequence-number>*]
 {deny|permit} {ip|any|proto *<ip-protocol>*}
 {*<ipv6-source-address/prefix>*|any}
 {*<ipv6-destination-address/prefix>*|any} [log]

no {deny|permit} {ip|any|proto *<ip-protocol>*}
 {*<ipv6-source-address/prefix>*|any}
 {*<ipv6-destination-address/prefix>*|any} [log]

no [*<sequence-number>*]

Parameter	Description
<i><sequence-number></i>	<i><1-65535></i> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
ip	IP packet.
any	Any packet.
proto <i><ip-protocol></i>	The IP Protocol type specified by its protocol number <i><1-255></i> .
<i><ip-protocol></i>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority http://www.iana.org/assignments/protocol-numbers).

<i><ipv6-source-address/prefix></i>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
<i><ipv6-destination-address/prefix></i>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Parameter(cont.)	Description(cont.)
any	Any destination address or remote address.
log	Log the results.

Mode IPv6 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter `any` may be specified if an address does not matter.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new ACL filter entry to the extended IPv6 access-list named `my-list` with sequence number 5 rejecting the IPv6 packet from `2001:db8:1::1` to `2001:db8:f::1`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny ip 2001:db8:1::1/128
2001:db8:f::1/128
```

To remove the ACL filter entry to the extended IPv6 access-list named `my-list` with sequence number 5, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

Related Commands [ipv6 access-list extended \(named\)](#)
[show ipv6 access-list \(IPv6 Software ACLs\)](#)
[show running-config](#)

(ipv6 access-list extended TCP UDP filter)

Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with a TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination port specified, to the current extended IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with a TCP or UDP source and destination port specified, from the current extended IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax
[tcp|udp]

```
[<sequence-number>] {deny|permit} {tcp|udp}
  {<ipv6-source-address/prefix>|any}
  {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}
  {<IPv6-destination-address/prefix>|any}
  {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no {deny|permit} {tcp|udp}
  {<ipv6-source-address/prefix>|any}
  {eq <sourceport>|lt <sourceport>|gt <sourceport>|ne <sourceport>}}
  {<IPv6-destination-address/prefix>|any}
  {eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
tcp	TCP packet.
udp	UDP packet.
<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
eq	Equal to.
lt	Less than.
gt	Greater than.
ne	Not equal to.
<sourceport>	The source port number, specified as an integer between 0 and 65535.
<ipv6-destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Parameter(cont.)	Description(cont.)
<code><destport></code>	The destination port number, specified as an integer between 0 and 65535.
<code>log</code>	Log the results.

Mode IPv6 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage The filter entry will match on any packet that has the specified source and destination IPv6 addresses and the specified TCP or UDP source and destination port. The parameter `any` may be specified if an address does not matter.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add a new filter entry with sequence number 5 to the access-list named `my-list` to reject TCP packets from `2001:0db8::0/64` port 10 to `2001:0db8::f/64` port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny tcp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To add a new filter entry with sequence number 5 to the extended IPv6 access-list named `my-list` to reject UDP packets from `2001:0db8::0/64` port 10 to `2001:0db8::f/64` port 20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny udp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To remove the filter entry with sequence number 5 to the extended IPv6 access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

Related Commands [ipv6 access-list extended \(named\)](#)
[show ipv6 access-list \(IPv6 Software ACLs\)](#)
[show running-config](#)

ipv6 access-list standard (named)

This command configures an IPv6 standard access-list for filtering frames that permit or deny IPv6 packets from a specific source IPv6 address.

The **no** variant of this command removes a specified IPv6 standard access-list.

Syntax [list-name]

```
ipv6 access-list standard <ipv6-acl-list-name>
no ipv6 access-list standard <ipv6-acl-list-name>
```

Parameter	Description
<ipv6-acl-list-name>	A user-defined name for the IPv6 software standard access-list.

Syntax [deny|permit]

```
ipv6 access-list standard <ipv6-acl-list-name>
  [{deny|permit}
  {<ipv6-source-address/prefix-length>|any}
  [exact-match]]
no ipv6 access-list standard <ipv6-acl-list-name>
  [{deny|permit}
  {<ipv6-source-address/prefix-length>|any}
  [exact-match]]
```

Parameter	Description
<ipv6-acl-list-name>	A user-defined name for the IPv6 software standard access-list.
deny	The IPv6 software standard access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The IPv6 software standard access-list permits packets that match the type, source, and destination filtering specified with this command.
<ipv6-source-address/ prefix-length>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
any	Matches any source IPv6 address.
exact-match	Exact match of the prefixes.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use IPv6 standard access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 standard access-list when a match is encountered.

For backwards compatibility you can either create IPv6 standard access-lists from within this command, or you can enter `ipv6 access-list standard` followed by only the IPv6 standard access-list name. This latter (and preferred) method moves you to the `(config-ipv6-std-acl)` prompt for the selected IPv6 standard access-list, and from here you can configure the filters for this selected IPv6 standard access-list.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Example To enter the IPv6 Standard ACL Configuration mode for the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)#
```

Related Commands [\(ipv6 access-list standard filter\)](#)
[show ipv6 access-list \(IPv6 Software ACLs\)](#)
[show running-config](#)

(ipv6 access-list standard filter)

Use this ACL filter to add a filter entry for an IPv6 source address and prefix length to the current standard IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source address and prefix from the current standard IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [**icmp**]

```
[<sequence-number>] {deny|permit}
    {<ipv6-source-address/prefix-length>|any}

no {deny|permit}
    {<ipv6-source-address/prefix-length>|any}

no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
<ipv6-source-address/prefix-length>	IPv6 source address and prefix-length in the form X:X::X/P.
any	Any IPv6 source host address.

Mode IPv6 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage The filter entry will match on any IPv6 packet that has the specified IPv6 source address and prefix length. The parameter *any* may be specified if an address does not matter.

Note Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.

Examples To add an ACL filter entry with sequence number 5 that will deny any IPv6 packets to the standard IPv6 access-list named *my-list*, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# 5 deny any
```

To remove the ACL filter entry that will deny any IPv6 packets from the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no deny any
```

Alternately, to remove the ACL filter entry with sequence number 5 to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no 5
```

Related Commands [ipv6 access-list standard \(named\)](#)
 [show ipv6 access-list \(IPv6 Software ACLs\)](#)
 [show running-config](#)

ipv6 prefix-list

Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list or a prefix list entry.

Syntax

```

ipv6 prefix-list <list-name> [seq <1-429496725>]
    {deny|permit}
    {any|<ipv6-prefix>}
    [ge <0-128>] [le <0-128>]

ipv6 prefix-list <list-name> description <text>

no ipv6 prefix-list <list-name> [seq <1-429496725>]

no ipv6 prefix-list <list-name> [description <text>]
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq <1-429496725>	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ipv6-prefix>	Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M.
any	Any prefix match. Same as ::0/0 le 128 .
ge <0-128>	Specifies the minimum prefix length to be matched.
le <0-128>	Specifies the maximum prefix length to be matched.
description	Prefix list specific description.
<text>	Up to 80 characters of text description of the prefix list.

Mode Global Configuration

Usage When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an **ip-prefix** is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the **ip-prefix** mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example To check the first 32 bits of the prefix 2001:db8:: and the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
                2001:db8::/32 ge 34 le 40
```

Related Commands [match ipv6 address](#)
[show ipv6 prefix-list](#)
[show running-config ipv6 prefix-list](#)

show ipv6 access-list (IPv6 Software ACLs)

Use the **show ipv6 access-list standard** command to display a specified standard named IPv6 access-list that has been defined using the **ipv6 access-list standard (named)** command.

Syntax `show ipv6 access-list standard <access-list-name>`

Parameter	Description
standard	Named standard access-list.
<access-list-name>	Specify an IPv6 access-list name.

Mode User Exec and Privileged Exec

Example To show the ipv6 access-list specified with the name `acl_name` use the following command:

```
awplus# show ipv6 access-list standard acl_name
```

Output **Figure 62-1: Example output from the show ipv6 access-list command**

```
Named Standard IPv6 access-list name
deny any
```

Related Commands **ipv6 access-list extended (named)**

show ipv6 prefix-list

Use this command to display the prefix-list entries. Note that this command is valid for RIPng and BGP4+ routing protocols only.

Syntax `show ipv6 prefix-list [<name>|detail|summary]`

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
detail	Specify this parameter to show detailed output for all IPv6 prefix lists.
summary	Specify this parameter to show summary output for all IPv6 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

Introduction

This chapter introduces the concept of Quality of Service (QoS) with particular reference to Allied Telesis switches running the AlliedWare Plus™ Operating System.

The concept of QoS is a departure from the original networking concept of treating all network traffic in the same way. Without QoS, all traffic types are equally likely to be dropped when a link becomes oversubscribed. With QoS, certain traffic types can be given preferential treatment. QoS is therefore a very useful tool both to control congestion and to meter or cap data in order to apply pre-agreed service levels.

Operationally, QoS is applied within the link and network layers. Functionally it provides the capability to intelligently transport your network traffic in order to provide stable and predictable end-to-end network performance.

Business benefits Quality of Service mechanisms enable:

- network service providers to sell different levels of service to customers, based on what their customers require, and be confident in their ability to guarantee the reliable delivery of these services
- enterprise and educational organizations to actively manage and provide many services across one network, for example live video streaming and standard data services, with preferential treatment being given to mission-critical traffic
- network administrators to manage network congestion as network traffic levels increase and time-critical applications, such as streaming media, become more widely in demand by customers and organizations

QoS Operations

Quality of Service is typically based on how the switch performs the following functions:

- assigns priority to incoming frames (that do not already carry priority information)
- correlates prioritized frames with traffic classes, or maps frames to traffic classes based on other criteria
- correlates traffic classes with egress queues, or maps prioritized frames to egress queues
- provides minimum and maximum bandwidths for traffic classes, egress queues, and/or ports
- schedules frames in egress queues for transmission (for example, empty queues in strict priority or sample each queue)
- re-labels the priority of outgoing frames
- determines which frames to drop or re-queue if the network becomes congested
- reserves memory for switching/routing or QoS operation (for example, reserving buffers for egress queues or buffers to store packets with particular characteristics)

QoS Packet Information

Provision for QoS information to be embedded within the data fields exists within both the data link and network layer protocols. This information can then be used to assess the priority of the data and the resource preferences that need to be applied. The process of applying these service quality tags to your data is known as marking.

Link Layer QoS

Link layer frames entering a port may either be tagged or untagged. VLAN tagged frames contain the additional 802.1Q tag fields shown in **Figure 63-1** below. Located within the TCI is a three bit User Priority field. This field is specifically provided to attach QoS based priority information, often referred to as the Class of Service (CoS) field.

Figure 63-1: IEEE 802.1Q Tagging

Appendix G of the IEEE Standard 802.1D provides some useful guidelines on applying priorities to 7 traffic types: These are summarized in the **Table 63-1** below:

Table 63-1: CoS Traffic Mapping Guidelines

User Priority	Traffic Types
1	Background
2	Spare
0	Best Effort
3	Excellent Effort
4	Controlled Load
5	Video <100 ms latency and jitter
6	Voice <10 ms latency and jitter
7	Network Control

On the switch you can use the **match cos** command to select frames that match a particular User Priority value and assign them to a particular class-map. You can then map these incoming frames to one of eight egress queues. This facility enables you to accept frames that are already carrying meaningful priority information and automatically assign them to an appropriate egress queue. For example, you could decide to send frames with a User Priority value of 2 to queue 0. The process of assigning queues based on CoS tags is commonly known as “PreMarking”.

Note You configure the pre-marking steps on an ingress port. This process marks the data packets so that when they reach the egress port the decisions made during pre-marking can be applied in accordance with the configuration of the egress port.

Application with VLAN double tagging

Note that if you are using VLAN double tagging, you could use the **match cos** command to set the individual QoS requirements *within* each client network and also separately within the provider network. You can then use the **match inner-cos** command to apply particular *client* QoS requirements that you want to apply within the provider network. This process applies two levels of QoS within the provider network; one that operates specifically for the network provider, and another that is specific for traffic belonging to selected clients. See **“VLAN Double Tagging (VLAN Stacking)” on page 16.5**.

At the network layer IPv4 packets contain an 8 bit field specifically to carry QoS information. This field, defined in RFC 1349, was originally named the Type of Service (ToS) field and contained a *ToS* component and a *Precedence* component. The ToS field however, has since been replaced by the Differentiated Services field.

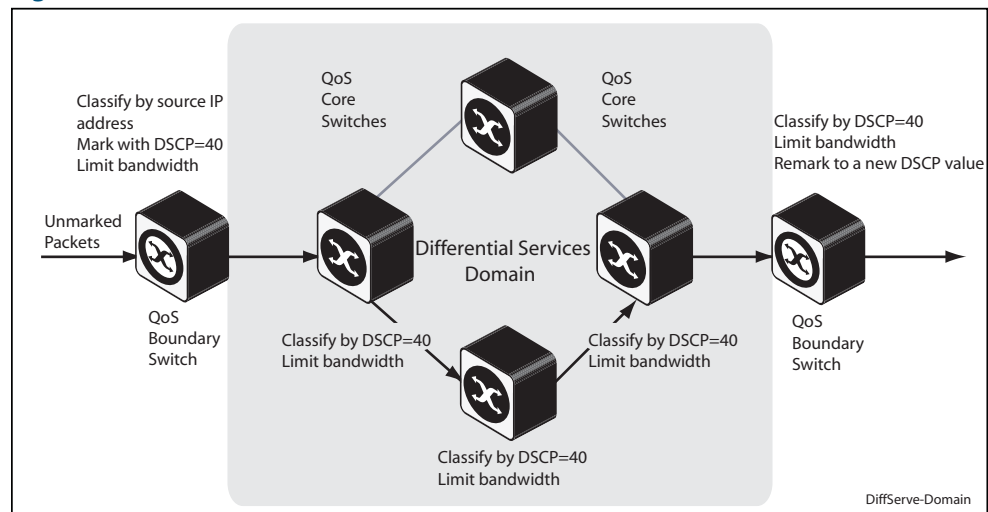

Differentiated Services Architecture

Whilst a full description of the differential services model is outside the scope of this software reference, a brief introduction is provided. For further information, RFC 2475 provides an in depth definition of the architecture.

The basic differential services model envisages a multi router network within which common service qualities are applied. At the network boundary, *QoS Edge Routers* inspect the traffic and classify it into common service quality groups called Per Hop Behaviors (PHBs). A specific marker value called a Differential Services Code Point (DSCP) is added to the IP header of each packet, which allocates it to a PHB. *QoS Core Routers* within the network can then use the DSCP to decide on an appropriate service quality level to apply. When a network contains a consistently applied differential services code points DSCP it is referred as a Differential Services Domain (often shortened to DiffServe Domain).

Figure 63-2 shows a simple Differential Services Domain.

Figure 63-2: Differentiated Services Domain

The Differential Services Field

Figure 63-3 shows an IP header containing a Differentiated Services field. The format of this redefined field is explained in RFC 2474; the main difference being that the old ToS field has been replaced by a 6 byte Differentiated Services Code Point (DSCP) field, which now provides for up to 64 defined values.

By applying this model only the QoS edge routers need to fully interrogate the incoming data packets; the QoS core routers are then relieved of this processing task and need only to inspect the DSCP before applying its appropriate forwarding, queuing, and shaping rules.

Figure 63-3: The DSCP bits of the DS field in the IPv4 header

On the switch you can use the **match inner-vlan** command to select frames containing a particular DSCP value, and associate them with a particular class-map and policy-map.

You can then use the **set queue** command to directly map these incoming frames to one of eight egress queues. This facility enables you to accept frames that are already carrying meaningful priority information to be automatically assigned to an appropriate egress queue. For example, you could decide to send frames with a User Priority value of 2 to queue 0.

Because the model offers considerable flexibility, and the mapping of traffic types to DSCPs is individual for each network, this locally applied definition is known as a *Differential Services Domain*. The previous section introduced the concept of a Per Hop (service quality) Behaviors or PHBs. RFC 2597 defines a specific PHB group called Assured Forwarding (AF). The AF PHB group provides delivery of IP packets in four independently forwarded AF classes. Within each AF class, an IP packet can be assigned one of three different levels of drop precedence. **Table 63-2** shows a list of recommended AF code points.

Table 63-2: Recommended DSCP Code Points

	(Lowest Priority) Class 1 (001xxxx)	Class 2 (010xxxx)	Class 3 (011xxxx)	(Highest Priority) Class 4 (100xxxx)
Low Drop Precedence	001010 AF11 Decimal 10	010010 AF21 Decimal 18	011010 AF31 Decimal 26	100010 AF41 Decimal 34
Medium Drop Precedence	001100 AF12 Decimal 12	010100 AF22 Decimal 20	011100 AF32 Decimal 28	100100 AF42 Decimal 36
High Drop Precedence	001110 AF13 Decimal 14	010110 AF23 Decimal 22	011110 AF33 Decimal 30	100110 AF43 Decimal 38

Processing pre-marked packets

A logical question to ask at this point is: how does the QoS switch deal with data that arrives with a pre-existing service level tag such as a DSCP? As previously touched on, the differentiated services model envisages a network that comprises QoS boundary routers at its edge and QoS core routers in its core network.

At the network edge the QoS boundary routers filter the incoming data based on specific packet components. Based on this filtering each packet is assigned a DSCP value. This value will determine the service level - priority, queueing etc - that will be applied.

Within the network core, the packet filtering required is reduced to simply reading the DSCP within each incoming packet, and applying the appropriate set of service levels. This relieves the core routers of the processing overhead of applying complex filtering to its high speed data streams.

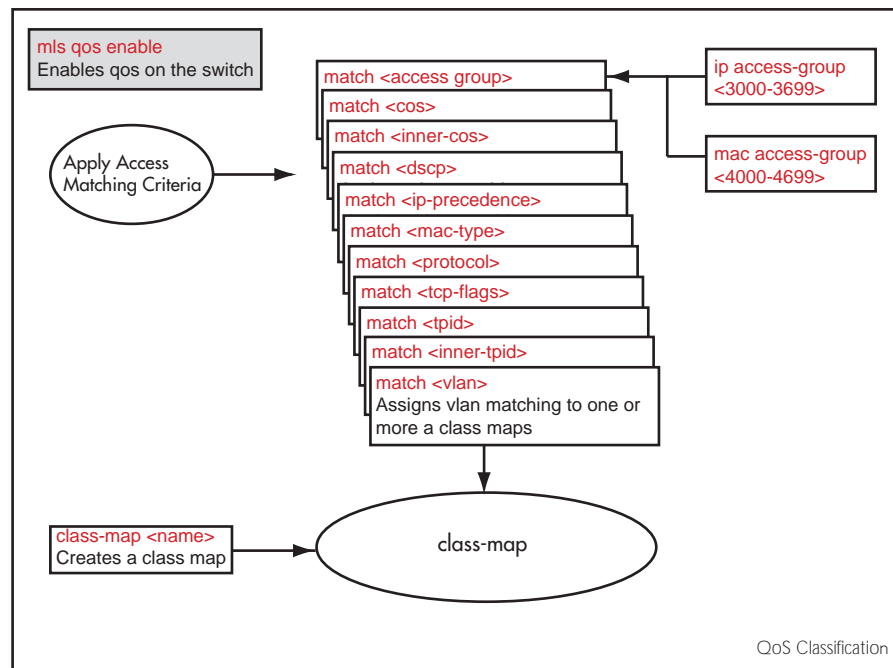

Applying QoS on Your Switch

This section steps you through the various stages of QoS set-up and introduces the QoS commands and how to apply them. Note that before you can configure any QoS functions on your switch, you must first enable QoS by using the `mls qos enable` command.

Classifying your Data

One of the early steps in setting up QoS on a network is planning and applying your classification rules. Classification is the process of **Filtering** and **Marking**. Filtering involves sorting your data into appropriate traffic types. Marking involves tagging the data so that downstream ports and routers can apply appropriate service policy rules. This process is known as **premarking**. **Figure 63-4** illustrates the classifying process, and will be referred to in the examples that follow.

Figure 63-4: QoS Classification Process

At the premarking stage you can assign your data a particular priority level by giving it a link level user priority, see **“Link Layer QoS” on page 63.3**, or a network level DSCP **“Differentiated Services Architecture” on page 63.4**. You can also assign the data to a particular output (or egress) queue.

Class Maps

Class Maps are among the pivotal QoS components. They provide the means that associate the classified traffic with its appropriate QoS actions. They are the linking elements for the following functions:

- classification
- policy-mapping
- aggregate policing and metering
- pre-marking

Figure 63-5 shows the relationship between a class-map and its associated functions. Note that the relationship between a class-map and a policy-map can be one-to-one or many-to-one. For information on policy-maps see the section, **“Policy Maps” on page 63.10**.

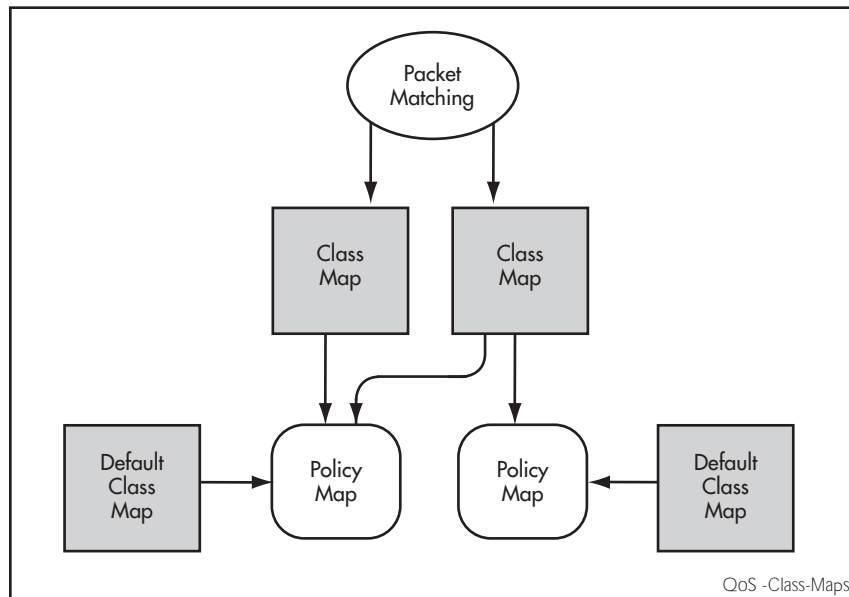

Note  If a conflict occurs between the settings in two class-maps, priority will be applied to the class-map that was created first. An example of such a conflict is the arrival of a packet that meets the classification requirements of two class-maps each configured to the same policy-map and set to apply different priority settings to the packet.

Figure 63-5: Relationship between a class-map and its associated functions

Creating a class-map

To create a class-map, use the **class-map** command on page 64.4.

This example creates a class-map called **video-traffic** and another called **data-traffic**:

```

awplus# configure terminal
awplus(config)# class-map video-traffic
awplus(config-cmap)# exit
awplus(config)# class-map data-traffic
awplus(config-cmap)#
  
```

Creating and configuring default class-maps

These (automatically created) default class-maps serve as the means to specify the action that will apply to all unclassified data, i.e. all data within a policy-map that is not captured by any of the applied match commands that are applied to the policy-map by its class-maps.

Each time a new policy-map is created a new class-map called “default” is also automatically created and assigned to the new policy-map. You can configure any of the default class-maps by using the **default-action** command on page 64.6

To set the default class-map for the policy-map **p-map1** to have the action of deny:

```
awplus# config
awplus(config)# policy-map p-map1
awplus(config-pmap)# default-action deny
```

Applying a match command to a class-map

To apply a matching filter to a class-map use one of the match commands.

This example creates a filter to select VLAN 5 traffic and applies this filter to the class-map named **video-traffic**.

```
awplus# config terminal
awplus(config)# class-map video-traffic
awplus(config-cmap)# match vlan 5
```

Associating a class-map with a policy-map

To associate a class-map with a policy-map, use the **class** command on page 64.3.

Note A maximum of 128 class-maps may be attached to each policy-map.

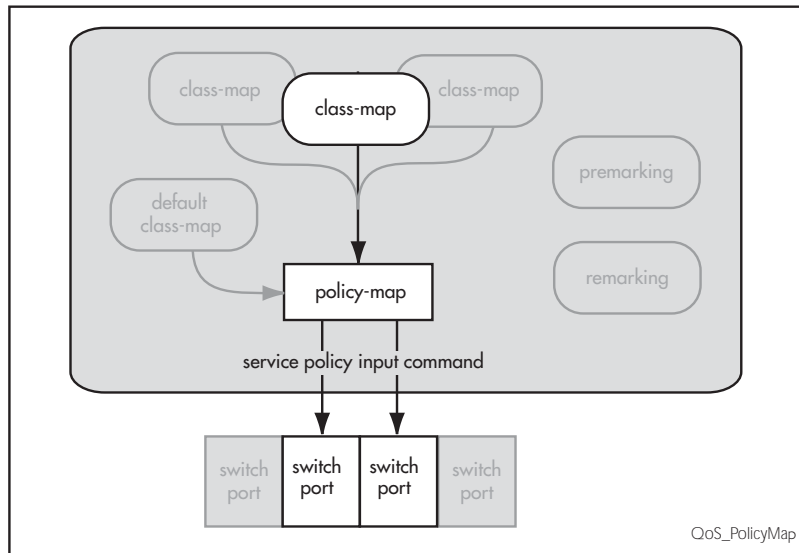

The following example creates a policy-map called **policy-one**, and associates it with the class-maps named **video-traffic**, and **database-traffic**:

```
awplus# configure terminal
awplus(config)# policy-map policy-one
awplus(config-pmap)# class video-traffic
awplus(config-pmap-c)# exit
awplus(config-pmap)# class database-traffic
awplus(config-pmap-c)#
```

Policy Maps

Policy maps are the means by which you apply your class-map properties to physical switch ports. [Figure 63-8 on page 63.23](#) illustrates this concept. Note that whilst a policy-map can be assigned to several ports, a port cannot have more than one policy-map assigned to it.

Figure 63-6: Policy Maps and Related Entities

To create and name a new policy-map you use the **policy-map** command on [page 64.44](#).

To create a policy-map called `pmap1` use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
```

Having created the policy-map `pmap1` we can use the **class** command on [page 64.3](#) to assign it to one or more class-maps. Since we created the class-maps `video-traffic` and `office-traffic` earlier in this chapter, we can now attach the policy-map `pmap1` to both class-maps.

Use the **class** command to assign the policy-map `pmap1` to the class-maps `video-traffic` and `office-traffic`:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class video-traffic
awplus(config-pmap-c)# exit
awplus(config-pmap)# class office-traffic
awplus(config-pmap-c)#
```

Premarking Your Traffic

Premarking relates to adding QoS markers to your incoming data traffic before it is metered (policed). Network switches will often be configured with two different premarking profiles, one for the QoS edge switches and another for the QoS core switches. This situation would apply if you are operating DSCP domains.

QoS markers can be applied at both the link layer (within the CoS field), and at the network layer (within the DSCP field). For more information on this topic see [“QoS Packet Information” on page 63.3](#).

For boundary QoS switches

Traffic entering QoS boundary switches is unlikely to contain pre-existing QoS tagging. In this case, you can apply one or more of the following QoS mapping options.

- Assign an output queue to data associated with a particular class-map, using the **set queue** command, and apply it to the input (ingress) port.
- Assign a CoS tag to data associated with a particular class-map using the **set cos** command. You can then map the CoS tag to an output (egress) port queue (using the **mls qos map cos-queue to** command).
- Assign a DSCP tag to data associated with a particular class-map using the **set dscp** command. Alternatively, you can use the **trust dscp** command to map the DSCP tag to an egress port queue, a CoS value, or both. At the premarking stage you can set this mapping using the **mls qos map premark-dscp to** command.

When no other mapping is set, all traffic is sent to the queue that is set by the **mls qos queue** command. If this command is unset (i.e. in the absence of any other queue selection) and the packet is untagged, traffic will be sent to queue 2.

For core QoS switches

Traffic entering ports within the QoS core network will almost certainly contain some pre-existing QoS tagging. Where this is the case, you can apply one of the following QoS mapping options.

- Map the CoS tag to an egress queue. You can do this either for the whole switch or for specific ports via their assigned policy-maps. See [“CoS to egress queue premarking” on page 63.12](#).
- Map the DSCP tag to an output queue. You can do this either for the whole switch or for specific ports via their assigned policy-maps. When no other mapping is set, all traffic is sent to the queue that is set by the **mls qos queue** command.
- Remap incoming data DSCP or CoS tags to values that are more appropriate for a particular switch or network.
- Assign bandwidth classes for your packets, based on the incoming DSCP. See [Setting the Trust DSCP Map command on page 63.14](#).

QoS Profiles

There is a global pool of 128 QoS profiles shared across all line cards installed in the switch. To display the QoS profile allocation for the switch use the **show platform classifier statistics utilization brief** command

The first 8 profiles are reserved for CoS to queue mapping, set with the **mls qos map cos-queue to** command.

The next 64 profiles are reserved for DSCP premarking, set with the **mls qos map premark-dscp to** command.

The remaining QoS profiles are shared between the default egress queue and the policy-map class configurations. The following commands will attempt to reuse an existing profile, but will consume a new profile if reuse is not possible: **mls qos queue**, **set bandwidth-class**, **set cos**, **set dscp** and **set queue**.

All ports at startup without the default egress queue specified in the configuration (**mls qos queue** command) share a common QoS profile entry that has a default queue of **2**. If a policy is added with a policy-map class configuration of **set queue 2** then the QoS profile allocated to the port would also be used for the rule. If multiple policies share the same policy-map class configuration settings then these policies reuse the same QoS profile. If a rule or a port has its own unique QoS profile then an additional profile will be consumed.

Note that when a QoS profile is created for a policy set on a port and **set cos** and **set bandwidth-class** are not specified, then the CoS value is set to **0** and the bandwidth-class is set to **green**. Therefore, if an ingress port has a queue set with the **mls qos queue** command this setting is overridden if there are any set commands (**set bandwidth-class**, **set cos**, **set dscp** and **set queue** commands) in the policy-map class configuration that are matched. A different QoS profile will come into effect.

CoS to egress queue premarking

If you are using CoS tagging for your QoS functions, your traffic is likely to be either entering the switch with a pre-existing CoS tag, or will have appropriate tags attached via your class-maps and policy-maps. You can now mark the data for a particular egress queue, which will take effect when the data reaches its output port. There are two fundamental methods of applying CoS tagged packets to egress queues:

1. Apply a global mapping of CoS tags to egress queues for all ports.
2. Apply a CoS to egress queue mapping for the class-map / policy-map. This mapping - which forms part of the policy-map - is applied at an input port, but will take effect at the packet's destination output port. Note that this procedure takes priority over that described in method (1) above.

These methods and their related commands will be now be described in greater detail.

CoS tagging commands

Table 63-3 shows the commands that can set or change the CoS tag within a packet.

Table 63-3: CoS Mapping Commands in Hierarchical Order

Command	Function
set cos	Assigns a CoS tag to a particular class-map / policy-map.
mls qos map premark-dscp to	Where a packet contains CoS tag and a DSCP tags. The table set by this command contains a configurable DSCP to CoS tag mapping.

Note  Where a packet contains both a CoS and a DSCP field, and each field maps to a different class-map; the switch will apply a priority based on the creation date of the class-maps to which they apply - the earlier the creation date, the higher the priority

Mapping CoS tags to traffic types

The command **mls qos map cos-queue to** enables you to create a switch-wide mapping of CoS values to egress queues. The default mappings for this command are:

```

COS :           0 1 2 3 4 5 6 7
-----
QUEUE:         2 0 1 3 4 5 6 7
    
```

These mappings match the CoS guidelines documented in Annex H.2 of ANSI/IEEE 802.1D 1988 Edition. Table H-15 on page 355 of the standard shows a table of user priorities for specific traffic types. **Table 63-4** shows an adapted version of the ANSI/IEEE table.

Table 63-4: Traffic Type Guidelines

User Priority (egress queue)	CoS Value	Acronym	Traffic type	Internal Traffic Queue Defaults
0 (lowest)	1	BK	Background	
1	2	-	Spare	
2	0	BE	Best Effort	Default
3	3	EE	Excellent Effort	
4	4	CL	Controlled Load	
5	5	VI	"Video," <100 ms latency and jitter	
6	6	VO	"Voice," <10 ms latency and jitter	EPSR-Management BPDU ARP-Requests
7 (highest)	7	NC	Network Control	Stack Management

DSCP to egress queue premarking

If you are using DSCP tagging for your QoS functions, your traffic is likely to be entering the switch either with a pre-existing DSCP tag, or will have appropriate DSCP tags attached via your class-maps and policy-maps. You can now mark the data for a particular egress queue, which will take effect when the data reaches its output port.

If your switch forms part of a DSCP domain, you can adapt the steps in this section to apply the mappings and settings to match the standards you have selected for the domain. This mapping - which forms part of the policy-map - is applied at an input port, but will take effect at the packet's destination output port.

DSCP to egress queue premarking commands

A number of commands can be used for mapping DSCP tags. Where these conflict, the switch applies a pre-defined set of priorities. **Table 63-5** lists these priorities in order (lowest priority first).

Where a packet that contains both CoS and a DSCP fields and each field maps to a different class-map / policy-map, the switch will apply a priority based on the creation date of class-maps - the earlier the creation date, the higher the priority priorities.

Table 63-5: DSCP Mapping Commands in Hierarchical Order

Command	Function
trust dscp	Setting the trust dscp enables the mls qos map premark-dscp to command to apply. See, " Setting the Trust DSCP Map " on page 63.14.
set dscp	With the trust dscp set, this command will change the dscp value in the packet.
mls qos map premark-dscp to	With the trust dscp set, this command applies a remapping table whose values include the dscp and egress queues.
mls qos queue	Sets a default egress queue for each individual port (or range of ports) on the switch.

If no overriding commands have been configured, and there is no CoS value in the packet, then the default setting of the **mls qos queue** command will send all data out via its port's egress queue 2. You can use the **mls qos queue** command to reset the egress queue for each port on the switch. If the packet does contain a CoS tag value, then this queue will be that shown in the mapping in the section "**Mapping CoS tags to traffic types**" on page 63.13.

Setting the Trust DSCP Map

The Trust DSCP mapping table assigns a new set of QoS values for a DSCP value supplied as table input. To configure this table you use the **mls qos map premark-dscp to** command.

Table 63-6: Drop Probability Table

Table Input	Table Output			
Existing DSCP	New DSCP Value	New CoS Value	New Queue No	New BW Class green yellow red

The Trust DSCP map provides the highest priority of all the pre-marking controls. To apply this table you must first apply the trust setting by using the **trust dscp** command.

At this point the DSCP input to the table will be that existing in the incoming packet. Note, that with the trust DSCP set, the DSCP value that is used for table lookup is on the DSCP of the incoming packet.

Policing (Metering) Your Data

Once you have set-up your classification and created your class-maps, you can start conditioning your traffic flows. One tool used for traffic conditioning is the policer (or meter). The principle of policing is to measure the data flow that matches the definitions for a particular class-map; then, by selecting appropriate data rates, allocate the flows into one of three categories: Red, Yellow, or Green. You then decide what action to apply to the Red, Yellow and Green data.

Two metering types can be configured from the [mls qos aggregate-police action command on page 64.23](#), these types are:

- single-rate three-color
- twin-rate three-color

Note that although the color marking process is carried out on the input port (on ingress), the egress port can also use this color marking to modify its output data flows. The meter operates in the color aware mode; however the premarker that precedes it senses all input data as being green. Note that all external data entering a switch port is considered to be marked green. This means that unless you have re-colored your data at the premarking stage - by using the [set bandwidth-class command on page 64.46](#) - the data entering the meter will be green.

The metering levels, CIR, CBS etc are defined within a policer. This class-map (along with others) is then added to a policy-map, which in turn is attached to a port.

Single-rate Three-color Policing

This policing method is based on that defined in RFC 2697. The principle of single-rate three-color policing is shown in [Figure 63-7](#). For a given class-map, a meter monitors both the token count in the buckets, and the input data flow.

Figure 63-7: Single-rate Three-color Policing

Each byte entering the meter is paired with a token in one of the buckets, and a token is removed as each byte is accepted. If the input data rate is the same as the CIR then the data passes through the port at the same rate as its bucket fills. Hence the bucket level remains constant. In this model, the data buffer is represented by two data buckets. You can specify the CIR using the **police single-rate action** command.

Initially both buckets have their full token count. A surge of data exceeding the CIR will begin to empty the bucket. As the data and tokens are paired, data bytes that match tokens below the CBS level are marked green, those that are between CBS and EBS will be marked yellow, and those that are above EBS are marked red.

Note that although the data is metered per byte, the color marking process is applied per packet. This means that if there were only sufficient tokens available to match part of a packet, then the whole packet would be marked red. Then, depending on the **action** parameter of the **police single-rate action** command, the whole packet will be either dropped or forwarded. In either situation, the red marked packet will leave the bucket counts unchanged.

Two-rate Three-color Policing

This policing method is based on that defined in RFC 2698. The principle of two-rate three-color policing is shown in [Figure 63-8](#).

Figure 63-8: Two-rate Three-color Policer

For a given class-map, the meter monitors the token count in both buckets, and the input data flow. Initially tokens enter both buckets until full. As the data enters a port, the meter pairs each byte to a token in one of the buckets, then removes a token from the appropriate bucket. Bucket C is topped up with tokens at the Committed Information Rate (CIR), and bucket P is topped up at the Peak Information Rate (PIR).

When data enters the port at the CIR, the bucket fills at the same rate as the incoming data, thus the token count in bucket C remains constant. Similarly, if data enters the port at the PIR, then the token count in bucket P remains constant. You can specify the CIR and the PIR by using either the **police twin-rate action** command or the **mls qos aggregate-police action** command. The function of each of these commands is explained in the section **“Configuring and Applying a Policer”** on page 63.24.

A surge of data exceeding the CIR will begin to empty bucket C. If bucket C empties to a point where it has insufficient tokens to match to an incoming data packet, then the data packet will be marked yellow. The data will now be measured against the level in bucket P and tokens will be removed from this bucket to match the incoming data. If the incoming data rate drops to less than the CIR then the data will continue to be marked yellow until the level in bucket C has had a chance to fill, whereupon it will be marked *green*.

If the incoming data is greater than the PIR, then bucket P begins to empty. If bucket P empties to a point where it has insufficient tokens to match to an incoming data packet, then the data packet will be marked *red*. In this situation no tokens are removed from either bucket.

Note that although the data is metered per byte, the color marking process is applied per packet. This means that if there were only sufficient tokens available to match part of a packet, then the whole packet would be marked red. Then, depending on the **action** parameter of the **police twin-rate action** command, the whole packet will be either dropped, or marked and forwarded. In either situation, the red marked packet will leave the bucket counts unchanged.

Configuring and Applying a Policer

The previous section showed how the policer works and how to select either the single rate or twin rate action. There are two methods to apply a policy to class-maps.

1. Select your policy-map and class-map from the command prompt, then enter either the **police single-rate action** command or the **police twin-rate action** command whilst selecting the appropriate command parameters.

This will apply the command to the selected class-map. By running this command several times, each for a different class-map, you can apply separate meter settings to each class-map.

2. Use the **mls qos aggregate-police action** to create a “named” aggregate policer whilst selecting the appropriate command parameters. Once you have done this, you can use the **police-aggregate** command to apply the aggregator to the policy-map and class-map selected from the command prompt. Note that you cannot apply an aggregate policer to a class-map that has already been attached to a policer by using either the **police single-rate action**, or the **police twin-rate action** commands.

The main difference between these two methods is that you use method (1) to apply policing to a number of class-maps, each having its own individually configured meter settings; whereas you use method (2) to apply policing to a number of class-maps and police them all using a single meter setting.

Note A set of class-maps that contribute traffic into a given aggregate policer can belong to different policy-maps. This means that the aggregate policer can meter packets destined for different egress ports.

Configuring the Egress Queues

Previous sections have explained the ingress functions. These include, how the incoming data can be classified and marked according to its priority and allocated to an egress queue, then finally how metering and remarking is applied. At this point the data then flows across the switch to its destination egress port where its transit to the egress queues is controlled.

The means by which data is applied to the egress queues is dependant on three functions:

- Egress queue and QoS markers that are set within each data packet
- Egress controls that are applied to the whole switch
- Egress that are applied to each individual switch port

Backplane queues - The Internal Paths

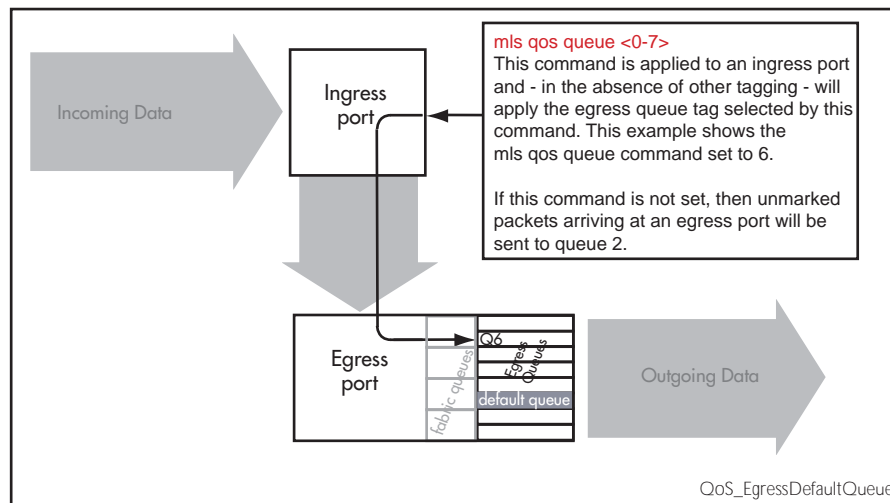

Although the internal hardware functions of the switch are outside the scope of this manual, this section provides some background information to help you understand and use the **mls qos backplane-queue** command. Basically, the internal path that links the fabric adaptors terminates in seven backplane queues. These queues schedule the data traversing across the Control Fabric Cards to the line cards.

The **mls qos backplane-queue** command enables you to select the scheduling algorithm to be either strict priority, or weighted round robin (WRR). The default is strict priority. Use the **show mls qos backplane-queue** command to see the present settings on your switch.

Egress Queues and QoS markers

Once the data packets have been appropriately filtered, classified, policed, and remarked, they travel across the switch's internal paths carrying their assigned QoS tag markers such as their priority, class and destination queues. For more details on ingress data marking, refer to the earlier sections of this chapter. At the egress port these markers are read and used to determine which queues each data packet will be forwarded to, and the priorities that will be applied.

There are eight egress queues allocated to each egress port. The egress queue that a particular packet passes through is determined by either the configuration of the switch, or by the markers contained within the packet itself.

Figure 63-9: Default Egress Queue

Egress Queue Commands Hierarchy

The destination queue that any one packet will take depends on the markers within the packet, and the way the queueing commands have been set. Also, some queueing commands will override others. Here is how the switch prioritizes its queueing commands.

Imagine a packet entering an ingress port then traveling through the switch fabric to reach its appropriate egress port. In this situation the following hierarchy will apply:

1. If the packet enters an egress port carrying no QoS markers and no QoS queueing commands have been set on the switch, then the packet will exit the port via queue number 2.
2. If the packet containing CoS marker arrives at an egress port, then with no other configuration applying, then its queue mapping will be subject to the setting of the **mls qos map cos-queue to** command.
3. Situations (1) and (2) can be overridden by the **mls qos queue** command. This command sets a default queue for each switch port.
4. If the **set queue** command has been applied to specific ports via its class-map / policy-map combination, then the queue mapping of this command will override that set by the **mls qos queue** command for those specific ports.
5. If the **trust dscp** then the egress queue assignment will be based on the entries in the mls qos map, which is set by the **mls qos queue** command. This mapping table will override all the previous commands in this list.

Egress Queue Shaping

This section is concerned with how the egress queues are cleared.

Scheduling

The scheduler determines how packets in the egress port queues are serviced. Two servicing methods can be applied:

- strict priority
- weighted round robin

A scheduler-set is used to apply the servicing method on an interface. You can create up to four scheduler-sets that are then shared across ports. First you configure a scheduler-set and then apply it to the specified port.

To apply scheduler-set 1 on port 1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# mls qos scheduler-set 1
```

To display the scheduler-set configuration, use the command:

```
awplus# show mls qos scheduler-set
```

Strict priority servicing

By default, all queues on all ports are serviced in a strict priority order. This means that the highest numbered priority queue (queue 7) is emptied first; then when it is completely empty, the next highest priority queue is processed, and so on. Thus, for a strict priority queue to be processed, all higher priority queues must be empty.

Strict priority servicing is the default setting; however if your system is configured for weighted round robin (WRR), you can return it to priority queueing by using the commands shown in the following example.

To return queue 3 of scheduler-set 1 from WRR servicing to strict priority queueing, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 1 priority-queue 3
```

Weighted round robin (WRR) servicing

You can group queues into one of two weighted round robin groups, called WRR1 and WRR2. Within each group, the queues will be emptied using a weighted round robin algorithm.

Within each group, you can give each queue a relative weight. Within that group, the switch empties each queue in proportion to its weight. The exact weight numbers are irrelevant, as long as they result in the ratio you want.

WRR1 does not take priority over WRR2, or vice versa; priority is determined by the queue number. The switch first empties queue 7 and any other queues in the same WRR group as queue 7. Then it empties queue 6 and any other queues in the same WRR group as queue 6, and so on.

To configure WRR, use the [mls qos scheduler-set wrr-queue group](#) command on page 64.36.

For example, suppose you want the queues on port1.1.1 to be processed as follows:

1. Queue 7 first
2. If queue 7 is empty, queue 6 next
3. If queues 6 and 7 are empty, queues 3, 4 and 5 next, in a ratio of 1:1:2 packets
4. If queues 3 to 7 are empty, queues 1 and 2 next, in equal ratio
5. If all other queues are empty, queue 0

In this example, you could configure the queues as follows:

- queues 6 and 7: strict priority (the default)
- queues 3, 4 and 5: WRR group 1 with weighting values of 6, 6 and 12 respectively
- queues 1 and 2: WRR group 2 with a weighting value of 6
- queue 0: strict priority (the default)

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 2 wrr-queue group 1
weight 6 queues 3 4
awplus(config)# mls qos scheduler-set 2 wrr-queue group 1
weight 12 queues 5
awplus(config)# mls qos scheduler-set 2 wrr-queue group 2
weight 6 queues 1 2
awplus(config)# interface port1.1.1
awplus(config-if)# mls qos scheduler-set 2
```

Egress Queue Mapping

On the switch you can use the [match inner-vlan command on page 64.14](#) to select frames of a particular type. You can then assign these frames with a particular User Priority value then map them to one of eight egress queues. This facility enables you to accept frames that are already carrying meaningful priority information to be automatically assigned to an appropriate egress queue. For example, you could decide to send frames with a User Priority value of 7 to queue 3, and frames with a User Priority value of 2 to queue 7.

Frames entering a port at Layer 2 may be tagged or untagged. VLAN tagged frames contain 3 additional fields as shown in [Figure 63-10](#) below. The User Priority field enables you to map incoming frames to any one of eight egress queues. This facility enables you can accept frames that are already carrying meaningful priority information to be automatically assigned to an appropriate egress queue. For example, you could decide to send frames with a User Priority value of 7 to queue 3, and frames with a User Priority value of 2 to queue 7.

Figure 63-10: User Priority Field

Mapping an Untagged frame to an Egress Queue

Frames entering a port with no VLAN tag and hence no User Priority Field, can be mapped to one of the eight Egress queue by using the [mls qos queue command on page 64.33](#). For example, you could decide to send all untagged frames to a low priority egress queue such as queue 7.

Mapping an IEEE 802.1P value to an Egress Queue

Immediately after ingress, a VLAN-tagged Ethernet frame can be assigned to an appropriate egress queue, based on the priority value that is set within the frame's VLAN Tag Information Field (TIF). To create the mapping between the TIF and a ports egress queue see the [mls qos map cos-queue to command on page 64.30](#).

Storm Protection

Storm protection uses QoS mechanisms to classify on traffic likely to cause a packet storm (broadcast and multicast). Unless you are running an enhanced storm protection feature such as Loop Protection, the per-port storm protection mechanism simply discards any traffic over the configured limit. However, with QoS storm protection, several actions are possible when a storm is detected:

- You can disable the port physically.
- You can disable the port logically.
- You can disable the port for a particular VLAN.

Before you can configure storm protection, you must first enable policer counters. To do this, enter the **police counters** command on page 64.39 in **config-pmap-c** mode.

To enable the policy-based storm protection, use the **storm-protection** command on page 64.70.

When a storm is detected on a port, a message is automatically recorded in the log, and you can configure an SNMP trap to signal that a port has been disabled. When a storm is detected on a trunk or port group, the entire trunk or port group is disabled.

The following table explains the basic concepts involved with storm protection.

Concept	Description
Window	The frequency at which traffic is measured to determine whether storm protection should be activated.
Rate	The amount of traffic per second that must be exceeded before the switch takes the configured action.
Action	What the switch does when it detects a storm on a port.
Timeout	The length of time the port remains disabled after a port has been disabled due to a packet storm.

To set the action to take when triggered by QoS Storm Protection (QSP), use the **storm-action** command on page 64.68.

To set the time to re-enable the port once disabled by QSP, use the **storm-downtime** command on page 64.69.

Chapter 64: QoS Commands

Command List	64.3
class	64.3
class-map	64.4
clear mls qos interface policer-counters.....	64.5
default-action	64.6
description (QoS policy-map).....	64.7
egress-rate-limit.....	64.8
match access-group.....	64.9
match cos.....	64.10
match dscp.....	64.11
match inner-cos.....	64.12

wrr-queue egress-rate-limit queues.....	64.75
wrr-queue queue-limit.....	64.76

Command List

This chapter provides an alphabetical reference for Quality of Service commands. For more information, see [Chapter 63, Quality of Service \(QoS\) Introduction](#) and [Chapter 58, Access Control Lists Introduction](#).

class

Use this command to associate an existing class-map to a policy or policy-map (traffic classification), and to enter Policy Map Class Configuration mode to configure the class-map.

Use the **no** variant of this command to delete an existing class-map.

For more information on class-maps and policy-maps, see the following sections: [“Class Maps” on page 63.7](#) and [“Policy Maps” on page 63.10](#).

Note that if your class-map does not exist, you can create it by using the [class-map](#) command.

Syntax `class {<name>|default}`

`no class <name>`

Parameter	Description
<code><name></code>	Name of the (already existing) class-map.
<code>default</code>	Specify the default class-map.

Mode Policy Map Configuration

Example The following example creates the policy-map `pmap1` (using the `policy-map` command), then associates this to an already existing class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)#
```

Related Commands [class-map](#)
[policy-map](#)

class-map

Use this command to create a class-map.

Use the **no** variant of this command to delete the named class-map.

Syntax `class-map <name>`
`no class-map <name>`

Parameter	Description
<code><name></code>	Name of the class-map to be created.

Mode Global Configuration

Example This example creates a class-map called `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)#
```

clear mls qos interface policer-counters

Resets an interface's policer counters to zero. This can either be for a specific class-map or for all class-maps.

Before running this command you must first enable the QoS counter platform enhanced mode.

Syntax `clear mls qos interface <port> policer-counters
[class-map <class-map>]`

Parameter	Description
<port>	The port may be a switch port (e.g. port1.1.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).
class-map	Select a class-map.
<class-map>	Class-map name.

Mode Privileged Exec

Example To reset the policy counters to zero for all class-maps for port1.1.1, use the command:

```
awplus# clear mls qos interface port1.1.1 policer-counters
```

Related Commands [show mls qos interface policer-counters](#)

default-action

Sets the action for the default class-map belonging to a particular policy-map. The action for a non-default class-map depends on the action of any ACL that is applied to the policy-map.

The default action can therefore be thought of as specifying the action that will be applied to any data that does not meet the criteria specified by the applied matching commands.

Use the **no** variant of this command to reset to the default action of 'permit'.

Syntax `default-action [permit|deny|send-to-cpu|copy-to-cpu|copy-to-mirror]`
`no default-action`

Parameter	Description
permit	Packets to permit.
deny	Packets to deny.
send-to-cpu	Specify packets to send to the CPU.
copy-to-cpu	Specify packets to copy to the CPU.
copy-to-mirror	Specify packets to copy to the mirror port.

Default The default is 'permit'.

Mode Policy Map Configuration

Examples To set the action for the default class-map to deny, use the command:

```
awplus(config-pmap)# default-action deny
```

To set the action for the default class-map to copy-to-mirror for use with the **mirror interface** command, use the command:

```
awplus(config-pmap)# default-action copy-to-mirror
```

Related Commands [mirror interface](#)

description (QoS policy-map)

Adds a textual description of the policy-map. This can be up to 80 characters long.

Use the **no** variant of this command to remove the current description from the policy-map.

Syntax `description <line>`
`no description`

Parameter	Description
<code><line></code>	Up to 80 character long line description.

Mode Policy Map Configuration

Example To add the description, VOIP traffic, use the commands:

```
awplus(config-pmap)# description VOIP traffic
```

egress-rate-limit

Sets a limit on the amount of traffic that can be transmitted per second from this port.

Use the **no** variant of this command to disable the limiting of traffic egressing on the interface.

Syntax `egress-rate-limit <bandwidth>`
`no egress-rate-limit`

Parameter	Description
<code><bandwidth></code>	Bandwidth <1-10000000 units per second> (usable units: k, m, g). The minimum is 651 Kb. The default unit is Kb (k), but Mb (m) or Gb (g) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be taken to mean 20 megabits.

Mode Interface Configuration

Examples To enable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# egress-rate-limit 500m
% Egress rate limit has been set to 500 Mb
```

To disable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no egress-rate-limit
```

match access-group

Use this command to define match criterion for a class-map.

Syntax `match access-group {<hw-IP-ACL> | <hw-MAC-ACL> | <hw-named-ACL>}`
`no match access-group {<hw-IP-ACL> | <hw-MAC-ACL> | <hw-named-ACL>}`

Parameter	Description
<hw-IP-ACL>	Specify a hardware IP ACL number in the range <3000-3699>.
<hw-MAC-ACL>	Specify a hardware MAC ACL number in the range <4000-4699>.
<hw-named-ACL>	Specify the hardware named ACL.

Mode Class Map Configuration

Usage First create an access-list that applies the appropriate permit, deny requirements etc. Then use the **match access-group** command to apply this access-list for matching to a class-map. Note that this command will apply the access-list matching only to *incoming* data packets.

Examples To configure a class-map named `cmap1` with one match criterion: `access-list 3001`, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 permit ip any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3001
```

To configure a class-map named `cmap2` with one match criterion: `access-list 4001`, which allows MAC traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit any any
awplus(config)# class-map cmap2
awplus(config-cmap)# match access-group 4001
```

To configure a class-map named `cmap3` with one match criterion: `access-list hw_acl`, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware hw_acl
awplus(config-ip-hw-acl)# permit ip any any
awplus(config)# class-map cmap3
awplus(config-cmap)# match access-group hw_acl
```

Related Commands [class-map](#)

match cos

Sets the CoS for a class-map to match on.

Use the **no** variant of this command to remove CoS.

Syntax `match cos <0-7>`

`no match cos`

Parameter	Description
<code><0-7></code>	Specify the CoS value.

Mode Class Map Configuration

Examples To set the class-map's CoS to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match cos 4
```

To remove CoS from a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match cos
```

match dscp

Use this command to define the DSCP to match against incoming packets.

Use the **no** variant of this command to remove a previously defined DSCP.

Syntax `match dscp <0-63>`

`no match dscp`

Parameter	Description
<0-63>	Specify DSCP value (only one value can be selected).

Mode Class Map Configuration

Usage Use the **match dscp** command to define the match criterion after creating a class-map.

Examples To configure a class-map named `cmap1` with criterion that matches IP DSCP 56, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match dscp 56
```

To remove a previously defined DSCP from a class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match dscp
```

Related Commands [class-map](#)

match inner-cos

Sets the Inner CoS for a class-map to match on.

Use the **no** variant of this command to remove CoS.

Syntax `match inner-cos <0-7>`

`no match inner-cos`

Parameter	Description
<code><0-7></code>	Specify the Inner CoS value.

Mode Class Map Configuration

Examples To set the class-map's inner-cos to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-cos 4
```

To remove CoS from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-cos
```

match inner-tpid

Sets the Inner Tag Protocol Identifier (TPID) for a class-map to match on.

Use the **no** variant of this command to remove the TPID for a class-map.

Syntax `match inner-tpid <tpid>`

`no match inner-tpid`

Parameter	Description
<code><tpid></code>	Two byte hexadecimal number representing the TPID.

Mode Class Map Configuration

Examples To set the class-map's inner-tpid to 0x9100, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-tpid 0x9100
```

To remove the class-map's inner-tpid, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-tpid
```

match inner-vlan

Use this command to define the inner VLAN ID used as match criteria to classify a traffic class.

Use the **no** variant of this command to disable the VLAN ID used as match criteria.

Syntax `match inner-vlan <1-4094>`
`no match inner-vlan`

Parameter	Description
<1-4094>	The VLAN number.

Mode Class Map Configuration

Usage This command is used in double-tagged networks to match on a VLAN ID belonging to the client network. For more information on VLAN double-tagged networks, see [“VLAN Double Tagging \(VLAN Stacking\)” on page 16.5](#).

Examples To configure a class-map named `cmap1` to include traffic from inner VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-vlan
```

match ip-precedence

Use this command to identify IP precedence values as match criteria.

Use the **no** variant of this command to remove IP precedence values from a class-map.

Syntax `match ip-precedence <0-7>`
`no match ip-precedence`

Parameter	Description
<code><0-7></code>	The precedence value to be matched.

Mode Class Map Configuration

Example To configure a class-map named `cmap1` to evaluate all IPv4 packets for a precedence value of 5, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match ip-precedence 5
```

match mac-type

Use this command to set the MAC type for a class-map to match on.

Use **no** variant of this command to remove the MAC type match entry.

Syntax `match mac-type {l2mcast|l2ucast}`
`no match mac-type`

Parameter	Description
l2mcast	Layer 2 Multicast and Broadcast traffic.
l2ucast	Layer 2 Unicast traffic.

Mode Class Map Configuration

Examples To set the class-map's MAC type to Layer 2 multicast, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match mac-type l2mcast
```

To remove the class-map's MAC type entry, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match mac-type
```

match protocol

This command sets the ethernet format and the protocol for a class-map to match on.

Select one Layer 2 format and one Layer 3 protocol when you issue this command.

Use the **no** variant of this command to remove the configured ethernet format and protocol from a class-map.

Syntax `match eth-format <layer-two-format> protocol <layer-three-protocol>`
`no match eth-format protocol`

Parameter	Description
<i><layer-two-formats></i>	
802dot2-tagged	802.2 Tagged Packets (enter the parameter name).
802dot2-untagged	802.2 Untagged Packets (enter the parameter name).
ethii-tagged	EthII Tagged Packets (enter the parameter name).
ethii-untagged	EthII Untagged Packets (enter the parameter name).
netwareraw-tagged	Netware Raw Tagged Packets (enter the parameter name).
netwareraw-untagged	Netware Raw Untagged Packets (enter the parameter name).
snap-tagged	SNAP Tagged Packets (enter the parameter name).
snap-untagged	SNAP Untagged Packets (enter the parameter name).
<i><layer-three-protocols></i>	
<word>	A Valid Protocol Number in hexadecimal.
any	Note that the parameter "any" is only valid when used with the netwarerawtagged and netwarerawuntagged protocol options.
sna-path-control	Protocol Number 04 (enter the parameter name or its number).
proway-lan	Protocol Number 0E (enter the parameter name or its number).
eia-rs Protocol	Number 4E (enter the parameter name or its number).
proway Protocol	Number 8E (enter the parameter name or its number).
ipx-802dot2	Protocol Number E0 (enter the parameter name or its number).
netbeui	Protocol Number F0 (enter the parameter name or its number).
iso-clns-is	Protocol Number FE (enter the parameter name or its number).

Parameter(cont.)	Description(cont.)
xdot75-internet	Protocol Number 0801 (enter the parameter name or its number).
nbs-internet	Protocol Number 0802 (enter the parameter name or its number).
ecma-internet	Protocol Number 0803 (enter the parameter name or its number).
chaosnet	Protocol Number 0804 (enter the parameter name or its number).
xdot25-level-3	Protocol Number 0805 (enter the parameter name or its number).
arp Protocol	Number 0806 (enter the parameter name or its number).
xns-compatible	Protocol Number 0807 (enter the parameter name or its number).
banyan-systems	Protocol Number 0BAD (enter the parameter name or its number).

ipx	Protocol Number 8137 (enter the parameter name or its number).

Mode Class Map Configuration

Examples To remove the eth-format and the protocol from the class-map `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match eth-format protocol
```

To set the eth-format to `ethii-tagged` and the protocol to 0800 (IP) for class-map `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match eth-format ethii-tagged protocol
0800
or
awplus(config-cmap)# match eth-format ethii-tagged protocol ip
```

match tcp-flags

Sets one or more tcp flags (control bits) for a class-map to match on.

Use the **no** variant of this command to remove one or more tcp flags for a class-map to match on.

Syntax `match tcp-flags {[ack][fin][rst][syn][urg]}`
`no match tcp-flags {[ack][fin][rst][syn][urg]}`

Parameter	Description
ack	Acknowledge.
fin	Finish.
rst	Reset.
syn	Synchronize.
urg	Urgent.

Mode Class Map Configuration

Examples To set the class-map's tcp flags to `ack` and `syn`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# match tcp-flags ack syn
```

To remove the tcp-flags `ack` and `rst`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# no match tcp-flags ack rst
```

match tpid

Sets the Tag Protocol Identifier (TPID) for a class-map to match on.

Use the **no** variant of this command to remove the TPID for a class-map.

Syntax `match tpid <tpid>`

`no match tpid`

Parameter	Description
<code><tpid></code>	Specify the Tag Protocol Identifier.

Mode Class Map Configuration

Examples To set the TPID of class-map named `cmap1` to `0x9100`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match tpid 0x9100
```

To remove the TPID set previously for class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match tpid
```

match vlan

Use this command to define the VLAN ID used as match criteria to classify a traffic class.

Use the **no** variant of this command to disable the VLAN ID used as match criteria.

Syntax `match vlan <1-4094>`

`no match vlan`

Parameter	Description
<1-4094>	The VLAN number.

Mode Class Map Configuration

Examples To configure a class-map named `cmap1` to include traffic from VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match vlan
```

mls qos aggregate-police action

This command creates or reconfigures an aggregate-policer for a class-map.

The **no** variant of this command removes a previously configured exceed action.

Syntax For single rate metering:

```
mls qos aggregate-police <name> single-rate <CIR> <CBS> <EBS>
  action [drop-red|transmit]
```

For twin rate metering:

```
mls qos aggregate-police <name> twin-rate <CIR> <CBS> <EIR> <PBS>
  action [drop-red|transmit]
```

```
no mls qos aggregate-police <name>
```

Parameter	Description
<name>	Specify aggregate-policer name.
single-rate	Single rate meter (one rate and two burst sizes).
twin-rate	Twin rate meter (two rates and two burst sizes).
<CIR>	The Committed Information Rate. Specify an average traffic rate, 1-16000000 (kbps).
<CBS>	The amount by which the data is allowed to burst beyond the value set by the CIR. Specify a value from 0-16777216 (bytes).
<EIR>	Excess Information Rate. Specify an average traffic rate, 1-16000000 (kbps).
<EBS>	<i>For single-rate metering</i> , this is the amount by which the data is allowed to burst beyond the value set by the CIR.
<PBS>	<i>For twin-rate metering</i> , this is the amount by which the data is allowed to burst beyond the value set by the EIR. Specify a value from 1-16777216 (bytes).
action	Specify the action: either drop-red or policed-dscp-transmit.
drop-red	Drop the red packets.
transmit	Packets are sent without modification.

Mode Global Configuration

Usage A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

Once you have created an aggregate policer, you can use the **police-aggregate** command on page 64.38 to assign it to one or more class-maps. This enables traffic classified by different characteristics to have accumulative application to the same policer. Another application of aggregate policers is to attach them to a single class-map but apply the class-maps to multiple ports (via its policy-map). This enables the same traffic to have accumulative policed application over multiple ports.

A single-rate policer is based on three values. These are:

- average rate (or Committed Information Rate CIR)
- minimum burst (or Committed Burst Size CBS)
- maximum burst (or Excess Burst Size EBS)

Traffic is classed as green if the rate is less than the combined CIR plus CBS values. Traffic is classed as yellow if the data rate is between the CBS and the EBS. Traffic is classed as red if the rate exceeds the average rate and the EBS.

A dual-rate policer is based on four values. These are:

- average rate (or Committed Information Rate CIR)
- minimum burst (or Committed Burst Size CBS)
- maximum burst (or Excess Burst Size EBS)
- Excess Information Rate (EIR)

Traffic is classed as green if the rate is less than the CIR and CBS. Traffic is classed as yellow if the rate is between the CBS and the EBS. Traffic is classed as red if the rate exceeds the average rate and the EBS.

Using an action of **drop-red** will result in all packets classed as red being discarded.

Example To create a single rate meter measuring traffic of 10 Mbps that drops any traffic bursting over 30000 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos aggregate-police ap1 single-rate 10000
                20000 30000 action drop-red
awplus(config)#
```

Related Commands **police-aggregate**
show mls qos aggregate-policer

mls qos aggregate-police counters

Use this command to enable policer counters for an aggregate-policer. This command can be used separately or in conjunction with a traffic meter (single or twin-rate meters).

Use the **no** variant of this command to disable policer counters for an aggregate-policer.

Syntax `mls qos aggregate-police <name> counters`
`no mls qos aggregate-police <name> counters`

Parameter	Description
<code><name></code>	Specify aggregate-policer name.

Default Policer counters are disabled by default.

Mode Global Configuration

Example To enable policer counters for aggregate-policer `MyPolicer`, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos aggregate-police MyPolicer counters
```

To disable policer counters for aggregate-policer `MyPolicer`, use the commands:

```
awplus# configure terminal
awplus(config)# no mls qos aggregate-police MyPolicer
counters
```

Related Commands [police counters](#)
[police single-rate action](#)
[police twin-rate action](#)

mls qos backplane-queue

Use this command to configure the scheduling algorithm for one or more backplane queues. If the scheduler is weighted round robin (WRR), you can also specify a weighting. You must specify at least one queue when setting this command.

Use the **no** variant of this command to reset the scheduling algorithm for one or more backplane queues to the default of priority.

Syntax `mls qos backplane-queue {[0][1][2][3][4][5][6][7]}
{priority|wrr [weight <6-255>]}`

`no mls qos backplane-queue {[0][1][2][3][4][5][6][7]}`

Parameter	Description
[0][1]...[7]	Backplane queues being configured.
priority	Applies strict priority queue servicing to the selected queues.
wrr	Applies weighted round robin queue servicing to the selected queues.
weight	The weight for weighted round robin selection. Queues are then serviced in proportion to their applied weights.
<6-255>	The weight value. Default is 6.

Default Priority is the default.

Mode Global Configuration

Usage Queues can be serviced in either priority sequence or a weighted round-robin sequence. All queues are set to priority servicing by default.

Priority Sequencing

In this mode the queue with the highest number, i.e. queue 7 is emptied first, in descending order to queue 0. Note that the lower queues are only serviced if there is no data waiting in the higher numbered queues.

Weighted Round Robin Sequencing

In this mode the weighting that you assign to each queue determines how often it is serviced with respect to the other WRR queues. For example, if queue 0 is configured with a weight of 50 and queue 1 is configured with a weight of 10, then queue 0 is serviced 5 times more than queue 1. Setting all weights to the same value will therefore apply an unweighted round selection method.

Mixed Sequencing

If you configure the queues with a mix of priority queueing and WRR, the priority queues are completely emptied before the any WRR queue is serviced.

Example To set the scheduler for backplane queues 0 and 1 to WRR and both have a weight of 50, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos backplane-queue 0 1 wrr weight 50
```

To reset the scheduling algorithm for backplane queues 0 and 1, use the commands:

```
awplus# configure terminal
awplus(config)# no mls qos backplane-queue 0 1
```

Related Commands [show mls qos backplane-queue](#)

mls qos cos

This command assigns a CoS (Class of Service) user-priority value to untagged frames entering a specified interface. By default, all untagged frames are assigned a CoS value of 0.

Use the **no** variant of this command to return the interface to the default CoS setting for untagged frames entering the interface.

Syntax `mls qos cos <0-7>`

`no mls qos cos`

Parameter	Description
<0-7>	The Class of Service, user-priority value.

Default By default, all untagged frames are assigned a CoS value of 0. Note that for tagged frames, the default behavior is not to alter the CoS value.

Mode Interface Configuration

Example To assign a CoS user priority value of 3 to all untagged packets entering ports 1.1.1 to 1.1.20, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1-port1.1.20
awplus(config-if)# mls qos cos 3
```

mls qos enable

Use this command to globally enable QoS on the switch.

Use the **no** variant of this command to globally disable QoS and remove all QoS configuration. The **no** variant of this command removes all class-maps, policy-maps, policers, and queue-sets that have been created. Running the **no mls qos** command will therefore remove all pre-existing QoS configurations on the switch.

Mode Global Configuration

Syntax mls qos enable

no mls qos

Example To enable QoS on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
```

mls qos map cos-queue to

Used to set the default CoS to queue mapping. This is the default queue mapping for packets that do not get assigned a queue via any other QoS functionality.

Use the **no** variant of this command to reset the cos-queue map back to its default setting. The default mappings for this command are:

```

CoS Priority :      0 1 2 3 4 5 6 7
-----
CoS QUEUE:        2 0 1 3 4 5 6 7

```

For more information see, ["Mapping CoS tags to traffic types" on page 63.13.](#)

Syntax `mls qos map cos-queue <cos-priority> to <queue-number>`
`no mls qos map cos-queue`

Parameter	Description
<code><cos-priority></code>	CoS priority value. Can take a value 0 to 7.
<code><queue-number></code>	Queue number. Can take a value 0 to 7.

Mode Global Configuration

Examples To set the cos-queue map back to its defaults, use the command:

```

awplus# configure terminal
awplus(config)# no mls qos map cos-queue

```

To map CoS 2 to queue 0, use the command:

```

awplus# configure terminal
awplus(config)# mls qos map cos-queue 2 to 0

```

Related Commands [show mls qos interface](#)

mls qos map premark-dscp to

This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has **trust dscp** configured. Based on a lookup DSCP, the map determines a new DSCP, CoS, queue and band width class for the traffic.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

Syntax

```
mls qos map premark-dscp <0-63> to {[new-dscp <0-63>]
[new-cos <0-7>] [new-bandwidth-class {green|yellow|red}]}

no mls qos map premark-dscp [<0-63>]
```

Parameter	Description
premark-dscp <0-63>	The DSCP value on ingress.
new-dscp <0-63>	The DSCP value that the packet will have on egress. If unspecified, this value will remain the DSCP ingress value.
new-cos <0-7>	The CoS value that the packet will have on egress. If unspecified, this value will retain its value on ingress.
new-bandwidth-class	Modify Egress Bandwidth-class. If unspecified, this value will be set to green.
green	Egress Bandwidth-class green (marked down Bandwidth-class).
yellow	Egress Bandwidth-class yellow (marked down Bandwidth-class).
red	Egress Bandwidth-class red (marked down Bandwidth-class).

Mode Global Configuration

Usage With the **trust dscp** command set, this command (**mls qos map premark-dscp**) enables you to make the following changes:

1. remap the DSCP (leaving the other settings unchanged)
2. remap any or all of CoS, output queue, or bandwidth class values (leaving the DSCP unchanged)

Note  If you attempt to remap both the DSCP and another setting, only the DSCP remap will take effect.

The **trust dscp** command and the premark-dscp map are one way to change packets' bandwidth-class, CoS, DSCP, and queue. They act by assigning a QoS profile to traffic that matches the policy-map.

You can also set these values explicitly for a class-map inside a policy-map, by using one of the commands:

- **set bandwidth-class** command on page 64.46
- **set cos** command on page 64.48
- **set dscp** command on page 64.50
- **set queue** command on page 64.52

Using *any* of these **set** commands overrides the premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- queue: 0

Example To set the entry for DSCP 1 to use a new DSCP of 2, a new CoS of 3, a new queue of 4 and a new bandwidth class of yellow, use the commands :

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
awplus(config)# mls qos map premark-dscp 2 to new-cos 3
awplus(config)# mls qos map premark-dscp 2 to new-queue 4
awplus(config)# mls qos map premark-dscp 2 to new-bandwidth-
class yellow
```

Example To set the entry for DSCP 1 to use a new DSCP of 2, a new CoS of 3, and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
new-cos 3 new-bandwidth-class yellow
```

Example To reset the entry for DSCP 1 use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map premark-dscp 1
```

Related Commands **show mls qos maps premark-dscp**
trust dscp

mls qos queue

Configures the default egress queue for any packet arriving on the specified interface. When no default queue is configured the cos-queue map is used to choose the queue for the packet.

Use the **no** variant of this command to turn off the use of a default queue on the interface.

Syntax `mls qos queue <0-7>`
`no mls qos queue`

Parameter	Description
<code><0-7></code>	The particular queue number.

Mode Interface Configuration

Examples To set the default egress queue to 7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# mls qos queue 7
```

To turn off the default mls queue usage on port1.1.1 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no mls qos queue
```

Related Commands [show mls qos interface](#)

mls qos scheduler-set

Use this command to set a scheduler-set on an interface.

Use the **no** variant of this command to reset an interface back to the default of strict priority.

Syntax `mls qos scheduler-set <1-4>`
`no mls qos scheduler-set`

Parameter	Description
<1-4>	Scheduler-set ID.

Mode Interface Configuration

Example To set port1.1.1 to use scheduler-set 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# mls qos scheduler-set 1
```

To reset scheduler-set 1 back to strict priority, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no mls qos scheduler-set
```

Related Commands [mls qos scheduler-set priority-queue](#)
[mls qos scheduler-set wrr-queue group](#)
[show mls qos scheduler-set](#)

mls qos scheduler-set priority-queue

Use this command to configure strict priority-based scheduling on the specified egress queues for a specific scheduler-set. You must specify at least one queue.

Syntax `mls qos scheduler-set <1-4> priority-queue [0][1][2][3][4][5][6][7]`

Parameter	Description
<1-4>	Scheduler-set ID.
[0][1]...[7]	Specify the egress queues to apply the scheduling rule to.

Mode Global Configuration

Example To apply priority based scheduling to egress queues 5, 6 and 7, for scheduler-set 1, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 1 priority-queue 5 6 7
```

Related Commands [mls qos scheduler-set wrr-queue group](#)
[show mls qos scheduler-set](#)

mls qos scheduler-set wrr-queue group

Use this command to configure weighted round-robin-based (WRR-based) scheduling on the specified egress queues for a specific scheduler-set.

You can group queues into one of two weighted round robin groups, called WRR1 and WRR2. Within each group, the queues will be emptied using a weighted round robin algorithm.

Within each group, you must give each queue a relative weight. Within that group, the switch empties the queues in proportion to their weights. The exact weight values are irrelevant, as long as they result in the ratio you want.

WRR1 does not take priority over WRR2, or vice versa; priority is determined by the queue number. The switch first empties queue 7 and any other queues in the same WRR group as queue 7. Then it empties queue 6 and any other queues in the same WRR group as queue 6, and so on.

Syntax `mls qos scheduler-set <1-4> wrr-queue group <1-2> weight <6-255>
queues [0][1][2]3][4][5][6][7]`

Parameter	Description
<1-4>	Scheduler-set ID.
<1-2>	WRR group 1 or 2.
<6-255>	Specify the weighting applied to the egress queues.
[0][1]...[7]	Specify the egress queues to apply the scheduling rule to.

Mode Global Configuration

Example To configure `wrr-queue group 2` applying a weighting value of 25 to queues 0 and 1 for `scheduler-set 1`, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 1 wrr-queue group 2
weight 25 queues 0 1
```

To configure `wrr-queue group 2` applying a weighting value of 50 to queues 2 and 3 for `scheduler-set 1`, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos scheduler-set 1 wrr-queue group 2
weight 50 queues 2 3
```

The switch will empty twice as many packets from queues 2 and 3 as it will from queues 0 and 1.

Related Commands [mls qos scheduler-set priority-queue](#)
[show mls qos scheduler-set](#)

no police

Disables any policer previously configured on the class-map.

Syntax no police

Mode Policy Map Class Configuration

Usage This command disables any policer previously configured on the class-map.

Example To disable policing on a class-map use the command:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police
```

Related Commands [police single-rate action](#)
[police twin-rate action](#)

police-aggregate

Use this command to apply a previously created aggregate-policer to the class-map.

Use the **no** variant of this command to remove a previously created aggregate-policer from the class-map.

Syntax `police-aggregate <name>`
`no police-aggregate <name>`

Parameter	Description
<code><name></code>	Specify a aggregate policer name.

Mode Policy Map Class Configuration

Usage This command enables you to apply an aggregate policer to a number of different class-maps, and meter them as one group. Note that you cannot apply this command to any class-map that already has a policer assigned by using the **police single (or twin) rate exceed action** command.

Examples To apply aggregate policer `ap1` to a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police-aggregate ap1
```

To remove a previously created aggregate-policer from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police-aggregate ap1
```

Related Commands [mls qos aggregate-police action](#)
[show mls qos aggregate-policer](#)

police counters

Use this command to enable policer counters for a class-map. This command can be used separately or in conjunction with a traffic meter (single or twin-rate meters).

Use the **no** variant of this command to disable policer counters for a class-map.

Syntax `police counters`
`no police counters`

Default Policer counters are disabled by default.

Mode Policy Map Class Configuration

Example To enable policer counters for a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police counters
```

To disable policer counters for a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police counters
```

Related Commands [mls qos aggregate-police counters](#)
[police single-rate action](#)
[police twin-rate action](#)
[storm-protection](#)

police single-rate action

Configures a single-rate policer for a class-map.

Syntax `police single-rate <cir> <cbs> <ebs> action
{drop-red|transmit}`

Parameter	Description
<cir>	Specify the Committed Information Rate (CIR) (1-16000000 kbps).
<cbs>	Specify the Committed Burst Size (CBS) (0-16777216 bytes).
<ebs>	Specify a Excess Burst Size (EBS) (0-16777216 bytes).
action	Specify the action if rate is exceeded.
	drop-red Drop the red packets.
	transmit Packets are sent without modification.

Mode Policy Map Class Configuration

Usage A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming). A single-rate policer is based on three values. These are the average rate, minimum burst and maximum burst.

Color	Definition
green	The traffic rate is less than the average rate and minimum burst.
yellow	The traffic rate is between the minimum burst and the maximum burst.
red	The traffic rate exceeds the average rate and the maximum burst.

Using an action of drop-red means that any packets classed as red are discarded.

Note This command will not take effect when applied to a class-map that attaches to a channel group whose ports span processor instances.

Example To configure a single rate meter measuring traffic of 10 Mbps that drops a sustained burst of traffic over this rate, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police single-rate 10000 1875000 1875000
action drop-red
```

Related Commands **no police**
 police twin-rate action

police twin-rate action

Configures a twin-rate policer for a class-map.

Syntax `police twin-rate <cir> <pir> <cbs> <pbs> action
{drop-red|transmit}`

Parameter	Description
<cir>	Specify the Committed Information Rate (CIR) (1-16000000 kbps).
<pir>	Specify the Peak Information Rate (PIR) (kbps).
<pbs>	Specify the Peak Burst Size (PBS) (0-16777216 bytes).
action	Specify the action if rate is exceeded.
drop-red	Drop the red packets.
transmit	Packets are sent without modification.

Mode Policy Map Class Configuration

Usage A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially-conforming), and red (non-conforming).

A twin-rate policer is based on four values. These are the minimum rate, minimum burst size, maximum rate, and maximum burst size.

Bandwidth Class	Definition
green	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is less than that set for the CBS.
yellow	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is between those set for the CBS and the PBS.
red	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time, result in a value that exceeds that set for the PBS.

Using an action of drop-red means that any packets classed as red will be discarded.

Example To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum

rate of 20 Mbps and transmit packets without modification, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action transmit
```

Related Commands **no police**
 police twin-rate action

policy-map

Use this command to create a policy-map and to enter Policy Map Configuration mode to configure the specified policy-map.

Use the **no** variant of this command to delete an existing policy-map.

Syntax `policy-map <name>`
`no policy-map <name>`

Parameter	Description
<code><name></code>	Name of the policy-map.

Mode Global Configuration

Example To create a policy-map called `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)#
```

Related Commands [class-map](#)

service-policy input

Use this command to apply a policy-map to the input of an interface.

Use the **no** variant of this command to remove a policy-map and interface association.

Syntax `service-policy input <policy-map>`
`no service-policy input <policy-map>`

Parameter	Description
<code><policy-map></code>	Policy map name that the input will applied to.

Mode Interface Configuration

Usage This command can be applied to switch ports or static channel groups, but not to dynamic (LACP) channel groups.

Example To apply a policy-map named `pmap1` to interface `port1.1.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# service-policy input pmap1
```

set bandwidth-class

Use this command to set a bandwidth-class color to assign to classified traffic. The color represents the traffic's conformance to the policers allocated bandwidth. Green traffic is assumed to be conforming, yellow is semi-conforming, and red is non-conforming.

Use the **no** variant of this command to turn off a bandwidth-class color assigned to classified traffic.

Syntax

```
set bandwidth-class {green|yellow|red}
no set bandwidth-class {green|yellow|red}
```

Parameter	Description
green	Mark the packet as green.
yellow	Mark the packet as yellow.
red	Mark the packet as red.

Mode Policy Map Class Configuration

Usage There is a limit to the number of unique combinations of CoS, DSCP, queue, and bandwidth-class color values that can be assigned to classified traffic. Each unique combination of values is referred to as a QoS profile. For more information, see [“QoS Profiles” on page 63.17](#).

This **set bandwidth-class** command is one way to set the packets' bandwidth class. The **trust dscp** command and the premark-dscp map are another way to do this. Both methods work by assigning a QoS profile to traffic that matches the policy-map.

As well as bandwidth class, there are also commands to explicitly set CoS, DSCP and queue values for packets that match a class-map inside a policy-map. The full set of commands is:

- [set bandwidth-class](#) command on page 64.46
- [set cos](#) command on page 64.48
- [set dscp](#) command on page 64.50
- [set queue](#) command on page 64.52

Using *any* of these **set** commands overrides the premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- queue: 0

Examples To set the bandwidth class for all traffic classified by this class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set bandwidth-class green
```

Note that the class-map and policy-map should already have been created by using the [class-map command on page 64.4](#) and the [policy-map command on page 64.44](#).

To turn off the setting of a packets in the green bandwidth-class, for the policy pmap1 and the class cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no set bandwidth-class green
```

Related Commands

- [class-map](#)
- [set cos](#)
- [set dscp](#)
- [set queue](#)
- [trust dscp](#)

set cos

Use this command to set a CoS value to assign to classified traffic.

Use the **no** variant of this command to turn off the CoS value assigned to classified traffic.

Syntax `set cos <0-7>`

`no set cos`

Parameter	Description
<0-7>	The new CoS value to be assigned.

Mode Policy Map Class Configuration

Usage There is a limit to the number of unique combinations of CoS, DSCP, queue, and bandwidth-class color values that can be assigned to classified traffic. However, a unique combination of values, referred to as a QoS profile, can be reused multiple times. For more information, see [“QoS Profiles” on page 63.17](#).

This **set cos** command is one way to set the packets' CoS. The **trust dscp** command and the **premark-dscp map** are another way to do this. Both methods work by assigning a QoS profile to traffic that matches the policy-map.

As well as CoS, there are also commands to explicitly set bandwidth-class, DSCP and queue values for packets that match a class-map inside a policy-map. The full set of commands is:

- [set bandwidth-class command on page 64.46](#)
- [set cos command on page 64.48](#)
- [set dscp command on page 64.50](#)
- [set queue command on page 64.52](#)

Using *any* of these **set** commands overrides the **premark-dscp map**, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- queue: 0

Examples To set the CoS value to 7 for all traffic classified by the selected class-map and policy-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set cos 7
```

To turn off the above setting, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no set cos
```

Related Commands **set bandwidth-class**
 set dscp
 set queue
 set dscp

set dscp

For a specific class-map and policy-map this command will assign or change the DSCP value within the packet. Note that where more than one class-map has been assigned to a particular DSCP, the switch will apply the action of the class-map that was created first.

The **no** variant of this command will negate the DSCP value specified with the **set dscp** command.

Syntax `set dscp <0-63>`

`no set dscp`

Parameter	Description
<0-63>	The new DSCP value. A value between 0 and 63.

Mode Policy Map Class Configuration

Usage There is a limit to the number of unique combinations of CoS, DSCP, queue, and bandwidth-class color values that can be assigned to classified traffic. However, a unique combination of values, referred to as a QoS profile, can be reused multiple times. For more information, see [“QoS Profiles” on page 63.17](#).

This **set dscp** command is one way to set the packets' DSCP. The **trust dscp** command and the **premark-dscp** map are another way to do this. Both methods work by assigning a QoS profile to traffic that matches the policy-map.

As well as DSCP, there are also commands to explicitly set bandwidth-class, CoS and queue values for packets that match a class-map inside a policy-map. The full set of commands is:

- [set bandwidth-class](#) command on page 64.46
- [set cos](#) command on page 64.48
- [set dscp](#) command on page 64.50
- [set queue](#) command on page 64.52

Using *any* of these **set** commands overrides the **premark-dscp** map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- queue: 0

Example To set a DSCP value of 35 to all traffic classified by a class-map of `cmap1` and a policy-map of `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set dscp 35
```

Related Commands

- set bandwidth-class**
- set cos**
- set queue**
- trust dscp**

set queue

Use this command to set a queue value to assign to classified traffic. This will override the default queue as configured by the **mls qos queue** command, but may be overridden by subsequent QoS mechanisms.

Use the **no** variant of this command to negate the queue value assigned to classified traffic by the **set queue** command.

Syntax `set queue <0-7>`

`no set queue`

Parameter	Description
<0-7>	Specify a new Queue value.

Mode Policy Map Class Configuration

Usage There is a limit to the number of unique combinations of CoS, DSCP, queue, and bandwidth-class color values that can be assigned to classified traffic. However, a unique combination of values, referred to as a QoS profile, can be reused multiple times. For more information, see **“QoS Profiles” on page 63.17**.

This **set queue** command is one way to set the packets' queue. The **trust dscp** command and the **premark-dscp map** are another way to do this. Both methods work by assigning a QoS profile to traffic that matches the policy-map.

As well as queue, there are also commands to explicitly set bandwidth-class, CoS and DSCP values for packets that match a class-map inside a policy-map. The full set of commands is:

- **set bandwidth-class** command on page 64.46
- **set cos** command on page 64.48
- **set dscp** command on page 64.50
- **set queue** command on page 64.52

Using *any* of these **set** commands overrides the **premark-dscp map**, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- queue: 0

Example To set the queue to value 7 for all traffic classified as `cmap1` and `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set queue 7
```

Related Commands

- set bandwidth-class**
- set cos**
- set dscp**
- trust dscp**

show class-map

Use this command to display the QoS class-maps to define the match criteria to classify traffic.

Syntax `show class-map <class-map name>`

Parameter	Description
<code><class-map name></code>	Name of the class-map.

Mode User Exec and Privileged Exec

Example To display the QoS class-maps to define the match criteria to classify traffic, use the command:

```
awplus# show class-map cmap1
```

Output **Figure 64-1: Example output from the show class-map command**

```
CLASS-MAP-NAME: cmap1
Set IP DSCP: 56
Match IP DSCP: 7
```

Related Commands [class-map](#)

show mls qos aggregate-policer

Displays all or a single aggregate-policer. If no name is specified, all aggregate policers will be displayed.

Syntax `show mls qos aggregate-policer [<name>]`

Parameter	Description
<name>	Aggregate policer name.

Mode User Exec and Privileged Exec

Example To display all aggregate-policers, use the command:

```
awplus# show mls qos aggregate-policer
```

Output **Figure 64-2: Example output from the show mls qos aggregate-policer command**

```
AGGREGATE-POLICER-NAME: ap1
Policer single-rate action drop-red:
average rate(1 kbps) minimum burst(2 B) maximum burst(3 B)
AGGREGATE-POLICER-NAME: ap2
Policer twin-rate action drop-red policed-dscp-tx:
minimum rate(1 kbps) maximum rate(2 kbps) minimum burst(3 B)
maximum burst(4 B)
```

Related Commands [mls qos aggregate-police action](#)
[police-aggregate](#)

show mls qos backplane-queue

Use this command to display the scheduling algorithms for the backplane-queues.

Syntax show mls qos backplane-queue

Mode Privileged Exec

Example To display all scheduling algorithms for the backplane-queues, use the command:

```
awplus# show mls qos backplane-queue
```

Output **Figure 64-3: Example output from the show mls qos backplane-queue command**

```
awplus#show mls qos backplane-queue
Backplane Queue:      0
  Scheduler:          Priority
Backplane Queue:      1
  Scheduler:          Priority
Backplane Queue:      2
  Scheduler:          Priority
Backplane Queue:      3
  Scheduler:          Priority
Backplane Queue:      4
  Scheduler:          Priority
Backplane Queue:      5
  Scheduler:          Priority
Backplane Queue:      6
  Scheduler:          Priority
Backplane Queue:      7
  Scheduler:          Priority
```

Related Commands [mls qos backplane-queue](#)

show mls qos interface

Displays the current settings for the interface. This includes its default CoS and queue, scheduling used for each queue, and any policies/maps that are attached.

Syntax `show mls qos interface [<port>]`

Parameter	Description
<port>	Switch port.

Mode User Exec and Privileged Exec

Example To display current CoS and queue settings for interface `port1.1.1`, use the command:

```
awplus# show mls qos interface port1.1.1
```

Output

Figure 64-4: Example output from the show mls qos interface command

```

Interface: port1.1.1

Scheduler-set: None
Number of egress queues: 8

Egress Queue:      0
  Status:          Enabled
  Queue Limit:    12%
  Egress Rate Limit: 0 Kb

Egress Queue:      1
  Status:          Enabled
  Queue Limit:    12%
  Egress Rate Limit: 0 Kb

Egress Queue:      2
  Status:          Enabled
  Queue Limit:    12%
  Egress Rate Limit: 0 Kb

Egress Queue:      3
  Status:          Enabled
  Queue Limit:    12%
  Egress Rate Limit: 0 Kb

Egress Queue:      4
  Status:          Enabled
  Queue Limit:    12%
  Egress Rate Limit: 0 Kb

Egress Queue:      5
  Status:          Enabled
  Queue Limit:    12%
  Egress Rate Limit: 0 Kb

Egress Queue:      6
  Status:          Enabled
  Queue Limit:    12%
  Egress Rate Limit: 0 Kb

Egress Queue:      7
  Status:          Enabled
  Queue Limit:    12%
  Egress Rate Limit: 0 Kb

```

Table 64-1: Parameters in the output of the show mls qos interface command

Parameter	Description
Scheduler-set	The number of the scheduler set that is applied to this interface. The scheduler set determines which queues are emptied using a weighted round robin algorithm instead of being emptied in strict priority order.
Number of egress queues	The total number of egress queues available on this interface.
Egress Queue	Number of this egress queue.
Status	Queue can either be enabled or disabled.
Queue Limit	The percentage of the port's buffers that have been allocated to this queue.
Egress Rate Limit	The amount of traffic that can be transmitted via this queue per second. 0 Kb means there is currently no rate-limiting enabled.

Related Commands [mls qos queue](#)
[wrr-queue queue-limit](#)

show mls qos interface policer-counters

This command displays an interface's policer counters. This can either be for a specific class-map or for all class-maps attached to the interface. If no class-map is specified then all class-map policer counters attached to the interface are displayed.

Note that these counters are based on metering performed on the specified class-map. Therefore, the 'Dropped Bytes' counter is the number of bytes dropped due to metering. This is different from packets dropped via a 'deny' action in the ACL. If a policer is configured to perform re-marking, bytes can be marked Red but are not dropped, and is shown with a value of 0 for the Dropped field and a non-0 value for the 'Red Bytes' field.

Syntax `show mls qos interface <port> policer-counters
[class-map <class-map>]`

Parameter	Description
<port>	Switch port.
class-map	Select a class-map.
<class-map>	Class-map name.

Mode User Exec and Privileged Exec

Usage Unless policer counters for a class-map are enabled with the **police counters** command before using this command, the following error message is displayed:

```
% Policy map QoS does not have any class-maps with policer
counters configured
```

Example To show the counters for all class-maps attached to port1.1.1, use the command:

```
awplus# show mls qos interface port1.1.1 policer-counters
```

Output **Figure 64-5: Example output from show mls qos interface policer-counters**

```
awplus#show mls qos int port1.1.1 policer-counters
Interface:                port1.1.1
Class-map:                default
  Green Bytes:            0
  Yellow Bytes:           0
  Red Bytes:              0
  Dropped Bytes:         0
  Non-dropped Bytes:     0
Class-map:                cmap1
  Green Bytes:            882368
  Yellow Bytes:           699968
  Red Bytes:              2723072
  Dropped Bytes:         0
  Non-dropped Bytes:     4305408
```

This output shows a policer configured with remarking through 'action policed-dscp-transmit', so although bytes are marked as Red, none are dropped. Therefore, the 'Non-dropped Bytes' field shows a summation of Green, Yellow and Red bytes.

Related Commands **mls qos queue**
 wrr-queue queue-limit

show mls qos interface queue-counters

This command displays an interface's egress queue counters. This can either be for a specific queue or for all queues on the interface. If no queue is specified all queue counters on the interface will be displayed.

The counters show the number of frames currently in the queue and the maximum number of frames allowed in the queue, for individual egress queues and the port's queue (which will be a sum of all egress queues).

QoS queue counters are unavailable on SBx81GT40 line cards. Output for these line cards displays N/A instead of a queue length.

Syntax `show mls qos interface <port> queue-counters [queue <0-7>]`

Parameter	Description
<port>	Switch port.
<0-7>	Queue.

Mode User Exec and Privileged Exec

Example To show the counters for all queues on port1.1.1, use the command:

```
awplus# show mls qos interface port1.1.1 queue-counters
```

Output **Figure 64-6: Example output from the show mls qos interface queue-counters command**

```

Interface port1.1.1 Queue Counters:
  Port queue length          0 (maximum 2318)
  Egress Queue length:
    Queue 0                  0 (maximum 50)
    Queue 1                  0 (maximum 50)
    Queue 2                  0 (maximum 50)
    Queue 3                  0 (maximum 50)
    Queue 4                  0 (maximum 50)
    Queue 5                  0 (maximum 50)
    Queue 6                  0 (maximum 50)
    Queue 7                  0 (maximum 50)

```

Table 64-2: Parameters in the output of the show mls qos interface queue-counters command

Parameter	Description
Interface	Port we are showing the counters for.
Port queue length	Number of frames in the port's queue. This will be the sum of all egress queues on the port.
Egress Queue length	Number of frames in a specific egress queue. QoS queue counters are unavailable on SBx81GT40 line cards. Output for these line cards displays N/A instead of a queue length.

Related Commands [wrr-queue queue-limit](#)

show mls qos interface storm-status

Show the current configuration and status of the QoS Storm Protection (QSP) on the given port.

Note that before you can enable storm protection, you must first enable policer counters. To do this, enter the **police counters** command on page 64.39 in **config-pmap-c** mode.

Syntax `show mls qos interface <port> storm-status`

Parameter	Description
<port>	Switch port.

Mode User Exec and Privileged Exec

Example To see the QSP status on port1.1.1, use command:

```
awplus# show mls qos interface port1.1.1 storm-status
```

Output **Figure 64-7: Example output from the show mls qos interface storm-status command**

```
Interface:          port1.1.1
Storm-Protection:   Enabled
Port-status:        Enabled
Storm Action:       vlandisable
Storm Window:       5000 ms
Storm Downtime:     0 s
Timeout Remaining: 0 s
Last read data-rate: 0 kbps
Storm Rate:         1000 kbps
```

Related Commands

- storm-action**

show mls qos maps cos-queue

Show the current configuration of the cos-queue map.

Syntax `show mls qos maps cos-queue`

Mode User Exec and Privileged Exec

Example To display the current configuration of the cos-queue map, use the command:

```
awplus# show mls qos maps cos-queue
```

Output **Figure 64-8: Example output from the show mls qos maps cos-queue command**

```
COS-TO-QUEUE-MAP:
COS :           0 1 2 3 4 5 6 7
-----
QUEUE:         0 7 1 3 4 5 6 7
```

Related Commands [mls qos map cos-queue to](#)

show mls qos maps premark-dscp

This command displays the premark-dscp map. This map is used when the **trust dscp** command has been specified for a policy-map's class-map to replace the DSCP, CoS, queue, and bandwidth class of a packet matching the class-map based on a lookup DSCP value.

Syntax `show mls qos maps premark-dscp [<0-63>]`

Parameter	Description
<0-63>	DSCP table entry.

Mode User Exec and Privileged Exec

Example To display the premark-dscp map for DSCP 1, use the command:

```
awplus# show mls qos maps premark-dscp 1
```

Output **Figure 64-9: Example output from the show mls qos maps premark-dscp command**

```
PREMARK-DSCP-MAP:
  DSCP 1
  Bandwidth Class      Green   Yellow  Red
  -----
  New DSCP              1      -       -
  New CoS               0      -       -
  New Queue             0      -       -
  New Bandwidth Class  green  -       -
```

Related Commands **mls qos map premark-dscp to set dscp**
trust dscp

show mls qos scheduler-set

Use this command to display the scheduler-set configuration.

Syntax `show mls qos scheduler-set`

Mode Privileged Exec

Example To display the scheduler-set configuration, use the command:

```
awplus# show mls qos scheduler-set
```

Output **Figure 64-10: Example output from the show mls qos scheduler-set command**

```
awplus(config)#show mls qos scheduler-set
Key: SP    = Strict Priority
      WRR1 = Weighted Round Robin arbitration group 1
      WRR2 = Weighted Round Robin arbitration group 2

egress queue:           0      1      2      3      4      5      6      7

Scheduler-set 1 algorithm:  WRR1  WRR1  WRR1  WRR1  WRR1  WRR1  SP    SP
                        WRR weight:  25   25   25   25   25   25

Scheduler-set 2 algorithm:  WRR1  WRR1  WRR1  WRR1  SP    SP    SP    SP
                        WRR weight:  10   20   30   50

show policy-map

Displays the policy-maps configured on the switch. The output also shows whether or not they are connected to a port (attached / detached) and shows their associated class-maps.

Syntax `show policy-map [<name>]`

Parameter	Description
<name>	The name of a specific policy-map.

Mode User Exec and Privileged Exec

Example To display a listing of the policy-maps configured on the switch, use the command:

```
awplus# show policy-map
```

Output **Figure 64-11: Example output from the show policy-map command**

```
POLICY-MAP-NAME: general-traffic
State: attached
  Default class-map action: permit
CLASS-MAP-NAME: default
CLASS-MAP-NAME: database-traffic
```

Related Commands [service-policy input](#)

storm-action

Sets the action to take when triggered by QoS Storm Protection (QSP). There are three available options:

- **portdisable** will disable the port in software.
- **vlandisable** will disable the port from the VLAN matched by the class-map in class-map.
- **linkdown** will physically bring the port down. The **vlandisable** requires the match vlan class-map to be present in the class-map.

The **no** variant of this command will negate the action set by the **storm-action** command.

Syntax `storm-action {portdisable|vlandisable|linkdown}`
`no storm-action`

Parameter	Description
portdisable	Disable the port in software.
vlandisable	Disable the VLAN.
linkdown	Shutdown the port physically.

Mode Policy Map Class Configuration

Examples To apply the storm protection of **vlandisable** to the policy-map named `pmap2`, and the class-map named `cmap1`, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# storm-action vlandisable
```

To negate the storm protection set on the policy-map named `pmap2`, and the class-map named `cmap1`, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# no storm-action
```

Related Commands [storm-downtime](#)

[storm-window](#)

storm-downtime

Sets the time to re-enable the port once disabled by QoS Storm Protection (QSP). The time is given in seconds, from a minimum of one second to maximum of 86400 seconds (i.e. one day).

The **no** variant of this command resets the time to the default value of 10 seconds.

Syntax `storm-downtime <1-86400>`
`no storm-downtime`

Parameter	Description
<code><1-86400></code>	Seconds.

Default 10 seconds

Mode Policy Map Class Configuration

Examples To re-enable the port in 1 minute, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# storm-downtime 60
```

To re-set the port to the default (10 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no storm-downtime
```

Related Commands [storm-action](#)
[storm-protection](#)
[storm-rate](#)
[storm-window](#)

storm-protection

Use this command to enable the policy-based storm protection (such as QSP - QoS Storm Protection). Storm protection is activated on a port after port state decisions have been made.

The **no** variant of this command disables Policy Based Storm Protection.

Syntax `storm-protection`
`no storm-protection`

Default By default, storm protection is disabled.

Mode Policy Map Class Configuration

Usage Before you can enable storm protection, you must first enable policer counters. To do this, enter the **police counters** command on page 64.39 in **config-pmap-c** mode.

Examples To enable QSP on `cmap2` in `pmap2`, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# police counters
awplus(config-pmap-c)# storm-protection
```

To disable QSP on `cmap2` in `pmap2`, use the following commands:

```
awplus# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-protection
```

Related Commands **police counters**
show mls qos interface storm-status
storm-action
storm-downtime
storm-rate
storm-window

storm-rate

Sets the data rate that triggers the storm-action. The rate is in kbps and the range is from 1kbps to 10Gbps.

Note that this setting is made in conjunction with the **storm window** command.

Use the **no** variant of this command to negate the **storm-rate** command.

Syntax `storm-rate <1-10000000>`
`no storm-rate`

Parameter	Description
<code><1-10000000></code>	The range of the storm-rate.

Default No default

Mode Policy Map Class Configuration

Usage This setting is made in conjunction with the **storm-window** command on page 64.72.

Examples To the limit to 1Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 1000
```

To negate the limit set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 1000
```

Related Commands **storm-action**
storm-downtime
storm-protection
storm-window

storm-window

Sets the window size of QoS Storm Protection (QSP). This sets the time to poll the data-rate every given milliseconds. Minimum window size of 100 ms and the maximum is 60 sec.

Use the **no** variant of this command to negate the **storm-window** command.

Syntax `storm-window <100-60000>`
`no storm-window`

Parameter	Description
<code><100-60000></code>	The window size, measured in milliseconds.

Default No default

Mode Policy Map Class Configuration

Usage This command should be set in conjunction with the **storm-rate** command on page 64.71.

Examples To set the QSP window size to 5000 ms, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

To negate the QSP window size set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

Related Commands [storm-action](#)
[storm-downtime](#)
[storm-protection](#)
[storm-rate](#)

trust dscp

This command enables the premark-dscp map to replace the bandwidth-class, CoS, DSCP, and queue of classified traffic based on a lookup DSCP value.

With the no variant of this command, no premark-dscp mapping function will be applied for the selected class-map. QoS components of the packet existing either at ingress, or applied by the class-map, will pass unchanged.

Syntax `trust dscp`

`no trust`

Usage The **trust dscp** command and the premark-dscp map are one way to change packets' bandwidth-class, CoS, DSCP, and queue. They act by assigning a QoS profile to traffic that matches the policy-map.

You can also set these values explicitly for a class-map inside a policy-map, by using one of the commands:

- [set bandwidth-class command on page 64.46](#)
- [set cos command on page 64.48](#)
- [set dscp command on page 64.50](#)
- [set queue command on page 64.52](#)

Using *any* of these **set** commands overrides the premark-dscp map, because the **set** commands cause the switch to replace the QoS profile. In the replacement profile, values that are not set by a **set** command default to:

- bandwidth-class: green
- queue: 0

Mode Policy-Map Configuration. Because policy-maps are applied to ports, you can think of **trust dscp** as a per-port setting.

Examples To enable the premark-dscp map lookup for policy-map `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# trust dscp
```

To disable the premark-dscp map lookup for policy-map `pmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# no trust
```

Related Commands [mls qos map premark-dscp to set bandwidth-class](#)
[set cos](#)
[set dscp](#)
[set queue](#)

wrr-queue disable queues

Use this command to disable an egress queue from transmitting traffic.

The **no** variant of this command enables an egress queue to transmit traffic.

Syntax `wrr-queue disable queues [0][1][2][3][4][5][6][7]`
`no wrr-queue disable queues [0][1][2][3][4][5][6][7]`

Parameter	Description
<code>[0][2]...[7]</code>	Selects one or more queues numbered 0 to 7.

Mode Interface Configuration

Examples To enable queue 1 to transmit traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no wrr-queue disable queues 1
```

To disable queue 1 from transmitting traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# wrr-queue disable queues 1
```

Related Commands [show mls qos interface](#)

wrr-queue egress-rate-limit queues

Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651Kb.

Syntax `wrr-queue egress-rate-limit <bandwidth> queues
{0}[1][2][3][4][5][6][7]`

`no wrr-queue egress-rate-limit <bandwidth> queues
{0}[1][2][3][4][5][6][7]`

Parameter	Description
<code><bandwidth></code>	Bandwidth <1-10000000 kbits> (usable units: k, m, g).
<code>{0}[1]...[7]</code>	Selects one or more queues to apply the bandwidth limit to as specified in the preceding <code><bandwidth></code> parameter.

Mode Interface Configuration

Example To limit the egress rate of queues 0, 1 and 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# wrr-queue egress-rate-limit 500M
queues 0 1 2
```

Related Commands [show mls qos interface](#)

wrr-queue queue-limit

Sets the percentages of a ports total buffer pool that each queue is allowed to use. This queue limit is applicable no matter what type of scheduling is configured for the specified queues (i.e. WRR or strict priority).

Syntax `wrr-queue queue-limit <1-100> <1-100> <1-100> <1-100> <1-100> <1-100>`
`<1-100> <1-100>`

`no wrr-queue queue-limit`

Parameter	Description
<1-100>	Queue ratio for Queue 0.
<1-100>	Queue ratio for Queue 1.
<1-100>	Queue ratio for Queue 2.
<1-100>	Queue ratio for Queue 3.
<1-100>	Queue ratio for Queue 4.
<1-100>	Queue ratio for Queue 5.
<1-100>	Queue ratio for Queue 6.
<1-100>	Queue ratio for Queue 7.

Mode Interface Configuration

Usage Note that at any time you cannot apply more than five unique sets of ratios across ports. The portion of the port's buffer pool that is assigned to each queue is divided by three, with one third applied to each of the three drop precedence colors, red, green, and yellow.

Where no color metering is applied, the queue limit is effectively reduced to a third of the configured value, because in this situation all traffic is classed as green. For example, if the overall queue size available is 792 frames, and equal portions (12.5% of 792 = 99 frames) are assigned to each queue, then 33 frames are assigned to each of the three drop precedence colors. Where no color metering is applied, all traffic is (by default) defined as green, and so is allocated 33 frames per queue. Tail dropping is then applied when each queue is only one third full.

Example To configure a wrr-queue queue-limit on port1.1.1 to port1.1.12 for each queue, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1-port1.1.12
awplus(config-if)# wrr-queue queue-limit 12 12 12 12 12 12 12
12
```

Chapter 65: 802.1X Introduction and Configuration

Introduction	65.2
802.1X System Components.....	65.2
The 802.1X Implementation.....	65.5
Configuring 802.1X.....	65.7

Introduction

802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

Networks have two important requirements:

- Security: Authentication and Authorisation
- Flexibility: The ability for users to roam

Networks need a device authentication method that is highly secure, but not tied to a port's physical location. Network resources presented to a given user need to be determined from their authentication credentials.

802.1X user authentication satisfies these requirements. It is relatively uncomplicated and has little impact on network performance. It is a protocol that is medium-independent — being equally as effective on wireless connections (802.11i) and wired connections. 802.1X user authentication is rapidly becoming an expected component on networks.

802.1X System Components

There are three main components to a system using 802.1X port authentication control:

- Authenticator: The device that wishes to enforce authentication before allowing access to services that are accessible behind it. An example of this is a switch that has 802.1X port authentication control enabled.
- Supplicant: The client that wishes to access services offered by the authenticator's system. An example of this is a Windows XP Professional PC with an 802.1X client.
- Authentication server: The device that uses the authentication credentials supplied by the supplicant, to determine if the authenticator should grant access to its services. The AlliedWare Plus implementation of 802.1X supports the use of a RADIUS authentication server using Extensible Authentication Protocol (EAP) in conjunction with RADIUS.

802.1X component protocols

There are two protocols involved in the authentication conversation:

- EAPoL exchanged between the supplicant and authenticator.
 - « EAPoL—Extensible Authentication Protocol over LAN—is the protocol defined in IEEE802.1X.
- RADIUS exchanged between the authenticator and authentication server.
 - « RADIUS has received specific extensions to interoperate with EAPoL.

The diagram below illustrates where EAPoL and RADIUS protocols are used in the authentication conversation:

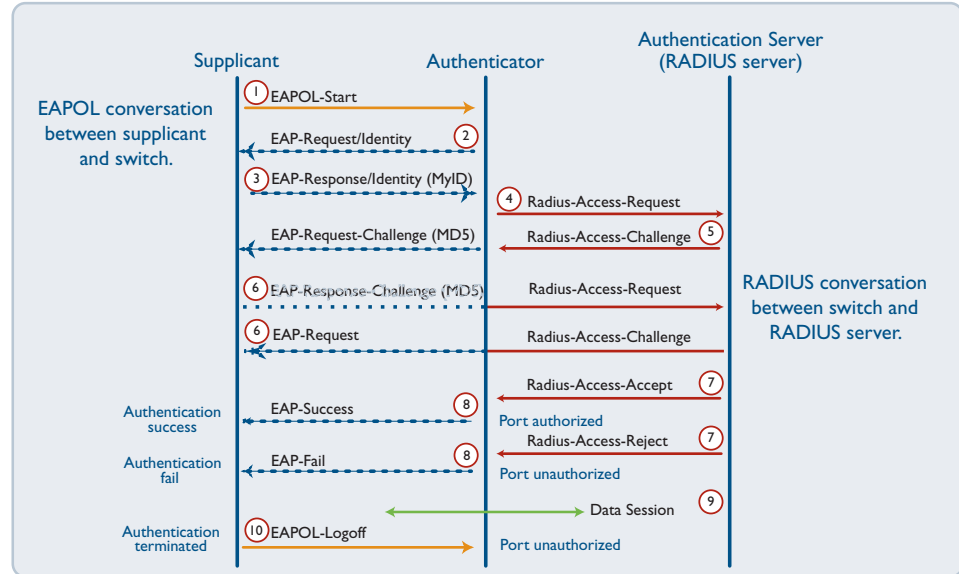

Basic steps in an 802.1X conversation

Step	Action
1	The supplicant informs the authenticator that it wants to initiate the conversation.
2	The authenticator requests the supplicant's credentials.
3	The supplicant sends username/password or X.509 certificate.
4	The authenticator wraps the supplicant's reply into a RADIUS packet and sends it to the RADIUS server.
5	The RADIUS server chooses an authentication method, and sends an appropriate request to the supplicant as a 'challenge'.
6	The RADIUS server and supplicant exchange some messages, ferried by the authenticator.
7	The RADIUS server eventually decides if the supplicant is allowed access and the RADIUS server sends an Access-Accept or Access-Reject message to the Authenticator.
8	The authenticator sends an EAPoL-Success or EAPoL-Fail to the supplicant.
9	The supplicant has a session using the network (if accepted).
10	When the session is over, the supplicant sends a log-off message.

Example message sequence

The diagram below illustrates an exchange using the EAP-MD5 authentication method, which is the simplest authentication method supported by 802.1X.

The EAPoL logoff message, of course, is not sent immediately after the other messages in the diagram, but is sent later on, at the end of the supplicant's data session, when it wishes to disconnect from the network. The EAPoL logoff message, of course, is not sent immediately after the other messages in the diagram, but is sent later on, at the end of the supplicant's data session, when it wishes to disconnect from the network.

The 802.1X Implementation

802.1X port access control is achieved by making devices attached to a controlled port authenticate themselves via communication with an authentication server before these devices are allowed to access the network behind the controlled port.

Authentication is required on a per-port basis. The main components of an 802.1X implementation are:

- the authenticator - the port on this device that wishes to enforce authentication before allowing access to services that are accessible behind it.
- the supplicant - the port that wishes to access services offered by the authenticator's system. The supplicant may be a port on a PC or other device connected to this device.
- the authentication server - a device that uses the authentication credentials supplied by the supplicant, via the authenticator, to determine if the authenticator should grant access to its services.

To configure the switch operating as authenticator, follow the instructions below:

1. Configure a RADIUS server for the switch to send requests to

```
awplus(config)# radius-server host 192.168.1.250 key  
                <secret-key>
```

2. Instruct 802.1X to use the configured RADIUS server

```
awplus(config)# aaa authentication dot1x default group radius
```

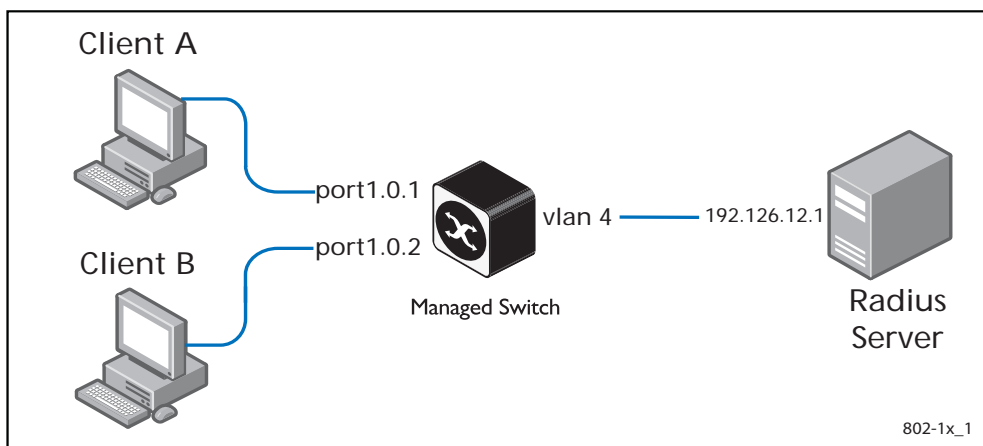

3. Configure port1.0.5 for 802.1X authentication

```
awplus(config)# interface port1.0.5  
awplus(config-if)# dot1x port-control auto  
awplus(config-if)# spanning-tree portfast
```

Configuring 802.1X

The following example explains how to configure 802.1X. In this example, the RADIUS Server keeps the Client information, validating the identity of the Client and updating the switch about the authentication status of the client. The switch is the physical access between the two clients and the server. It requests information from the client, relays information to the server and then back to the client.

To configure 802.1X authentication, first enable authentication on port1.0.1 and port1.0.2 and then specify the RADIUS Server IP address and port.

To configure 802.1X authentication, first enable authentication on port1.1.1 and port1.1.2 and then specify the RADIUS Server IP address and port.

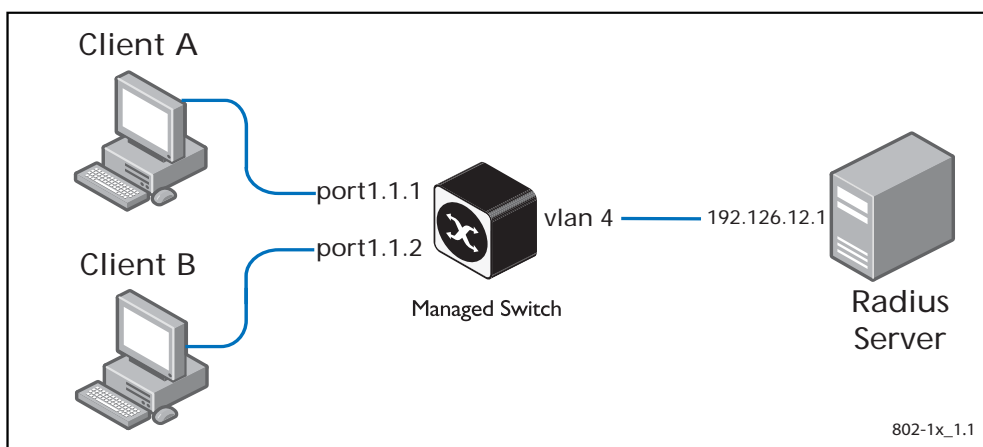

Table 65-1: 802.1X configuration on the switch

<code>awplus#</code>	
<code>configure terminal</code>	Enter the Global Configuration mode.
<code>awplus(config)#</code>	
<code>aaa authentication dot1x default group radius</code>	Enable authentication globally.
<code>awplus(config)#</code>	
<code>interface port1.1.1</code>	Specify the interface (port1.1.1) to be configured and enter the Interface mode.

Table 65-1: 802.1X configuration on the switch

<code>awplus(config-if)# dot1x port-control auto</code>	Enable authentication (via RADIUS) on port1.1.1.
<code>awplus(config-if)# dot1x control-direction both</code>	Block traffic in both directions, other than authentication packets, until authentication is complete.
<code>awplus(config-if)# exit</code>	Exit the Interface Configuration mode and enter the Global Configuration mode.
<code>awplus(config)# interface port1.1.2</code>	Specify the interface (port1.1.2) you are configuring and enter the Interface mode.
<code>awplus(config-if)# dot1x port-control auto</code>	Enable authentication (via RADIUS) on port1.1.2.
<code>awplus(config-if)# exit</code>	Exit the Interface Configuration mode and enter the Global Configuration mode.
<code>awplus(config)# radius-server host 192.126.12.1 auth-port 1812</code>	Specify the RADIUS Server address (192.126.12.1) and authentication port.
<code>awplus(config)# radius-server key secret</code>	Specify the shared key <code>secret</code> between the RADIUS server and the client.
<code>awplus(config)# interface vlan4</code>	Specify the vlan (vlan4) to be configured and enter the Interface mode.
<code>awplus(config-if)# ip address 192.126.12.2/24</code>	Set the IP address on vlan4.

Command List

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control.

debug dot1x

Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

Syntax `debug dot1x [all|auth-web|event|nsm|packet|timer]`
`no debug all dot1x`
`no debug dot1x [all|auth-web|event|nsm|packet|timer]`

Parameter	Description
all	Used with the no variant of this command exclusively; turns off all debugging for 802.1X.
auth-web	Specifies debugging for 802.1X auth-web information.
events	Specifies debugging for 802.1X events.
nsm	Specifies debugging for NSM messages.
packet	Specifies debugging for 802.1X packets.
timer	Specifies debugging for 802.1X timers.

Mode Privileged Exec and Global Configuration

Usage This command without any parameters turns on normal 802.1X debug information.

```
awplus# debug dot1x

awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

Examples

```
awplus# debug dot1x

awplus# debug dot1x all
```

Related Commands **show debugging dot1x**
 undebug dot1x

dot1x control-direction

This command sets the direction of the filter for the unauthorized interface.

If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.

If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.

The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

Syntax dot1x control-direction {in|both}
no dot1x control-direction

Parameter	Description
in	Discard received packets from the supplicant (ingress packets).
both	Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets).

Default The authentication port direction is set to **both** by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Example To set the port direction to the default (**both**) for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x control-direction in
```

Validation Commands

- show dot1x
- show dot1x interface
- show auth-mac interface
- show auth-web interface

dot1x eap

This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

Syntax `dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}`

Parameter	Description
discard	Discard.
forward	Forward to all ports on the switch.
forward-untagged-vlan	Forward to ports with the same untagged VLAN.
forward-vlan	Forward to ports with the same VLAN.

Default The transmit mode is set to `discard` EAP packets by default.

Mode Global Configuration

Example To set the transmit mode of EAP packet to `forward` to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to `discard` to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to `forward-untagged-vlan` to forward EAP packets to ports with the same untagged vlan, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to `forward-vlan` to forward EAP packets to ports with the same vlan, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

dot1x eapol-version

This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

Syntax dot1x eapol-version {1|2}
no dot1x eapol-version

Parameter	Description
1	EAPOL version.
2	EAPOL version.

Default The EAP version for 802.1X authentication is set to 1 by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Example To set the EAPOL protocol version to 2 for port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x eapol-version
```

Validation Commands **show dot1x**
show dot1x interface

dot1x initialize interface

This command removes authorization for a connected **interface** with the specified *<interface-list>*. The connection will attempt to re-authorize when the specified **port** attempts to make use of the network connection.

Note Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.

Syntax `dot1x initialize interface <interface-list>`

Parameter	Description
<i><interface-list></i>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> ■ a comma-separated list of the above; e.g. <code>port1.1.1, port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example To initialize 802.1X port authentication on the interface `port1.1.2`, use the command:

```
awplus# dot1x initialize interface port1.1.2
```

To unauthorize switch `port1.1.1` and attempt reauthentication on switch `port1.1.1`, use the command:

```
awplus# dot1x initialize interface port1.1.1
```

To unauthorize all switch ports for a 24 switch port line card and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.1.1-port1.1.24
```

Validation Commands `show dot1x`
`show dot1x interface`

Related Commands `dot1x initialize supplicant`

dot1x initialize supplicant

This command removes authorization for a connected *supplicant* with the specified **MAC address** or **username**. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

 **Note** Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.

Syntax `dot1x initialize supplicant {<macadd>|username}`

Parameter	Description
<code>dot1x</code>	IEEE 802.1X Port-Based Access Control.
<code>initialize</code>	Initialize the port to attempt reauthentication.
<code>supplicant</code>	Specify the supplicant to initialize.
<code><macadd></code>	MAC (hardware address of the supplicant).
<code>username</code>	The name of the supplicant entry.

Mode Privileged Exec

Example To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant
0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

Validation Commands `show dot1x`
`show dot1x supplicant`

Related Commands `dot1x initialize interface`

dot1x keytransmit

This command enables key transmission on the interface specified previously in Interface mode.

The **no** variant of this command disables key transmission on the interface specified.

Syntax dot1x keytransmit
no dot1x keytransmit

Default Key transmission for port authentication is enabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use this command to enable key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant. Use the **no** variant of this command to disable key transmission.

Example To enable the key transmit feature on interface `port1.1.2`, after it has been disabled by negation, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature from the default startup configuration on interface `port1.1.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x keytransmit
```

Validation Commands **show dot1x**
show dot1x interface

dot1x max-auth-fail

Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the **auth-fail vlan** feature, to the default configuration of 3 login attempts.

Syntax `dot1x max-auth-fail <0-10>`
`no dot1x max-auth-fail`

Parameter	Description
<code><0-10></code>	Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is three (3) login attempts.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the **auth-fail VLAN** from the **Guest VLAN** after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the related [auth auth-fail vlan command on page 68.3](#). See also the section [“Failed Authentication VLAN” on page 67.25](#) for information about the **auth-fail VLAN** feature.

See the section [“Limitations on Allowed Feature Combinations” on page 67.25](#) for information about restrictions regarding combinations of authentication enhancements working together.

Examples To configure the maximum number of login attempts for a supplicant on interface `port1.1.2` to a single (1) login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface `port1.1.2` to the default number of three (3) login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x max-auth-fail
```

Validation Commands `show running-config`

Related Commands **auth auth-fail vlan**
 dot1x max-reauth-req
 show dot1x interface

dot1x max-reauth-req

This command sets the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

Syntax `dot1x max-reauth-req <1-10>`
`no dot1x max-reauth-req`

Parameter	Description
<1-10>	Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use this command to set the maximum reauthentication attempts after failure.

Examples To configure the maximum number of reauthentication attempts for interface `port1.1.2` to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface `port1.1.2` to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x max-reauth-req
```

Validation Commands `show running-config`

Related Commands `dot1x max-auth-fail`
`show dot1x interface`

dot1x port-control

This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port. When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

The **no** variant of this command disables the port authentication on the interface specified.

Syntax `dot1x port-control {force-unauthorized|force-authorized|auto}`
`no dot1x port-control`

Parameter	Description
<code>force-unauthorized</code>	Force port state to unauthorized. Specify to force a port to always be in an unauthorized state.
<code>force-authorized</code>	Force port state to authorized. Specify to force a port to always be in an authorized state.
<code>auto</code>	Allow port client to negotiate authentication. Specify to enable authentication on port.

Default 802.1X port control is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use this command to force a port state. Note that all **dot1x** commands can only be applied to switch ports. They cannot be applied to dynamic (LACP) or static channel groups.

Example To enable port authentication on the interface `port1.1.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface `port1.1.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x port-control
```

**Validation
Commands** **show dot1x interface**

Related Commands **aaa authentication dot1x**

dot1x timeout tx-period

This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

Syntax dot1x timeout tx-period <1-65535>
no dot1x timeout tx-period

Parameter	Description
<1-65535>	Seconds.

Default The default transmit period for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use this command to set the interval between successive attempts to request an ID.

Example To set the transmit timeout period to 5 seconds on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no dot1x timeout tx-period
```

Validation Commands show dot1x
show dot1x interface

show debugging dot1x

Use this command to display the 802.1X debugging option set.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show debugging dot1x

Mode User Exec and Privileged Exec

Usage This is a sample output from the show debugging dot1x command.

```
awplus# debug dot1x
```

```
awplus# show debugging dot1x
```

```
802.1X debugging status:
 802.1X events debugging is on
 802.1X timer debugging is on
 802.1X packets debugging is on
 802.1X NSM debugging is on
```

Example

```
awplus# show debugging dot1x
```

Related Commands [debug dot1x](#)

show dot1x

This command shows authentication information for dot1x (802.1X) port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show dot1x [all]`

Parameter	Description
all	Displays all authentication information for each port available on the switch.

Mode Privileged Exec

Example

```
awplus# show dot1x all
```

show dot1x diagnostics

This command shows 802.1X authentication diagnostics for the specified interface (optional), which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show dot1x diagnostics [interface <interface-list>]`

Parameter	Description
interface	Specify a port to show.
<interface-list>	The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"> ■ an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> ■ a comma-separated list of the above; e.g. <code>port1.1.1,port1.1.8-1.1.24</code>. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example See the sample output below showing 802.1X authentication diagnostics for `port1.1.12`:

```
awplus# show dot1x diagnostics interface port1.1.12
```

Output **Figure 66-1: Example output from the show dot1x diagnostics command**

```
Authentication Diagnostics for interface port1.1.12
  Supplicant address: 00d0.59ab.7037
  authEnterConnecting: 2

  BackendAccessChallenges: 1
  BackendOtherrequestToSupplicant: 3
  BackendAuthSuccess: 1
```

show dot1x interface

This command shows the status of 802.1X port-based authentication on the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the optional **diagnostics** parameter to show authentication diagnostics for the specified interfaces. Use the optional **sessionstatistics** parameter to show authentication session statistics for the specified interfaces. Use the optional **statistics** parameter to show authentication diagnostics for the specified interfaces. Use the optional **supplicant** parameter to show the supplicant state for the specified interfaces.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show dot1x interface <interface-list>
[diagnostics|sessionstatistics|statistics|supplicant [brief]]`

Parameter	Description
<code><interface-list></code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> ■ a comma-separated list of the above; e.g. <code>port1.1.1, port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>
<code>diagnostics</code>	Diagnostics.
<code>sessionstatistics</code>	Session Statistics.
<code>statistics</code>	Statistics.
<code>supplicant</code>	Supplicant.
<code>brief</code>	Brief summary of supplicant state.

Mode Privileged Exec

Example See the sample output below showing 802.1X authentication status for port1.1.12:

Table 66-3: Parameters in the output of the show dot1x interface command

Parameter	Description
portEnabled	Interface operational status (Up-true/down-false).
portControl	Current control status of the port for 802.1X control.
portStatus	802.1X status of the port (authorized/unauthorized).
reAuthenticate	Reauthentication enabled/disabled status on port.
reAuthPeriod	Value holds meaning only if reauthentication is enabled.
abort	Indicates that authentication should be aborted when set to true.
fail	Indicates failed authentication attempt when set to false.
start	Indicates authentication should be started when set to true.
timeout	Indicates authentication attempt timed out when set to true.
success	Indicates authentication successful when set to true.
state	Current 802.1X operational state of interface.
mode	Configured 802.1X mode.
reAuthCount	Reauthentication count.
quietperiod	Time between reauthentication attempts.
reAuthMax	Maximum reauthentication attempts.
BE	Backend authentication state machine variables and constants.
state	State of the state machine.
reqCount	Count of requests sent to server.
suppTimeout	Supplicant timeout.
serverTimeout	Server timeout.
maxReq	Maximum requests to be sent.
CD	Controlled Directions State machine.
adminControlledDirections	Administrative value (Both/In).
operControlledDirections	Operational Value (Both/In).
KR	Key receive state machine.

Table 66-3: Parameters in the output of the show dot1x interface command (cont.)

Parameter	Description
rxKey	True when EAPOL-Key message is received by supplicant or authenticator. false when key is transmitted.
KT	Ket Transmit State machine.
keyAvailable	False when key has been transmitted by authenticator, true when new key is available for key exchange.
keyTxEnabled	Key transmission enabled/disabled status.

Related Commands [show auth-web diagnostics](#)

[show dot1x statistics interface](#)
[show dot1x supplicant interface](#)

show dot1x sessionstatistics

This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show dot1x sessionstatistics [interface <interface-list>]`

Parameter	Description
interface	Specify a port to show.
<interface-list>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. vlan2), a switch port (e.g. port1.1.12), a static channel group (e.g. sa3) or a dynamic (LACP) channel group (e.g. po4) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. vlan2-8, or port1.1.1-1.1.24, or sa2-4, or po1-3 ■ a comma-separated list of the above; e.g. port1.1.1,port1.1.8-1.1.24. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example See sample output below showing 802.1X (dot1x) authentication session statistics for port1.1.12:

```
awplus# show dot1x sessionstatistics interface port1.1.12
```

```
Authentication session statistics for interface port1.1.12
  session user name: manager
  session authentication method: Remote server
  session time: 19440 secs
  session terminat cause: Not terminated yet
```

show dot1x statistics interface

This command shows the authentication statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show dot1x statistics interface <interface-list>`

Parameter	Description
<code><interface-list></code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> a comma-separated list of the above; e.g. <code>port1.1.1, port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example See sample output below showing 802.1X authentication statistics for `port1.1.12`:

```
awplus# show dot1x statistics interface port1.1.12
```

```

Related Commands [show dot1x supplicant interface](#)

show dot1x supplicant interface

This command shows the supplicant state of the authentication mode set for the interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

This command shows a summary when the optional **brief** parameter is used.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show dot1x supplicant interface <interface-list> [brief]`

Parameter	Description
<code><interface-list></code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> a comma-separated list of the above; e.g. <code>port1.1.1,port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>
<code>brief</code>	Brief summary of the Supplicant state.

Mode Privileged Exec

Example See sample output below showing the supplicant on the interface `port1.1.19`:

```
awplus# show dot1x supplicant interface port1.1.19
```

```
Interface port1.1.19
 authenticationMethod: dot1x
  totalSupplicantNum: 1
  authorizedSupplicantNum: 1
  macBasedAuthenticationSupplicantNum: 0
  dot1xAuthenticationSupplicantNum: 1
  webBasedAuthenticationSupplicantNum: 0
  otherAuthenticationSupplicantNum: 0

Supplicant name: VCSPCVLAN10
Supplicant address: 0000.cd07.7b60
 authenticationMethod: 802.1X
 portStatus: Authorized - currentId: 3
 abort:F fail:F start:F timeout:F success:T
 PAE: state: Authenticated - portMode: Auto
 PAE: reAuthCount: 0 - rxRespId: 0
 PAE: quietPeriod: 60 - maxReauthReq: 2
 BE: state: Idle - reqCount: 0 - idFromServer: 2
 CD: adminControlledDirections:in -
 operControlledDirections:in
  CD: bridgeDetected: false
  KR: rxKey: false
  KT: keyAvailable: false - keyTxEnabled: false
```

See sample output below showing the supplicant on the switch using the `brief` parameter:

```
awplus# show dot1x supplicant interface brief
```

```
Interface port1.1.12
  authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
```

Interface	VID	Mode	MAC Address	Status	IP Address	Username
=====	====	====	=====	=====	=====	=====
port1.1.12	2	D	00d0.59ab.7037	Authenticated	192.168.2.201	manager

See the sample output below for static channel group (static aggregator) interface `sa1`:

```
awplus# show dot1x interface sa1 supplicant brief
```

```
awplus#show dot1x interface sa1 supplicant brief
Interface sa1
  authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
  macBasedAuthenticationSupplicantNum: 0
  dot1xAuthenticationSupplicantNum: 1
  webBasedAuthenticationSupplicantNum: 0
  otherAuthenticationSupplicantNum: 0
```

Interface	VID	Mode	MAC Address	Status	IP Address	Username
=====	====	====	=====	=====	=====	=====
sa1	1	D	00d0.59ab.7037	Authenticated	--	test1

Authentication Introduction

Authentication commands enable you to specify three different types of device authentication: 802.1X-authentication, Web-authentication, and MAC-authentication.

802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Web-authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested. MAC-authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

Configuring a Guest VLAN

In a secure network, the default behavior is to deny any access to supplicants that cannot be authenticated. However, it is often convenient to allow unauthenticated users to have limited access. A popular solution is to define a limited-access VLAN, called the Guest VLAN, and assign unauthenticated users into that VLAN. Unauthenticated supplicants are either supplicants who have attempted and failed authentication or haven't performed any authentication.

See the [auth guest-vlan command on page 68.8](#) for command information about Guest VLAN.

By default, traffic from unauthenticated supplicants in the Guest VLAN will only be L2 switched within the Guest VLAN. But, if the **routing** parameter for the **auth guest vlan** command is configured, then the switch will route unauthenticated supplicants' traffic to other VLANs if required, and will relay their DHCP requests to servers in other VLANs if required.

You can configure 802.1X to accept a Dynamic VLAN assignment, or fall back to a Guest VLAN upon failure.

To configure a switch to perform 802.1X authentication, and assign VLAN IDs to ports where devices authentication successfully, and put non-authenticated users into a Guest VLAN, proceed as follows:

```
awplus# configure terminal
awplus(config)# radius-server host <ip-address> key
                    <key-string>
awplus(config)# aaa authentication dot1x default group
                    radius
awplus(config)# interface <interface-range>
awplus(config-if)# switchport mode access
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth guest-vlan 100
```

802.1X-Authentication

802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

For more information about 802.1X, see [Chapter 65, 802.1X Introduction and Configuration](#).

Web-Authentication

What is Web-Authentication?

Web-authentication is a convenient alternative to 802.1X authentication. It's commonly used to authenticate users in educational institutions, where regular users' workstations are not managed by the network administrator. Web-authentication enables the switch to detect an unauthenticated workstation web browsing into the network, then redirect the user's web browser to its own authentication web page.

Web-authentication works like this:

- The user enters their username and password into the web page, which the switch then sends to a RADIUS server for checking.
- If the RADIUS server accepts the user's credentials, the switch then allows their traffic into the network.

The Web-authenticating switch interacts with a RADIUS server in the same way as an 802.1X authenticator. The two methods can be used together in the same network, using the same RADIUS server.

Web-Authentication Basics

The operation of Web-authentication is explained as below:

1. The authenticating switch receives HTTP or HTTPS traffic from an unauthenticated supplicant. It intercepts the supplicant's web session and redirects it to its own internal web server.

- The web server serves up an authentication page on which the user enters their username and password.

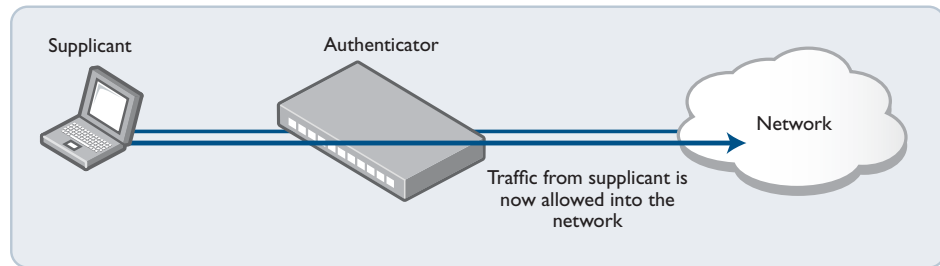

- The username and password are sent to a RADIUS server, which informs the authenticating switch whether or not the supplicant is authenticated.

- The user is then informed of the RADIUS server's verdict.

5. If the supplicant has been successfully authenticated, the authenticating switch will give the supplicant workstation access to the network.

Configuring Web-Authentication

Web-authentication can be configured on a switch in the following steps:

1. Configure a RADIUS server.

```
awplus(config)# radius-server host <server-ip-address> key
<shared-secret>
```

2. Instruct Web-authentication to use the configured RADIUS server.

```
awplus(config)# aaa authentication auth-web default group
radius
```

3. Define the IP address through which the Web-authentication service will be accessed.

```
awplus(config)# auth-web-server ipaddress <ip-address>
```

4. Configure ports for Web-authentication.

```
awplus# interface port1.0.1-1.0.20
awplus(config)# auth-web enable
```

Choosing the Web-authentication server address

When you come to configure Web-authentication, you need to answer some questions:

Questions What IP address should I specify as the Web-authentication server address? Is it okay to use just any IP address that is configured on one of the switch's VLANs, or is the choice more constrained than that?

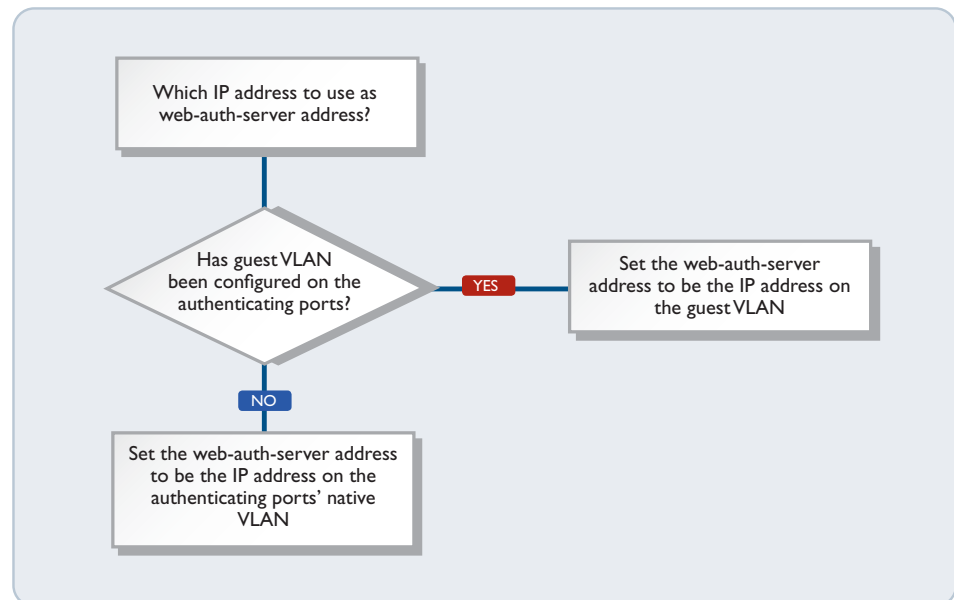

Answer You must use the IP address that is configured on the VLAN that the supplicant's packets will arrive on.

The logic that the switch uses in deciding which VLAN to associate non-authenticated supplicants' packets with is:

- If guest VLAN has been configured on the port where the packet arrives, then associate the packet with the guest VLAN.
- Otherwise associate the packet with the port's native VLAN.

If you configure the supplicant-connected ports with guest VLAN, then use the IP address on the guest VLAN as the IP address of the Web-authentication server. Otherwise use the IP address on the supplicant-connected ports' native VLAN.

The diagram below illustrates how to decide which IP address to use as the Web-auth-server address:

Configuration Example 1: Using a guest VLAN

```

VLAN database
VLAN 20 name guest
VLAN 10 name edge
VLAN 30 name core

radius-server host 192.168.30.129 key verysecret
aaa authentication auth-Web default group RADIUS
auth-Web-server ipaddress 192.168.20.1

int vlan10
 ip address 192.168.10.1/24
int vlan20
 ip address 192.168.20.1/24
int vlan30
 ip address 192.168.30.1/24

int port1.0.1-1.0.20
 switchport access vlan 10
 auth-Web enable
 auth guest-vlan 20

int port1.0.21-1.0.22
 switchport access vlan 30
    
```

Configuration Example 2: Not using a guest VLAN

```
VLAN database
  VLAN 10 name edge
  VLAN 30 name core

radius-server host 192.168.30.129 key verysecret
aaa authentication auth-web default group radius
auth-web-server ipaddress 192.168.10.1

int vlan10
  ip address 192.168.10.1/24
int vlan30
  ip address 192.168.30.1/24

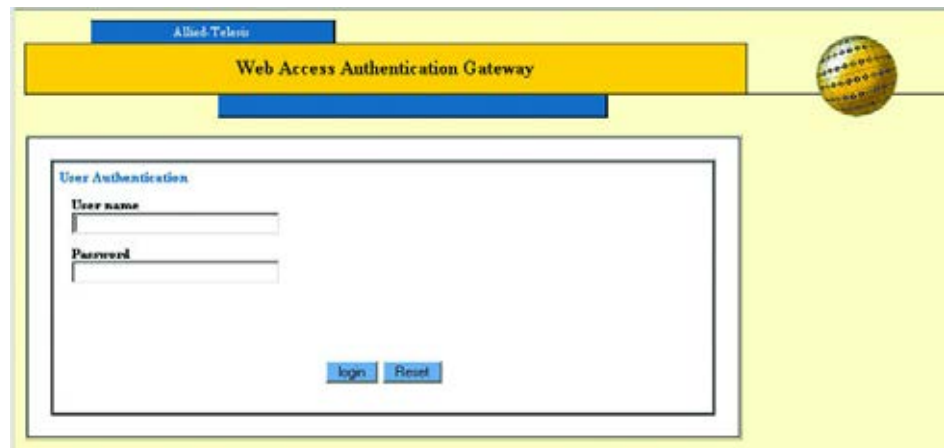

int port1.0.1-1.0.20
  switchport access vlan 10
  auth-Web enable

int port1.0.21-1.0.22
  switchport access vlan 30
```

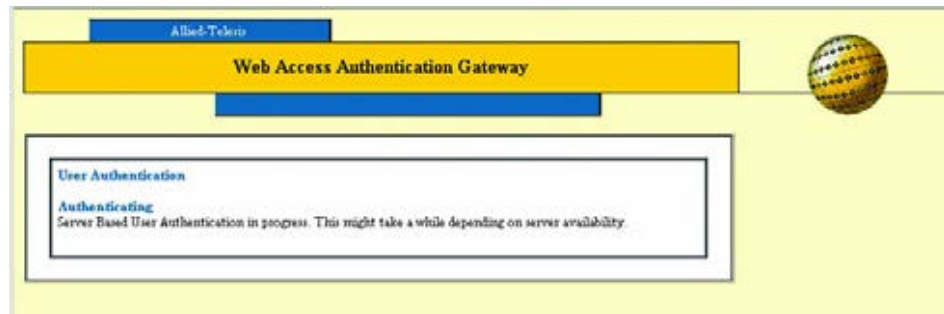

Starting a Web-Authentication Session

This chapter explains what the user actually sees in a Web-authentication session:

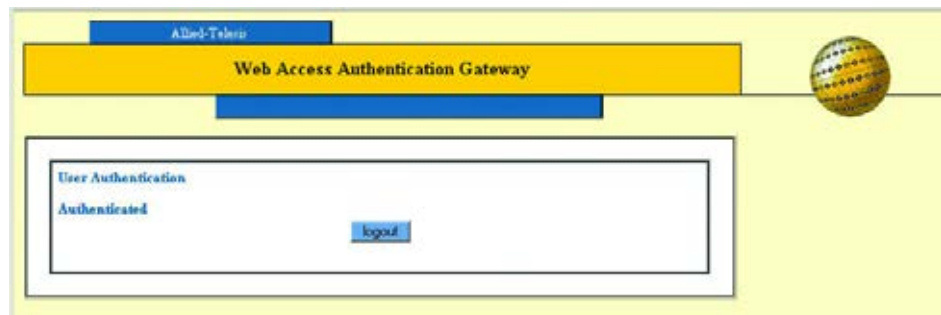

1. The user starts their Web browser, and browses to a page they wish to view. Shortly thereafter, the address in the browser's address bar automatically changes to the address of the authenticating switch's authentication page.
2. In the switch's authentication page, the user enters their user name and password, and clicks **login**. The maximum length of the user name and password is 64 characters. The local RADIUS server has a password length limit of 31 characters.

3. The switch displays a page that informs them that authentication is in progress.

4. Once authentication is complete, the authentication result is displayed.

If the user enters a username/password combination that is not accepted by the RADIUS server, the switch presents an invitation to check the username and password.

If the user enters incorrect usernames/passwords several times, the authentication fails. The number of times a user can try to login is configurable but it is set to 3 by default.

Support for Protocols Underlying Web-Authentication

Web-authentication does not use a dedicated protocol like 802.1X, with a standards-defined set of messages for authentication conversation. Instead, the switch overlays the Web-authentication process on top of the web browser communication process. The browser communication process was not designed for authentication and is itself reliant on IP addressing, ARP, and DNS.

The authentication needs to occur in a seamless manner for all users, irrespective of their IP and DNS setting, and before they have full access to the network.

To make this possible, the switch needs to provide facilities that enable the user's PC to access the authentication web page.

Following features of Web-authentication work together to achieve this.

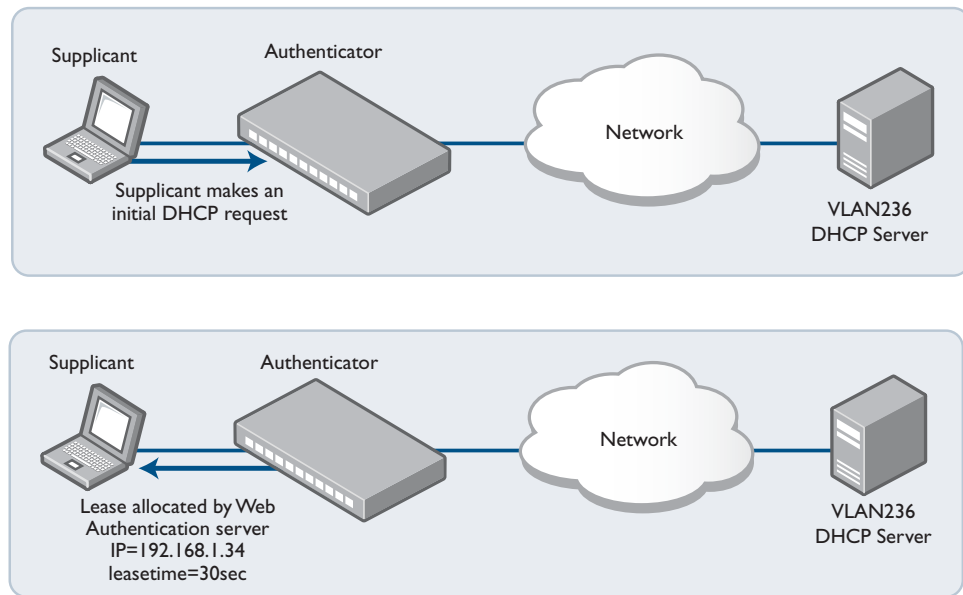

- DHCP server for Web-authentication
- Interception of clients' ARPs
- Proxy DNS response

DHCP server for Web-authentication

To initiate a web browsing session, the supplicant needs an IP address. If the supplicant has been configured to obtain its IP address by DHCP, then the authenticating switch needs to ensure that the supplicant will be served an IP address.

The simplest way to achieve this, is to have the Web-authentication process itself act as a DHCP server. This avoids forwarding the supplicant's DHCP request to any other DHCP server. Therefore, there is a DHCP server built in to Web-authentication.

This DHCP server is dedicated to serving IP addresses to be used by Web-authentication clients.

This DHCP service is configured by the command:

```
awplus(config)# auth-web-server dhcp ipaddress <ip-address/
prefix-length>
```

See the [auth-web-server dhcp ipaddress command on page 68.34](#) and the [auth-web-server dhcp lease command on page 68.35](#) for details about configuring the Web-authentication DHCP Server.

How can we force the supplicant to request a new DHCP lease after the completion of the authentication process? There is no mechanism by which the supplicant’s web browser signals down to the DHCP client process to say “I’ve just completed an authentication session, you need to request a new DHCP lease”.

The solution is to ensure that the lease allocated by the dedicated Web-authentication DHCP service is of a very short duration. This way the lease will expire within a short time from the completion of the authentication process, resulting in the supplicant requesting a new lease.

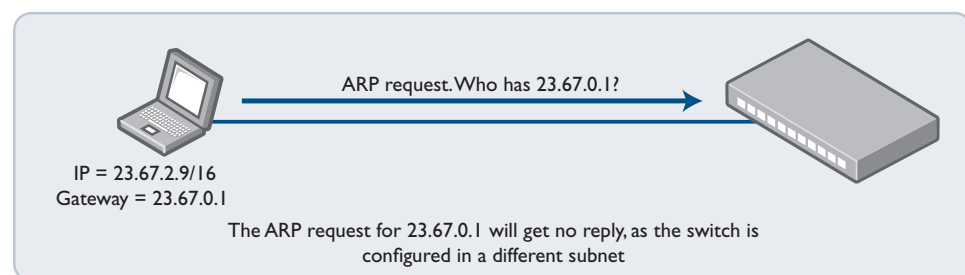

This new request will now be serviced by the DHCP server on the supplicant’s new VLAN.

Interception of clients' ARPs

If the supplicant has been configured with a static IP address, then it is more than likely that the supplicant's IP configuration bears no relation to the Web-authentication server address. A computer's IP communications will always be preceded by sending out ARP requests for host addresses in its local subnet, or for its gateway address.

If the IP address and gateway address have been statically configured on the computer, and the subnet used in this static configuration is different to that on the authenticating switch, then the ARP requests will receive no reply, and the PC will not begin IP communication.

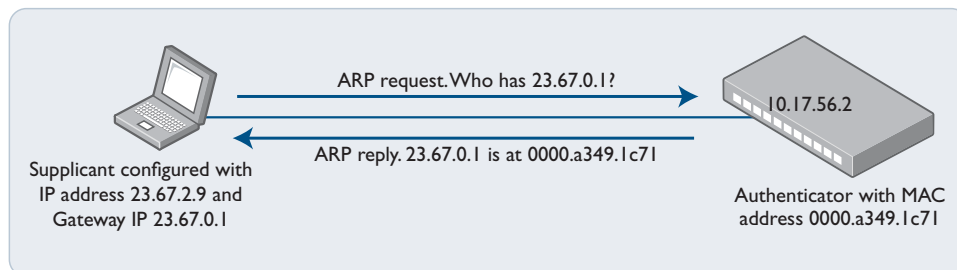

To deal with any arbitrary IP configuration on the supplicants, Web-authentication needs a method for replying to arbitrary ARP requests. This is the ARP interception feature.

ARP interception can operate in three modes.

1. **Intercept** – will respond to ARP requests for any IP address that is in the same subnet as the switch's own IP address. Will provide its own MAC address in the ARP reply, irrespective of what IP address (within its own subnet) was being requested.
2. **None** – will only respond to ARP requests for its own IP address.

- Promiscuous** – will respond to **any** ARP request. Will provide its own MAC address in the ARP reply, irrespective of what IP address was being requested. When this mode is configured, the Web-authentication server can interoperate with **any** static IP configuration on a supplicant.

In promiscuous mode, the switch will send its own MAC address in response to an ARP request for ANY address, no matter whether the requested address bears any relation to the switch's own IP address on the interface where the ARP is received.

See the [auth-web-server mode command on page 68.38](#) for command information about setting the Web-authentication mode.

Proxy DNS response

Typically, an HTTP session from a web browser is preceded by a DNS request for the IP address of the web site the user wishes to browse to. If the DNS request receives no reply, the web browser will never progress on to connecting an HTTP session.

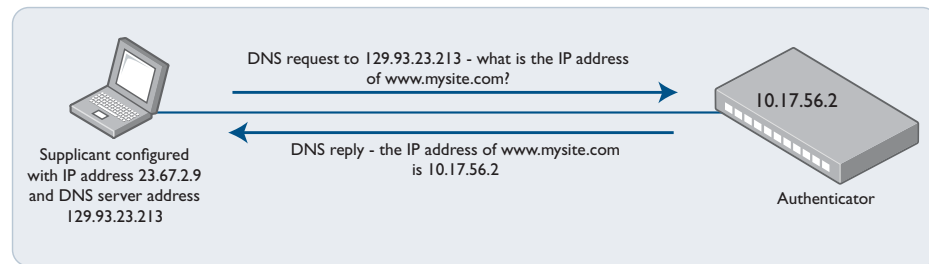

The Web-authentication server needs a mechanism to reply to DNS requests, so that the Web-authentication session can begin.

A web browser must request a DNS Server for the IP address corresponding to a URL. But the switch will not forward the request if the supplicant is not yet authenticated

The three modes listed also control the operation of the proxy DNS replies.

- Intercept** – responds to DNS requests whose source IP address is within the same subnet as the IP address on the switch. The IP address provided as the resolution of the DNS lookup is the switch's own IP address, so that the subsequent HTTP traffic will be directed to the switch.
- None** – the default. Does not respond to DNS requests.
- Promiscuous** – responds to DNS requests from any source IP address. The IP address provided as the resolution of the DNS lookup is the switch's own IP address, so that the subsequent HTTP traffic will be directed to the switch.

In promiscuous mode, the switch will reply to ANY DNS request from an authenticated supplicant, regardless of whether the destination IP address of the DNS server bears any relation to the switch's own IP address. The DNS reply from the switch will always specify its own IP address as the URL that was being requested.

See the [auth-web-server mode](#) command on page 68.38 for command information about setting the Web-authentication mode.

You can use the parameter *<ip-address>* of the [auth-web forward](#) command to specify a server for the switch to send packets from the supplicant to, for example DNS packets. For more information and an example, see the "Forwarding DNS packets using Auth-web forward command" section in the [AlliedWare Plus Technical Tips and Tricks](#).

Web-Authentication Timeout Connect

The command [auth timeout connect-timeout](#) allows you to increase the connection period for a supplicant's interface port.

The default timeout period is 30 seconds, but this command allows the timeout period to be set from 1 second to 65535 seconds. When [auth-web-server session-keep](#) is enabled, it is recommended to configure a longer connect-timeout period.

MAC-Authentication

Why is MAC-Authentication Required?

The authentication mechanisms provided by 802.1X and Web authentication are powerful and effective. But, they are not universally applicable. Web authentication is only applicable to devices that have a human user who opens the web browser and types in a username and password when requested. 802.1X authentication is only possible from devices whose software implements an 802.1X supplicant.

There are plenty of network-connected devices, like printers, scanners, fire-alarm monitors and so on, that have neither a human user nor implement an 802.1X supplicant. In a network that ensures all access is authenticated, there needs to be a mechanism for authenticating these devices.

Fortunately, all Ethernet transceivers have a unique identifier—their MAC address. Hence, even without user input of a username and password, any Ethernet device will automatically identify itself simply by virtue of the source MAC address in the packets it sends. The method that has been developed for authenticating these devices uses the MAC address as the identifier, and so is called MAC-based authentication.

How Does MAC-Authentication Work?

In essence, MAC-authentication works little differently from 802.1X or Web-based authentication.

Here are the main steps:

1. The supplicant is connected to the switch.
2. The switch (acting as the authenticator) receives an ID from the supplicant.
3. The switch passes the supplicant's ID to a RADIUS server in an Access-Request packet
4. The RADIUS server returns an Access-Accept or an Access-Deny. The Access-Accept can be accompanied with other attributes, for dynamic VLAN assignment.

The unique aspects of MAC-authentication are in steps 2 and 3.

MAC-authentication does not involve a process whereby the switch sends an ID request to the supplicant. The switch receives the ID from the supplicant by simply looking at the source MAC in the packets being sent from the supplicant.

The MAC address of the supplicant is a single identifier. But a RADIUS access-request requires both a username and a password. The workaround employed by MAC-authentication is simply to use the MAC address as both username and password.

The switch extracts the source MAC address from the supplicant's packets and puts it into a string of the form xx-xx-xx-xx-xx-xx, using lower-case letters for any hex digits in the range a-f. This string is then used as both the username and the password in the RADIUS access-request packet. The supplicant MAC address is also sent in the attribute 31 "calling-station-id" as usual.

Configuring MAC-Authentication

Under AlliedWare Plus, there are two steps to setting up MAC-authentication.

1. Define the authentication method list that is used for MAC-authentication.

There is only one method list that can be created for MAC-authentication—the default method list. Moreover, the only authentication server type that can be used is RADIUS.

The command for defining the method list is:

```
awplus(config)# aaa authentication auth-mac default group  
radius
```

Enable MAC-authentication on the ports that are to perform this authentication:

```
awplus(config)# interface port1.0.2  
awplus(config)# auth-mac enable  
awplus(config)# spanning-tree edgeport
```

On the RADIUS server, it is necessary to create user entries where both the username and password are the MAC address of the supplicant, in the form xx-xx-xx-xx-xx-xx. For example on the AlliedWare Plus local RADIUS server, the configuration is:

```
awplus(config)# radius-server local  
awplus(config-radsrv)# user xx-xx-xx-xx-xx-xx  
password xx-xx-xx-xx-xx-xx
```

The supplicant, requires no configuration, as the whole purpose of MAC-authentication is to authenticate devices that cannot be configured for authentication.

It is also possible to configure the authentication protocol that the switch uses in its interaction with the RADIUS server. There are two choices of protocol: EAP-MD5 and PAP. The default method is PAP, and can be changed by using the command:

```
awplus(config-if)# auth-mac method [eap-md5|pap]
```

Tri-Authentication

The switch supports three types of authentication for devices that connect to switch ports.

- 802.1X-authentication of devices connecting to switch ports
- MAC-authentication of devices connecting to switch ports
- Web-authentication of devices connecting to switch ports

All three types can be configured to run simultaneously on a switch port. The simultaneous configuration and authentication of all three types on a port is called tri-authentication.

Tri-Authentication Configuration

Follow the below three steps to configure tri-authentication across a range of switch ports:

Step 1: Define the RADIUS Server:

Define the RADIUS Server where the switch will send authentication requests by using the below commands:

```
awplus# configure terminal
awplus(config)# radius-server host <ip-address> key
                    <key-string>
```

These commands add the RADIUS Server address and set parameters to the RADIUS server. The key parameter specifies the secret key for the server.

 **Note** The RADIUS Server, where the switch sends authentication requests, can be the switch's own Local RADIUS Server. For information on how to configure Local RADIUS Server see [Chapter 75, Local RADIUS Server Introduction and Configuration](#).

Step 2: Define the default authentication server lists:

Define the default authentication server lists for 802.1X authentication, Web-authentication, and MAC-authentication:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
awplus(config)# aaa authentication auth-web default group
                    radius
awplus(config)# aaa authentication auth-mac default group
                    radius
```

Step 3: Enable 802.1X-authentication, Web-authentication, and MAC-authentication:

Follow the instructions below to enable 802.1X-authentication, Web-authentication, and MAC-authentication on switch ports to attach supplicant devices. This authenticates the supplicant if any of the three methods that the supplicant tries work, depending on the auth-fail VLAN settings. After enabling the authentication, refer to earlier chapters to configure VLAN, IP address and other authentication configurations for the authentication type you want.

```
awplus# configure terminal
awplus(config)# interface <interface-range>
awplus(config-if)# switchport mode access
awplus(config-if)# switchport access vlan 1
awplus(config-if)# auth-web enable
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
```

Roaming Authentication

When network security is required, the usability of network security must be considered. The Roaming Authentication feature improves the usability of network security by enabling users to move within the network without requiring them to re-authenticate each time they move.

If a supplicant (client device) moves from one wireless access point to another wireless access point, and the wireless access points are connected to different ports, then the switch (authenticator) recognizes that the supplicant has been authenticated and accepts the supplicant without requiring re-authentication.

Figure 67-1: Diagram showing Roaming Authentication running on a standalone switch

Web-authentication and MAC-authentication are the authentication methods in a Wireless LAN environment, and 802.1X is the authentication method used for supplicants attached to edge switches.

Roaming Authentication is normally enabled using the **auth roaming enable** command on page 68.17 command. However, Roaming Authentication has been extended (with the **auth roaming disconnected** command on page 68.15) to work where an interface is link down. This allows you to enable supplicants to move from authenticated interfaces that are link down, without requiring re-authentication.

Roaming Authentication is available on static and dynamic (LACP) channel group interfaces.

Roaming Authentication Overview

Without the Roaming Authentication feature enabled, if a supplicant moves from one switch port to another switch port, the supplicant's authenticated status, authentication, and assigned VLAN is deleted and the supplicant is re-authenticated so the supplicant can access the network, and all traffic from the supplicant is dropped while the supplicant is being re-authenticated.

With the Roaming Authentication feature enabled, a switch port inherits the status of a supplicant from the switch port that the supplicant was moved from. If the Roaming Authentication feature is enabled on a switch, then once a supplicant (client device) is authenticated on the switch it does not have to be re-authenticated if it moves between ports of that switch. Supplicant traffic is not dropped because there is no delay for re-authentication, during which the supplicant cannot access the network.

For example, when the Roaming Authentication feature is used in a wireless LAN environment with wireless access points, then the wireless clients can roam between wireless access points connected to different switch ports without re-authentication.

See the [auth roaming disconnected command on page 68.15](#) and the [auth roaming enable command on page 68.17](#) for further information about configuring Roaming Authentication.

Roaming Authentication Feature Interactions

When the Roaming Authentication feature is disabled, a supplicant must be re-authenticated on the destination interface when it roams. When the Roaming Authentication is enabled, the following supplicant authentication status and information is inherited from the source interface:

- Authentication status
- Authentication method
- Supplicant MAC address
- Supplicant IP address
(if an authenticated interface is configured for Web authentication)
- Supplicant name
- Authorized dynamic VLAN ID
- Authorized RADIUS server
- Reauthentication timer
(if configured using the [auth timeout reauth-period command on page 68.23](#))

Roaming Authentication is only supported between interfaces with the same authentication configuration. If source and destination interfaces have different authentication configuration then the supplicant will be re-authenticated at the destination interface.

When the host mode is set with the **auth host-mode** command on page 68.10, a supplicant is not authenticated on a destination interface, and the authentication status is deleted on the source interface.

When a supplicant moves from an interface with authentication configured to an interface without authentication configured, the supplicant's authentication status is deleted.

A supplicant is re-authenticated when it moves to a destination interface that is configured on a different VLAN than the VLAN that is configured for the source interface.

See the following Roaming Authentication feature interactions:

- The Roaming Authentication feature will not function with Dynamic VLANs.
- The Roaming Authentication feature will not function with Guest VLANs.

Unauthenticated Supplicant Traffic

When any authentication is configured on a switch port, the question arises as to what the switch does with packets that arrive into the switch port from unauthenticated supplicants.

Unauthenticated supplicants fall into three categories listed below:

- Newly attached supplicants, which are still in the process of their first authentication attempt
- Supplicants that have made an authentication attempt, but have failed authentication
- Supplicants that have been attached, but have not made an authentication attempt. For example, on a port that has only 802.1X authentication enabled, any supplicant that has no 802.1X client software will not be able to attempt 802.1X authentication.

In switches that are running the AlliedWare Plus™ Operating System, packets from all these three categories of unauthenticated supplicants are treated equally; no distinction is made between these three categories. The treatment of the traffic from unauthenticated supplicants does, however, depend on two factors:

- Whether a Guest VLAN has been configured on the switch port to which the supplicant is attached
- Whether Web authentication has been configured on the switch port to which the supplicant is attached

The rules governing the treatment of packets from unauthenticated supplicants are laid out in the table below:

Table 67-1: Treatment of packets from unauthenticated supplicants

Switch port configuration	No Guest VLAN configured	No Guest VLAN configured, auth-fail VLAN configured	Guest VLAN configured
Web-authentication configured	<p>Packets from unauthenticated supplicants are associated with the Native VLAN of the port. Packets from unauthenticated supplicants are processed according to these rules:</p> <ul style="list-style-type: none"> ■ Packets destined to the WebAuth server IP address/TCP port are forwarded to the server (which may well be the switch itself). ■ DHCP packets are sent to the CPU, to be processed by a local DHCP server, or relayed to another DHCP server, depending on the configuration of the switch. ■ DNS packets are forwarded to the CPU, and then sent on to a DNS server, if the switch is configured with a DNS server address. ■ ARP packets are forwarded to the CPU, and an ARP entry for the supplicant is learnt. ■ If web-auth forwarding is enabled for particular types of packets, then those packets will be forwarded within the Native VLAN ■ All other packets are dropped. 	<p>Packets from unauthenticated supplicants are associated with the Native VLAN of the port. If newly connected supplicants attempt 802.1X port authentication or Web-authentication and fail, then they are moved to the auth-fail VLAN.</p>	<p>Packets from unauthenticated supplicants are associated with the Guest VLAN of the port. No Web-authentication configured	<p>All non-eap packets from unauthenticated supplicants are dropped.</p>	<p>All non-eap packets from unauthenticated supplicants are dropped.</p>	<p>Packets from unauthenticated supplicants are associated with the Guest VLAN of the port. The packets are processed according to these rules:</p> <ul style="list-style-type: none"> ■ Drop packets destined to the IP address of the Guest VLAN. ■ Layer 2 forward packets destined to other addresses within the Guest VLAN. ■ Drop all other packets.

Deciding When a Supplicant Fails Authentication

Although the treatment of packets from unauthenticated supplicants does not differentiate between the three categories of supplicant, it is still useful to know for sure when the switch decides that a supplicant has failed authentication.

The rules for deciding that a supplicant has failed authentication are listed below for each type of authentication available:

Deciding when a supplicant fails 802.1X authentication

If the supplicant responds to EAP authentication requests, and the supplicant's authentication information is sent to the RADIUS server, and the RADIUS server replies with an Authentication-Reject, then the supplicant is immediately deemed to have failed authentication.

If the supplicant does not respond to EAP authentication requests, then the switch will resend the authentication requests up to a maximum number of attempts set by the command `dot1x max-reauth-req` (the default is 2). The interval between the attempts is set by the command `dot1x timeout tx-period` (the default is 30 seconds). If the supplicant still has not responded after this, it is deemed to have not attempted authentication.

See [Chapter 66, 802.1X Commands](#) for 802.1X authentication command information.

Deciding when a supplicant fails Web authentication

As soon as the supplicant attempts any web-browsing, the switch will intercept the web session, and present the supplicant with an authentication request page. If the user enters a username and password, and clicks the login button, then the switch will send the username and password to the RADIUS server. If the RADIUS server replies with an Authentication-Reject, then the supplicant is immediately deemed to have failed authentication.

Until the supplicant has attempted any web-browsing, or has received the authentication request page, but not yet clicked the login button, the supplicant is deemed to be not yet authenticated (as against not able to authenticate).

See [Chapter 68, Authentication Commands](#) for Web authentication command information.

Deciding when a supplicant fails MAC authentication

As soon as the supplicant sends any packet, the source MAC address from the packet will be sent to the RADIUS server for authentication. If the RADIUS server replies with an Authentication-Reject, then the supplicant is immediately deemed to have failed authentication.

With MAC auth there really is no concept of not-yet-attempted authentication, because authentication is attempted as soon as a supplicant sends a packet.

See [Chapter 68, Authentication Commands](#) for MAC authentication command information.

Failed Authentication VLAN

The auth-fail VLAN feature allows the network administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication.

This feature enables the network administrator to enact a security policy in which the supplicants who fail authentication are given extremely limited access, or are given access to remedial applications.

If the Guest VLAN and auth-fail VLAN are both configured on a switch, then a newly connected supplicant initially belongs to the Guest VLAN. If newly connected supplicants attempt 802.1X port authentication or Web-authentication and fail, then they are moved from the Guest VLAN to the auth-fail VLAN.

The criteria for how many failed authentication attempts are allowed before the supplicant is moved to the auth-fail VLAN differs, depending on the authentication method used.

If Web-authentication is used, then the supplicant is moved to the auth-fail VLAN after the first failed attempt. If 802.1X port authentication is used, then the supplicant is moved to the auth-fail VLAN after the number of failed attempts is equal to the value configured by the dot1x max-auth-fail command (by default, three failed 802.1X authentication attempts are allowed).

The MAC-authentication feature does not support the max-auth-fail option. If auth-fail VLAN feature is used in conjunction with MAC-authentication only one attempt is allowed for a MAC-authentication supplicant. If the attempt fails, then the supplicant will be treated as "Authenticated" and the interface will be added to the configured auth-fail VLAN.

Limitations on Allowed Feature Combinations

Note that the Web-authentication feature cannot be used with the Guest VLAN or auth-fail VLAN features. For further limitation information see the below tables:

Table 67-2: Interoperation of authentication types with Guest VLAN and auth-fail VLAN

Authentication Type:	Guest VLAN (without routing mode)	Guest VLAN (with routing mode)	Failed Authentication VLAN
802.1X-authentication	Layer 2 forward packets destined to other addresses within the Guest VLAN.	Unauthorized supplicant can access Guest VLAN. Use ACL for security on the interface.	Failed authentication supplicant can access auth-fail VLAN. See limitations table below for ACL usage limitation.
MAC-authentication	Layer 2 forward packets destined to other addresses within the Guest VLAN.	Unauthorized supplicant can access Guest VLAN. Use ACL for security on the interface.	Failed authentication supplicant can access auth-fail VLAN. See limitations table below for ACL usage limitation.
Web-authentication (without intercept mode)	Layer 2 forward packets destined to other addresses within the Guest VLAN.	Unauthorized supplicant can access Guest VLAN. Use ACL for security on the interface.	Failed authentication supplicant can access auth-fail VLAN. See limitations table below for ACL usage limitation.
Web-authentication (with intercept mode)	(Not Available)	(Not Available)	(Not Available)

Table 67-3: Interactions between Guest VLAN and auth-fail VLAN

Authentication Feature:	Guest VLAN (without routing mode)	Guest VLAN (with routing mode)	Failed Authentication VLAN
Guest VLAN (without routing mode)	(Not Available)	(Not Available)	Cannot configure ACLs on the Guest VLAN when it is not in routing mode. The Guest VLAN without routing mode has reserved ACLs already attached to it.
Guest VLAN (with routing mode)	(Not Available)	(Not Available)	Configuration of ACLs for additional interface security is recommended.
Failed Authentication VLAN	Cannot configure ACLs on the Guest VLAN when it is not in routing mode. The Guest VLAN without routing mode has reserved ACLs already attached to it.	Configuration of ACLs for additional interface security is recommended.	Failed authentication supplicant can access auth-fail VLAN. See limitations table below for ACL usage limitation.

Chapter 68: Authentication Commands

Command List	68.3
auth auth-fail vlan	68.3
auth critical	68.5
auth dynamic-vlan-creation	68.6
auth guest-vlan	68.8
auth host-mode	68.10
auth log	68.11
auth max-supplicant	68.13
auth reauthentication	68.14
auth roaming disconnected	68.15
auth roaming enable	68.17

show auth-web-server	68.70

Command List

This chapter provides an alphabetical reference for Authentication commands.

auth auth-fail vlan

Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices), which have failed port authentication, to the specified VLAN interface.

Use the **no** variant of this command to disable the **auth-fail vlan** feature for a specified VLAN interface.

Syntax `auth auth-fail vlan <1-4094>`

`no auth auth-fail vlan`

Parameter	Description
<1-4094>	Assigns the VLAN ID to any supplicants that have failed port authentication.

Default The **auth-fail vlan** feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Use the **auth-fail vlan** feature when using Web-authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web authentication feature is shorter, and the **auth fail vlan** feature enables assignment to a different VLAN if a supplicant fails authentication.

When using 802.1X port authentication, use a **dot1x max-auth-fail** command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the **“dot1x max-auth-fail” on page 66.10** for command information.

See the section **“Failed Authentication VLAN” on page 67.25 in Chapter 67, Authentication Introduction and Configuration** for further overview information about the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication.

See the section **“Limitations on Allowed Feature Combinations”** on page 67.25 for information about restrictions regarding combinations of authentication enhancements working together.

Use appropriate ACLs (Access Control Lists) on interfaces for extra security if a supplicant allocated to the designated auth-fail vlan can access the same network as a supplicant on the Guest VLAN. For more information about ACL concepts, and configuring ACLs see **Chapter 58, Access Control Lists Introduction**. For more information about ACL commands see:

- **Chapter 59, IPv4 Hardware Access Control List (ACL) Commands**
- **Chapter 60, IPv4 Software Access Control List (ACL) Commands**
- **Chapter 62, IPv6 Software Access Control List (ACL) Commands**

Examples To enable **auth-fail vlan** for port1.1.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the **auth-fail vlan** feature for port1.1.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth auth-fail vlan
```

Validation Commands **show running-config**

Related Commands **dot1x max-auth-fail**
show dot1x
show dot1x interface

auth critical

This command enables the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables critical port feature on the interface.

Syntax `auth critical`

`no auth critical`

Default The critical port of port authentication is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To enable the critical port feature on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth critical
```

To disable the critical port feature on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth critical
```

**Validation
Commands** `show auth-web-server`
`show dot1x`
`show dot1x interface`
`show running-config`

auth dynamic-vlan-creation

This command enables and disables the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

Syntax `auth dynamic-vlan-creation [rule {deny|permit}]`

`no auth dynamic-vlan-creation`

Parameter	Description
rule	VLAN assignment rule.
deny	Deny a differently assigned VLAN ID. This is the default rule.
permit	Permit a differently assigned VLAN ID.

Default By default, the Dynamic VLAN assignment feature is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage If the Dynamic VLAN assignment feature is enabled (disabled by default), VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports.

The optional **rule** parameter specifies the VLAN assignment rule when the second supplicant's VLAN ID is different from VLAN ID from the first supplicant. If the **deny** value is applied with the command then the second supplicant with a different VLAN ID is rejected. If the **permit** value is applied with the command then the second supplicant with a different VLAN ID is accepted and assigned to the first supplicant's VLAN.

If you issue an **auth dynamic-vlan-creation** command without an optional **rule** parameter and a required **deny** or **permit** keyword value then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without an optional **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VLANs.

Examples To enable the Dynamic VLAN assignment feature on interface `port1.1.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth dynamic-vlan-creation
```

To disable the Dynamic VLAN assignment feature on interface `port1.1.2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth dynamic-vlan-creation
```

**Validation
Commands** **show dot1x**
 show dot1x interface
 show running-config

Related Commands **auth host-mode**

auth guest-vlan

This command enables and configures the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface if its not already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest vlan feature on the interface specified.

Syntax `auth guest-vlan <1-4094> [routing]`
`no auth guest-vlan [routing]`

Parameter	Description
<1-4094>	VLAN ID (VID).
routing	Enables routing from the Guest VLAN to other VLANs.

Default The Guest VLAN authentication feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must first define the VLAN with the **vlan** command that you will assign as a guest VLAN using this command. Also note that 802.1X must first be enabled on the port.

Guest VLAN authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping command on page 81.24](#)), and vice versa.

The Guest VLAN feature in previous releases had some limitations that have been removed. Until this release the Guest VLAN feature could not lease the IP address to the supplicant using DHCP Server or DHCP Relay features unless Web authentication was also applied. When using NAP authentication, the supplicant should have been able to log on to a domain controller to gain certification, but the Guest VLAN would not accept access to another VLAN.

The Guest VLAN routing mode in this release overcomes these issues. With the Guest VLAN routing mode, the switch can lease DHCP addresses and accept access to a limited network.

See the section [“Configuring a Guest VLAN” on page 67.2](#) for information about the Guest VLAN feature.

See the section **“Limitations on Allowed Feature Combinations”** on page 67.25 for information about restrictions regarding combinations of authentication enhancements working together.

Examples To define `vlan100` and assign the guest VLAN feature to `vlan100` on interface `port1.1.2`, and enable routing from the guest vlan to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest vlan feature on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth guest-vlan
```

Validation Commands `show dot1x`
`show dot1x interface`
`show running-config`

Related Commands `dot1x port-control`
`vlan`

auth host-mode

This command selects host mode on the interface. Multi-host is an extension to IEEE802.1X.

Use the **no** variant of this command to set host mode to the default setting (single host).

Syntax `auth host-mode {single-host|multi-host|multi-supPLICANT}`
`no auth host-mode`

Parameter	Description
single-host	Single host mode.
multi-host	Multi host mode.
multi-supPLICANT	Multi supplicant (client device) mode.

Default The default host mode for port authentication is for a single host.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the host mode to multi-supPLICANT on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth host-mode multi-supPLICANT
```

To set the host mode to default (single host) on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth host-mode
```

Validation Commands `show dot1x`
`show dot1x interface`
`show running-config`

auth log

Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

Syntax `auth log {dot1x|auth-mac|auth-web} {success|failure|logoff|all}`
`no auth log {dot1x|auth-mac|auth-web} {success|failure|logoff|all}`

Parameter	Description
dot1x	Specify only 802.1X authentication log messages are output to the log file.
auth-mac	Specify only MAC authentication log messages are output to the log file.
auth-web	Specify only Web authentication log messages are output to the log file.
success	Specify only successful authentication log messages are output to the log file.
failure	Specify only authentication failure log messages are output to the log file.
logoff	Specify only authentication logoff messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.
all	Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature.

Default All types of authentication log messages are output to the log file by default.

Mode Interface Configuration

Examples To configure the logging of MAC authentication failures to the log file for supplicants (client devices) connected to interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth log auth-mac failure
```

To configure the logging of all types of authentication log messages to the log file for supplicants (client devices) connected to interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth log all
```

Validation **show running-config**
Commands

auth max-supPLICant

This command sets the maximum number of supplicants (client devices) on the interface that can be authenticated. After this value is exceeded supplicants are not authenticated.

The **no** variant of this command resets the maximum supplicant number to the default (1024).

Syntax `auth max-supPLICant <2-1024>`
`no auth max-supPLICant`

Parameter	Description
<2-1024>	Limit number.

Default The max supplicant of port authentication is 1024.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the maximum number of supplicants to 10 on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth max-supPLICant 10
```

To reset the maximum number of supplicant to default on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth max-supPLICant
```

**Validation
Commands** `show dot1x`
`show dot1x interface`
`show running-config`

auth reauthentication

This command enables re-authentication on the interface specified in the Interface mode, which may be a static channel group (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the **no** variant of this command to disables reauthentication on the interface.

Syntax `auth reauthentication`
`no auth reauthentication`

Default Reauthentication of port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To disable reauthentication on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth reauthentication
```

**Validation
Commands** `show dot1x`
`show dot1x interface`
`show running-config`

auth roaming disconnected

This command enables the roaming authentication feature on an authenticated interface that is link down. A supplicant (a client device) is not reauthenticated when moved between authenticated interfaces, providing both interfaces have the roaming authentication feature enabled before the supplicant is moved.

Use the **auth roaming enable** command before using this command. The **auth roaming disconnected** command on its own will have no effect on the operation of the switch. This command will only come into effect once the base Roaming Authentication feature is enabled, using the **auth roaming enable** command.

The **no** variant of this command disables the roaming authentication feature on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See **“Web-Authentication” on page 67.4** for further information about this feature.

Syntax `auth roaming disconnected`
`no auth roaming disconnected`

Default The roaming authentication `disconnected` feature is disabled by default on an interface. Authentication status for a roaming supplicant is deleted by default when an interface goes down.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage This command allows a supplicant to move to another authenticating interface without reauthentication, if the link is down for the interface that the supplicant is moved from.

Note that 802.1X port authentication, or MAC authentication, or Web Authentication must first be enabled on an interface to use this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Configure **auth roaming enable** on an interface before configuring **auth roaming disconnected** if you require **auth roaming disconnected** configured on an interface for a roaming supplicant.

Roaming authentication cannot be enabled if DHCP snooping is enabled (**service dhcp-snooping** command on page 81.24), and vice versa.

Examples To enable roaming authentication `disconnected` feature for `port1.1.2`, after enabling 802.1x authentication and enabling roaming authentication `enable`, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To disable roaming authentication `disconnected` feature for `port1.1.2`, use the

commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth roaming disconnected
```

**Validation
Commands** **show running-config**

Related Commands **auth-mac enable**
auth roaming enable
auth-web enable
dot1x port-control
show auth-mac interface
show auth-web interface
show dot1x interface

auth roaming enable

This command enables the roaming authentication feature on an authenticated interface that is link up. A supplicant (a client device) is not reauthenticated when moved between authenticated interfaces, providing both interfaces have the roaming authentication feature enabled before the supplicant is moved.

Use the **auth roaming enable** command before using **auth roaming disconnected** command. The **auth roaming disconnected** command on its own will have no effect on the operation of the switch. This command will only come into effect once the base Roaming Authentication feature is enabled, using the **auth roaming enable** command.

The **no** variant of this command disables the roaming authentication feature on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See “**Web-Authentication**” on page 67.4 for further information about this feature.

Syntax `auth roaming enable`
`no auth roaming enable`

Default The roaming authentication enable feature is disabled by default on an interface. Authentication status for a roaming supplicant is deleted by default when an interface goes down.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage This command allows a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is moved from.

Note that 802.1X port authentication, or MAC authentication, or Web Authentication must first be enabled on an interface to use this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Configure **auth roaming enable** on an interface before configuring **auth roaming disconnected** if you require **auth roaming disconnected** configured on an interface for a roaming supplicant.

Roaming authentication cannot be enabled if DHCP snooping is enabled (**service dhcp-snooping** command on page 81.24), and vice versa.

Examples To enable the roaming authentication enable feature for interface `port1.1.4`, after enabling 802.1x authentication, since an authentication method is required, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
```

To disable roaming authentication enable for port1.1.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# no auth roaming enable
```

**Validation
Commands** **show running-config**

Related Commands **auth-mac enable**
auth roaming disconnected
auth-web enable
dot1x port-control
show auth-mac interface
show auth-web interface
show dot1x interface

auth supplicant-mac

This command adds a supplicant (client device) mac address on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address added by the **auth supplicant-mac** command, and resets to the default for the supplicant parameter.

Syntax

```

auth supplicant <mac-addr>
    [max-reauth-req <1-10>]
    [port-control {auto | force-authorized | force-unauthorized }]
    [quiet-period <1-65535>]
    [reauth-period <1-4294967295>]
    [supp-timeout <1-65535>]
    [server-timeout <1-65535>][reauthentication]

no auth supplicant-mac <macadd> [reauthentication]
    
```

Parameter	Description
<mac-addr>	MAC (hardware) address of the Supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.
port-control	Port control commands.
auto	Allow port client to negotiate authentication.
force-authorized	Force port state to authorized.
force-unauthorized	Force port state to unauthorized.
quiet-period	Quiet period in the HELD state (default 60 seconds).
<1-65535>	Seconds for quiet period.
reauth-period	Seconds between reauthorization attempts (default 3600 seconds).
<1-4294967295>	Seconds for reauthorization attempts (reauth-period).
supp-timeout	Supplicant response timeout (default 30 seconds).
<1-65535>	Seconds for supplicant response timeout.
server-timeout	Authentication server response timeout (default 30 seconds).
<1-65535>	Seconds for authentication server response timeout.
reauthentication	Enable reauthentication on a port.
max-reauth-req	No of reauthentication attempts before becoming unauthorized (default 2).
<1-10>	Count of reauthentication attempts.

Default No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters applied are as shown in the table.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To add the supplicant MAC address 0009.41A4.5943 to force authorized port control for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth supplicant-mac 0009.41A4.5943 port-
control force-authorized
```

To delete the supplicant MAC address 0009.41A4.5943 for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth supplicant-mac 0009.41A4.5943
```

To reset reauthentication to disable for the supplicant MAC address 0009.41A4.5943, for interface `port1.1.2` use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth supplicant-mac 0009.41A4.5943
reauthentication
```

Validation Commands **show dot1x**
show dot1x interface
show running-config

auth timeout connect-timeout

This command sets the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default (30 seconds).

Syntax `auth timeout connect-timeout <1-65535>`
`no auth timeout connect-timeout`

Parameter	Description
<1-65535>	Seconds.

Default The connect-timeout default is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage This command is used for MAC and Web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When **auth-web-server session-keep** is enabled it is recommended to configure a longer connect-timeout period.

Examples To set the connect-timeout period to 3600 for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout connect-timeout
```

Validation Commands `show dot1x`
`show dot1x interface`

auth timeout quiet-period

This command sets the time period for which the authentication request is not accepted on a given interface, after the authentication request has failed an authentication.

Use the **no** variant of this command to reset quiet period to the default (60 seconds).

Syntax `auth timeout quiet-period <1-65535>`
`no auth timeout quiet-period`

Parameter	Description
<1-65535>	Seconds.

Default The quiet period of port authentication is 60 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the quiet period to 10 for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout quiet-period
```

auth timeout reauth-period

This command sets the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

Syntax `auth timeout reauth-period <1-4294967295>`

`no auth timeout reauth-period`

Parameter	Description
<1-4294967295>	Seconds.

Default The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the reauthentication period to 1 day for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout reauth-period
```

Validation Commands `show dot1x`
`show dot1x interface`
`show running-config`

Related Commands `auth reauthentication`

auth timeout server-timeout

This command sets the timeout for the waiting response from the RADIUS server on a given interface.

The **no** variant of this command resets the server-timeout to the default (30 seconds).

Syntax `auth timeout server-timeout <1-65535>`
`no auth timeout server-timeout`

Parameter	Description
<1-65535>	Seconds.

Default The server timeout for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the server timeout to 120 seconds for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout server-timeout
```

Validation Commands `show dot1x`
`show dot1x interface`
`show running-config`

auth timeout supp-timeout

This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

Syntax `auth timeout supp-timeout <1-65535>`

`no auth timeout supp-timeout`

Parameter	Description
<1-65535>	Seconds.

Default The supplicant timeout of port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the server timeout to 2 seconds for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the server timeout to the default (30 seconds) for interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth timeout supp-timeout
```

Validation Commands `show dot1x`
`show dot1x interface`
`show running-config`

auth-mac enable

This command enables MAC based authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC based authentication on an interface.

Syntax `auth-mac enable`
`no auth-mac enable`

Default MAC authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage Enabling **spanning-tree edgeport** on ports after enabling MAC based authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

Examples To enable MAC authentication on interface `port1.1.2` and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-mac enable
```

Validation Commands `show auth-mac`
`show auth-mac interface`
`show running-config`

Related Commands `aaa accounting auth-mac default`
`aaa authentication auth-mac`
`spanning-tree edgeport (RSTP and MSTP)`
`switchport mode access`

auth-mac method

This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the Interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

Syntax `auth-mac method [eap-md5|pap]`
`no auth-mac method`

Parameter	Description
<code>eap-md5</code>	Enable EAP-MD5 of authentication method.
<code>pap</code>	Enable PAP of authentication method.

Default The mac authentication method is PAP.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the MAC authentication method to `pap` on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-mac method
```

Validation Commands `show auth-mac`
`show auth-mac interface`
`show running-config`

auth-mac reauth-relearning

This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

Syntax `auth-mac reauth-relearning`
`no auth-mac reauth-relearning`

Default Re-learning for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To enable the re-authentication re-learning feature on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-mac reauth-relearning
```

Validation Commands `show auth-mac`
`show auth-mac interface`
`show running-config`

auth-web enable

This command enables Web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to disable Web-based authentication on an interface.

Syntax auth-web enable
no auth-web enable

Default Web authentication is disabled by default.

Mode Interface Configuration for a static channel or a switch port.

Usage Web-based authentication cannot be enabled if DHCP snooping is enabled ([service dhcp-snooping command on page 81.24](#)), and vice versa.

Examples To enable Web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# auth-web enable
```

To disable Web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# no auth-web enable
```

Validation Commands show auth-web
show auth-web interface
show running-config

Related Commands aaa accounting auth-web default
aaa authentication auth-web

auth-web forward

This command enables the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

The **no** variant of this command disables or deletes the packet forwarding feature on the interface.

Syntax `auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`
`no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}`

Parameter	Description
arp	Enable forwarding of ARP.
dhcp	Enable forwarding of DHCP (67/udp).
dns	Enable forwarding of DNS (53/udp).
tcp	Enable forwarding of TCP specified port number.
<1-65535>	TCP Port number.
udp	Enable forwarding of UDP specified port number.
<1-65535>	UDP Port number.

Default Packet forwarding for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Usage For more information about the <ip-address> parameter, and an example, see the “auth-web forward” section in the [Alliedware Plus Technical Tips and Tricks](#).

Examples To enable the arp forwarding feature on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web forward arp
```

To add the tcp forwarding port 137 on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-web forward arp
```

To delete the tcp forwarding port 137 on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-web forward tcp 137
```

To delete the all of tcp forwarding on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-web forward tcp
```

**Validation
Commands** **show auth-web**
 show auth-web interface
 show running-config

auth-web max-auth-fail

This command sets the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than has been set to the maximum number of authentication failures then login requests are refused during the quiet period.

The **no** variant of this command resets the maximum number of authentication failures to the default (3 authentication failures).

Syntax `auth-web max-auth-fail <0-10>`
`no auth-web max-auth-fail`

Parameter	Description
<code><0-10></code>	Lock count specified.

Default The **max-auth-fail** lock counter is set to 3 authentication failures by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Examples To set the lock count to 5 on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no auth-web max-auth-fail
```

Validation Commands `show auth-web`
`show auth-web interface`
`show running-config`

Related Commands `auth timeout quiet-period`

auth-web method

This command sets the authentication method of WEB authentication that is used with RADIUS on the interface specified.

The **no** variant of this command sets the authentication method to PAP for the interface specified when Web authentication is also used with the RADIUS authentication method.

Syntax `auth-web method {eap-md5|pap}`
`no auth-web method`

Parameter	Description
<code>eap-md5</code>	Enable EAP-MD5 as the authentication method.
<code>pap</code>	Enable PAP as the authentication method.

Default The web authentication method is set to PAP by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port.

Example To set the web authentication method to eap-md5 on interface `port1.1.2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# auth-web method eap-md5
```

Validation Commands `show auth-web`
`show auth-web interface`
`show running-config`

auth-web-server dhcp ipaddress

Use this command to assign an IP address and enable the DHCP service on the web authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the web authentication server for supplicants.

Syntax `auth-web-server dhcp ipaddress <ip-address/prefix-length>`
`no auth-web-server dhcp ipaddress`

Parameter	Description
<code><ip-addr/prefix-length></code>	The IPv4 address and prefix length assigned for the DHCP service on the web authentication server for supplicants.

Default No IP address for the web authentication server is set by default.

Mode Global Configuration

Usage See the section [“DHCP server for Web-authentication” on page 67.10](#) in [Chapter 67, Authentication Introduction and Configuration](#) for further overview information about the Web-authentication enhancements, allowing Web-authentication to work as seamlessly as 802.1X authentication.

See the section [“Limitations on Allowed Feature Combinations” on page 67.25](#) for information about restrictions regarding combinations of authentication enhancements working together.

Examples To assign the IP address 10.0.0.1 to the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

Validation Commands `show running-config`

Related Commands `show auth-web-server`
`auth-web-server dhcp lease`

auth-web-server dhcp lease

Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the web authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the web authentication server.

Syntax `auth-web-server dhcp lease <20-60>`
`no auth-web-server dhcp lease`

Parameter	Description
<20-60>	DHCP lease time for supplicants using the DHCP service on the web authentication server in seconds.

Default The default DHCP lease time for supplicants using the DHCP service on the web authentication server is set to 30 seconds.

Mode Global Configuration

Usage See the section [“DHCP server for Web-authentication” on page 67.10](#) in [Chapter 67, Authentication Introduction and Configuration](#) for further overview information about the Web-authentication enhancements, allowing Web-authentication to work as seamlessly as 802.1X authentication.

See the section [“Limitations on Allowed Feature Combinations” on page 67.25](#) for information about restrictions regarding combinations of authentication enhancements working together.

Examples To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

Validation Commands `show running-config`

Related Commands `show auth-web-server`
`auth-web-server dhcp ipaddress`

auth-web-server http-redirect

This command enables the HTTP redirect feature on every interface on which web-based port authentication is enabled. When the HTTP redirect feature is enabled, any HTTP request received on an unauthorized interface is redirected to the web authentication server automatically.

Use the **no** variant of this command to disable the HTTP redirect feature.

Syntax `auth-web-server http-redirect`
`no auth-web-server http-redirect`

Default The HTTP redirect feature is enabled by default.

Mode Global Configuration

Examples To disable the HTTP redirect feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server http-redirect
```

To re-enable the HTTP redirect feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server http-redirect
```

**Validation
Commands** `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server ipaddress

This command sets the IP address for the web authentication server.

Use the **no** variant of this command to delete the IP address for the web authentication server.

Syntax `auth-web-server ipaddress <ip-address>`
`no auth-web-server ipaddress`

Parameter	Description
<code><ip-address></code>	Web authentication server dotted decimal IP address in A.B.C.D format.

Default The web authentication server address on the system is not set by default.

Mode Global Configuration

Examples To set the IP address 10.0.0.1 to the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

Validation Commands `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server mode

Use this command with required keyword to configure an intercept mode (from the intercept, none, or promiscuous modes available) on the web authentication server for supplicants (client devices). The intercept modes available affect the interception of clients' ARPs and the proxy DNS response when using Web-authentication. These enhancements ensure that Web-authentication will proceed smoothly irrespective of the IP configuration on the client PC.

Use the **no** variant of this command to disable the intercept mode (either the intercept, none, or promiscuous intercept modes) configured on the web authentication server for supplicants.

Syntax `auth-web-server mode {intercept|none|promiscuous}`
`no auth-web-server mode {intercept|promiscuous}`

Parameter	Description
<code>intercept</code>	Selecting this parameter results in web authentication server on the switch intercepting and replying to ARP and DNS messages from the same interface and IP address.
<code>none</code>	Selecting this parameter disables the intercept mode on the web authentication server. No ARP and DNS messages are intercepted and replied to from the switch from any interfaces or from any IP addresses.
<code>promiscuous</code>	Selecting this parameter results in the web authentication server on the switch intercepting and replying to any ARP or DNS messages from any IP address.

Default Intercept mode on the web authentication server is set to **none** by default.

Mode Global Configuration

Usage See [Chapter 67, Authentication Introduction and Configuration](#) for overview information about Web-authentication, allowing Web-authentication to work as seamlessly as 802.1X authentication.

See the sub-sections [“Interception of clients’ ARPs” on page 67.12](#) and [“Proxy DNS response” on page 67.13](#) for an details of the associated usage of the available intercept modes.

See the section [“Limitations on Allowed Feature Combinations” on page 67.25](#) for information about restrictions regarding combinations of authentication enhancements working together.

Examples To enable the intercept mode on the web authentication server, resulting in the switch intercepting and replying to ARP and DNS messages from the same interface and IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server mode intercept
```

To disable the intercept mode on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server mode intercept
```

To reset the intercept mode to the default setting of none on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server mode none
```

To enable the promiscuous mode on the web authentication server, resulting in the switch intercepting and replying to any ARP or DNS messages from any IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server mode promiscuous
```

To disable the promiscuous mode on the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server mode promiscuous
```

**Validation
Commands** **show running-config**

Related Commands **show auth-web-server**

auth-web-server ping-poll enable

This command enables the ping polling to the supplicant (client device) that is authenticated by web authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by web authentication.

Syntax `auth-web-server ping-poll enable`
`no auth-web-server ping-poll enable`

Default The ping polling feature for web authentication is disabled by default.

Mode Global Configuration

Examples To enable the ping polling feature for web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

**Validation
Commands** `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll failcount

This command sets a fail count for the ping polling feature when used with web authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

Syntax `auth-web-server ping-poll failcount <1-100>`
`no auth-web-server ping-poll failcount`

Parameter	Description
<1-100>	Count.

Default The default failcount for ping polling is 5 pings.

Mode Global Configuration

Examples To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

Validation Commands `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll interval

This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

Syntax `auth-web-server ping-poll interval <1-65535>`
`no auth-web-server ping-poll interval`

Parameter	Description
<1-65535>	Seconds.

Default The interval for ping polling is 30 seconds by default.

Mode Global Configuration

Examples To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

Validation Commands `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll reauth-timer-refresh

This command modifies the **reauth-timer-refresh** parameter for the web-authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

Syntax `auth-web-server ping-poll reauth-timer-refresh`
`no auth-web-server ping-poll reauth-timer-refresh`

Default The `reauth-timer-refresh` parameter is disabled by default.

Mode Global Configuration

Examples To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll reauth-timer-
refresh
```

**Validation
Commands** `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server ping-poll timeout

This command modifies the ping poll **timeout** parameter for the web authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

Syntax `auth-web-server ping-poll timeout <1-30>`

`no auth-web-server ping-poll timeout`

Parameter	Description
<1-30>	Seconds.

Default The default timeout for ping polling is 1 second.

Mode Global Configuration

Examples To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

Validation Commands `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server port

This command sets the HTTP port number for the web authentication server.

Use the **no** variant of this command to reset the HTTP port number to the default (80).

Syntax `auth-web-server port <port-number>`

`no auth-web-server port`

Parameter	Description
<code><port-number></code>	Set the local web authentication server port within the TCP port number range 1 to 65535.

Default The web authentication server HTTP port number is set to 80 by default.

Mode Global Configuration

Examples To set the HTTP port number 8080 for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

Validation Commands `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server redirect-delay-time

Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

Syntax `auth-web-server redirect-delay-time <5-60>`
`no auth-web-server redirect-delay-time`

Parameter	Description
<code>redirect-delay-time</code>	Set the delay time before jumping to a specified URL after the supplicant is authorized.
<code><5-60></code>	The time in seconds.

Default The default redirect delay time is 5 seconds.

Mode Global Configuration

Examples To set the delay time to 60 seconds for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

Validation Command `show auth-web-server`
`show running-config`

Related Commands `auth-web-server redirect-url`
`show auth-web-server`

auth-web-server redirect-url

This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

Syntax `auth-web-server redirect-url <url>`
`no auth-web-server redirect-url`

Parameter	Description
<code><url></code>	URL (hostname or dotted IP notation).

Default The redirect URL for the web authentication server feature is not set by default (null).

Mode Global Configuration

Examples To enable and set redirect a URL string `www.alliedtelesis.com` for the web authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

Validation Commands `show auth-web`
`show auth-web-server`
`show running-config`

Related Commands `auth-web-server http-redirect`
`auth-web-server redirect-delay-time`

auth-web-server session-keep

This command enables the session-keep feature to jump to the original URL after being authorized by web authentication.

Use the **no** variant of this command to disable the session keep feature.

Syntax `auth-web-server session-keep`

`no auth-web-server session-keep`

Default The session-keep feature is disabled by default.

Mode Global Configuration

Examples To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

**Validation
Commands** `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server ssl

This command enables HTTPS functionality for the web authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the web authentication server.

Syntax `auth-web-server ssl`
`no auth-web-server ssl`

Default HTTPS functionality for the web authentication server feature is disabled by default.

Mode Global Configuration

Examples To enable HTTPS functionality for the web authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the web authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

**Validation
Commands** `show auth-web`
`show auth-web-server`
`show running-config`

auth-web-server sslport

This command sets the HTTPS port number for the web authentication server feature.

Use the **no** variant of this command to reset the HTTPS port number to the default port number (443) for the web authentication server feature.

Syntax `auth-web-server sslport <1-65535>`

`no auth-web-server sslport`

Parameter	Description
<code><1-65535></code>	Set the local web authentication server port within the TCP port number range 1 to 65535.

Default The HTTPS port number for the web authentication server feature is set to 443 by default.

Mode Global Configuration

Examples To set the HTTPS port number to 4433 for the web authentication server, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server sslport 4433
```

To reset the HTTPS port number for the web authentication server to the default (443), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server sslport
```

Validation Commands `show auth-web`
`show auth-web-server`
`show running-config`

copy web-auth-https-file

Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

Syntax `copy <filename> web-auth-https-file`

Parameter	Description
<code><filename></code>	The URL of the server certificate file.

Mode Privileged Exec

Example To download the server certificate file `verisign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/verisign_cert.pem web-auth-https-  
file
```

Related Commands [auth-web-server ssl](#)
[erase web-auth-https-file](#)
[show auth-web-server](#)

erase web-auth-https-file

Use this command to remove the SSL server certificate for web-based authentication.

Syntax `erase web-auth-https-file`

Mode Privileged Exec

Example To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

Related Commands [auth-web-server ssl](#)
[copy web-auth-https-file](#)
[show auth-web-server](#)

show auth-mac

This command shows authentication information for MAC-based authentication.

Syntax `show auth-mac [all]`

Parameter	Description
all	Display all authentication information for each interface available on the switch.

Mode Privileged Exec

Example To display all MAC based authentication information, enter the command:

```
awplus# show auth-mac all
```

Output **Figure 68-1: Example output from the show auth-mac command**

```
802.1X Port-Based Authentication Disabled
MAC-based Port Authentication Enabled
WEB-based Port Authentication Disabled
```

Related Commands [show dot1x](#)
[show auth-web](#)

show auth-mac diagnostics

This command shows MAC authentication diagnostics, optionally for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

Syntax `show auth-mac diagnostics [interface <interface-list>]`

Parameter	Description
interface	Specify an interface to show
<interface-list>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. vlan2), a switch port (e.g. port1.1.12), a static channel group (e.g. sa3) or a dynamic (LACP) channel group (e.g. po4) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. vlan2-8, or port1.1.1-1.1.24, or sa2-4, or po1-3 ■ a comma-separated list of the above; e.g. port1.1.1,port1.1.8-1.1.24. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example To display authentication diagnostics for port1.1.12, enter the command:

```
awplus# show auth-mac diagnostics interface port1.1.12
```

Output **Figure 68-2: Example output from the show auth-mac diagnostics command**

```
Authentication Diagnostics for interface port1.1.12
  Supplicant address: 00d0.59ab.7037
    authEnterConnecting: 2
    authEaplogoffWhileConnecting: 1
    authEnterAuthenticating: 2
    authSuccessWhileAuthenticating: 1
    authTimeoutWhileAuthenticating: 1
    authFailWhileAuthenticating: 0
    authEapstartWhileAuthenticating: 0
    authEaplogoggWhileAuthenticating: 0
    authReauthsWhileAuthenticated: 0
    authEapstartWhileAuthenticated: 0
    authEaplogoffWhileAuthenticated: 0
  BackendResponses: 2
  BackendAccessChallenges: 1
  BackendOtherrequestToSupplicant: 3
  BackendAuthSuccess: 1
```

show auth-mac interface

This command shows the status for MAC based authentication on the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the optional **diagnostics** parameter to show authentication diagnostics for the specified interface. Use the optional **sessionstatistics** parameter to show authentication session statistics for the specified interface. Use the optional **statistics** parameter to show authentication diagnostics for the specified interface. Use the optional **supplicant** (client device) parameter to show the supplicant state for the specified interface.

Syntax `show auth-mac interface <interface-list>`
`[diagnostics|sessionstatistics|statistics|supplicant [brief]]`

Parameter	Description
<code><interface-list></code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> a comma-separated list of the above; e.g. <code>port1.1.1, port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>
<code>diagnostics</code>	Diagnostics.
<code>sessionstatistics</code>	Session statistics.
<code>statistics</code>	Statistics.
<code>supplicant</code>	Supplicant (client device).
<code>brief</code>	Brief summary of supplicant state.

Mode Privileged Exec

Examples To display MAC based authentication status for port1.1.12, enter the command:

```
awplus# show auth-mac interface port1.1.2
```

```
% Port-Control not configured on port1.1.2
```

To display MAC authentication diagnostics for port1.1.12, enter the command:

```
awplus# show auth-mac interface port1.1.12 diagnostics
```

```
Authentication Diagnostics for interface port1.1.2
  Supplicant address: 00d0.59ab.7037
  authEnterConnecting: 2
  authEaplogoffWhileConnecting: 1
  authEnterAuthenticating: 2
  authSuccessWhileAuthenticating: 1
  authTimeoutWhileAuthenticating: 1
  authFailWhileAuthenticating: 0
  authEapstartWhileAuthenticating: 0
  authEaplogoggWhileAuthenticating: 0
  authReauthsWhileAuthenticated: 0
  authEapstartWhileAuthenticated: 0
  authEaplogoffWhileAuthenticated: 0
  BackendResponses: 2
  BackendAccessChallenges: 1
  BackendOtherrequestToSupplicant: 3
  BackendAuthSuccess: 1
```

To display authentication session statistics for port1.1.12, enter the command:

```
awplus# show auth-mac interface port1.1.12 sessionstatistics
```

```
Authentication session statistics for interface port1.1.12
  session user name: manager
  session authentication method: Remote server
  session time: 19440 secs
  session terminat cause: Not terminated yet
```

To display MAC authentication statistics for port1.1.12, enter the command:

```
awplus# show auth-mac interface port1.1.12 statistics
```

To display the MAC authenticated supplicant on interface port1.1.12, enter the command:

```
awplus# show auth-mac interface port1.1.12 supplicant
```

Related Commands

show auth-mac sessionstatistics

This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth-mac sessionstatistics [interface <interface-list>]`

Parameter	Description
interface	Specify an interface to show.
<interface-list>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> ■ a comma-separated list of the above; e.g. <code>port1.1.1, port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example To display output displaying MAC authentication session statistics for `port1.1.12`, enter the command:

```
awplus# show auth-mac sessionstatistics interface port1.1.12
```

Output **Figure 68-3: Example output from the show auth-mac sessionstatistics command**

```
Authentication session statistics for interface port1.1.12
  session user name: manager
    session authentication method: Remote server
    session time: 19440 secs
    session terminat cause: Not terminated yet
```

show auth-mac statistics interface

This command shows the authentication statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth-mac statistics [interface <interface-list>]`

Parameter	Description
<code>interface</code>	Specify ports to show.
<code><interface-list></code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> ■ a comma-separated list of the above; e.g. <code>port1.1.1,port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example To display MAC authentication statistics for `port1.1.12`, enter the command:

```
awplus# show auth-mac statistics interface port1.1.12
```

Related Commands [show dot1x interface](#)

show auth-mac supplicant

This command shows the supplicant (client device) state when MAC authentication is configured for the switch. This command shows a summary when the optional **brief** parameter is used.

Syntax `show auth-mac supplicant [<macadd>] [brief]`

Parameter	Description
<macadd>	Mac (hardware) address of the Supplicant Entry format is HHHH.HHHH.HHHH (hexadecimal).
brief	Brief summary of the Supplicant state.

Mode Privileged Exec

Example To display the MAC authenticated supplicant for MAC address 00d0 . 59ab . 7037, enter the command:

```
awplus# show auth-mac supplicant 00d0.59ab.7037
```

```
Web authentication server
  Server status: enabled
  Server address: -
  HTTP Port No: 80
  Security: enabled
  Certification: default
  SSL Port No: 443
  Redirect URL:
  Redirect Delay Time: 30
  HTTP Redirect: disabled
  Session keep: disabled
  PingPolling: disable
  PingInterval: 30
  Timeout: 1
  FailCount: 5
  ReauthFresh: disabled
```

show auth-mac supplicant interface

This command shows the supplicant (client device) state for the MAC authenticated interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port. This command shows a summary when the optional **brief** parameter is used.

Syntax `show auth-mac supplicant [interface <interface-list>] [brief]`

Parameter	Description
<code>interface</code>	Specify ports to show.
<code><interface-list></code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> ■ a comma-separated list of the above; e.g. <code>port1.1.1, port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>
<code>brief</code>	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display the MAC authenticated supplicant on the interface `port1.1.12`, enter the command:

```
awplus# show auth-mac supplicant interface port1.1.12
```

show auth-web

This command shows authentication information for Web-based authentication.

Syntax `show auth-web [all]`

Parameter	Description
all	Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port.

Mode Privileged Exec

Example To display all Web authentication information, enter the command:

```
awplus# show auth-web all
```

Output **Figure 68-4: Example output from the show auth-web command**

```
802.1X Port-Based Authentication Disabled
MAC-based Port Authentication Disabled
WEB-based Port Authentication Enabled
```

Related Commands [show dot1x](#)
[show auth-mac](#)

show auth-web diagnostics

This command shows Web authentication diagnostics, optionally for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

Syntax `show auth-web diagnostics [interface <interface-list>]`

Parameter	Description
interface	Specify ports to show.
<interface-list>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. vlan2), a switch port (e.g. port1.1.12), a static channel group (e.g. sa3) or a dynamic (LACP) channel group (e.g. po4) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. vlan2-8, or port1.1.1-1.1.24, or sa2-4, or po1-3 ■ a comma-separated list of the above; e.g. port1.1.1, port1.1.8-1.1.24. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example To display authentication diagnostics for port1.1.12, enter the command:

```
awplus# show auth-web diagnostics interface port1.1.12
```

Output **Figure 68-5: Example output from the show auth-web diagnostics command**

```
Authentication Diagnostics for interface port1.1.12
  Supplicant address: 00d0.59ab.7037
    authEnterConnecting: 2

show auth-web sessionstatistics

This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth-web sessionstatistics [interface <interface-list>]`

Parameter	Description
interface	Specify ports to show.
<interface-list>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> ■ an interface (e.g. vlan2), a switch port (e.g. port1.1.12), a static channel group (e.g. sa3) or a dynamic (LACP) channel group (e.g. po4) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. vlan2-8, or port1.1.1-1.1.24, or sa2-4, or po1-3 ■ a comma-separated list of the above; e.g. port1.1.1, port1.1.8-1.1.24. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example To display authentication statistics for port1.1.12, enter the command:

```
awplus# show auth-web sessionstatistics interface port1.1.12
```

Output **Figure 68-6: Example output from the show auth-web sessionstatistics command**

```
Authentication session statistics for interface port1.1.12
  session user name: manager
    session authentication method: Remote server
    session time: 19440 secs
    session terminat cause: Not terminated yet
```

show auth-web statistics interface

This command shows the authentication statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth-web statistics interface <interface-list>`

Parameter	Description
<code><interface-list></code>	<p>The interfaces or ports to configure. An interface-list can be:</p> <ul style="list-style-type: none"> an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> a comma-separated list of the above; e.g. <code>port1.1.1, port1.1.8-1.1.24</code>. Do not mix interface types in a list <p>The specified interfaces must exist.</p>

Mode Privileged Exec

Example To display Web authentication statistics for `port1.1.12`, enter the command:

```
awplus# show dot1x statistics interface port1.1.12
```

Related Commands [show dot1x interface](#)

show auth-web supplicant

This command shows the supplicant (client device) state when Web authentication is configured for the switch. This command shows a summary when the optional **brief** parameter is used.

Syntax `show auth-web supplicant [<macadd>] [brief]`

Parameter	Description
<macadd>	Mac (hardware) address of the supplicant Entry format is HHHH.HHHH.HHHH (hexadecimal).
brief	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display Web authenticated supplicant information on the switch, enter the command:

```
awplus# show auth-web supplicant
```

show auth-web supplicant interface

This command shows the supplicant (client device) state for the Web authenticated interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port. This command shows a summary when the optional **brief** parameter is used.

Syntax `show auth-web supplicant interface <interface-list> [brief]`

Parameter	Description
<code><interface-list></code>	The interfaces or ports to configure. An interface-list can be: <ul style="list-style-type: none"> ■ an interface (e.g. <code>vlan2</code>), a switch port (e.g. <code>port1.1.12</code>), a static channel group (e.g. <code>sa3</code>) or a dynamic (LACP) channel group (e.g. <code>po4</code>) ■ a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. <code>vlan2-8</code>, or <code>port1.1.1-1.1.24</code>, or <code>sa2-4</code>, or <code>po1-3</code> ■ a comma-separated list of the above; e.g. <code>port1.1.1,port1.1.8-1.1.24</code>. Do not mix interface types in a list The specified interfaces must exist.
<code>brief</code>	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display the Web authenticated supplicant on the interface `port1.1.12`, enter the command:

```
awplus# show auth-web supplicant interface port1.1.12
```

To display brief summary output for the Web authenticated supplicant, enter the command:

```
awplus# show auth-web supplicant brief
```

show auth-web-server

This command shows the web authentication server configuration and status on the switch.

Syntax show auth-web-server

Mode Privileged Exec

Example To display web authentication server configuration and status, enter the command:

```
awplus# show auth-web-server
```

Output **Figure 68-7: Example output from the show auth-web-server command**

```
Web authentication server
Server status: enabled
Server address: -

Chapter 69: AAA Introduction and Configuration

AAA Introduction	69.2
Available functions and server types.....	69.2
Server Groups and Method Lists	69.3
Configuring AAA Login Authentication.....	69.5
AAA Configuration Tasks	69.5
Sample Authentication Configurations	69.7
Sample 802.1X Authentication Configuration	69.7
Sample MAC Authentication Configuration	69.8
Sample Web-Authentication Configuration	69.9
Sample Tri-Authentication Configuration	69.10

AAA Introduction

AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These function can be applied in a variety of methods with a variety of servers. The purpose of the AAA commands is to map instances of the AAA functions to sets of servers.

The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1x authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

Available functions and server types

Authentication, Authorization and Accounting functions are available.

Authentication is performed in the following contexts:

- Login authentication of user shell sessions on the console port, and via telnet/SSH
- Enable password authentication for user shell sessions on the console port, and via telnet/SSH (TACACS+ only)
- 802.1x authentication of devices connecting to switch ports
- MAC authentication of devices connecting to switch ports
- Web-based authentication of devices connecting to switch ports

Authorization is performed in the following context:

- TACACS+ login authentication. Note that with the AlliedWare Plus TACACS+ implementation:
 - « authorization cannot be performed independently of the login authentication process
 - « authorization will not be attempted if enable password authentication is configured
 - « there are no authorization commands available

Accounting is performed in the following contexts:

- Accounting of console, telnet, and SSH login sessions
- Accounting of commands executed within user shell sessions (TACACS+ only)
- Accounting of 802.1x-authenticated connections
- Accounting of MAC-authenticated connections
- Accounting of Web-authenticated connections

The three types of servers that can be used are:

- Local user database
- RADIUS servers
- TACACS+ servers

Server Groups and Method Lists

There are two constructs that underlie the structure of the AAA commands:

- Server groups are lists of RADIUS servers
- Method Lists are lists of server types

Server Groups

A server group is defined by the command **aaa group server**. This command puts you into Server Group configuration mode. Once in that mode you can add servers to the group by using the command **server auth-port**.

Any number of servers can be added to a group. Typically, you will add servers which have already been configured by the command **radius-server host**. If you add a server that has not yet been configured by the command **radius-server host**, you will receive a warning that the server has not yet been configured, but the command will be accepted.

There is one server group that is always present on the switch by default that cannot be removed. It is the group simply named **radius** that comprises all servers that have been configured using the command **radius-server host**. As soon as a server is configured by the command **radius-server host**, it is automatically a member of the server group **radius** and cannot be removed from it.

Method Lists

A method list defines the set of server types that you want to be used for authenticating a user/device, and the order in which you want the server types to be used.

- You may want the usernames proffered for logging in at the console to be checked for in the local user database. You can create a server list that specifies **local**.
- You may want to check the TACACS+ servers first, and resort to the local user database if none of the TACACS+ servers respond. You can create a server list that specifies **group tacacs+** first, followed by **local**.
- You may want to check the RADIUS servers first, and resort to the local user database if none of the RADIUS servers respond. You can create a server list that specifies **group radius** first, followed by **local**.

A method list defines the servers where authentication requests are sent. The first server listed is used to authenticate users; if that server fails then the next authentication server type in the method list is selected. This process continues until there is a successful authentication or until all server types fail.

When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies `group tacacs+ local`, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers not the local user database; the user login fails.

Default Method Lists

For every authentication or accounting type, it is always possible to define a method list called **default**. For most of the authentication and accounting types, the only method list that can be defined is default.

As soon as the default method list is defined for a given authentication or accounting type, it is automatically applied as the method list to be used for any instance of that type of authentication or accounting, except for instances to which another named method list has been specifically applied.

Configuring AAA Login Authentication

To configure AAA authentication, create default or a named method list for different authentication types. In the case of login authentication, the named method lists are then applied to consoles or VTY lines.

AAA Configuration Tasks

To define how a given accounting or authentication type will be applied to a given port or line:

- either create a server group using the **aaa group server** command (RADIUS only),
- or create a method list for the authentication or accounting type as required,
- then apply that method list to the port or line as required.

Step 1: Define a group of RADIUS Servers:

Create a server group using the **aaa group server** command.

To create a RADIUS server group named `GROUP1` with hosts `192.168.1.1`, `192.168.2.1` and `192.168.3.1`, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-
port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-
port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-
port 1813
```

Step 2: Specify the login authentication or accounting Method List:

Create a method list for the authentication (**aaa authentication login**) or accounting (**aaa accounting login**) type as required.

To configure a user login authentication method list called `USERS` to use first all available RADIUS servers for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure a user login authentication method list called `USERS` to use first the TACACS+ servers for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

Step 3: Apply Method List to Interface Port or Line:

Apply that method list to the port or line as required.

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication USERS
```

For most Authentication and Accounting types, the only possible server list is **default**, and the only server that can be put into it is **radius**. You will typically use all RADIUS servers, so **group radius** can be used, rather than having to create a specific user group. Often the configuration of a given Authentication or Accounting type will consist of a single command, the command that defines the default server list, which contains just one server.

AAA 802.1x Authentication Configuration:

AAA 802.1x authentication will typically be configured with the following commands.

To enable 802.1x Authentication globally for all RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
```

Sample Authentication Configurations

Sample 802.1X Authentication Configuration

See the below sample configuration script for a sample 802.1X authentication configuration. Copy and paste then edit the sample 802.1X authentication configuration in your config file. See the [edit](#) command in the [Chapter 7, File Management Commands](#) for further information.

Output

Figure 69-1: Sample 802.1X Authentication Configuration

```
!  
radius-server host 127.0.0.1 key awplus-local-radius-server  
!  
aaa authentication dot1x default group radius  
!  
radius-server local  
server enable  
nas 127.0.0.1 key awplus-local-radius-server  
user guest password guest!  
!  
no spanning-tree rstp enable  
!  
interface port1.1.1  
switchport  
switchport mode access  
dot1x port-control auto  
!  
interface vlan1  
ip address 192.168.1.120/24  
!
```

The 802.1X authentication feature needs the [aaa authentication dot1x](#) command and the [dot1x port-control](#) command configured on an interface. See [Chapter 70, AAA Commands](#) and [Chapter 66, 802.1X Commands](#) for command information to edit this configuration.

Local RADIUS Server has been configured to use 802.1X authentication in this sample configuration. See the [radius-server local](#) and [server enable](#) commands in [Chapter 76, Local RADIUS Server Commands](#) for command information to edit this sample configuration.

This sample configuration enables 802.1X authentication on interface `vlan1` with IP address `192.168.1.120`. Change the VLAN ID and IP address as required for your configuration.

Sample MAC Authentication Configuration

See the below sample configuration script for a sample MAC authentication configuration. Copy, paste, and edit the sample MAC authentication configuration in the config file. See the **edit** command in the **Chapter 7, File Management Commands** for further information.

Output

Figure 69-2: Sample MAC Authentication Configuration

```
!  
radius-server host 127.0.0.1 key awplus-local-radius-server  
!  
aaa authentication auth-mac default group radius  
!  
radius-server local  
server enable  
nas 127.0.0.1 key awplus-local-radius-server  
user 00-d0-59-ab-70-37 password 00-d0-59-ab-70-37  
!  
no spanning-tree rstp enable  
!  
interface port1.1.1  
switchport  
switchport mode access  
auth-mac enable  
!  
interface vlan1  
ip address 192.168.1.120/24  
!
```

The MAC authentication feature needs the **aaa authentication auth-mac** and the **auth-mac enable** commands configured on an interface. See **Chapter 70, AAA Commands** and **Chapter 68, Authentication Commands** for command information to edit this configuration.

Local RADIUS Server has been configured to use MAC authentication in this sample configuration. See the **radius-server local** and **server enable** commands in **Chapter 76, Local RADIUS Server Commands** for command information to edit this sample configuration.

See the **user (RADIUS server)** command in **Chapter 76, Local RADIUS Server Commands** for command information to edit the MAC address of the supplicant for use with local RADIUS server as the RADIUS user name and the user password, as shown in the above configuration.

This configuration enables MAC authentication on `vlan1` with IP address `192.168.1.120`. Change the interface VLAN ID, MAC, and IP addresses as needed in your configuration.

Sample Web-Authentication Configuration

See the below sample configuration script for a sample Web-authentication configuration. Copy, paste, and edit the sample Web-authentication configuration for your config file. See the **edit** command in the **Chapter 7, File Management Commands** for further information.

Output

Figure 69-3: Sample Web-Authentication Configuration

```
!  
radius-server host 127.0.0.1 key awplus-local-radius-server  
!  
aaa authentication auth-web default group radius  
!  
radius-server local  
server enable  
nas 127.0.0.1 key awplus-local-radius-server  
user guest encrypted password

!  
no spanning-tree rstp enable  
!  
interface port1.1.1  
switchport  
switchport mode access  
auth-web enable  
!  
interface vlan1  
ip address 192.168.1.120/24  
!
```

The Web-authentication feature needs the **aaa authentication auth-web** and the **auth-web enable** commands configured on an interface. See **Chapter 70, AAA Commands** and **Chapter 68, Authentication Commands** for command information to edit this configuration.

Local RADIUS Server has been configured to use Web-authentication in this sample configuration. See the **radius-server local** and **server enable** commands in **Chapter 76, Local RADIUS Server Commands** for command information to edit this sample configuration.

The above sample Web-authentication configuration requires the user name 'guest' with password 'guest!' on IP address 192.168.1.120 from interface port1.1.1.

Sample Tri-Authentication Configuration

See the below sample configuration script for a sample tri-authentication configuration that configures 802.1X authentication, MAC authentication, and Web-authentication on the same interface. Copy, paste, and edit the sample tri-authentication configuration for your config file. See the [edit](#) command in the [Chapter 7, File Management Commands](#) for further information.

Output

Figure 69-4: Sample Tri-Authentication Configuration

```
!
 radius-server host 127.0.0.1 key awplus-local-radius-server
!
 aaa authentication dot1x default group radius
 aaa authentication auth-mac default group radius
 aaa authentication auth-web default group radius
!
 radius-server local
 server enable
 nas 127.0.0.1 key awplus-local-radius-server

!
 no spanning-tree rstp enable
!
 interface port1.1.1
 switchport
 switchport mode access
 dot1x port-control auto
 auth-mac enable
 auth-web enable
!
 interface vlan1
 ip address 192.168.1.120/24
!
```

The 802.1X authentication feature needs the [aaa authentication dot1x](#) command and the [dot1x port-control](#) command configured on an interface. See [Chapter 70, AAA Commands](#) and [Chapter 66, 802.1X Commands](#) for command information to edit this configuration.

The MAC authentication feature needs the [aaa authentication auth-mac](#) and the [auth-mac enable](#) commands configured on an interface. See [Chapter 70, AAA Commands](#) and [Chapter 68, Authentication Commands](#) for command information to edit this configuration.

The Web-authentication feature needs the [aaa authentication auth-web](#) and the [auth-web enable](#) commands configured on an interface. See [Chapter 70, AAA Commands](#) and [Chapter 68, Authentication Commands](#) for command information to edit this configuration.

Local RADIUS Server has been configured to use tri-authentication in this sample configuration. See the [radius-server local](#) and [server enable](#) commands in [Chapter 76, Local RADIUS Server Commands](#) for command information to edit this sample configuration.

This sample tri-authentication configuration requires a user name 'guest' with password 'guest!' on IP address 192.168.1.120 from port1.1.1. Note this sample also configures 802.1X and MAC authentication on vlan1 with IP address 192.168.1.120. Change the interface VLAN ID, MAC and IP address as needed for your configuration.

Note that when tri-authentication is applied to the same interface then the order of execution is MAC authentication first, then 802.1X or Web-authentication, if MAC authentication fails.

Chapter 70: AAA Commands

Command List	70.2
aaa accounting auth-mac default	70.2
aaa accounting auth-web default	70.4

undebug aaa	70.29

Command List

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see [Chapter 69, AAA Introduction and Configuration](#).

aaa accounting auth-mac default

This command configures a default accounting method list for MAC-based Authentication. The default accounting method list specifies what type of accounting messages are sent and specifies which RADIUS Servers the accounting messages are sent to. The default accounting method list is automatically applied to interfaces with MAC-based Authentication enabled.

Use the **no** variant of this command to disable AAA accounting for MAC-based Authentication globally.

Syntax

```
aaa accounting auth-mac default {start-stop|stop-only|none}
    group {<group-name>|radius}

no aaa accounting auth-mac default
```

Parameter	Description
start-stop	Start and stop records to be sent.
stop-only	Stop records to be sent.
none	No accounting record to be sent.
<group-name>	Server group name.
radius	Use all RADIUS servers

Default RADIUS accounting for MAC-based Authentication is disabled by default

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Examples To enable RADIUS accounting for MAC-based Authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

Related Commands [aaa authentication auth-mac](#)

aaa accounting auth-web default

This command configures a default accounting method list for Web-based Port Authentication. The default accounting method list specifies what type of accounting messages are sent and specifies which RADIUS Servers the accounting messages are sent to. The default accounting method list is automatically applied to interfaces with Web-based Authentication enabled.

Use the **no** variant of this command to disable AAA accounting for Web-based Port Authentication globally.

Syntax `aaa accounting auth-web default {start-stop|stop-only|none}
group {<group-name>|radius}`

`no aaa accounting auth-web default`

Parameter	Description
start-stop	Start and stop records to be sent.
stop-only	Stop records to be sent.
none	No accounting record to be sent.
<group-name>	Server group name.
radius	Use all RADIUS servers.

Default RADIUS accounting for WEB-based Port Authentication is disabled by default.

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <group-name>** : use the specified RADIUS server group configured with the **aaa group server** command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Examples To enable RADIUS accounting for Web-based Authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable RADIUS accounting for Web-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

Related Commands [aaa authentication auth-web](#)

aaa accounting commands

Use this command to configure and enable TACACS+ command accounting. When command accounting is enabled, information about a command entered at a specified privilege level on a device is sent to a TACACS+ server. To account for all commands entered on a device you need to configure command accounting for each discrete privilege level. A command accounting record includes the command as entered for the specified privilege level, the date and time each command execution finished, and the username of the user who executed the command.

This command creates a default method list that is applied to every console and vty line. The **stop-only** parameter indicates that an accounting message is sent to the TACACS+ server when a command has stopped executing.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured and only the first reachable server is used. If no server is found the accounting message is dropped.

Use the **no** variant of this command to disable command accounting.

Syntax `aaa accounting commands <1-15> default stop-only group tacacs+`
`no aaa accounting commands <1-15> default`

Parameter	Description
<1-15>	The privilege level, in the range 1 to 15.

Default TACACS+ command accounting is disabled by default.

Mode Global Configuration

Usage When command accounting is enabled, the command as entered is included in the accounting packets sent to the TACACS+ accounting server.

You cannot enable command accounting if a trigger is configured. An error message is displayed if you attempt to enable command accounting and a trigger is configured.

The **show tech-support** command runs a number of commands and each command is accounted separately.

When the **copy <filename> running-config** command is executed all the commands of a configuration file copied into the running-config are accounted separately.

Examples To configure command accounting for privilege level 15 commands, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege level 15 commands, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 15 default
```

Related Commands **aaa authentication login**
 aaa accounting login
 accounting login
 tacacs-server host

aaa accounting dot1x

This command configures the default accounting method list for IEEE 802.1x-based Authentication. The default accounting method list specifies what type of accounting messages are sent and specifies which RADIUS Servers the accounting messages are sent to. The default accounting method list is automatically applied to interfaces with IEEE 802.1x-based Authentication enabled.

Use the **no** variant of this command to disable AAA accounting for 802.1x-based Port Authentication globally.

Syntax

```
aaa accounting dot1x default {start-stop|stop-only|none}
    group {<group-name>|radius}

no aaa accounting dot1x default
```

Parameter	Description
start-stop	Start and stop records to be sent.
stop-only	Stop records to be sent.
none	No accounting record to be sent.
<group-name>	Server group name.
radius	Use all RADIUS servers.

Default RADIUS accounting for 802.1X-based Port Authentication is disabled by default. (There is no default server set by default).

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <group-name>** : use the specified RADIUS server group configured with the **aaa group server** command

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Example To enable RADIUS accounting for 802.1x-based Authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group
radius
```

To disable RADIUS accounting for 802.1x-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

- [radius-server host](#)

aaa accounting login

This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and vty line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e is unreachable.

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or vty line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

Syntax

```
aaa accounting login {default|<list-name>}
    {start-stop|stop-only|none} {group {radius|tacacs+|<group-name>}}
```

```
no aaa accounting login {default|<list-name>}
```

Parameter	Description
default	Default accounting method list.
<list-name>	Named accounting method list.
start-stop	Start and stop records to be sent.
stop-only	Stop records to be sent.
none	No accounting record to be sent.
group	Specify the servers or server group where accounting packets are sent.
radius	Use all RADIUS servers configured by the radius-server host command on page 72.6.
tacacs+	Use all TACACS+ servers configured by the tacacs-server host command.
<group-name>	Use the specified RADIUS server group, as configured by the aaa group server command.

Default Accounting for login shell sessions is disabled by default.

Mode Global Configuration

Usage This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name `default` and any number of other named method lists. The `<list-name>` for any method list that you define can then be used as the `<list-name>` parameter in the **accounting login** command available from Line Configuration mode.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <group-name>** : use the specified RADIUS server group configured with the **aaa group server** command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by **tacacs-server host** command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Examples To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group
tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting login default
```

Related Commands

- aaa accounting commands**
- aaa authentication login**
- aaa accounting login**
- aaa accounting update**
- accounting login**
- radius-server host**
- tacacs-server host**

aaa accounting update

This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

Syntax `aaa accounting update [periodic <1-65535>]`
`no aaa accounting update`

Parameter	Description
<code>periodic</code>	Send accounting records periodically.
<code><1-65535></code>	The interval to send accounting updates (in minutes). The default is 30 minutes.

Default Periodic accounting update is disabled by default.

Mode Global Configuration

Usage Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting report is enabled, interim accounting records are sent according to the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is reenabled, unless this interval is specified.

Example To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting update wherever accounting has been configured, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting update
```

Related Commands [aaa accounting auth-mac default](#)
[aaa accounting auth-web default](#)
[aaa accounting dot1x](#)
[aaa accounting login](#)

aaa authentication auth-mac

This command enables MAC-based Port Authentication globally and allows you to specify an authentication method list. It is automatically applied to every interface running MAC-based Port Authentication.

Use the **no** variant of this command to globally disable MAC-based Port Authentication.

Syntax `aaa authentication auth-mac default group {<group-name>|radius}`
`no aaa authentication auth-mac default`

Parameter	Description
<code><group-name></code>	Server group name.
<code>radius</code>	Use all RADIUS servers.

Default MAC-based Port Authentication is disabled by default.

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by [radius-server host](#) command
- **group <group-name>** : use the specified RADIUS server group configured with the [aaa group server](#) command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group `<group-name>`, it also remains a member of the group **radius**.

Example To enable MAC-based Port Authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group
radius
```

To disable MAC-based Port Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

Related Commands [aaa accounting auth-mac default](#)
[auth-mac enable](#)

aaa authentication auth-web

This command enables Web-based Port Authentication globally and allows you to enable an authentication method list (in this case, a list of RADIUS Servers). It is automatically applied to every interface running Web-based Port Authentication.

Use the **no** variant of this command to globally disable Web-based Port Authentication.

Syntax `aaa authentication auth-web default group {<group-name>|radius}`
`no aaa authentication auth-web default`

Parameter	Description
<code><group-name></code>	Server group name.
<code>radius</code>	Use all RADIUS servers.

Default Web-based Port Authentication is disabled by default.

Mode Global Configuration

Usage There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <group-name>** : use the specified RADIUS server group configured with the **aaa group server** command

Example To enable Web-based Port Authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group
radius
```

To disable Web-based Port Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

Related Commands **aaa accounting auth-web default**
auth-mac enable

aaa authentication dot1x

This command enables 802.1X-based Port Authentication globally and allows you to enable an authentication method list. It is automatically applied to every interface running 802.1X-based Port Authentication.

Use the **no** variant of this command to globally disable 802.1X-based Port Authentication.

Syntax `aaa authentication dot1x default group {<group-name>|radius}`
`no aaa authentication dot1x default`

Parameter	Description
<code>radius</code>	Use all RADIUS servers.
<code><group-name></code>	Server group name.

Default 802.1x-based Port Authentication is disabled by default.

Mode Global Configuration

Usage Use this command to specify the default method list to use for authentication on all switch ports with 802.1X enabled. Use the **no** variant of this command to reset the default authentication method list for 802.1X, to its default, that is, to use the group **radius**, containing all RADIUS servers configured by the **radius-server host** command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by **radius-server host** command
- **group <group-name>** : use the specified RADIUS server group configured with the **aaa group server** command

Example To enable 802.1X-based Port Authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based Port Authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

[dot1x port-control](#)
[radius-server host](#)

aaa authentication enable default group tacacs+

This command enables AAA authentication to determine the privilege level a user can access for passwords authenticated against the TACACS+ server.

Use the **no** variant of this command to disable privilege level authentication.

Syntax `aaa authentication enable default group tacacs+ [local] [none]`
`no aaa authentication enable default`

Parameter	Description
local	Use the locally configured enable password (enable password command) for authentication.
none	No authentication.

Default Local privilege level authentication is enabled by default (**aaa authentication enable default local** command).

Mode Global Configuration

Usage A user is configured on a TACACS+ server with a maximum privilege level. When they enter the **enable (Privileged Exec mode)** command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

Note If both **local** and **none** are specified, you must always specify **local** first.

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**
then the user is never granted access to Privileged Exec mode.
- **aaa authentication enable default group tacacs+ local**
then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.
- **aaa authentication enable default group tacacs+ none**
then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.
- **aaa authentication enable default group tacacs+ local none**
then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

Example To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

Related Commands

- aaa authentication login**
- aaa authentication enable default local enable (Privileged Exec mode)**
- enable password**
- enable secret**
- tacacs-server host**

aaa authentication enable default local

This command enables AAA authentication to determine the privilege level a user can access for passwords authenticated locally.

Syntax `aaa authentication enable default local`

Default Local privilege level authentication is enabled by default.

Mode Global Configuration

Usage The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an **enable (Privileged Exec mode)** command.

Example To enable local privilege level authentication command, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

Related Commands [aaa authentication enable default group tacacs+](#)

aaa authentication login

Use this command to create an ordered list of methods to use to authenticate user login, or to replace an existing method list with the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the **login authentication** command. To apply a non-default method list, you must also use the **login authentication** command.

Use the **no** variant of this command to remove an authentication method list for user login. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

Syntax

```
aaa authentication login {default|<list-name>}
    {[local] [group {radius|tacacs+|<group-name>}]}
no aaa authentication login {default|<list-name>}
```

Parameter	Description
default	Set the default authentication server for user login.
<list-name>	Name of authentication server.
local	Use the local username database.
group	Use server group.
radius	Use all RADIUS servers configured by the radius-server host command on page 72.6.
tacacs+	Use all TACACS+ servers configured by the tacacs-server host command.
<group-name>	Use the specified RADIUS server group, as configured by the aaa group server command.

Default If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

local is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. Reset to the default method list using the **no aaa authentication login default** command.

Mode Global Configuration

Usage When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies group tacacs+ local, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers not the local user database; the user login fails.

Examples To configure the default authentication method list for user login to use first all available RADIUS servers for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure a user login authentication method list called USERS to use first the RADIUS server group RAD_GROUP1 for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group
RAD_GROUP1 local
```

To configure a user login authentication method list called USERS to use first the TACACS+ servers for user login authentication and then the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list USERS created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

Related Commands [aaa accounting commands](#)

aaa group server

This command configures a RADIUS server group. A server group can be used to specify a subset of RADIUS servers in **aaa** commands. The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command.

RADIUS servers are added to a server group using the **server** command. Each RADIUS server should be configured using the **radius-server host** command.

Use the **no** variant of this command to remove an existing RADIUS server group.

Syntax

```
aaa group server radius <group-name>
no aaa group server radius <group-name>
```

Parameter	Description
<group-name>	Server group name.

Mode Global Configuration

Usage Use this command to create an AAA group of RADIUS servers, and to enter Server Group Configuration mode, in which you can add servers to the group. Use a server group to specify a subset of RADIUS servers in AAA commands. Each RADIUS server must be configured by the **radius-server host** command. To add RADIUS servers to a server group, use the **server** command.

Example To create a RADIUS server group named GROUP1 with hosts 192.168.1.1, 192.168.2.1 and 192.168.3.1, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-
port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-
port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-
port 1813
```

To remove a RADIUS server group named GROUP1 from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

aaa local authentication attempts lockout-time

This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

Syntax `aaa local authentication attempts lockout-time <lockout-time>`
`no aaa local authentication attempts lockout-time`

Parameter	Description
<code><lockout-time></code>	<code><0-10000></code> . Time in seconds to lockout the user.

Mode Global Configuration

Default The default for the lockout-time is 300 seconds (5 minutes).

Usage While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the **clear aaa local user lockout** command.

Example To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

Related Commands [aaa local authentication attempts max-fail](#)

aaa local authentication attempts max-fail

This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (5 failed login attempts).

Syntax `aaa local authentication attempts max-fail <failed-logins>`
`no aaa local authentication attempts max-fail`

Parameter	Description
<code><failed-logins></code>	<code><1-32></code> . Number of login failures allowed before locking out a user.

Mode Global Configuration

Default The default for the maximum number of failed login attempts is 5 failed login attempts.

Usage When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the **aaa local authentication attempts lockout-time** command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

Example To configure the number of login failures that will lock out a user account to 2 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (5 login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

Related Commands **aaa local authentication attempts lockout-time**
clear aaa local user lockout

accounting login

This command applies a login accounting method list to console or vty lines for user login. When login accounting is enabled using this command, then logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA (Authentication, Authorization, Accounting) Accounting applied to console or vty lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

Syntax `accounting login {default|<list-name>}`
`no accounting login`

Parameter	Description
default	Default accounting method list.
<list-name>	Named accounting method list.

Default By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command beforehand.

Mode Line Configuration

Example To apply the accounting server `USERS` to all vty lines use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

To reset accounting for login sessions on the console, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no accounting login
```

Related Commands [aaa accounting commands](#)
[aaa accounting login](#)

clear aaa local user logout

Use this command to clear the lockout on a specific user account or all user accounts.

Syntax `clear aaa local user logout {username <username>|all}`

Parameter	Description
username	Clear lockout for the specified user.
<username>	Specifies the user account.
all	Clear lockout for all user accounts.

Mode Privileged Exec

Examples To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user logout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user logout all
```

Related Commands [aaa local authentication attempts lockout-time](#)

debug aaa

This command enables AAA debugging.

Use the **no** variant of this command to disable AAA debugging.

Syntax `debug aaa [accounting|all|authentication|authorization]`
`no debug aaa [accounting|all|authentication|authorization]`

Parameter	Description
accounting	Accounting debugging.
all	All debugging options are enabled.
authentication	Authentication debugging.
authorization	Authorization debugging.

Default AAA debugging is disabled by default.

Mode Privileged Exec

Example To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

Related Commands [show debugging aaa](#)
[undebug aaa](#)

login authentication

Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

Command Syntax `login authentication {default|<list-name>}`
`no login authentication`

Parameter	Description
<code>default</code>	The default authentication method list. If the default method list has not been configured by the aaa authentication login command, the local user database is used for user login authentication.
<code><list-name></code>	Named authentication server.

Default The default login authentication method list, as specified by the **aaa authentication login** command, is used to authenticate user login. (If this has not been specified, the default is to use the local user database.)

Mode Line Configuration

Examples To apply the authentication method list called `CONSOLE` to the console port terminal line (asyn 0), use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication CONSOLE
```

To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

Related Commands [aaa authentication login](#)
[line](#)

show debugging aaa

This command displays the current debugging status for AAA (Authentication, Authorization, Accounting).

Syntax `show debugging aaa`

Mode User Exec and Privileged Exec

Example To display the current debugging status of AAA, use the command:

```
awplus# show debug aaa
```

Output **Figure 70-1: Example output from the show debug aaa command**

```
AAA debugging status:
  Authentication debugging is on
  Accounting debugging is off
```

undebug aaa

This command applies the functionality of the [no debug aaa](#) command on page 70.26.

RADIUS Server Configuration using Server Groups	71.18

Introduction

The main purpose of RADIUS (Remote Authentication Dial In User Service) is to enable the authentication of network users stored in a database on a server known as a RADIUS Server.

When users connect to the network, the switch the users connect to can challenge the users for authentication, and pass on the authentication to the RADIUS server to check. Based on the result of the check against the database, the RADIUS Server informs the switch whether or not to allow the connected user access to the network.

A RADIUS Server can do more than allow or deny access to the network. A RADIUS Server can send back parameters to the connected users, such as an IP address for the user, or a VLAN for the user, or a privilege level for a session. RADIUS also provides an accounting service. Switches can inform the RADIUS Server how long a user has been connected to the network, and how much traffic the user has sent and received while connected to the network.

The original use for RADIUS was for the authentication of users dialing into an ISP (Internet Service Provider). A PPP (Point-to-Point Protocol) connection would be established between the remote client and the ISP's access switch. The ISP's access switch would receive the client's username and password using PAP (Password Authentication Protocol) or using CHAP (Challenge Handshake Authentication Protocol) and pass on the client's username and password to the RADIUS server to authenticate the client. The RADIUS Server's response to the authentication request would be sent back to the client as a PAP or CHAP allow or deny.

RADIUS has been adapted to network access authentication applications. Network access authentication using RADIUS follows a similar method to the PPP dial-up application for ISPs. For general network access authentication there is the RADIUS Server where the database of user authentication data is stored and a NAS (Network Access Server), which is the switch that user connects to first. The RADIUS Server and the NAS communicate with each other through exchanging attributes. Usernames and passwords are treated as attributes in RADIUS packets to and from a RADIUS Server and a NAS. The RADIUS Server is configured with a list of valid NASs that are allowed to send authentication requests to the RADIUS Server.

The RADIUS Server will not accept authentication requests from a NAS that is not on the list of valid NASs. Each NAS has a shared secret, which is a shared key with the RADIUS Server that is used to authenticate requests. The RADIUS Server has access to a list of user authentication data, stored within the RADIUS Server or accessed from another server.

Communication between the NAS and RADIUS Server uses the RADIUS protocol. The RADIUS protocol uses UDP packets. There are two UDP ports used as the destination port for RADIUS authentication packets (ports 1645 and 1812). Note that port 1812 is in more common use than port 1645 for authentication packets. UDP ports (ports 1646 and 1813) are used for RADIUS accounting separately from the ports used for RADIUS authentication.

Figure 71-1: Example showing a User to a NAS to a RADIUS Server network connection

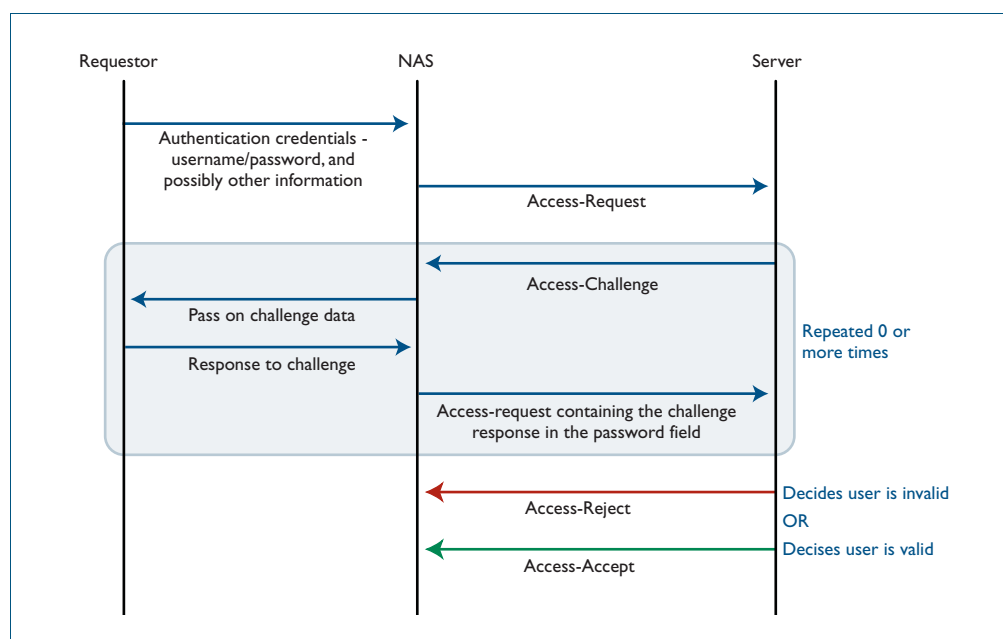

RADIUS Packets

The RADIUS RFCs define the RADIUS packet types and attributes. RADIUS authentication is defined by RFC2058, RFC2138, RFC2865, and RFC2868. RADIUS accounting is defined by RFC2059, RFC2139, RFC2866, and RFC2867. These RADIUS RFCs define over fifty attributes and six packet types (*Access-Request*, *Access-Accept*, *Access-Reject*, *Accounting-Request*, *Accounting-Response*, *Access-Challenge*).

A RADIUS exchange is initiated by the NAS when a user requests access to the NAS. The NAS obtains the user authentication data and adds them into a RADIUS *Access-Request* packet type and sends the RADIUS *Access-Request* packet to the RADIUS Server.

- If a RADIUS Server has not been configured for authentication request from a NAS then it will silently discard an *Access-Request* packet from it.
- If the RADIUS Server accepts the request from the NAS it considers the authentication data provided in the *Access-Request* packet. The RADIUS Server may verify the user from its own database or it may connect to other servers to verify.
- If the RADIUS Server decides that the user is not allowed access to the NAS it responds to the NAS with an *Access-Reject* packet and the NAS will block the user.
- If the RADIUS Server decides that the user is valid but needs more information to verify that the user is not an imposter, it may send an *Access-Challenge* packet to the NAS that the NAS forwards to the user. The NAS forwards the user response to the *Access-Challenge* packet in an *Access-Request* packet to the RADIUS Server to accept or reject to allow or deny NAS user access.
- If the RADIUS Server rejects the user it sends an *Access-Reject* packet to the NAS.
- If the RADIUS Server accepts the user it sends an *Access-Accept* packet to the NAS. The *Access-Accept* packet to the NAS contains attributes that the NAS can apply.

Figure 71-2: Example showing an exchange from a Requestor to a NAS to a RADIUS Server

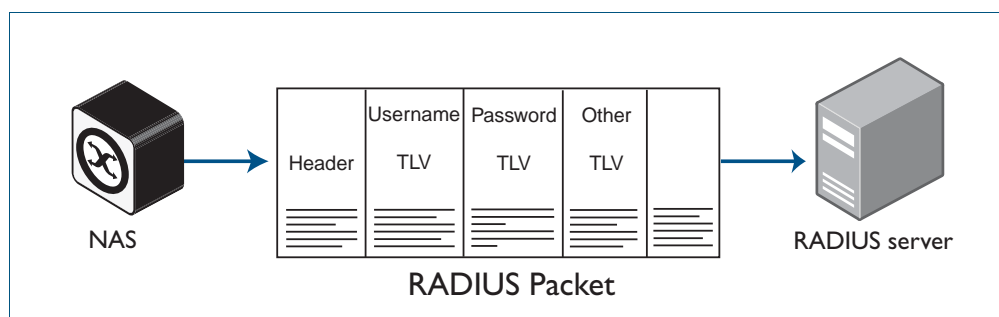

RADIUS Attributes

Each attribute is identified by its RFC-defined name, followed by its attribute ID in parenthesis.

- **User-name(1)**
 User-names are strings of at least three characters and have a maximum of 253 characters, which is the upper limit on all RADIUS attributes.
- **User-password(2)**
 User-passwords are encrypted using an MD5 hash of the password, the NAS's shared secret with the RADIUS Server, and a request authenticator value. User-passwords can either be used at the initial authentication attempt or in response to an Access-Challenge packet type from the RADIUS Server to the NAS.
- **CHAP-password(3)**
 CHAP-passwords are used if the NAS is using CHAP to authenticate the user, and doesn't receive the use the user's password but sends the CHAP response to the RADIUS Server instead. The CHAP password is an encrypted string that is an MD5 hash of the password and challenge value sent by the user.
- **Framed-IP-Address(8)**
 Used for dial-in user making PPP connections to the NAS who are dynamically allocated an IP address that they can use for the duration of their connect. The RADIUS Server sends the Framed-IP-Address to the NAS to allocate.
- **Service-Type(6)**
 Used when the NAS is authenticating a user who wants to open a management session on the NAS, and is sent by the RADIUS Server back to the NAS in an Access-Accept type packet to indicate the level of access the NAS gives a user. Service-Type(6) is mapped to a Privileged management session for AlliedWare Plus.
- **NAS-Port-Type(61)**
 Identifies the type of port on which the user is accessing the NAS. The NAS-Port-Type(61) attribute is sent by the NAS to the RADIUS Server in Access-Request type packet, so the RADIUS Server may use it to choose access type. For 802.1X sessions, the NAS-Port-Type sent by the NAS is Ethernet (15).
- **802.1X VLAN assignment uses:**
 Tunnel-Type(64), Tunnel-Medium-Type(65), Tunnel-Private-Group-ID(81), Egress-VLANID(56), and Egress-VLAN-Name(58) attributes (specified in RFC4675 used to specify 802.1Q tagged and untagged VLAN assignments with LLDP-MED/Voice-VLAN).

Attributes are carried within RADIUS packets in the form of TLVs (Type Length Values). Every attribute has an attribute ID number in the Type field of the TLV. The Length field holds a one-byte number that represents then length of the TLV. The Value field holds the value of the attribute.

Figure 71-3: Example showing TLVs in a RADIUS Packet from a NAS to a RADIUS Server

RADIUS Security

RADIUS is used for network security and carries user authentication information, so can be a target for security attacks. To counter threats there are three elements to RADIUS security:

- **Shared secret**
- **Authenticator**
- **Password Encryption**

Shared Secret

Every NAS and server are configured with a pre-shared key, called the “shared secret”, which is a key string, with no particular format of at least 16 characters.

The protocol has no method for choosing and sharing the secret between the NAS and the server. The secret must be manually generated and separately configured on the NAS and on the server.

The shared secret itself never appears in any RADIUS packets. It is used as an input to the algorithms used for creating encrypted values that are carried in the packets.

Authenticator

The authenticator is a random 16-byte value generated by the NAS. The NAS creates a new authenticator value for each `Access-Request` that it sends.

The response packets that come back from the server contain a value called the Response Authenticator. This is a value that is created by performing an MD5 hash on a string that is created by concatenating the packet type identifier, Session ID, Authenticator sent in the request packet, Attribute fields in the packet, Shared secret that the server shares with the NAS to which it is responding.

When the NAS receives the response packet, it performs the same hash on the same values, and verifies that it comes up with the same result. If not, then it must assume that the response packet has been spoofed, and silently discards it.

Password Encryption

The value placed in the user-password TLV of an `Access-Request` packet is not simply an exact copy of the password sent from the requestor to the NAS.

The NAS concatenates together the shared secret and the authenticator that it has randomly generated for this request and then performs manipulations (MD5, XOR) on that concatenation, and the password to create the value to go into password TLV.

When the server validates the `Access-Request`, it retrieves the user’s password from the user credentials database, and performs the same manipulation upon that password. If the result matches the value in the user-password field of the `Access-Request`, then the password sent by the requestor is deemed to be correct.

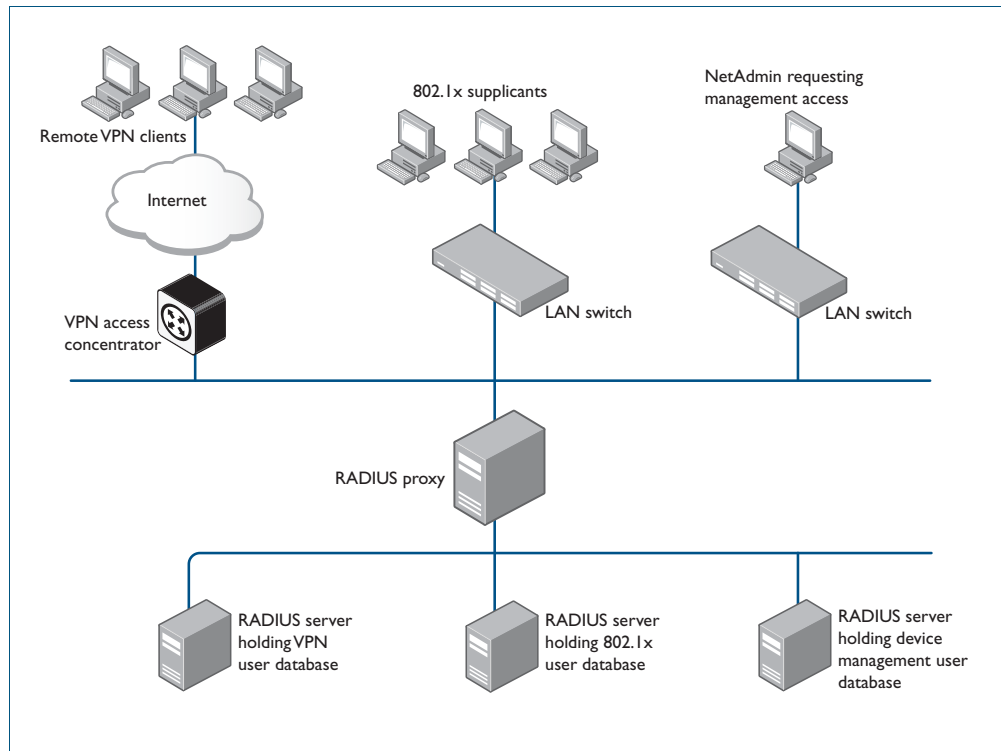

RADIUS Proxy

The user database, which user credentials sent to a RADIUS server are looked up in, may not reside on the RADIUS server itself. The external user database may reside on another RADIUS server, and the communication to that server uses RADIUS. In the case where a RADIUS server communicates with a NAS, but also acts as a client to another RADIUS server, is said to be acting as a RADIUS proxy.

There are a variety of situations where RADIUS proxy is useful. Multiple RADIUS servers could have been set up, holding user databases for different purposes such as Authentication, Switch management sessions, Authenticating VPN connections, and Authenticating 802.1X sessions.

But it is convenient for there to be just one address that all the NASs in the network use as their RADIUS server. That one RADIUS server that the NASs send their requests to, can act as a proxy for all the servers holding the different user databases.

Figure 71-4: Example showing RADIUS Proxy

RADIUS Accounting

There are only two types of RADIUS accounting packet: `Accounting-Request` and `Accounting-Response`.

The `Accounting-Request` packets are always sent from the NAS to the server. The `Accounting-Response` packets are always sent from the server to the NAS, and are effectively ACKs of the `Accounting-Request` packets.

The `Accounting-Request` packets always carry the attribute `Acct-Status-Type`. The most commonly used values of this attribute are:

- **Start** – which denotes a packet marking that a session is beginning
- **Stop** – which denotes a packet marking that a session is ending
- **Interim update** – packets sent periodically during the session to give update reports on the statistics that are being collected.

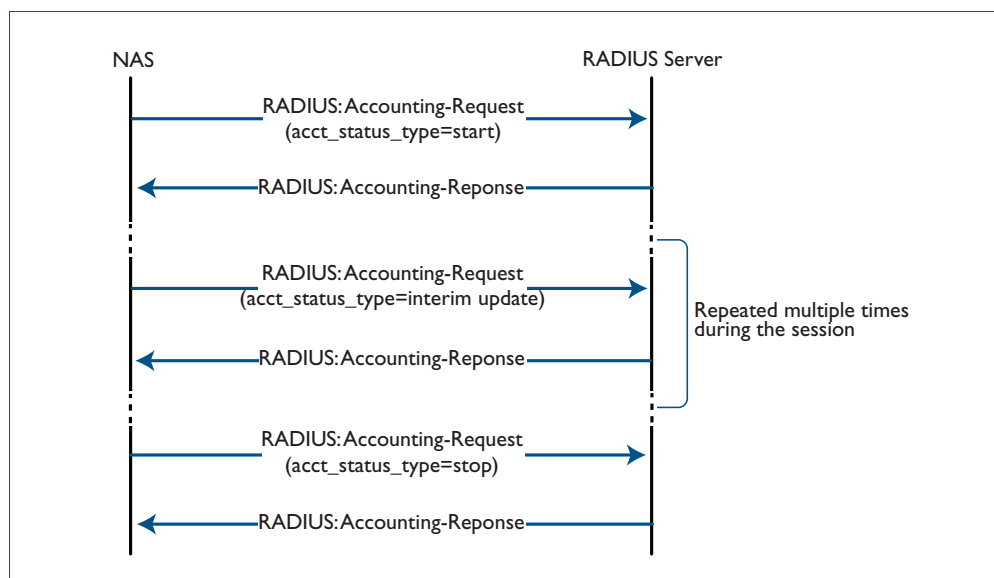

The statistics that can be exchanged in the session are:

- **Input Octets**
- **Input Packets**
- **Output Octets**
- **Output Packets**
- **Session Duration**

There is no requirement to exchange all these statistics – NAS implementations are at liberty to choose which statistics they will send. Each of these statistics has a corresponding attribute type. The attributes are sent in Interim-Update and Stop accounting request packets.

Each accounting session has a unique session ID, which is chosen by the NAS. The session ID is carried in an `Acct-Session-Id` attribute, that should be present in every packet involved in the session. The accounting packets typically do not use the same UDP port as the authentication packets. The default port for RADIUS accounting is 1813.

Figure 71-5: Example showing RADIUS Accounting between a NAS and a RADIUS Server

RADIUS Configuration

This section describes how to configure RADIUS with the available AAA commands. For a description of AAA commands, refer to the [AAA Commands](#) chapter. For a description of the RADIUS commands used, refer to the [RADIUS Commands](#) chapter.

RADIUS is often used in a variety of networks that need high security while maintaining access for remote users. RADIUS is suitable for the following networks that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database.
- Networks in which a user may access a single service. Using RADIUS, you can control user access to a single host, or to a single utility such as Telnet.
- Networks that require accounting. You can use RADIUS accounting independent of RADIUS authentication. The RADIUS accounting functions allow data to be sent at the start and end of services, indicating the amount of resources (time, packets, bytes) used.

Switch Configuration Tasks

To configure RADIUS on your switch or access server, you must perform the following tasks:

- Use the **aaa authentication** command to define method lists for RADIUS authentication. For information about this command, refer to the [AAA Commands](#) chapter.
- Use authentication commands to enable the defined method lists to be used. For more information, refer to the [Authentication Commands](#) chapter.

The following configuration tasks are optional:

- You can use the **aaa group server** command to group selected RADIUS hosts for specific services. For detailed information about this command, refer to the [AAA Server Groups Configuration](#) section in this chapter and refer to the [AAA Commands](#) chapter.
- You can use the **aaa accounting login** command to enable accounting for RADIUS connections. For information about this command, refer to the [AAA Commands](#) chapter.

This section describes how to set up RADIUS for authentication and accounting on your network, and includes the following sections:

- Switch to RADIUS Server Communication (Required)
- Configuring AAA Server Groups (Optional)
- Configuring AAA Server Groups with Deadtime (Optional)
- Specifying RADIUS Authentication
- Specifying RADIUS Accounting (Optional)

For RADIUS configuration examples using the commands in this chapter, refer to the section [RADIUS Configuration Examples](#) at the end of this chapter.

Switch to RADIUS Server Communication

The RADIUS host is normally a multiuser system running RADIUS server software from a software provider. Switch to RADIUS server communication has several components:

- Host name or IP address
- Authentication destination port
- Accounting destination port
- Timeout period
- Retransmission value
- Key string

RADIUS security servers are identified on the basis of their host name or IP address, host name and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

A RADIUS server and a switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS using the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text string that it shares with the switch, which you can specify using the **key** parameter in the **radius-server host** command.

The timeout, retransmission, and encryption key values are configurable globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings. To apply these settings globally to all RADIUS servers communicating with the switch, use the three global commands: **radius-server timeout**, **radius-server retransmit**, and **radius-server key**. To apply these values on a specific RADIUS server, use the **radius-server host** command.

Note  You can configure both global and per-server timeout, retransmission, and key value commands simultaneously on the same Network Access Server.

If both global and per-server functions are configured on a switch, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands.

To configure per-server RADIUS server communication, use the following command in the Global Configuration mode:

Mode and Command	Command Purpose
<pre>awplus(config)# radius-server host {<hostname> <ip-address>} [auth-port <port-number>] [acct-port <port-number>] [timeout <seconds>] [retransmit <retries>] [key <string>]</pre>	<p>Specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.</p> <p>Use the <code>auth-port <port-number></code> option to configure a specific UDP port on this RADIUS server to be used solely for authentication.</p> <p>Use the <code>acct-port <port-number></code> option to configure a specific UDP port on this RADIUS server to be used solely for accounting.</p> <p>To configure the network access server to recognize more than one host entry associated with a single IP address, simply repeat this command as many times as necessary, making sure that each UDP port number is different.</p> <p>Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host. If no timeout is set, the global value is used; otherwise, enter a value in the range 1 to 1000.</p> <p>If no retransmit value is set, the global value is used; otherwise enter a value in the range 1 to 1000. If no key string is specified, the global value is used.</p>

To configure global communication settings between the switch and a RADIUS server, use the following **radius-server** commands in the Global Configuration mode:

Mode and Command	Command Purpose
<pre>awplus(config)# radius-server key <key></pre>	<p>Specifies the shared secret text string used between the switch and a RADIUS server (no default is set).</p>
<pre>awplus(config)# radius-server retransmit <retries></pre>	<p>Specifies how many times the switch transmits each RADIUS request to the RADIUS server before giving up (the default is 3).</p>
<pre>awplus(config)# radius-server timeout <seconds></pre>	<p>Specifies for how many seconds a switch waits for a reply to a RADIUS request before retransmitting the request.</p>
<pre>awplus(config)# radius-server deadtime <minutes></pre>	<p>Specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.</p>

AAA Server Groups Configuration

Configuring the switch to use AAA server groups provides a way to group existing server hosts. This allows you to select a subset of the configured server hosts and use them for a particular service. A server group is used in conjunction with a global server-host list. The server group lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server, as long as each entry has a unique identifier. The combination of an IP address and a UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service.

To define a server host with a server group name, enter the following commands in the Global Configuration mode. The listed RADIUS server must exist in the Global Configuration mode:

Mode and Command	Command Purpose
<pre>awplus(config)# radius-server host {<hostname> <ip-address>} [auth-port <port-number>] [acct-port <port-number>] [timeout <seconds>] [retransmit <retries>] [key <string>]</pre>	<p>Specifies and defines the IP address of the server host before configuring the AAA server-group. Refer to the section Switch to RADIUS Server Communication of this chapter for more information on the radius-server host command.</p>
<pre>awplus(config-if)# aaa group server <group-name></pre>	<p>Defines the AAA server group with a group name. This command puts the switch in server group sub configuration mode.</p>
<pre>awplus(config-sg)# server {<hostname> <ip-address>} [auth-port <port-number>] [acct-port <port-number>]</pre>	<p>Associates a particular RADIUS server with the defined server group. Each security server is identified by its IP address and UDP port number. Repeat this step for each RADIUS server in the AAA server group. Each server in the group must be defined previously using the radius-server host command.</p>

Configuring AAA Server Groups with Deadtime

After you have configured a server host with a server name, you can use the **deadtime (RADIUS server group)** command to configure each server per server group. Configuring deadtime within a server group allows you to direct AAA traffic to separate groups of servers that have different operational characteristics.

Configuring **deadtime** is no longer limited to a global configuration. A separate timer has been attached to each server host in every server group. When a server is found to be unresponsive after numerous retransmissions and time-outs, the server is assumed to be dead. The timers attached to each server host in all server groups are triggered. In essence, the timers are checked and subsequent requests to a server, once it is assumed to be dead, are directed to alternate servers, if configured. When the network access server receives a reply from the server, it checks and stops all configured timers, if running, for that server in all server groups.

If the timer has expired, only the server to which the timer is attached is assumed to be alive. This becomes the only server that can be tried for later AAA requests using the server groups to which the timer belongs.

 **Note** Since one server has different timers and may have different deadtime values configured in the server groups, the same server may in the future have different states, dead and alive, at the same time. To change the state of a server, you must start and stop all configured timers in all server groups.

The size of the server group will be increased because of the addition of new timers and the deadtime attribute. The overall impact of the structure depends on the number and size of the server groups and how the servers are shared among server groups in a specific configuration.

To configure deadtime within a server group, use the following commands beginning in the Global Configuration mode:

Mode and Command	Command Purpose
<code>awplus(config)# aaa group server radius group1</code>	Defines a RADIUS type server group.
<code>awplus(config-sg)# deadtime 1</code>	Configures and defines a deadtime value in minutes.
<code>awplus(config-sg)# exit</code>	Exits server group configuration mode.

Specifying RADIUS Authentication

After you have identified the RADIUS server and defined the RADIUS authentication key, you must define method lists for RADIUS authentication. Because RADIUS authentication is facilitated through AAA, you must enter the **aaa authentication login** command, specifying RADIUS as the authentication method. For detailed **aaa authentication login** command information, refer to the **AAA Commands** chapter.

Specifying RADIUS Accounting

The AAA accounting feature enables you to track the services users are accessing as well as the amount of network resources they are consuming. Because RADIUS accounting is facilitated through AAA, you must issue the **aaa accounting login** command, specifying RADIUS as the accounting method. For detailed **aaa accounting login** command information, refer to the **AAA Commands** chapter.

Monitoring and Maintaining RADIUS

To monitor and maintain RADIUS, use the following commands in Privileged Exec mode:

Mode and Command	Command Purpose
<code>awplus# debug radius</code>	Displays information associated with RADIUS. For detailed debug radius command information, refer to the RADIUS Commands chapter.
<code>awplus# show radius statistics</code>	Displays the RADIUS statistics for accounting and authentication packets. For detailed show radius statistics command information, refer to the RADIUS Commands chapter.

RADIUS Configuration Examples

The following sections provide RADIUS configuration examples:

- RADIUS Authentication
- Single RADIUS Server Configuration
- Multiple RADIUS Server Configuration
- RADIUS Server Group Configuration
- RADIUS Server Configuration using Server Groups

RADIUS Authentication

Example The following example shows how to configure the switch to authenticate using RADIUS:

Figure 71-6: Sample RADIUS Authentication to configure the switch to authenticate users

```
!  
radius-server host 172.10.10.1  
radius-server key radiuspass  
username newuser password newpass  
aaa authentication login admin  
!
```

The lines in this example RADIUS authentication and accounting configuration are defined as follows:

- The **radius-server host** command defines the IP address of the RADIUS server host.
- The **radius-server key** command defines the shared secret text string between the network access server and the RADIUS server host.
- The **aaa authentication login** command defines a method list named **admin** for login authentication.

Example The following example shows how to configure the switch to authenticate logins using RADIUS:

Figure 71-7: Sample RADIUS Authentication to authenticate logins

```
!  
aaa authentication login radius-login group radius  
!
```

This sample RADIUS authentication configuration is defined as follows:

- The **aaa authentication login radius-login group radius** command configures the switch to use RADIUS for authentication at the login prompt.

Example The following example shows how to configure the authentication method to verify a username and password at login. In this example, if a username is entered at the username prompt, that username is used for authentication.

Figure 71-8: Sample RADIUS Authentication to verify a username and password

```
!  
aaa authentication login default group radius  
radius-server host 172.10.10.1 auth-port 1812 acct-port 1813  
!
```

The lines in this sample RADIUS authentication configuration are defined as follows:

- The **aaa authentication login default group radius** command specifies that the username and password are verified by RADIUS.
- The **radius-server host 172.10.10.1 auth-port 1812 acct-port 1813** command specifies the IP address of the RADIUS server host, the UDP destination port for authentication requests, and the UDP destination port for accounting requests.

Single RADIUS Server Configuration

Example The following example shows how to configure server-specific timeout, retransmit, and key values for the RADIUS server with IP address 172.2.2.2:

Figure 71-9: Single RADIUS Server sample configuration

```
!  
radius-server host 172.2.2.2 timeout 5 retransmit 5 key 10  
!
```

Multiple RADIUS Server Configuration

Example The following example shows how to configure two RADIUS servers with specific timeout, retransmit, and key values. The **radius-server retransmit** command changes the global retransmission value to 4 for all RADIUS servers. The **radius-server host** command configures specific timeout, retransmission, and key values for the RADIUS server hosts with IP addresses 172.2.2.2 and 172.1.1.1

Figure 71-10: Multiple RADIUS Server sample configuration

```
!  
! Enable and configure radius authentication and accounting  
! services on the switch:  
!  
aaa authentication login default group radius  
aaa accounting default start-stop group radius  
!  
! Change the retransmission value for all RADIUS servers:  
!  
radius-server retransmit 4  
!  
! Configure per-server specific timeout, retransmission, and  
! key values. Change the default auth-port and acct-port  
! values.  
!  
radius-server host 172.2.2.2 auth-port 1645 acct-port 1646  
timeout 3 retransmit 3 key radkey  
!  
! Configure per-server specific timeout and key values. This  
! server uses the global retransmission value.  
!  
radius-server host 172.1.1.1 timeout 6 key rad123  
!
```

RADIUS Server Group Configuration

Example The following example shows how to create server group `group2` with three RADIUS server members, each with the same IP address but with unique authentication and accounting ports:

Figure 71-11: RADIUS Server Group sample configuration using the same IP address

```
!  
aaa group server radius group2  
  server 172.1.1.1 auth-port 1645 acct-port 1646  
  server 172.1.1.1 auth-port 1812 acct-port 1813  
  server 172.1.1.1 auth-port 2000 acct-port 2001  
!
```

RADIUS Server Configuration using Server Groups

The following example shows how to configure the network access server to recognize two different RADIUS server groups.

One of these groups, `group1`, has two different host entries on the same RADIUS server configured for the same services. The second host entry configured acts as fail over backup to the first one. Each group is individually configured for `deadtime`; `deadtime` for `group1` is one minute, and `deadtime` for `group2` is two minutes.

Figure 71-12: Multiple RADIUS Servers using Server Groups sample configuration

```
!  
! The following command configures default RADIUS parameters:  
!  
aaa authentication login default group group1  
!  
! The following commands define the group1 RADIUS server group  
! and associate servers with it and configures a deadtime of  
! one minute:  
!  
aaa group server radius group1  
  server 172.1.1.1 auth-port 1645 acct-port 1646  
  server 172.2.2.2 auth-port 1812 acct-port 1813  
  deadtime 1  
!  
! The following commands define the group2 RADIUS server group  
! and associate servers with it and configures a deadtime of  
! two minutes:  
!  
aaa group server radius group2  
  server 172.2.2.2 auth-port 1812 acct-port 1813  
  server 172.3.3.3 auth-port 2000 acct-port 2001  
  deadtime 2  
!  
! The following commands configure the RADIUS attributes  
! for each host entry associated with one of the defined  
! server groups:  
!  
radius-server host 172.1.1.1 auth-port 1645 acct-port 1646  
radius-server host 172.2.2.2 auth-port 1812 acct-port 1813  
radius-server host 172.3.3.3 auth-port 2000 acct-port 2001  
!
```

Chapter 72: RADIUS Commands

Command List	72.2
deadtime (RADIUS server group)	72.2
debug radius	72.3
ip radius source-interface.....	72.4
radius-server deadtime	72.5
radius-server host.....	72.6
radius-server key	72.10
radius-server retransmit.....	72.11
radius-server timeout	72.12
server (Server Group).....	72.14
show debugging radius.....	72.16
show radius	72.17
show radius statistics	72.19
undebug radius	72.19

Command List

This chapter provides an alphabetical reference for commands used to configure the device to use RADIUS servers.

deadtime (RADIUS server group)

Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the [radius-server deadtime command on page 72.5](#). The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is “dead”. Note that a RADIUS server is considered “dead” if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

Syntax `deadtime <0-1440>`
`no deadtime`

Parameter	Description
<code><0-1440></code>	Amount of time in minutes.

Default The deadtime is set to 0 minutes by default.

Mode Server Group Configuration

Usage If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked “dead”, and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

Examples To configure the deadtime for 5 minutes for the RADIUS server group “GROUP1”, use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group “GROUP1”, use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

Related Commands [aaa group server](#)
[radius-server deadtime](#)

debug radius

This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

Syntax `debug radius [packet|event|all]`
`no debug radius [packet|event|all]`

Parameter	Description
packet	Debugging for RADIUS packets is enabled or disabled.
event	Debugging for RADIUS events is enabled or disabled.
all	Enable or disable all debugging options.

Default RADIUS debugging is disabled by default.

Mode Privileged Exec

Examples To enable debugging for RADIUS packets, use the command:

```
awplus# debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus# debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

Related Commands [show debugging radius](#)
[undebug radius](#)

ip radius source-interface

This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

Syntax `ip radius source-interface {<interface>|<ip-address>}`
`no ip radius source-interface`

Parameter	Description
<interface>	Interface name.
<ip-address>	IP address in the dotted decimal format A.B.C.D.

Default Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Mode Global Configuration

Examples To configure all outgoing RADIUS packets to use the IP address of the interface “vlan1” for the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip radius source-interface
```

Related Commands [radius-server host](#)
[show radius statistics](#)

radius-server deadtime

Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

Syntax `radius-server deadtime <minutes>`

`no radius-server deadtime`

Parameter	Description
<minutes>	RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours).

Default The default RADIUS deadtime configured on the system is 0 seconds.

Mode Global Configuration

Usage The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the **radius-server retransmit** command or for the server by the **radius-server host** command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

Examples To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

Related Commands **deadtime (RADIUS server group)**
radius-server host
radius-server retransmit
show radius statistics

radius-server host

Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

Syntax

```
radius-server host {<host-name>|<ip-address>} [acct-port <0-65535>]
[auth-port <0-65535>] [key <key-string>] [retransmit <0-100>]
[timeout <1-1000>]

no radius-server host {<host-name>|<ip-address>}
[acct-port <0-65535>] [auth-port <0-65535>]
```

Parameter	Description
<host-name>	Server host name. The DNS name of the RADIUS server host.
<ip-address>	The IP address of the RADIUS server host.
acct-port	Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.
<0-65535>	UDP port number (Accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting.
auth-port	Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.
<0-65535>	UDP port number (Authentication port number is set to 1812 by default) Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.

Parameter(cont.)	Description(cont.)
timeout	Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the radius-server timeout command is used.
<1-1000>	Time in seconds to wait for a server reply (timeout is set to 5 seconds by default) The time interval (in seconds) to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the radius-server timeout command. If no timeout value is specified for this server, the global value is used.
retransmit	Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the radius-server retransmit command is used.
<0-100>	Maximum number of retries (maximum number of retries is set to 3 by default) The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the radius-server retransmit command. If no retransmit value is specified, the global value is used.
key	Set shared secret key with RADIUS servers
<key-string>	Shared key string applied Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used. If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the radius-server key command. If no key value is specified, the global value is used.

Default The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

Mode Global Configuration

Usage Multiple **radius-server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the **auth-port** parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group **radius**, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

Examples To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to **allied** on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key allied
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure **rad1.company.com** for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com
                    acct-port 0
```

To remove the RADIUS server **rad1.company.com** configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
                    acct-port 0
```

To configure **rad2.company.com** for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com
                    auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

Related Commands [aaa group server](#)

[radius-server retransmit](#)
[radius-server timeout](#)
[show radius statistics](#)

radius-server key

This command sets a global secret key for RADIUS authentication on the switch. The shared secret text string is used for RADIUS authentication between the switch and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

Syntax `radius-server key <key>`
`no radius-server key`

Parameter	Description
<code><key></code>	Shared secret among radius server and 802.1X client.

Default The RADIUS server secret key on the system is not set by default (null).

Mode Global Configuration

Usage Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

Examples To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

Related Commands [radius-server host](#)
[show radius statistics](#)

radius-server retransmit

This command sets the retransmit counter to use RADIUS authentication on the switch. This command specifies how many times the switch transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

Syntax `radius-server retransmit <retries>`
`no radius-server retransmit`

Parameter	Description
<retries>	RADIUS server retries in the range <0-100> The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the radius-server host command, this global value is used.

Default The default RADIUS retransmit count on the switch is 3.

Mode Global Configuration

Examples To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

Related Commands [radius-server deadtime](#)
[radius-server host](#)
[show radius statistics](#)

radius-server timeout

Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

Syntax `radius-server timeout <seconds>`

`no radius-server timeout`

Parameter	Description
<seconds>	RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the radius-server retransmit command).

Default The default RADIUS transmit timeout on the system is 5 seconds.

Mode Global Configuration

Examples To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

server (Server Group)

This command adds a RADIUS server to a server group in Server-Group Configuration mode. The RADIUS server should be configured by the [radius-server host](#) command.

The server is appended to the server list of the group and the order of configuration determines the precedence of servers. If the server exists in the server group already, it will be removed before added as a new server.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set `auth-port` to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set `acct-port` to 0. If the accounting port is missing, the default port number is 1812.

Use the **no** variant of this command to remove a RADIUS server from the server group.

Syntax

```
server {<hostname>|<ip-address>}
      [auth-port <0-65535>][acct-port <0-65535>]
no server {<hostname>|<ip-address>}
      [auth-port <0-65535>][acct-port <0-65535>]
```

Parameter	Description
<hostname>	Server host name
<ip-address>	Server IP address The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.
auth-port	Authentication port The auth-port specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set auth-port to 0. If the authentication port is missing, the default port number is 1812.
<0-65535>	UDP port number (default: 1812)
acct-port	Accounting port The acct-port specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set acct-port to 0. If the accounting port is missing, the default port number is 1813.
<0-65535>	UDP port number (default: 1813)

Default The default Authentication port number is 1812 and the default Accounting port number is 1813.

Mode Server Group Configuration

Usage The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

Examples To create a RADIUS server group RAD_AUTH1 for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000
acct-port 0
```

To create a RADIUS server group RAD_ACCT1 for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0
acct-port 1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group **GROUP1**, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

show debugging radius

This command displays the current debugging status for the RADIUS servers.

Syntax `show debugging radius`

Mode User Exec and Privileged Exec

Example To display the current debugging status of RADIUS servers, use the command:

```
awplus# show debugging radius
```

Output **Figure 72-1: Example output from the show debugging radius command**

```
RADIUS debugging status:  
RADIUS event debugging is off  
RADIUS packet debugging is off
```

show radius

This command displays the current RADIUS server configuration and status.

Syntax show radius

Mode User Exec and Privileged Exec

Example To display the current status of RADIUS servers, use the command:

```
awplus# show radius
```

Output **Figure 72-2: Example output from the show radius command showing RADIUS servers**

```
RADIUS Global Configuration
Source Interface : not configured
Secret Key : secret
Timeout : 5 sec
Retransmit Count : 3
Deadtime : 20 min
Server Host : 192.168.1.10
Authentication Port : 1812
Accounting Port : 1813
Secret Key : secret
Timeout : 3 sec
Retransmit Count : 2
Server Host : 192.168.1.11
Authentication Port : 1812
Accounting Port : not configured
Server Name/Auth Acct Auth Acct
IP Address Port Port Status Status
-----
192.168.1.10 1812 1813 Alive Alive
192.168.1.11 1812 N/A Alive N/A
```

Example See the sample output below showing RADIUS client status and RADIUS configuration:

```
awplus# show radius
```

Output **Figure 72-3: Example output from the show radius command showing RADIUS client status**

```
RADIUS global interface name: awplus
Secret key:
Timeout: 5
Retransmit count: 3
Deadtime: 0

Server Address: 150.87.18.89
Auth destination port: 1812
Accounting port: 1813
Secret key: swg
Timeout: 5
Retransmit count: 3
Deadtime: 0show radius local-server group
```

Output Parameter	Meaning	
Source Interface	The interface name or IP address to be used for the source address of all outgoing RADIUS packets.	
Secret Key	A shared secret key to a radius server.	
Timeout	A time interval in seconds.	
Retransmit Count	The number of retry count if a RADIUS server does not response.	
Deadtime	A time interval in minutes to mark a RADIUS server as "dead".	
Interim-Update	A time interval in minutes to send Interim-Update Accounting report.	
Group Deadtime	The deadtime configured for RADIUS servers within a server group.	
Server Host	The RADIUS server hostname or IP address.	
Authentication Port	The destination UDP port for RADIUS authentication requests.	
Accounting Port	The destination UDP port for RADIUS accounting requests.	
Auth Status	The status of the authentication port. The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for.	
	Alive	The server is alive.
	Error	The server is not responding.
	Dead	The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time.
	Unknown	The server is never used or the status is unknown.
Acct Status	The status of the accounting port. The status ("dead", "error", "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.	

show radius statistics

This command shows the RADIUS client statistics for the switch.

Syntax `show radius statistics`

Mode User Exec and Privileged Exec

Example See the sample output below showing RADIUS client statistics and RADIUS configuration:

```
awplus# show radius statistics
```

Output **Figure 72-4: Example output from the show radius statistics command:**

```
RADIUS statistics for Server: 150.87.18.89
Access-Request Tx : 5 - Retransmit : 0
Access-Accept Rx : 1 - Access-Reject Rx : 2
Access-Challenge Rx : 2
Unknown Type : 0 - Bad Authenticator: 0
Malformed Access-Resp: 0 - Wrong Identifier: 0
Bad Attribute : 0 - Packet Dropped : 0
TimeOut : 0 - Dead count : 0
Pending Request: 0
```

undebug radius

This command applies the functionality of the **no debug radius** command on page 72.3.

Chapter 73: TACACS+ Introduction and Configuration

TACACS+ Overview	73.2
The AlliedWare Plus TACACS+ Implementation.....	73.2
Authentication	73.3
Authorization	73.3
Accounting.....	73.4
Configuration	73.5
Configure TACACS+	73.5
TACACS+ Configuration Example.....	73.7

Introduction

This chapter provides information about the AlliedWare Plus implementation of TACACS+ and how to configure it on this switch. For detailed descriptions of the commands used to configure TACACS+, see [Chapter 74, TACACS+ Commands](#). For information about Authentication, Authorization and Accounting (AAA), see [Chapter 69, AAA Introduction and Configuration](#) and [Chapter 70, AAA Commands](#).

TACACS+ Overview

TACACS+ (Terminal Access Controller Access-Control System Plus) provides a method for securely managing multiple network access points from a single management service.

TACACS+ is a TCP-based access control protocol, utilizing TCP port 49, that allows a device to forward a user's username and password to an authentication server to determine whether access can be allowed. In addition to this authentication service, TACACS+ can also provide authorization and accounting services.

One of the features of TACACS+ is the ability to separate authentication, authorization and accounting so that these functions can be provided independently on separate servers. Authentication involves identifying a user, typically by requiring the user to supply a valid username and password before access is granted. Following authentication, the user must gain authorization to perform tasks. For example, after logging into a switch, a user may try to issue configuration commands. The authorization process determines whether the user has the authority to issue these commands. Authorization is always preceded by authentication.

The AlliedWare Plus TACACS+ Implementation

The AlliedWare Plus TACACS+ implementation provides authentication, authorization, and accounting. Note that:

- Authorization cannot be performed independently of the authentication process. There are no authorization commands available.
- Authentication and authorization must be configured on the same server.
- Authorization is only applicable if enable password authentication has not been configured with the **aaa authentication enable default group tacacs+** command.

With the AlliedWare Plus TACACS+ implementation, all traffic that passes between the TACACS+ client and the TACACS+ servers on the network is encrypted. TACACS+ encrypts the entire payload of packets, which means that it encrypts the user's password between the client and the server.

A TACACS+ client is available on your switch. You need a system running TACACS+ server software from a software provider to use the TACACS+ functionality on your switch.

Authentication

The TACACS+ protocol can forward many types of username and password information. The AlliedWare Plus TACACS+ implementation supports username and password login authentication, as well as enable password authentication. This information is encrypted over the network with MD5 (Message Digest 5).

When TACACS+ login authentication is enabled on the switch with the **aaa authentication login** command and at least one TACACS+ server is configured and reachable, all user login authentications are authenticated against the TACACS+ server. No local login or other means of authentication is allowed or accepted by the switch unless the switch has been configured to use another authentication method as a backup, and the TACACS+ server is not reachable.

When TACACS+ enable password authentication is enabled on the switch with the **aaa authentication enable default group tacacs+** command and at least one TACACS+ server is configured and reachable, all user attempts to access a higher privilege level using the **enable (Privileged Exec mode)** command are authenticated against the TACACS+ server. If TACACS+ enable password authentication is enabled and the TACACS+ server is not reachable, then the user is only granted access to the desired privilege level if a backup authentication method is also configured.

 **Note** If TACACS+ login authentication is enabled on the switch, and enable password authentication is configured as default with the **aaa authentication enable default local** command, then a local enable password must be configured for each privilege level that needs to be accessible to users.

Authorization

In the AlliedWare Plus TACACS+ implementation, authorization cannot be performed independently of the authentication process. Authorization is concerned with what users are allowed to do once they have gained access to the managed device. This involves the passing of Attribute Value pairs (AV pairs) from the TACACS+ server to the managed device. An AV pair is made up of two pieces of information: the attribute that identifies the parameter to be set, and the value that specifies the value to assign to that parameter. These AV pairs are configured on a per-user or per-group basis on the TACACS+ server. The AV pairs that are supported by the AlliedWare Plus TACACS+ implementation are:

- **Privilege Level**
Privilege levels range from 1 to 15, with 15 being the highest. For information about privilege levels see **“How to Add and Remove Users” on page 1.28** and the **username** command on page 5.38.
- **Timeout**
The value assigned to this attribute specifies the length of time that the session can exist. After this value has expired, the session will either be disconnected, or have the privilege of the user reduced. The valid range of timeout values is 0 to 65535 (minutes).
- **Idletime**
If no input or output traffic is received or sent in the period specified by the value for this attribute, the session is disconnected. The valid idletime range is 0 to 65535 (minutes).

 **Note** In the AlliedWare Plus TACACS+ implementation, authorization for privilege level, timeout, and idletime AV pairs is only attempted if enable password authentication (**aaa authentication enable default group tacacs+** command) is not configured. If enable password authentication is configured then the privilege level a user is granted access to is determined during the enable password authentication session.

Accounting

TACACS+ accounting usually takes place after authentication and authorization. However, because TACACS+ separates these three functions, neither authentication nor authorization are required for accounting to function. TACACS+ accounting provides the following two distinct functions:

- a record of services used for billing purposes
- an audit trail for user exec sessions

The AlliedWare Plus TACACS+ accounting implementation supports an audit trail for user exec sessions only. This includes the ability to configure accounting for user logins and logouts, and accounting of any commands executed by the user while they are logged into the switch.

TACACS+ accounting includes three different types of accounting records:

- **start** records that indicate a service is about to start
- **stop** records that indicate a service has just ended
- **update** records that indicate a service is still in progress

Configuration

This section describes how to set up TACACS+ for login authentication, enable password authentication, and accounting.

The TACACS+ server is normally a multiuser system running TACACS+ server software from a software provider. TACACS+ servers are identified on the basis of their host name or IP address. A TACACS+ server and a switch use a shared secret text string to encrypt passwords and exchange responses. To configure TACACS+, you must specify the host running the TACACS+ server software and a secret text string that it shares with the switch.

Configure TACACS+

Table 73-1: General configuration procedure for TACACS+ authentication and accounting

Specify a remote TACACS+ server and the shared secret key

<pre>awplus# configure terminal</pre>	Enter Global Configuration mode.
<pre>awplus(config)# tacacs-server host {<host-name> <ip-address>} [key [8]<key-string>]</pre>	<p>Specify the IP address or host name of the remote TACACS+ server host and the shared secret key to use with the specified TACACS+ server.</p> <p>Specify 8 if you are entering a password as a string that has already been encrypted instead of entering a plain text password.</p> <p>As many as four TACACS+ servers can be configured and consulted for authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn.</p>
<pre>awplus(config)# tacacs-server key [8] <key-string></pre>	<p>Specify the global shared secret text string used between the switch and all TACACS+ servers.</p> <p>Specify 8 if you are entering a password as a string that has already been encrypted instead of entering a plain text password.</p> <p>If no secret key is explicitly specified for a TACACS+ server with the tacacs-server host command, the global secret key will be used.</p>

Specify the timeout value

<pre>awplus(config)# tacacs-server timeout <seconds></pre>	Specify for how many seconds a switch waits for a reply to a TACACS+ request before considering the TACACS+ server dead.
--	--

Table 73-1: General configuration procedure for TACACS+ authentication and accounting(cont.)**Define the method list for TACACS+ login authentication**

<pre>awplus(config)# aaa authentication login {default <list-name>} {[local] [group {radius tacacs+ <group-name>}]}</pre>	<p>This method list defines the AAA server type used for login authentication. The server types are always used in the order specified with this command. If the first server in the method list is unreachable, the switch sends the request to the next server in the list. If the authentication server denies the authentication request because of an incorrect username or password then the user login fails.</p>
--	--

Define the method list for TACACS+ enable password authentication

<pre>awplus(config)# aaa authentication enable default group tacacs+ [local] [none]</pre>	<p>This method list defines the authentication method used to determine the privilege command level a user can access. Specify local to use the locally configured enable password and none to grant access to Privileged Exec mode with no authentication, if the TACACS+ server goes offline, or is not reachable during enable password authentication.</p>
---	--

Define the method for TACACS+ login accounting

<pre>awplus(config)# aaa accounting login {default <list-name>} {start-stop stop-only none} {group {radius tacacs+ <group- name>}]}</pre>	<p>You can only define one method for login accounting, either RADIUS or TACACS+. Specify start-stop to send both start and stop login accounting records, stop-only to send only stop login accounting records, or none to disable the sending of login accounting records.</p>
--	---

Configure TACACS+ command accounting

<pre>awplus(config)# aaa accounting commands <1-15> default stop-only group tacacs+</pre>	<p>TACACS+ command accounting is configured per privilege level and only commands of the specified privilege level are accounted. Therefore, if you require that all commands are accounted to the TACACS+ server, you must configure command accounting for each privilege level separately. Commands are accounted to the TACACS+ server after they have successfully executed.</p>
---	---

Troubleshooting TACACS+

<pre>awplus(config)# show tacacs+</pre>	<p>Display the current TACACS+ server configuration and status.</p>
<pre>awplus# debug aaa authentication</pre>	<p>Enable debug output for TACACS+ authentication.</p>
<pre>awplus# debug aaa authorization</pre>	<p>Enable debug output for TACACS+ authorization.</p>
<pre>awplus# debug aaa accounting</pre>	<p>Enable debug output for TACACS+ accounting.</p>

TACACS+ Configuration Example

Example The following example shows how to configure the switch to authenticate and account using TACACS+.

Figure 73-1: Sample TACACS+ authentication and accounting to configure the switch to authenticate and account user exec sessions

```
!
tacacs-server host 172.10.10.1
tacacs-server key tacacspass
aaa authentication login admin group tacacs+ local
aaa authentication enable default group tacacs+ local
aaa accounting login admin start-stop group tacacs+
aaa accounting commands 1 default stop-only group tacacs+
aaa accounting commands 7 default stop-only group tacacs+
aaa accounting commands 15 default stop-only group tacacs+

line console 0
login authentication admin
accounting login admin
!
```

The lines in this example TACACS+ authentication and accounting configuration are defined as follows:

- The **tacacs-server host** command defines the IP address of the TACACS+ server host.
- The **tacacs-server key** command defines the global shared secret text string between the network access server and the TACACS+ server host.
- The **aaa authentication login** command defines a method list named **admin** to use first the TACACS+ servers and then the local user database for user login authentication.
- The **aaa authentication enable default group tacacs+** command defines a method list to use first the TACACS+ servers and then the local enable passwords, set with the **enable password** command, for user enable password authentication.
- The **aaa accounting login** command defines a method named **admin** to use TACACS+ servers for login accounting.
- The **aaa accounting commands** command specifies the privilege level of the commands that will be accounted.
- The **login authentication** command specifies that this method list will be used for authenticating users logging in on the asynchronous console port.
- The **accounting login** command specifies that this method list will be used for accounting users logging in on the asynchronous console port.

Chapter 74: TACACS+ Commands

Command List	74.2
tacacs-server host	74.2
tacacs-server key	74.4
tacacs-server timeout	74.5
show tacacs+	74.6

Command List

This chapter provides an alphabetical reference for commands used to configure the device to use TACACS+ servers. For more information about TACACS+, see [Chapter 73, TACACS+ Introduction and Configuration](#).

tacacs-server host

Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

Syntax `tacacs-server host {<host-name>|<ip-address>} [key [8]<key-string>]`
`no tacacs-server host {<host-name>|<ip-address>}`

Parameter	Description
<code><host-name></code>	Server host name. The DNS name of the TACACS+ server host.
<code><ip-address></code>	The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.
<code>key</code>	Set shared secret key with TACACS+ servers.
<code>8</code>	Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.
<code><key-string></code>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the tacacs-server key command. If no key value is specified, the global value is used.

Default No TACACS+ server is configured by default.

Mode Global Configuration

Usage A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable
- it cannot communicate with the switch properly due to the switch and the server having different secret keys

Examples To add the server `tacl.company.com` as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tacl.company.com
```

To set the secret key to `secret` on the TACACS+ server `192.168.1.1`, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server `tacl.company.com`, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tacl.company.com
```

Related Commands

- [aaa accounting commands](#)
- [aaa authentication login](#)
- [tacacs-server key](#)
- [tacacs-server timeout](#)
- [show tacacs+](#)

tacacs-server key

This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the **tacacs-server host** command, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

Syntax `tacacs-server key [8] <key-string>`
`no tacacs-server key`

Parameter	Description
8	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server.

Mode Global Configuration

Usage Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the **tacacs-server host** command, this global key is used.

Examples To set the global secret key to `secret` for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server key
```

Related Commands **tacacs-server host**
show tacacs+

tacacs-server timeout

Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.

Note that this command configures the **timeout** parameter for TACACS+ servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

Syntax `tacacs-server timeout <seconds>`
`no tacacs-server timeout`

Parameter	Description
<code><seconds></code>	TACACS+ server timeout in seconds, in the range 1 to 1000.

Default The default timeout value is 5 seconds.

Mode Global Configuration

Examples To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server timeout
```

Related Commands [tacacs-server host](#)
[show tacacs+](#)

show tacacs+

This command displays the current TACACS+ server configuration and status.

Syntax show tacacs+

Mode User Exec and Privileged Exec

Example To display the current status of TACACS+ servers, use the command:

```
awplus# show tacacs+
```

Output **Figure 74-1: Example output from the show tacacs+ command**

```
TACACS+ Global Configuration
  Timeout                : 5 sec

Server Host/           Server
IP Address             Status
-----
192.168.1.10           Alive
192.168.1.11           Unknown
```

Table 74-1: Parameters in the output of the show tacacs+ command

Output Parameter	Meaning
Timeout	A time interval in seconds.
Server Host/IP Address	TACACS+ server hostname or IP address.
Server Status	The status of the authentication port.
Alive	The server is alive.
Dead	The server has timed out.
Error	The server is not responding or there is an error in the key string entered.
Unknown	The server is never used or the status is unknown.
Unreachable	The server is unreachable.
Unresolved	The server name can not be resolved.

Chapter 75: Local RADIUS Server Introduction and Configuration

Local RADIUS Server Introduction	75.2
Enable the Local RADIUS Server	75.2
Add the Local RADIUS Server as a RADIUS Server	75.3
Add authenticators to the list of authenticators	75.3
Configure the Local RADIUS Server User Database	75.4
Authenticating login sessions	75.5
RADIUS Authentication with User Privileges	75.5
Creating certificates for single users and all users	75.8
Defined RADIUS attributes list	75.9

Local RADIUS Server Introduction

Local RADIUS Server provides a user authentication service feature. This feature must be enabled on the switch, because it is disabled by default. For details of commands used to configure the local RADIUS server, see [Chapter 76, Local RADIUS Server Commands](#).

Enable the Local RADIUS Server

The Local RADIUS Server is disabled by default. Enter the following commands to enable the Local RADIUS Server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

This will automatically initialize the internal Certificate Authority (CA) in the switch. It will also automatically create a server certificate and enrol the certificate with the Local CA by implicitly executing the following commands:

```
awplus(config)# crypto pki trustpoint local
awplus(config)# crypto pki enroll local
```

The **crypto pki trustpoint local** command declares the Local CA as the CA from which to obtain Certificates. The Local CA has been defined first so Certificates can be obtained from it. The **crypto pki enroll local** command obtains the system certificate from the Local CA.

The switch is automatically added to the list of authenticators that may send authentication requests to the Local RADIUS Server by implicitly executing the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 127.0.0.1 key awplus-local-radius-
server
```

Note  The key **awplus-local-radius-server** is a pre-defined component that can be used for internal exchanges between the switch's RADIUS client and its RADIUS server.

Add the Local RADIUS Server as a RADIUS Server

Although the switch is automatically defined as a NAS (Network Access Server) for the Local RADIUS Server, you must manually add the Local RADIUS Server to the server list defined for the Local RADIUS Client.

Use the following commands to add the Local RADIUS Server as a RADIUS Server. The Local RADIUS Client can then send authentication requests to its Local RADIUS Server:

```
awplus# configure terminal
awplus(config)# radius-server host 127.0.0.1 key awplus-local-
radius-server
```

Add authenticators to the list of authenticators

Authenticators can send authentication requests to the Local RADIUS Server.

Use the following commands to add other authenticators to the list of authenticators.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas <nas-ip-address> key <nas-keysting>
```

Configure the Local RADIUS Server User Database

Add users to the RADIUS user list without assigning VLANs

For entries that will be used to authenticate dot1x supplicants, but not assign them to a VLAN, the following commands will add users to the RADIUS user list:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user <radius-user-name> password <user-
password>
```

Add users to the RADIUS user list and assign VLANs

Add users to the RADIUS user list, and define a VLAN ID that will be assigned to them.

To add entries to be used to authenticate dot1x supplicants, and assign them to a VLAN, follow the two steps shown below:

Step 1: Create groups associated with the VLANs that will be allocated

Enter the following commands to create groups with the VLANs that will be allocated to them:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group VLAN10Users
awplus(config-radsrv)# vlan 10
awplus(config-radsrv)# group VLAN11Users
awplus(config-radsrv)# vlan 11
```

Step 2: Add the users after creating groups

Add the users and refer to the relevant group in the command that creates the user as below:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user VCSPCVLAN10 password VCSPCPass
group VLAN10Users
awplus(config-radsrv)# user VCSPCVLAN11 password VCSPCPass
group VLAN11Users
```

Authenticating login sessions

Authentication can be performed in multiple contexts, such as the authentication of users logging in at a console, as well as tri-authentication of devices connecting to switch ports, see [Tri-Authentication Configuration](#) in [Chapter 67, Authentication Introduction and Configuration](#).

RADIUS Authentication with User Privileges

There are three groups of privilege levels:

- Users with privilege levels 1 to 6 have access to privilege 1 level commands.
- Users with privilege 7 to 14 have access to privilege level 1 commands and all show commands.
- Users with privilege level 15 have access to all commands.

When a user logs into a management session on a switch by console, telnet, or SSH and is being authenticated by RADIUS, the RADIUS server needs to be able to indicate to the switch what privilege level to assign to the user's session.

The way that the privilege level is associated with a user is to use the RADIUS attributes. The attributes are configured on RADIUS groups.

Because there are three group of security privilege levels there will need to be up to three different groups for login users; each group specifying a different privilege level.

The attributes that need to be configured on the three different RADIUS groups are as follows:

1. For the users with a privilege level of 1-6 use just the RADIUS attribute `Service-Type`, and assign it the value `NAS-Prompt-User`:

```
attribute Service-Type NAS-Prompt-User
```

2. For users with the security privilege of 7-14 use the following 2 RADIUS attributes:

```
attribute Cisco-AVPair shell:priv-lvl=7
attribute Service-Type NAS-Prompt-User
```

3. User with the administrator security privilege use just the RADIUS attribute `Service-Type`, and assign it the value `Administrative-User`:

```
attribute Service-Type Administrative-User
```

Since there is not an explicit RADIUS attribute for the users with the security privilege level 7, use "Cisco-AVPair" to specify this user privilege. Also, it is very important that you specify the attribute Service-Type NAS-Prompt-User as well, otherwise the following error is generated when a user allocated to this group tries to login into the AlliedWare Plus switch:

```
19:09:14 awplus login[16974]: Invalid user name "tests" in
main:698. Abort.
```

The RADIUS Server attribute NAS-Prompt-User is used for non-privileged level users as per the RADIUS RFC. This attribute is used for users with security privilege levels of 1 to 6.

Configuring these RADIUS Server attributes is achieved using Local RADIUS Server commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group users
awplus(config-radsrv-group)# attribute Service-Type NAS-
Prompt_User
```

See the below sample configuration for an AlliedWare Plus switch acting as the RADIUS Server, with the three different security privileges for admin, middle-management, and users groups:

Figure 75-1: Sample RADIUS Server configuration for three different security privileges:

```
crypto pki trustpoint local
!
crypto pki enroll local
radius-server local
  server enable
  nas 10.1.1.1 key test
  nas 127.0.0.1 key awplus-local-radius-server
group admin
  attribute Service-Type Administrative-User
group middle-management
  attribute Cisco-AVPair shell:priv-lvl=7
  attribute Service-Type NAS-Prompt-User
group users
  attribute Service-Type NAS-Prompt-User
  user test encrypted password UukoSyvxY2v9iWXm8e/
  JMDJd9iIc3RPyY09lGOb3pA4= group users
  user tested encrypted password
  sEDhM4iJRfJrLhhs+RgjjpgkDXtCwuji6AllpApi9EjA= group admin
  user tests encrypted password il9aIh8JLOT6kHDV+Ix7/
  8fzyfVpAwRErJg6NPQdJy8= group middle-management
```

Removing users from the RADIUS users list

To remove the user Tom from the user database of the Local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

Creating certificates for single users and all users

Create a certificate for a single user

A certificate for user Tom can be created from the local CA by using the commands:

```
awplus# configure terminal
awplus(config)# crypto pki enroll local user Tom
```

Create a certificate for all users

Certificates can be created for all currently defined users by using the commands:

```
awplus# configure terminal
awplus(config)# crypto pki enroll local local-radius-all-users
```

Exporting certificates

User certificates can be exported in PKCS12 format.

To export a certificate for user Tom and upload it to the TFTP server at 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# crypto pki export local pkcs12 Tom tftp://
192.168.1.1/tomcert.pkcs
```

Defined RADIUS attributes list

This is a full list of valid attributes and pre-defined values that may be used in conjunction with the **attribute** command on page 76.2, to show or configure defined RADIUS attributes.

Table 75-1 lists all Standard attributes and values, **Table 75-2** lists the Vendor-Specific attribute (attribute ID 26) names and values.

More detailed information can be found in the following RFCs, defining the attributes and values for RADIUS server:

- RFC2865: Remote Authentication Dial In User Service (RADIUS)
- RFC2866: RADIUS Accounting
- RFC2867: RADIUS Accounting Modifications for Tunnel Protocol Support
- RFC2868: RADIUS Attributes for Tunnel Protocol Support
- RFC2869: RADIUS Extensions
- RFC3162: RADIUS and IPv6
- RFC3576: Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)
- RFC3580: IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines
- RFC4072: Diameter Extensible Authentication Protocol (EAP) Application
- RFC4372: Chargeable User Identity
- RFC4603: Additional Values for the NAS-Port-Type Attribute
- RFC4675: RADIUS Attributes for Virtual LAN and Priority Support
- RFC4679: DSL Forum Vendor-Specific RADIUS Attributes
- RFC4818: RADIUS Delegated-IPv6-Prefix Attribute
- RFC4849: RADIUS Filter Rule Attribute
- RFC5176: Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)
- RFC5580: Carrying Location Objects in RADIUS and Diameter
- RFC5607: Remote Authentication Dial-In User Service (RADIUS) Authorization for Network Access Server (NAS) Management
- RFC5904: RADIUS Attributes for IEEE 802.16 Privacy Key Management Version 1 (PKMv1) Protocol Support

Table 75-1: Standard RADIUS Attributes

Attribute ID and Name		Value Type/Pre-defined Values
1	User-Name	string

vlan (RADIUS server)	76.39

Command List

This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see [Chapter 75, Local RADIUS Server Introduction and Configuration](#).

attribute

Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see [“Defined RADIUS attributes list” on page 75.9](#).

When used with the **help** parameter the **attribute** command displays a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

If an attribute name is specified with the **help** parameter, then the **attribute** command displays a list of predefined attribute names. Note that you can only use the defined RADIUS attribute names and not define your own.

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

Syntax

```
attribute [<attribute-name>|<attribute-id>] help
attribute {<attribute-name>|<attribute-id>} <value>
no attribute {<attribute-name>|<attribute-id>}
```

Parameter	Description
<attribute-name>	RADIUS attribute name for standard attributes (see Table 75-1 on page 75.10) or Vendor-Specific attributes (see Table 75-2 on page 75.18).
<attribute-id>	RADIUS attribute numeric identifier for standard attributes (Table 75-1 on page 75.10).
<value>	RADIUS attribute value.
help	Display a list of available attribute types.

Default By default, no attributes are configured.

Mode RADIUS Server Group Configuration

Usage For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
help
```

will produce the same results as command:

```
awplus(config-radsrv-group)# attribute 49 help
```

In the same way, where the specific attribute has a pre-defined value, the parameter *<value>* may be substituted with the Value Name or with its numeric value, for example command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
user-request
```

will produce the same results as command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

Example To check a list of all available defined RADIUS attribute names, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute help
```

A list of Vendor-specific Attributes displays after the list of defined Standard Attributes.

To get help for valid RADIUS attribute values for the attribute *Service-Type*, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type help
```

```
Service-Type : integer (Integer number)
Pre-defined values :
Administrative-User (6)
Authenticate-Only (8)
Authorize-Only (17)
Callback-Administrative (11)
Callback-Framed-User (4)
Callback-Login-User (3)
Callback-NAS-Prompt (9)
Call-Check (10)
Framed-User (2)
Login-User (1)
NAS-Prompt-User (7)
Outbound-User (5)
```

To define the attribute name 'Service-Type' with Administrative User (6) to the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute 'Service-Type' from the RADIUS User Group 'Admin', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# no attribute Service-Type
```

Related Commands [egress-vlan-id](#)
[egress-vlan-name](#)

authentication

Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

Syntax `authentication {mac|eapmd5|eaptls|peap}`
`no authentication {mac|eapmd5|eaptls|peap}`

Parameter	Description
mac	Enable MAC authentication method.
eapmd5	Enable EAP-MD5 authentication method.
eaptls	Enable EAP-TLS authentication method.
peap	Enable EAP-PEAP authentication method.

Default All authentication methods are enabled by default.

Mode RADIUS Server Configuration

Example The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

Related Commands [server enable](#)
[show radius local-server statistics](#)

clear radius local-server statistics

Use this command to clear the statistics stored on the switch for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

Syntax `clear radius local-server statistics [nas|server|user]`

Parameter	Description
nas	Clear the NAS (Network Access Server) statistics on the switch. For example, clearing statistics stored for NAS server invalid passwords.
server	Clear the Local RADIUS Server statistics on the switch. For example, clearing Local RADIUS Servers statistics for all failed login attempts.
user	Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.

Mode Privileged Exec

Usage Refer to the sample output for the [show radius local-server statistics](#) for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the **user** parameter clears the number of successful and failed logins for each local RADIUS server user.

Example To clear the NAS (Network Access Server) statistics stored on the switch, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the switch, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the switch, use the command:

```
awplus# clear radius local-server statistics user
```

Related Commands [show radius local-server statistics](#)

copy fdb-radius-users (to file)

Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

Syntax `copy fdb-radius-users {local-radius-user-db|flash|nvs|usb|debug|tftp|scp|<url>} [interface <port>] [vlan <vid>] [group <name>] [export-vlan [<group-name>]]`

Parameter	Description
local-radius-user-db	Copy the local RADIUS server users created to the local RADIUS server.
flash	Copy the local RADIUS server users created to Flash memory.
nvs	Copy the local RADIUS server users created to NVS memory.
usb	Copy the local RADIUS server users created to USB storage device.
debug	Copy the local RADIUS server users created to debug.
tftp	Copy the local RADIUS server users created to the TFTP destination.
scp	Copy the local RADIUS server users created to the SCP destination.
<url>	Copy the local RADIUS server users created to the specified URL.
interface <port>	Copy only MAC addresses learned on a specified switch port. Wildcards may be used when specifying an interface name.
vlan <vid>	Copy only MAC addresses learned on a specified VLAN.
group <name>	Assign a RADIUS group name to the local RADIUS server users created.
export-vlan <group-name>	Assign a RADIUS group name to the assigned export VLAN.

Mode Privileged Exec

Usage The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server users can then be imported to a local RADIUS server using the [copy local-radius-user-db \(from file\)](#) command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

Examples To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface `port1.1.1` to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface  
port1.1.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on `vlan10` on interface `port1.1.1` to the file `radius-user.csv`, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface  
port1.1.1 vlan10
```

Related Commands [copy local-radius-user-db \(to file\)](#)
[copy local-radius-user-db \(from file\)](#)

copy local-radius-user-db (from file)

Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

Syntax `copy <source-url> local-radius-user-db [add|replace]`

Parameter	Description
<code><source-url></code>	URL of the source file.
<code>add</code>	Add file contents to local RADIUS server user database.
<code>replace</code>	Replace current local RADIUS server user database with file contents.

Default When no copy method is specified with this command the **replace** option is applied.

Mode Privileged Exec

Examples To replace the current local RADIUS server user data to the contents of `http://datahost/user.csv`, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of `http://datahost/user.csv` to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

Related commands [copy fdb-radius-users \(to file\)](#)
[copy local-radius-user-db \(to file\)](#)

copy local-radius-user-db (to file)

Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

Syntax `copy local-radius-user-db {flash|nvs|usb|tftp|scp} <destination-url>`

Parameter	Description
flash	Copy to flash memory.
nvs	Copy to NVS memory.
usb	Copy to USB storage device.
tftp	Copy to TFTP destination.
scp	Copy to SCP destination.
<destination-url>	URL of the Destination file.

Mode Privileged Exec

Example Copy the current local RADIUS server user data to http://datahost/user.csv.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

Related Commands [copy fdb-radius-users \(to file\)](#)
[copy local-radius-user-db \(from file\)](#)

crypto pki enroll local

Use this command to obtain a system certificate from the Local CA (Certificate Authority).

Use the **no** variant of this command to delete system certificates created by a Local CA (Certificate Authority).

Syntax `crypto pki enroll local`
`no crypto pki enroll local`

Default The system certificate is not available until this command is issued.

Mode Global Configuration

Example The following command obtains the system certificate from the Local CA (Certificate Authority).

```
awplus# configure terminal
awplus(config)# crypto pki enroll local
```

The following command deletes the system certificate created by the Local CA (Certificate Authority).

```
awplus# configure terminal
awplus(config)# no crypto pki enroll local
```

Related Commands [crypto pki trustpoint local group](#)

crypto pki enroll local local-radius-all-users

Use this command to create certificates for all users registered in the local RADIUS server. These certificates are created by the Local Certificate Authority (CA) on the switch.

Syntax `crypto pki enroll local local-radius-all-users`

Default By default, there are no certificates for users in the local RADIUS server.

Mode Global Configuration

Example The following command obtains the local RADIUS server certificates for the user from the Local CA (Certificate Authority).

```
awplus# configure terminal
awplus(config)# crypto pki enroll local local-radius-all-users
```

Related Commands [crypto pki trustpoint local](#)
[show crypto pki certificates](#)

crypto pki enroll local user

Use this command to obtain a local user certificate from the Local CA (Certificate Authority).

Use the **no** variant of this command to delete user certificates created by the Local CA (Certificate Authority).

Syntax `crypto pki enroll local user <user-name>`
`no crypto pki enroll local user <user-name>`

Parameter	Description
<code><user-name></code>	User name.

Default By default, there is no user certificate.

Mode Global Configuration

Example The following command obtains Tom's certificate from the Local CA (Certificate Authority).

```
awplus# configure terminal
awplus(config)# crypto pki enroll local user Tom
```

The following command deletes Tom's certificates created by the Local CA (Certificate Authority):

```
awplus# configure terminal
awplus(config)# no crypto pki enroll local user Tom
```

Related Commands [crypto pki trustpoint local](#)
[show crypto pki certificates](#)

crypto pki export local pem

Use this command to export the certificate associated with the Local CA to a PEM format file.

Syntax `crypto pki export local pem url <url>`

Parameter	Description
<url>	URL string.

Mode Global Configuration

Example The following command exports the Local CA certificate to a PEM format file.

```
awplus# configure terminal
awplus(config)# crypto pki export local pem url tftp://
192.168.1.1/cacert.pem
```

Related Commands [crypto pki enroll local](#)

crypto pki export local pkcs12

Use this command to export a specified certificate to a PKCS12 format file.

This command cannot be used for exporting certificates for the local system.

Syntax `crypto pki export local pkcs12 <user-name> <destination-url>`

Parameter	Description
<code><user-name></code>	User name.
<code><destination-url></code>	Destination URL string.

Mode Global Configuration

Example The following commands exports a certificate for a user named **client** to a PKCS12 format file.

```
awplus# configure terminal
awplus(config)# crypto pki export local pkcs12 client tftp://
192.168.1.1/cacert.pem
```

To export Tom's certificate to PKSC12 format file, use the commands:

```
awplus# configure terminal
awplus(config)# crypto pki export local pksc12 Tom tftp://
192.168.1.1/tom.pfx
```

Related Commands [crypto pki enroll local](#)

crypto pki trustpoint local

Use this command to declare the Local CA (Certificate Authority) as the trustpoint that the system uses. The ca-trustpoint configuration mode is available after this command is issued.

Use the **no** variant of this command to delete all information and certificates associated with Local CA as the trustpoint.

Syntax `crypto pki trustpoint local`
`no crypto pki trustpoint local`

Default Local CA is not a trustpoint.

Mode Global Configuration

Examples Use the following commands to declare the Local CA as the trustpoint.

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint local
```

Use the following commands to delete all information and certificates associated with the Local CA.

```
awplus# configure terminal
awplus(config)# no crypto pki trustpoint local
```

To create a client certificate for all users registered to the local RADIUS server, use the following commands:

```
awplus(config)# crypto pki trustpoint local
awplus(ca-trust-point)# exit
awplus(config)# crypto pki enroll local alternative
```

Related Commands [crypto pki enroll local](#)
[show crypto pki trustpoints](#)

debug crypto pki

Use this command to enable Public Key Infrastructure (PKI) debugging. When PKI debugging is enabled, the PKI module starts generating diagnostic messages to the system log.

Use the **no** variant of this command to disable Public Key Infrastructure (PKI) debugging. When PKI debugging is disabled, the PKI module stops generating diagnostic messages to the system log.

Syntax `debug crypto pki`
`no debug crypto pki`

Default PKI debugging is disabled by default

Mode Privileged Exec

Example To enable the PKI debugging facility, use the command:

```
awplus# debug crypto pki
```

To disable the PKI debugging facility, use the command:

```
awplus# no debug crypto pki
```

domain-style

Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

Syntax `domain-style {suffix-atsign|ntdomain}`

Parameter	Description
<code>suffix-atsign</code>	Enable at sign "@" delimited suffix style, i.e. "user@domain".
<code>ntdomain</code>	Enable NT domain style, i.e. "domain\user".

Default This feature is disabled by default.

Mode RADIUS Server Configuration

Usage When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

Example To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

Related Commands [server enable](#)

egress-vlan-id

Use this command to configure the standard RADIUS attribute “Egress-VLANID (56)” for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

Syntax `egress-vlan-id <vid> [tagged|untagged]`
`no egress-vlan-id`

Parameter	Description
<vid>	The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.
tagged	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
untagged	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

Default By default, no Egress-VLANID attributes are configured.

Mode RADIUS Server Group Configuration

Usage When a Voice VLAN is configured for dynamic VLAN allocation ([switchport voice vlan command on page 17.32](#)), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the [egress-vlan-id command](#) or the [egress-vlan-name command on page 76.20](#), and specify the **tagged** parameter.

Examples To set the “Egress-VLANID” attribute for the NormalUsers local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the “Egress-VLANID” attribute for the NormalUsers local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

Related Commands [attribute](#)
[egress-vlan-name](#)
[switchport voice vlan](#)

egress-vlan-name

Use this command to configure the standard RADIUS attribute “Egress-VLAN-Name (58)” for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

Syntax `egress-vlan-name <vlan-name> [tagged|untagged]`
`no egress-vlan-name`

Parameter	Description
<code><vlan-name></code>	The VLAN name to be configured as the Egress-VLAN-Name attribute.
<code>tagged</code>	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
<code>untagged</code>	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

Default By default, no Egress-VLAN-Name attributes are configured.

Mode RADIUS Server Group Configuration

Usage When a Voice VLAN is configured for dynamic VLAN allocation ([switchport voice vlan command on page 17.32](#)), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the [egress-vlan-id command on page 76.19](#) or the **egress-vlan-name** command, and specify the **tagged** parameter.

Examples To configure the “Egress-VLAN-Name” attribute for the RADIUS server user group NormalUsers with the VLAN name “vlan2” and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the “Egress-VLAN-Name” attribute for the NormalUsers group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

Related Commands **attribute**
 egress-vlan-id
 switchport voice vlan

group

Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

Syntax `group <user-group-name>`
`no group <user-group-name>`

Parameter	Description
<code><user-group-name></code>	User group name string.

Mode RADIUS Server Configuration

Example The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

Related Commands [user \(RADIUS server\)](#)
[show radius local-server user](#)
[vlan \(RADIUS server\)](#)

nas

This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

Syntax `nas <ip-address> key <nas-keystring>`

`no nas <ip-address>`

Parameter	Description
<code><ip-address></code>	RADIUS NAS IP address.
<code><nas-keystring></code>	NAS shared keystring.

Mode RADIUS Server Configuration

Example The following commands add the NAS with an IP address of 192.168.1.2 to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identify is NAS_PASSWORD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of 192.168.1.2 from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

Related Commands [show radius local-server nas](#)

radius-server local

Use this command to navigate to the Local RADIUS server configuration mode (`config-radsrv`) from the Global Configuration mode (`config`).

Syntax `radius-server local`

Mode Global Configuration

Example Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (`config-radsrv`), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

Related Commands

- `show radius local-server statistics`
- `show radius local-server user`

server auth-port

Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

Syntax `server auth-port <1-65535>`
`no server auth-port`

Parameter	Description
<1-65535>	UDP port number.

Default The default local RADIUS server UDP authentication port number is 1812.

Mode RADIUS Server Configuration

Example The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server port
```

Related Commands [server enable](#)
[show radius local-server statistics](#)

server enable

This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

Syntax `server enable`
`no server enable`

Default The local RADIUS server is disabled by default and must be enabled for use with this command.

Mode RADIUS Server Configuration

Examples To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

Related Commands [server auth-port](#)

show crypto pki certificates

Use this command to display certificate information for Local CA and Local System certificates.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show crypto pki certificates [local-ca|local]`

Parameter	Description
local-ca	Local CA certificate.
local	Local system certificate.

Mode User Exec and Privileged Exec

Example The following command displays Local CA (Certificate Authority) certificate information.

```
awplus# show crypto pki certificates local-ca
```

The following command displays Local System certificate information.

```
awplus# show crypto pki certificates local
```

The following command displays information for all Local CA and Local System certificates.

```
awplus# show crypto pki certificates
```

Output**Figure 76-1: Example output from the show crypto pki certificates command showing Local System and Local CA certificates**

```

awplus#show crypto pki certificates
Certificate: Local System
  Data:
    Version: 3 (0x2)
    Serial Number: 4 (0x4)
    Signature Algorithm: sha1WithRSAEncryption
    Issuer: O=Allied-Telesis, CN=AlliedwarePlusCA
    Validity
      Not Before: Oct  8 07:50:55 2009 GMT
      Not After  : Oct  6 07:50:55 2019 GMT
    Subject: O=Allied-Telesis, CN=Tom
Certificate: Local CA
  Data:
    Version: 3 (0x2)
    Serial Number: 0 (0x0)
    Signature Algorithm: sha1WithRSAEncryption
    Issuer: O=Allied-Telesis, CN=AlliedwarePlusCA
    Validity
      Not Before: Oct  8 07:55:55 2009 GMT
      Not After  : Oct  6 07:55:55 2019 GMT
    Subject: O=Allied-Telesis, CN=Tom

```

Table 76-1: Parameters in the output of the show crypto pki certificates command

Parameter	Description
Certificate	Certificate name.
Version	Protocol version.
Serial Number	Serial number of the certificate.
Signature Algorithm	Algorithm used for the certificate signature.
Issuer	Subject of issuer creating the certificate.
Validity	Validity period.
Subject	Subject of the certificate.

Related Commands [crypto pki enroll local](#)

show crypto pki certificates local-radius-all-users

Use this command to display certificate information for local RADIUS server users.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show crypto pki certificates local-radius-all-users`

Mode User Exec and Privileged Exec

Example The following command displays information of all local RADIUS server user certificates.

```
awplus# show crypto pki certificates local-radius-all-users
```

Output

Figure 76-2: Example output from the show crypto pki certificates local-radius-all-users command

```
awplus#show crypto pki certificates local-radius-all-users
Certificate:
  Data:
    Version: 3 (0x2)
    Serial Number: 2 (0x2)
    Signature Algorithm: sha1WithRSAEncryption
    Issuer: O=Allied-Telesis, CN=AlliedwarePlusCA
    Validity
      Not Before: Oct  8 07:50:55 2009 GMT
      Not After : Oct  6 07:50:55 2019 GMT
    Subject: O=Allied-Telesis, CN=Tom
```

Table 76-2: Parameters in the output of the show crypto pki certificates local-radius-all-users command

Parameter	Description
Certificate	Certificate name.
Version	Protocol version.
Serial Number	Serial number of the certificate.
Signature Algorithm	Algorithm used for the certificate signature.
Issuer	Subject of issuer creating the certificate.
Validity	Validity period.
Subject	Subject of the certificate.

Related Commands [crypto pki enroll local local-radius-all-users](#)

show crypto pki certificates user

Use this command to display certificate information for a specified local RADIUS server user.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax show crypto pki certificates user [*<user-name>*]

Parameter	Description
<i><user-name></i>	User name.

Mode User Exec and Privileged Exec

Example The following command displays Tom’s certificate information.

```
awplus# show crypto pki certificates user Tom
```

Output

Figure 76-3: Example output from the show crypto pki certificates user command to show certificate information for user Tom

```
awplus#show crypto pki certificates user Tom
Certificate:
  Data:
    Version: 3 (0x2)
    Serial Number: 2 (0x2)
    Signature Algorithm: sha1WithRSAEncryption
    Issuer: O=Allied-Telesis, CN=AlliedwarePlusCA
    Validity
      Not Before: Oct  8 07:50:55 2009 GMT
      Not After : Oct  6 07:50:55 2019 GMT
    Subject: O=Allied-Telesis, CN=Tom
```

Table 76-3: Parameters in the output of the show crypto pki certificates user command

Parameter	Description
Certificate	Certificate name.
Version	Protocol version.
Serial Number	Serial number of the certificate.
Signature Algorithm	Algorithm used for the certificate signature.
Issuer	Subject of issuer creating the certificate.
Validity	Validity period.
Subject	Subject of the certificate.

Related Commands [crypto pki enroll local user](#)

show crypto pki trustpoints

Use this command to display trustpoint information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show crypto pki trustpoints`

Mode User Exec and Privileged Exec

Example The following command displays trustpoint information.

```
awplus# show crypto pki trustpoint
```

Output

Figure 76-4: Example output from the show crypto pki trustpoints command

```
Trustpoint local:
Subject Name:
CN = AlliedwarePlusCA
o = Allied-Telesis
Serial Number:0C
```

Table 76-4: Parameters in the output of the show crypto pki trustpoints command

Parameter	Description
Subject Name	CA certificate subject.
Serial Number	Current serial number of CA.

Related Commands [crypto pki enroll local](#)

show radius local-server group

Use this command to display information about the local RADIUS server user group.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show radius local-server group [<user-group-name>]`

Parameter	Description
<code><user-group-name></code>	User group name string.

Mode User Exec and Privileged Exec

Example The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

Output

Figure 76-5: Example output from the show radius local-server group command

Group-Name	Vlan

NetworkOperators	ManagementNet
NormalUsers	CommonNet

Table 76-5: Parameters in the output of the show radius local-server group command

Parameter	Description
Group-Name	Group name.
vlan	VLAN name assigned to the group.

Related Commands [group](#)

show radius local-server nas

Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show radius local-server nas [<ip-address>]`

Parameter	Description
<ip-address>	Specify NAS IP address for show output.

Mode User Exec and Privileged Exec

Example The following command displays NAS information.

```
awplus# show radius local-server nas
```

Output

Figure 76-6: Example output from the show radius local-server nas command

NAS-Address	Shared-Key

127.0.0.1	awplus-local-radius-server

Table 76-6: Parameters in the output of the show radius local-server nas command

Parameter	Description
NAS-Address	IP address of NAS.
Shared-Key	Shared key used for RADIUS connection.

Related Commands `nas`

show radius local-server statistics

Use this command to display statistics about the local RADIUS server.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show radius local-server statistics

Mode User Exec and Privileged Exec

Usage Both unknown usernames and invalid passwords will display as failed logins in the show output.

Example The following command displays Local RADIUS server statistics.

```
awplus# show radius local-server statistics
```

Output

Figure 76-7: Example output from the show radius local-server statistics command

```
Server status : Run (administrative status is enable)
Enabled methods: MAC EAP-MD5 EAP-TLS EAP-PEAP

Successes          :1  Unknown NAS          :0

show radius local-server user

Use this command to display information about the local RADIUS server user.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show radius local-server user [<user-name>]`
`show radius local-server user <user-name> format csv`

Parameter	Description
<code><user-name></code>	RADIUS user name. If no user name is specified, information for all users is displayed.
<code>format</code>	File format.
<code>csv</code>	Comma separated value format.

Mode User Exec and Privileged Exec

Usage You can send output from any show command, including the CSV format output from this command, to a file. See [“Controlling “show” Command Output” on page 1.35](#).

Example The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

Figure 76-8: Example output from the show radius local-server user command

User-Name	Password	Group	Vlan
Tom	abcd	NetworkOperators	ManagementNet

The following command displays all Local RADIUS server information for all users.

```
awplus# show radius local-server user
```

The following command displays Local RADIUS server user information for TOM in CSV format.

```
awplus# show radius local-server user Tom format csv
```

Figure 76-9: Example output from the show radius local-server user csv command

<pre>true,"NetworkOperators","Tom", "abcd",0,2099/01/ 01,1,"","","ManagementNet",false,3600,false,0,"",false,"</pre>
--

Table 76-7: Parameters in the output from the show radius local-server user command

Parameter	Description
User-Name	User name.
Password	User password.
Group	Group name assigned to the user.
Vlan	VLAN name assigned to the user.

Related Commands `group user (RADIUS server)`

user (RADIUS server)

Use this command to register a user to the local RADIUS server.

Use the **no** variant of this command to delete a user from the local RADIUS server.

Syntax `user <radius-user-name> [encrypted] password <user-password>
[group <user-group>]`

`no user <radius-user-name>`

Parameter	Description
<code><radius-user-name></code>	RADIUS user name. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.
<code>encrypted</code>	Specifies that the password is being entered in its encrypted form, so that it is not further encrypted. When creating a new user, enter the password in plaintext, and do not use the encrypted parameter. Use the encrypted parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the encrypted parameter, and enter the encrypted version of the password that appears in the output of show commands for the user.
<code><user-password></code>	User password. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.
<code>group</code>	Specify the group for the user.
<code><user-group></code>	User group name.

Mode RADIUS Server Configuration

Usage RADIUS user names cannot contain question mark (?), space (), or quote (" ") characters. RADIUS user names containing the below characters cannot use certificate authentication:

`/ \ ' $ & () * ; < > ` |`

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the [Sample MAC Authentication Configuration](#) in [Chapter 69, AAA Introduction and Configuration](#). See also the command `user 00-db-59-ab-70-37 password 00-db-59-ab-70-37` as shown in the command examples.

Examples The following commands add user Tom to the local RADIUS server and sets his password to QwerSD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user Tom to the local RADIUS server user group NormalUsers and sets his password QwerSD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user Tom from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password 00-db-
59-ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

Related Commands [group](#)
[show radius local-server user](#)

vlan (RADIUS server)

Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

Syntax `vlan {<vid>|<vlan-name>}`
`no vlan`

Parameter	Description
<code><vid></code>	VLAN ID.
<code><vlan-name></code>	VLAN name.

Default VLAN information is not set by default.

Mode RADIUS Server Group Configuration

Example The following commands set VLAN ID 200 to the group named NormalUsers:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named NormalUsers:

```
awplus# configure terminal

Introduction

This chapter describes how the Secure Shell protocol is implemented in the AlliedWare Plus™ Operating System. It covers:

- Support for Secure Shell.
- Configuring your device as a Secure Shell server and client.
- Using Secure Shell to manage your device.

The AlliedWare Plus™ OS supports SSH version 2 and SSH version 1.5, making it backwards compatible with SSH version 1.

Secure management is important in modern networks, as the ability to easily and effectively manage switches and routers, and the requirement for security, are two almost universal requirements. Protocols such as Telnet and rlogin allow you to manage devices remotely, but can have serious security problems, such as relying on reusable plaintext passwords that are vulnerable to wiretapping or password guessing. The Secure Shell (SSH) protocol is superior to these protocols by providing encrypted and strongly authenticated remote login sessions.

SSH provides sessions between a host running a SSH server and a machine with a SSH client. The AlliedWare Plus™ OS includes both a SSH server and a SSH client to enable you to securely—with the benefit of cryptographic authentication and encryption—manage your devices over an insecure network:

- SSH replaces Telnet for remote terminal sessions; SSH is strongly authenticated and encrypted.
- Remote command execution allows you to send commands to a device securely and conveniently, without requiring a terminal session on the device.
- SSH allows you to connect to another host from your switch or router.

The AlliedWare Plus™ OS supports Secure Copy (SCP) and SSH File Transfer Protocol (SFTP). Both these protocols allow you to securely copy files between your device and remote machines. SFTP provides additional features from SCP, such as allowing you to manipulate the remote files, and halt or resume file transfers without closing the session.

Secure Shell on the AlliedWare Plus OS

The AlliedWare Plus™ OS implementation of SSH is compatible with the following RFCs and Internet Drafts:

- The Secure Shell (SSH) Protocol Architecture (RFC 4251)
- The Secure Shell (SSH) Authentication Protocol (RFC 4252)
- The Secure Shell (SSH) Transport Layer Protocol (RFC 4253)
- The Secure Shell (SSH) Connection Protocol (RFC 4254)
- The SSH (Secure Shell) Remote Login Protocol (draft-ylonen-ssh-protocol-00.txt)
- SSH File Transfer Protocol (draft-ietf-secsh-filexfer-13.txt)

Secure Shell supports the following features for both SSH version 2 and SSH version 1.5:

- Inbound SSH connections (server mode) and outbound SSH connections (client mode).
- File loading to and from remote machines using Secure Copy, using either the SSH client or SSH server mode.
- RSA public keys with lengths of 768–32768 bits, and DSA keys with lengths of 1024 bits. Keys are stored in a format compatible with other SSH implementations, and mechanisms are provided to copy keys to and from your device.
- Secure encryption, such as Triple DES and Blowfish.
- Remote non-interactive shell that allows arbitrary commands to be sent securely to your device, possibly automatically.
- Compression of Secure Shell traffic.
- Tunnelling of TCP/IP traffic.

Secure Shell supports the following features for SSH version 2 only:

- File loading from remote machines using SSH File Transfer Protocol (SFTP).
- A login banner on the SSH server, that displays when SSHv2 clients connect to the server.

Configuring the SSH Server

This section provides instructions on:

- [Creating a Host Key](#)
- [Enabling the Server](#)
- [Modifying the Server](#)
- [Validating the Server Configuration](#)
- [Adding SSH Users](#)
- [Authenticating SSH Users](#)
- [Adding a Login Banner](#)
- [Monitoring the Server and Managing Sessions](#)
- [Debugging the Server](#)

Creating a Host Key

The SSH server uses either an RSA or DSA host key to authenticate itself with SSH clients. This key must be configured before the SSH server can operate. If no host key exists, you cannot start the SSH server.

Once created, the host key is stored securely on the device. To generate a host key for the SSH server, use the command:

```
awplus(config)# crypto key generate hostkey {dsa|rsa|rsa1}
[<768-32768>]
```

This command has two parameters for creating RSA keys. The `rsa` parameter creates a host key for SSH version 2 sessions only. To create a host key for SSH version 1 sessions, use the `rsa1` parameter.

To destroy a host key, use the command:

```
awplus(config)# crypto key destroy hostkey {dsa|rsa|rsa1}
```

To display a host key stored on your device, use the command:

```
awplus(config)# show crypto key hostkey [dsa|rsa|rsa1]
```

Enabling the Server

You must enable the SSH server before connections from SSH, SCP, and SFTP clients are accepted. When the SSH server is disabled it rejects connections from SSH clients. The SSH server is disabled by default on your device.

To enable the SSH server, use the command:

```
awplus(config)# service ssh [ip|ipv6]
```

To disable the SSH server, use the command:

```
awplus(config)# no service ssh [ip|ipv6]
```

When enabled, the SSH server allows SCP and SFTP sessions by default. To disable these services, use the commands:

```
awplus(config)# no ssh server scp
```

```
awplus(config)# no ssh server sftp
```

This allows you to reject SCP or SFTP file transfer requests, while still allowing Secure Shell connections. To re-enable SCP and SFTP services, use the command:

```
awplus(config)# ssh server scp
```

```
awplus(config)# ssh server sftp
```

Modifying the Server

To modify the SSH version that the server supports, or the TCP port that the server listens to for incoming sessions, use the command:

```
awplus(config)# ssh server {[v1v2|v2only]|<1-65535>}
```

The server listens on port 22 for incoming sessions, and supports both SSH version 2 and SSH version 1, by default.

To modify session and login timeouts on the SSH server, and the number of unauthenticated connections the server allows, use the command:

```
awplus(config)# ssh server {[session-timeout <0-3600>]  
[login-timeout <1-600>]  
[max-startups <1-128>]}
```

The SSH server waits 60 seconds for a client to authenticate itself, by default. You can alter this waiting time by using the **login-timeout** parameter. If the client is still not authenticated after the set timeout, then the SSH server disconnects the session.

The SSH server only allows only 10 unauthenticated SSH sessions at any point in time, by default. You can modify the number of unauthenticated sessions it allows, by using the **max-startups** parameter.

Once a client has authenticated, the SSH session does not time out, by default. Use the **session-timeout** parameter to set a **maximum time period the server waits before deciding that a session is inactive and terminating it**

For example, to set the session timeout to 600 seconds, the login timeout to 30 seconds, and the maximum number of concurrent unauthenticated sessions to 5, use the command:

```
awplus(config)# ssh server session-timeout 600 login-timeout  
30 max-startups 5
```

To remove the configured session timeout, login timeout, or maximum startups, use the command:

```
awplus(config)# no ssh server session-timeout login-timeout  
max-startups
```

Validating the Server Configuration

To validate the SSH server configuration, use the command:

```
awplus(config)# show running-config ssh
```

Adding SSH Users

The SSH server requires you to register SSH users. Users that are not registered cannot access the SSH server. Ensure first that you have defined the user in the Authorized User Database of your device. To add a new user, use the command:

```
awplus(config)# username USERNAME (privilege 1-15) password  
PASSWORD
```

To register a user with the SSH server, use the command:

```
awplus(config)# ssh server allow-users <username-pattern>  
[<hostname-pattern>]
```

Registered entries can contain just the username, or the username with some host details, such as an IP address range. Additionally you can specify a range of users or hostname details by using an asterisk to match any string of characters. For example, to allow any user from the IP range 192.168.1.1 to 192.168.1.255, use the command:

```
awplus(config)# ssh server allow-users * 192.168.1.*
```

To display the list of allowed users, use the command:

```
awplus# show ssh server allow-users
```

To delete an entry from the list of allowed users, use the command:

```
awplus(config)# no ssh server allow-users <username-pattern>  
[<hostname-pattern>]
```

The SSH server also contains a list of denied users. The server checks all incoming sessions against this list and denies any matching session, regardless of whether the session matches an entry in the allowed users list. To add an entry to the list of denied users, use the command:

```
awplus(config)# ssh server deny-users <username-pattern>  
[<hostname-pattern>]
```

This allows you to deny specific users from a range of allowed users. For example, to deny a user with the IP address 192.168.1.12, use the command:

```
awplus(config)# ssh server deny-users * 192.168.1.12
```

To display the database of denied users, use the command:

```
awplus# show ssh server deny-users
```

To delete a client from the database of denied users, use the command:

```
awplus(config)# no ssh server deny-users <username-pattern>
[<hostname-pattern>]
```

Authenticating SSH Users

SSH users can use either their password or public key authentication to authenticate themselves with the SSH server. To use public key authentication, copy the user's public key file from their client device to the SSH server. To associate the key with a user, use the command:

```
awplus(config)# crypto key pubkey-chain userkey <username>
[<filename>]
```

For example, to associate the file `key.pub` with the user "langley", use the command:

```
awplus(config)# crypto key pubkey-chain userkey langley
key.pub
```

To add a key as text into the terminal for user "geoff", first enter the command:

```
awplus(config)# crypto key pubkey-chain userkey geoff
```

then paste or type the key in as text.

You can add multiple keys for the same user. To display the list of public keys associated with a user, use the command:

```
awplus(config)# show crypto key pubkey-chain userkey
<username> [<1-65535>]
```

The `<1-65535>` parameter allows you to display an individual key.

To delete a key associated with a user from your device, use the command:

```
awplus(config)# no crypto key pubkey-chain userkey
<username> <1-65535>
```

Adding a Login Banner

You can add a login banner to the SSH server for sessions with SSH version 2 clients. The server displays the banner to clients before the login prompt. To set the login banner's message, use the command:

```
awplus(config)# banner login
```

then enter your message and use Ctrl+D to finish.

To view the configured login banner, use the command:

```
awplus# show banner login
```

To remove the configured message for the login banner, use the command:

```
awplus(config)# no banner login
```

Monitoring the Server and Managing Sessions

To display the current status of the SSH server, use the command:

```
awplus# show ssh server
```

To display the current status of SSH sessions on your device, use the command:

```
awplus# show ssh
```

Note that this displays both SSH server and SSH client sessions that your Allied Telesis device is running. Use this command to view the unique identification number assigned to each incoming or outgoing SSH session. You need the ID number when terminating a specific session from your device.

To terminate a session, or all sessions, use the command:

```
awplus# clear ssh {<1-65535>|all}
```

Debugging the Server

Information which may be useful for troubleshooting the SSH server is available using the SSH debugging function. You can enable server debugging while the SSH server is functioning. Use the command:

```
awplus# debug ssh server [brief|full]
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

Configuring the SSH Client

This section provides instructions on:

- [Modifying the Client](#)
- [Adding SSH Servers](#)
- [Authenticating with a Server](#)
- [Connecting to a Server and Running Commands](#)
- [Copying files to and from the Server](#)
- [Debugging the Client](#)

Modifying the Client

You can configure a selection of variables when using the SSH client. Note that the following configuration commands apply only to client sessions initiated after the command. The configured settings are not saved; after you have logged out from the SSH client, the client returns to using the default settings. Use the command:

```
awplus(config)# ssh client {port <1-65535>|version {1|2}|  
session-timeout <0-3600>|connect-timeout  
<1-600>}
```

The SSH client uses TCP port 22, by default. You can change the TCP port for the remote SSH server by using the **port** parameter.

The client supports both SSH version 1 and version 2 sessions, by default. To change the SSH client to only use a specific SSH version for sessions, for example SSH version 1, use the **version** parameter.

The client terminates sessions that are not established after 30 seconds, by default. You can change this time period by using the **session-timeout** parameter.

Once the client has authenticated with a server, the client does not time out the SSH session, by default. Use the **session-timeout** parameter to set a maximum time period the client waits before deciding that a session is inactive and terminating the session.

To modify the SSH client so that it uses port 2000 for sessions, and supports only SSH version 1 connections, use the command:

```
awplus(config)# ssh client port 2000 version 1
```

To modify the SSH client so that unestablished sessions time out after 60 seconds, and inactive sessions time out after 100 seconds, use the command:

```
awplus(config)# ssh client session-timeout 100 connect-timeout  
100
```

To remove the configured port, SSH version, session timeout, and connection timeout settings, use the command:

```
awplus(config)# no ssh client port version session-timeout  
connect-timeout
```

Adding SSH Servers

SSH servers identify themselves using a host key (see [“Creating a Host Key” on page 77.4](#)). Before the SSH client establishes a session with a SSH server, it confirms that the host key sent by the server matches its database entry for the server. If the database does not contain a host key for the server, then the SSH client requires you to confirm that the host key sent from the server is correct.

To add an SSH server to the client’s database, use the command:

```
awplus# Syntaxcrypto key pubkey-chain knownhosts [ip|
ipv6] <hostname> [rsa|dsa|rsa1]
```

To display the SSH servers in the client’s database, use the command:

```
awplus# Syntaxshow crypto key pubkey-chain knownhosts
[<1-65535>]
```

To remove an entry in the database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts <1-65535>
```

Authenticating with a Server

You can authenticate your session with a server by either using a password, or using RSA or DSA public key authentication. To use public key authentication, you must generate a pair of keys, one private and one public, and copy the public key onto the SSH server.

To generate an RSA or DSA set of private and public keys for an SSH user, use the command:

```
awplus(config)# crypto key generate userkey <username> {dsa|
rsa|rsa1} [<768-32768>]
```

You can generate one key of each encryption type per user on your client. When authenticating with an SSH server that supports SSH version 1 only, you must use a key generated by the **rsa1** parameter.

To copy the public key onto the SSH server, you must display the key onscreen. To display the public key associated with a user, use the command:

```
awplus# show crypto key userkey <username> [dsa|rsa|
rsa1]
```

To display the public keys set for other users, you must specify their username. Only users with the highest privilege setting can use this command to view the keys of other users.

To delete a public and private pair of keys associated with a user, use the command:

```
awplus(config)# crypto key destroy userkey <username> {dsa|rsa|
rsa1}
```

Connecting to a Server and Running Commands

To connect to a remote SSH server and execute a command, use the command:

```
awplus# Syntaxssh [ip|ipv6][{[user <username>]|[port  
<1-65535>]|[version {1|2}]] <hostname>  
[<line>]
```

By default, the SSH client attempts to use SSH version 2 with the SSH server. If this fails, the client uses SSH version 1.

For example, to connect to the SSH server at 192.168.1.2 as user "john", and execute the command "show sys", use the command:

```
awplus# ssh user john 192.168.1.2 "show sys"
```

Copying files to and from the Server

You can use either the SCP or SFTP client to transfer files from a remote SSH server. Use the command:

```
awplus# copy <source-url> <destination-url>
```

For example, to use SFTP to load a file from the SSH server 192.168.1.2, onto the flash memory of your device, use the command:

```
awplus# copy sftp://192.168.1.2/key.pub flash
```

To upload files to the SSH server, you must use SCP. For example, to upload the file bobskey.pub as the user "bob", use the command:

```
awplus# copy flash:/bobskey.pub scp://bob@192.168.1.2
```

For more information see [Chapter 6, Creating and Managing Files](#).

Debugging the Client

Information which may be useful for troubleshooting the SSH client is available using the SSH debugging function. You can enable client debugging while the SSH client is functioning. Use the command:

```
awplus# debug ssh client [brief|full]
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

Chapter 78: Secure Shell (SSH) Configuration

SSH Server Configuration Example	78.2
--	------

SSH Server Configuration Example

This chapter provides a Secure Shell server configuration example. For more information about the SSH server, see [Chapter 77, Secure Shell \(SSH\) Introduction](#). For detailed information about the commands used to configure the SSH server, see [Chapter 79, Secure Shell \(SSH\) Commands](#).

The following example configures a SSH server where:

- the SSH server uses RSA encryption
- the SSH server is compatible with both SSH version 1 and version 2 clients
- three SSH users are configured: Manager, John and Asuka. “Manager” can connect from only a defined range of hosts, while “John” and “Asuka” can SSH from all hosts
- the SSH users use RSA private and public key authentication

This example shows how to create RSA encryption keys, configure the Secure Shell server, and register users to make Secure Shell connections to your device.

Step 1: Login as a highest Privileged User.

To create the keys and add users, you must login as a privileged user.

Step 2: Create encryption keys.

Two RSA private keys are required before enabling the Secure Shell server for each type of SSH version. Use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa
awplus(config)# crypto key generate hostkey rsa1
awplus(config)# exit
```

To verify the key creation, use the command:

```
awplus# show crypto key hostkey
```

Step 3: Enable the Secure Shell server.

Enable Secure Shell on the device using the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

Modify the SSH server settings as desired. For example, to set the login-timeout to 60, and the session-timeout to 3600, use the commands:

```
awplus(config)# ssh server session-timeout 3600 login-timeout 60
```

To verify the server configuration, use the command:

```
awplus# show ssh
```

Step 4: Create SSH users.

In order to connect and execute commands, you must register users in the SSH user database, and in the User Authentication Database of the device.

To create the users `john` and `asuka` in the User Authentication Database, use the commands:

```
awplus# configure terminal
awplus(config)# username john privilege 15 password secret
awplus(config)# username asuka privilege 15 password
very-secret
```

To register `john` and `asuka` as SSH clients, use the commands:

```
awplus(config)# ssh server allow-users john
awplus(config)# ssh server allow-users asuka
```

To register “`manager`” as an SSH client so that can only connect from the IP address 192.168.1.1, use the command:

```
awplus(config)# ssh server allow-users manager 192.168.1.1
```

Step 5: Set up Authentication.

SSH users cannot connect unless the server can authenticate them. There are two ways to authenticate an SSH session: password authentication, and RSA or DSA private/public key authentication. When using password authentication, the user must supply their User Authentication Database password.

To use private/public key authentication, copy the public keys for each user onto the device. To copy the files onto flash from the key directory of an attached TFTP server, use the command:

```
awplus# copy tftp://key/john.pub flash:/john.pub
awplus# copy tftp://key/asuka.pub flash:/asuka.pub
```

To associate the key file with each user, use the command:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey john john.pub
awplus(config)# crypto key pubkey-chain userkey asuka
asuka.pub
awplus(config)# crypto key pubkey-chain userkey manager
manager.pub
```

Chapter 79: Secure Shell (SSH) Commands

Introduction	79.2
Command List	79.2
banner login (SSH)	79.2
clear ssh	79.3

undebug ssh server	79.40

Introduction

This chapter provides an alphabetical reference for commands used to configure Secure Shell (SSH). For more information, see [Chapter 77, Secure Shell \(SSH\) Introduction](#), and [Chapter 78, Secure Shell \(SSH\) Configuration](#).

Command List

banner login (SSH)

This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

Syntax banner login
no banner login

Default No banner is defined by default.

Mode Global Configuration

Examples To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login
```

Type CNTL/D to finish.

```
... banner message comes here ...
```

```
^D
```

```
awplus(config)#
```

and enter the message. Use Ctrl+D to finish.

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

Related Commands [show banner login](#)

clear ssh

This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

Syntax `clear ssh {<1-65535>|all}`

Parameters	Description
<1-65535>	Specify a session ID in the range 1 to 65535 to delete a specific session.
all	Delete all SSH sessions.

Mode Privileged Exec

Examples To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

Related Commands [service ssh](#)
[ssh](#)

crypto key destroy hostkey

This command deletes the existing public and private keys of the SSH server. Note that for an SSH server to operate it needs at least one set of hostkeys configured before an SSH server is started.

Syntax `crypto key destroy hostkey {dsa|rsa|rsa1}`

Parameter	Description
dsa	Deletes the existing DSA public and private keys.
rsa	Deletes the existing RSA public and private keys configured for SSH version 2 connections.
rsa1	Deletes the existing RSA public and private keys configured for SSH version 1 connections.

Mode Global Configuration

Example To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

Related Commands [crypto key generate hostkey](#)
[service ssh](#)

crypto key destroy userkey

This command destroys the existing public and private keys of an SSH user configured on the device.

Syntax `crypto key destroy userkey <username> {dsa|rsa|rsa1}`

Parameters	Description
<code><username></code>	Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<code>dsa</code>	Deletes the existing DSA userkey.
<code>rsa</code>	Deletes the existing RSA userkey configured for SSH version 2 connections.
<code>rsa1</code>	Deletes the existing RSA userkey for SSH version 1 connections.

Mode Global Configuration

Example To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

Related Commands [crypto key generate hostkey](#)
[show ssh](#)
[show crypto key hostkey](#)

crypto key generate hostkey

This command generates public and private keys for the SSH server using either an RSA or DSA cryptography algorithm. You must define a host key before enabling the SSH server. Start SSH server using the **service ssh** command. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax `crypto key generate hostkey {dsa|rsa|rsa1} [<768-32768>]`

Parameters	Description
dsa	Creates a DSA hostkey. Both SSH version 1 and 2 connections can use the DSA hostkey.
rsa	Creates an RSA hostkey for SSH version 2 connections.
rsa1	Creates an RSA hostkey for SSH version 1 connections.
<768-32768>	The length in bits of the generated key. The default is 1024 bits.

Default 1024 bits is the default key length. The DSA algorithm supports 1024 bits.

Mode Global Configuration

Examples To generate an RSA host key for SSH version 2 connections that is 2048 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 2048
```

To generate a DSA host key, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate dsa
```

Related Commands [crypto key destroy hostkey](#)
[service ssh](#)
[show crypto key hostkey](#)

crypto key generate userkey

This command generates public and private keys for an SSH user using either an RSA or DSA cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax `crypto key generate userkey <username> {dsa|rsa|rsa1} [<768-32768>]`

Parameters	Description
<username>	Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
dsa	Creates a DSA userkey. Both SSH version 1 and 2 connections can use a key created with this command.
rsa	Creates an RSA userkey for SSH version 2 connections.
rsa1	Creates an RSA userkey for SSH version 1 connections.
<768-32768>	The length in bits of the generated key. The DSA algorithm supports only 1024 bits. Default: 1024.

Mode Global Configuration

Examples To generate a 2048-bits RSA user key for SSH version 2 connections for the user bob, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 2048
```

To generate a DSA user key for the user lapo, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo dsa
```

Related Commands [crypto key destroy userkey](#)
[show crypto key userkey](#)

crypto key pubkey-chain knownhosts

This command adds a public key of the specified SSH server to the known host database on your switch. The SSH client on your switch uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

Syntax `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [rsa|dsa|rsa1]`

`no crypto key pubkey-chain knownhosts <1-65535>`

Parameter	Description
<code>ip</code>	Keyword used prior to specifying an IPv4 address
<code>ipv6</code>	Keyword used prior to specifying an IPv6 address
<code><hostname></code>	IPv4/IPv6 address or hostname of a remote server in the format <code>a.b.c.d</code> for an IPv4 address, or in the format <code>x:x::x:x</code> for an IPv6 address.
<code>rsa</code>	Specify the RSA public key of the server to be added to the known host database.
<code>dsa</code>	Specify the DSA public key of the server to be added to the known host database.
<code>rsa1</code>	Specify the SSHv1 public key of the server to be added to the know host database.
<code><1-65535></code>	Specify a key identifier when removing a key using the no parameter.

Default If no cryptography algorithm is specified, then `rsa` is used as the default cryptography algorithm.

Mode Privilege Exec

Usage This command adds a public key of the specified SSH server to the known host database on the switch. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

Examples To add the RSA host key of the remote SSH host IPv4 address `192.0.2.11` to the known

host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

Validation **show crypto key pubkey-chain knownhosts**
Commands

crypto key pubkey-chain userkey

This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

Syntax `crypto key pubkey-chain userkey <username> [<filename>]`
`no crypto key pubkey-chain userkey <username> <1-65535>`

Parameters	Description
<username>	Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default
<filename>	Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.
<1-65535>	The key ID number of the user's key. Specify the key ID to delete a key.

Mode Global Configuration

Usage You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <username>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the switch first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the switch using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <username>** command. Use [Ctrl]+D after entering it to save it.

Examples To generate a valid SSH RSA key on the switch and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit

awplus# show crypto key hostkey rsa
AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J

+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=

awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey joe
Type CNTL/D to finish:
AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J
20bWluhnUC768EoWhyPW6FZ2t536005M29EpKBmGq1kQaz5V0mU9
IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16
+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=
control-D

awplus(config)#
```

To add a public key for the user graydon from the file key.pub, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user tamara from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user john, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

Related Commands [show crypto key pubkey-chain userkey](#)

debug ssh client

This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

Syntax `debug ssh client [brief|full]`
`no debug ssh client`

Parameter	Description
brief	Enables brief debug mode.
full	Enables full debug mode.

Default SSH client debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

Related Commands [debug ssh server](#)
[show ssh client](#)
[undebug ssh client](#)

debug ssh server

This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

Syntax `debug ssh server [brief|full]`

`no debug ssh server`

Parameter	Description
brief	Enables brief debug mode.
full	Enables full debug mode.

Default SSH server debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

Related Commands [debug ssh client](#)

[undebug ssh server](#)

service ssh

This command enables the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

SSH server needs a host key before it starts. If an SSHv2 host key does not exist, then this command fails. If SSHv1 is enabled but a host key for SSHv1 does not exist, then SSH service is unavailable for version 1.

The **no** variant of this command disables the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the **clear ssh** command.

Syntax `service ssh [ip|ipv6]`
`no service ssh [ip|ipv6]`

Default The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

Mode Global Configuration

Examples To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

show banner login

This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

Syntax `show banner login`

Mode User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

Example To display the current login banner message, use the command:

```
awplus# show banner login
```

Related Commands [banner login \(SSH\)](#)

show crypto key hostkey

This command displays the SSH host keys generated by RSA and DSA algorithm.

A host key pair (public and private keys) is needed to enable SSH server. The private key remains on the device secretly. The public key is copied to SSH clients to identify the server

Syntax `show crypto key hostkey [dsa|rsa|rsa1]`

Parameter	Description
dsa	Displays the DSA algorithm public key.
rsa	Displays the RSA algorithm public key for SSH version 2 connections.
rsa1	Displays the RSA algorithm public key for SSH version 1 connections.

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-1: Example output from the show crypto key hostkey command**

Type	Bits	Fingerprint
rsa	2058	4e:7d:1d:00:75:79:c5:cb:c8:58:2e:f9:29:9c:1f:48
dsa	1024	fa:72:3d:78:35:14:cb:9a:1d:ca:1c:83:2c:7d:08:43
rsa1	1024	e2:1c:c8:8b:d8:6e:19:c8:f4:ec:00:a2:71:4e:85:8b

Table 79-1: Parameters in output of the show crypto key hostkey command

Parameter	Description
Type	Algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the public key.

Examples To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

Related Commands [crypto key destroy hostkey](#)

show crypto key pubkey-chain knownhosts

This command displays the list of public keys maintained in the known host database on the device.

Syntax `show crypto key pubkey-chain knownhosts [<1-65535>]`

Parameter	Description
<1-65535>	Key identifier for a specific key. Displays the public key of the entry if specified.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-2: Example output from the show crypto key public-chain knownhosts command**

No	Hostname	Type	Fingerprint
1	172.16.23.1	rsa	c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18
2	172.16.23.10	rsa	c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd
3	5ffe:1053:ac21:ff00:0101:bcdf:ffff:0001	rsa1	af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57

Table 79-2: Parameters in the output of the show crypto key public-chain knownhosts command

Parameter	Description
No	Number ID of the key.
Hostname	Host name of the known SSH server.
Type	The algorithm used to generate the key.
Fingerprint	Checksum value for the public key.

Examples To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

Related Commands [crypto key pubkey-chain knownhosts](#)

show crypto key pubkey-chain userkey

This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

Syntax `show crypto key pubkey-chain userkey <username> [<1-65535>]`

Parameter	Description
<username>	User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<1-65535>	Key identifier for a specific key.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-3: Example output from the show crypto key public-chain userkey command**

No	Type	Bits	Fingerprint
1	dsa	1024	2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd
2	rsa	2048	6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e

Table 79-3: Parameters in the output of the show crypto key userkey command

Parameter	Description
No	Number ID of the key.
Type	The algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the key.

To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

Related Commands [crypto key pubkey-chain userkey](#)

show crypto key userkey

This command displays the public keys created on this device for the specified SSH user.

Syntax `show crypto key userkey <username> [dsa|rsa|rsa1]`

Parameter	Description
<username>	User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
dsa	Displays the DSA public key.
rsa	Displays the RSA public key used for SSH version 2 connections.
rsa1	Displays the RSA key used for SSH version 1 connections.

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-4: Example output from the show crypto key userkey command**

Type	Bits	Fingerprint
rsa	2048	e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11
rsa1	1024	12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b

Table 79-4: Parameters in the output of the show crypto key userkey command

Parameter	Description
Type	The algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the key.

Examples To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

Related Commands [crypto key generate userkey](#)

show running-config ssh

This command displays the current running configuration of Secure Shell (SSH).

Syntax `show running-config ssh`

Mode Privileged Exec and Global Configuration

Output **Figure 79-5: Example output from the show running-config ssh command**

```
!
ssh server session-timeout 600
ssh server login-timeout 30
ssh server allow-users manager 192.168.1.*
ssh server allow-users john
ssh server deny-user john*.a-company.com
ssh server
```

Table 79-5: Parameters in the output of the show running-config ssh command

Parameter	Description
<code>ssh server</code>	SSH server is enabled.
<code>ssh server v2</code>	SSH server is enabled and only support SSHv2.
<code>ssh server <port></code>	SSH server is enabled and listening on the specified TCP port.
<code>no ssh server scp</code>	SCP service is disabled.
<code>no ssh server sftp</code>	SFTP service is disabled.
<code>ssh server session-timeout</code>	Configure the server session timeout.
<code>ssh server login-timeout</code>	Configure the server login timeout.
<code>ssh server max-startups</code>	Configure the maximum number of concurrent sessions waiting authentication.
<code>no ssh server authentication password</code>	Password authentication is disabled.
<code>no ssh server authentication publickey</code>	Public key authentication is disabled.
<code>ssh server allow-users</code>	Add the user (and hostname) to the allow list.
<code>ssh server deny-users</code>	Add the user (and hostname) to the deny list.

Example To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

Related Commands [service ssh](#)
[show ssh server](#)

show ssh

This command displays the active SSH sessions on the device, both incoming and outgoing.

Syntax `show ssh`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-6: Example output from the show ssh command**

```
Secure Shell Sessions:
ID  Type Mode  Peer Host      Username      State          Filename
-----
414 ssh  server 172.16.23.1   root          open
456 ssh  client 172.16.23.10 manager       user-auth
459 scp  client 172.16.23.12 root          download       550dev_.awd
463 ssh  client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
                                manager       user-auth
```

Table 79-6: Parameters in the output of the show ssh command

Parameter	Description																						
ID	Unique identifier for each SSH session.																						
Type	Session type; either SSH, SCP, or SFTP.																						
Mode	Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session.																						
Peer Host	The hostname or IP address of the remote server or client.																						
Username	Login user name of the server.																						
State	The current state of the SSH session. One of: <table border="1"> <tbody> <tr> <td>connecting</td> <td>The device is looking for a remote server.</td> </tr> <tr> <td>connected</td> <td>The device is connected to the remote server.</td> </tr> <tr> <td>accepted</td> <td>The device has accepted a new session.</td> </tr> <tr> <td>host-auth</td> <td>host-to-host authentication is in progress.</td> </tr> <tr> <td>user-auth</td> <td>User authentication is in progress.</td> </tr> <tr> <td>authenticated</td> <td>User authentication is complete.</td> </tr> <tr> <td>open</td> <td>The session is in progress.</td> </tr> <tr> <td>download</td> <td>The user is downloading a file from the device.</td> </tr> <tr> <td>upload</td> <td>The user is uploading a file from the device.</td> </tr> <tr> <td>closing</td> <td>The user is terminating the session.</td> </tr> <tr> <td>closed</td> <td>The session is closed.</td> </tr> </tbody> </table>	connecting	The device is looking for a remote server.	connected	The device is connected to the remote server.	accepted	The device has accepted a new session.	host-auth	host-to-host authentication is in progress.	user-auth	User authentication is in progress.	authenticated	User authentication is complete.	open	The session is in progress.	download	The user is downloading a file from the device.	upload	The user is uploading a file from the device.	closing	The user is terminating the session.	closed	The session is closed.
connecting	The device is looking for a remote server.																						
connected	The device is connected to the remote server.																						
accepted	The device has accepted a new session.																						
host-auth	host-to-host authentication is in progress.																						
user-auth	User authentication is in progress.																						
authenticated	User authentication is complete.																						
open	The session is in progress.																						
download	The user is downloading a file from the device.																						
upload	The user is uploading a file from the device.																						
closing	The user is terminating the session.																						
closed	The session is closed.																						
Filename	Local filename of the file that the user is downloading or uploading.																						

Example To display the current SSH sessions on the device, use the command:

```
awplus# show ssh
```

Related Commands [clear ssh](#)

show ssh client

This command displays the current configuration of the Secure Shell client.

Syntax `show ssh client`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-7: Example output from the show ssh client command**

```
Secure Shell Client Configuration
-----
Port                               : 22
Version                             : 2,1
Connect Timeout                     : 30 seconds
Session Timeout                     : 0 (off)
Debug                               : NONE
```

Table 79-7: Parameters in the output of the show ssh client command

Parameter	Description
Port	SSH server TCP port where the SSH client connects to. The default is port 22.
Version	SSH server version; either "1", "2" or "2,1".
Connect Timeout	Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout.
Debug	Whether debugging is active on the client.

Example To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

Related Commands [show ssh server](#)

show ssh server

This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

Syntax `show ssh server`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-8: Example output from the show ssh server command**

```
Secure Shell Server Configuration
-----
SSH Server           : Enabled
Port                 : 22
Version              : 2
Services              : scp, sftp
User Authentication  : publickey, password
Idle Timeout         : 60 seconds
Maximum Startups     : 10
Debug                : NONE
```

Table 79-8: Parameters in the output of the show ssh server command

Parameter	Description
SSH Server	Whether the Secure Shell server is enabled or disabled.
Port	TCP port where the Secure Shell server listens for connections. The default is port 22.
Version	SSH server version; either "1", "2" or "2,1".
Services	List of the available Secure Shell service; one or more of SHELL, SCP or SFTP.
Authentication	List of available authentication methods.
Login Timeout	Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.
Idle Timeout	Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off.
Maximum Startups	The maximum number of concurrent connections that are waiting authentication. The default is 10.
Debug	Whether debugging is active on the server.

Example To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

Related Commands [show ssh](#)
[show ssh client](#)

show ssh server allow-users

This command displays the user entries in the allow list of the SSH server.

Syntax `show ssh server allow-users`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-9: Example output from the show ssh server allow-users command**

Username	Remote Hostname (pattern)
awplus	192.168.*
john	
manager	*.alliedtelesis.com

Table 79-9: Parameters in the output of the show ssh server allow-users command

Parameter	Description
Username	User name that is allowed to access the SSH server.
Remote Hostname (pattern)	IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts.

Example To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

Related Commands [ssh server allow-users](#)
[ssh server deny-users](#)

show ssh server deny-users

This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

Syntax `show ssh server deny-users`

Mode User Exec, Privileged Exec and Global Configuration

Output **Figure 79-10: Example output from the show ssh server deny-user command**

Username	Remote Hostname (pattern)
john	*.b-company.com
manager	192.168.2.*

Table 79-10: Parameters in the output of the show ssh server deny-user command

Parameter	Description
Username	The user that this rule applies to.
Remote Hostname (pattern)	IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts.

Example To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

Related Commands [ssh server allow-users](#)
[ssh server deny-users](#)

ssh

This command initiates a Secure Shell connection to a remote SSH server.

If the server requests a password for the user login, the user needs to type in the correct password on "Password:" prompt.

SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, it is required that the public key of the server should be explicitly added to the known host database.

Note  Note that any hostname specified with ssh cannot begin with a hyphen (-) character.

Syntax `ssh [ip|ipv6][{[user <username>]|[port <1-65535>]|[version {1|2}]]] <hostname> [<line>]`

Parameter	Description
ip	Specify IPv4 SSH.
ipv6	Specify IPv6 SSH.
user	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used. <username> User name to login on the remote server.
port	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used. <1-65535> TCP port.
version	SSH client version. If version is specified, the SSH client supports only the specified SSH version. By default, SSH client uses SSHv2 first. If the server does not support SSHv2, it will try SSHv1. The default version can be configured by "ssh client" command. 1 Use SSH version 1. 2 Use SSH version 2.
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format a.b.c.d for an IPv4 address, or in the format x:x:x:x for an IPv6 address corresponding to the ip or ipv6 optional keywords used. Note that any hostname specified with ssh cannot begin with a hyphen (-) character. <line> Command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

Mode User Exec and Privileged Exec

Examples To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user **manager**, use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server with `example_host` using IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the `cmd` command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

ssh client

This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the **ssh client** command, and restores the defaults.

This command does not affect the existing SSH sessions.

Syntax

```
ssh client {port <1-65535>|version {1|2}|session-timeout <0-3600>|
connect-timeout <1-600>}
no ssh client {port|version|session-timeout|connect-timeout}
```

Parameter	Description
port	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: 22
	<1-65535> TCP port number.
version	The SSH version used by the client for SSH sessions. The SSH client supports both version 2 and version 1 Default: version 2 Note: SSH version 2 is the default SSH version. SSH client supports SSH version 1 if SSH version 2 is not configured using a ssh version command.
	1 SSH clients on the device supports SSH version 1 only.
	2 SSH clients on the device supports SSH version 2 only
session-timeout	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: 0 (session timer remains off)
	<0-3600> Timeout in seconds.
connect-timeout	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: 30
	<1-600> Timeout in seconds.

Mode Privileged Exec

Examples To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

Related Commands [show ssh client](#)
[ssh](#)

ssh server

This command modifies the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

The **no** variant of this command restores the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the **service ssh** command.

Syntax

```
ssh server {[v1v2|v2only]|<1-65535>}
ssh server {[session-timeout <0-3600>} [login-timeout <1-600>}
    [max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout] [max-startups]}
```

Parameter	Description
v1v2	Supports both SSHv2 and SSHv1 client connections. Default: v1v2
v2only	Supports SSHv2 client connections only.
<1-65535>	The TCP port number that the server listens to for incoming SSH sessions. Default: 22
session-timeout	There is a maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages. Default: 0 (session timer remains off). <0-3600> Timeout in seconds.
login-timeout	The maximum time period the server waits before disconnecting an unauthenticated client. Default: 60 <1-600> Timeout in seconds.
max-startups	The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection. Default: 10 <1-128> Number of sessions.

Mode Global Configuration

Examples To configure the session timer of SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 600
```

To configure the login timeout of SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting authentication from SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups
```

To set max-startups parameters of SSH server to the default configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the Secure Shell server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

To force the Secure Shell server to support SSHv2 only, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v2only
```

To support both SSHv2 and SSHv1, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v1v2
```

Related Commands [show ssh server](#)
[ssh client](#)

ssh server allow-users

This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

Syntax `ssh server allow-users <username-pattern> [<hostname-pattern>]`
`no ssh server allow-users <username-pattern> [<hostname-pattern>]`

Parameter	Description
<code><username-pattern></code>	The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.
<code><hostname-pattern></code>	The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Example To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from a `company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server allow-users john 192.168.1.*
```

Related Commands [show running-config ssh](#)
[show ssh server allow-users](#)
[ssh server deny-users](#)

ssh server authentication

This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

Syntax `ssh server authentication {password|publickey}`
`no ssh server authentication {password|publickey}`

Parameter	Description
password	Specifies user password authentication for SSH server.
publickey	Specifies user publickey authentication for SSH server.

Default Both RSA public-key authentication and password authentication are enabled by default.

Mode Global Configuration

Usage For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

Example To enable password authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable publickey authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable password authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable publickey authentication for users connecting through SSH, use the

commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server authentication publickey
```

Related Commands [crypto key pubkey-chain userkey](#)
[service ssh](#)

ssh server deny-users

This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

Syntax `ssh server deny-users <username-pattern> [<hostname-pattern>]`
`no ssh server deny-users <username-pattern> [<hostname-pattern>]`

Parameter	Description
<code><username-pattern></code>	The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters.
<code><hostname-pattern></code>	The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Example To deny the user john to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user john to access SSH login from b-company.com domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server deny-users john 192.168.2.*
```

Related Commands [show running-config ssh](#)
[show ssh server deny-users](#)

ssh server resolve-host

This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

Syntax `ssh server resolve-hosts`
`no ssh server resolve-hosts`

Default This feature is disabled by default.

Mode Global Configuration

Usage Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. To add a DNS server to the list of servers that the device sends DNS queries to use the [ip name-server](#) command on page 27.42.

For information about configuring DNS see [“Domain Name System \(DNS\)” on page 26.8](#).

Example To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

Related Commands [ip name-server](#)

ssh server scp

This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

Syntax `ssh server scp`
`no ssh server scp`

Mode Global Configuration

Examples To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

Related Commands [show running-config ssh](#)
[show ssh server](#)

ssh server sftp

This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

Syntax `ssh server sftp`
`no ssh server sftp`

Mode Global Configuration

Examples To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

Configure DHCP Snooping	80.10
Disabling DHCP Snooping	80.15
Related Features	80.16

Introduction

This chapter provides information about DHCP snooping, support for it on this switch, and how to configure it.

For detailed descriptions of the commands used to configure DHCP snooping, see [Chapter 81, DHCP Snooping Commands](#); for related ACL commands, see [Chapter 59, IPv4 Hardware Access Control List \(ACL\) Commands](#). For information about Dynamic Host Configuration protocol and how to configure it, see [Chapter 90, Dynamic Host Configuration Protocol \(DHCP\) Introduction](#) and [Chapter 91, Dynamic Host Configuration Protocol \(DHCP\) Commands](#).

DHCP Snooping

DHCP snooping provides an extra layer of security on the switch via dynamic IP source filtering. DHCP snooping filters out traffic received from unknown, or 'untrusted' ports, and builds and maintains a DHCP snooping database.

Dynamic Host Configuration Protocol (DHCP) dynamically assigns IP addresses to client devices. The use of dynamically assigned addresses requires traceability, so that a service provider can determine which clients own a particular IP address at a certain time.

With DHCP snooping, IP sources are dynamically verified, and filtered accordingly. IP packets that are not sourced from recognized IP addresses can be filtered out. This ensures the required traceability.

With DHCP snooping, an administrator can control port-to-IP connectivity by:

- permitting port access to specified IP addresses only
- permitting port access to DHCP issued IP addresses only
- dictating the number of IP clients on any given port
- passing location information about an IP client to the DHCP server
- permitting only known IP clients to ARP

Ports on the switch are classified as either trusted or untrusted:

- Trusted ports receive only messages from within your network.
- Untrusted ports receive messages from outside your network.

DHCP snooping blocks unauthorized IP traffic from untrusted ports, and prevents it from entering the trusted network. It validates DHCP client packets from untrusted ports and forwards them to trusted ports in the VLAN.

On this switch, DHCP snooping is disabled by default, and can be enabled on per-VLAN basis to operate over switch ports and over static and dynamic (LACP) link aggregators (channel groups).

DHCP Snooping Database

When you enable DHCP snooping, the switch intercepts all DHCP packets it receives, and sends them to the Central Processing Unit (CPU), where they are verified. The DHCP snooping database stores and maintains this information. The database contains entries for:

- current IP address leases dynamically allocated by a DHCP server
- static or dynamic entries added from the command line—typically used to add a DHCP snooping entry for a client that has a preconfigured IP address on an untrusted port

Database backup The switch periodically saves the dynamic entries in the DHCP snooping database to a hidden file (`.dhcp.dsn.gz`) in Non-Volatile Storage (NVS), or can be configured to save it to Flash memory or to a USB storage device.

If such a database file exists, it is loaded when the switch starts up with DHCP snooping enabled, or when DHCP snooping is subsequently enabled.

Lease entries Each entry in the database corresponds to a DHCP IP address lease.

For dynamic entries added automatically by DHCP snooping, each entry contains the following information:

- the IP address that was allocated to that client
- the MAC address of the client device
- the time until expiry
- the VLAN to which the client is attached
- the port to which the client is attached
- the IP address of the DHCP server

For static entries added from the command line, each entry contains the following subset of information:

- the IP address allocated to the client
- the MAC address of the client device (optional)
- the VLAN to which the client is attached
- the port to which the client is attached

Each entry also shows its source: Dynamic or Static.

On this switch, the maximum number of lease entries that can be stored in the DHCP snooping database for each port can be configured—the default is 1.

Expired entries For dynamic entries, the switch receives expiry information with the client lease information in DHCP packets. Entries expire when the time left to expiry is 0 seconds. Expired entries are automatically deleted from the database. Static entries have no expiry information, and are not checked. All dynamic entries in the database are written to the backup file. Whenever DHCP snooping is enabled, the DHCP snooping database is repopulated from the backup file and any static entries in the start-up configuration file. Any entries present in the backup file that have expired are ignored.

DHCP Relay Agent Option 82

If the switch is at the edge of the network, it can be configured to insert DHCP Relay Agent Option 82 information into client-originated BOOTP/DHCP packets that it is forwarding to a DHCP server. The switch also removes DHCP Relay Agent Option 82 information from BOOTP reply packets destined for an untrusted port if the DHCP client hardware is directly attached to a port on the switch.

DHCP servers that are configured to recognize DHCP Relay Agent Option 82 may use the information to implement IP address or other parameter assignment policies, based on the network location of the client device.

When DHCP Relay Agent Option 82 information for DHCP snooping is enabled, the switch inserts DHCP Relay Agent Option 82 information into BOOTP request packets received from an untrusted port. The switch inserts the following DHCP Relay Agent Option 82 information:

- Remote ID: this identifies the host. By default, this is the MAC address of the switch (sub-option1).
- Circuit ID: this specifies the switch port and VLAN ID that the client-originated DHCP packet was received on (sub-option2). By default, this is the VLAN ID and the Iindex (interface number).
- Subscriber ID (optional): this is a string of up to 50 characters that differentiates or groups client ports on the switch (sub-option 6).

Support on this switch

This switch inserts DHCP Relay Agent Option 82 (agent option) information into DHCP packets received through untrusted ports, and removes it from DHCP packets transmitted through untrusted ports. This is enabled by default, and can be disabled if required.

You can specify values for the Remote ID and Circuit ID sub-options of the DHCP Relay Agent Option 82 field. The Remote ID can be specified as an alphanumeric (ASCII) string, 1 to 63 characters in length. The Circuit ID can be specified as the VLAN ID and port number.

Subscriber IDs can be configured for ports, and if they have been configured, they are inserted in DHCP packets as part of the DHCP Relay Agent Option 82 information.

Regardless of whether DHCP Relay Agent Option 82 is enabled for DHCP snooping, if the switch receives a BOOTP/DHCP request packet on a trusted port, and the packet contains DHCP Relay Agent Option 82 information, it does not update the DHCP Relay Agent Option 82 information for the receiver port. By default, if it receives a DHCP request packet containing DHCP Relay Agent Option 82 information on an untrusted port, it drops the packet. However, if the switch is connected via untrusted ports to edge switches that insert DHCP Relay Agent Option 82 information into DHCP packets, you may need to allow these DHCP packets through the untrusted ports—the switch can be configured to forward these packets.

Note that the DHCP Relay Agent Option 82 agent information inserted by the DHCP snooping differs from the information added by DHCP Relay (see [“DHCP Relay Agent Introduction” on page 90.9](#)). The switch cannot be configured to use both the DHCP relay agent option and DHCP snooping.

Operation Figure 80-1 shows DHCP packet flow between DHCP clients and server, where:

- Switch A has DHCP snooping enabled. The DHCP server is connected to a trusted port on Switch A; DHCP clients and Switch B are connected to untrusted ports.
- Switch A is configured to add and remove DHCP Relay Agent Option 82 information (**ip dhcp snooping agent-option** command on page 81.10).
- Switch A is configured to forward DHCP packets that already contain DHCP Relay Agent Option 82 information without changing it (**ip dhcp snooping agent-option allow-untrusted** command on page 81.11).
- Switch B is Layer 2 switching traffic from downstream DHCP clients, and adds and removes DHCP Relay Agent Option 82 information.

Figure 80-1: DHCP packet flow with DHCP snooping and DHCP Relay Agent Option 82 (agent option)

For more information about DHCP Relay Agent Option 82, see RFC 3046, DHCP Relay Agent Information Option.

Traffic Filtering with DHCP Snooping

DHCP filtering prevents IP addresses from being falsified or 'spoofed'. This guarantees that customers cannot avoid detection by spoofing IP addresses that are not actually allocated to them. With DHCP filtering, the switch permits packets to enter over a specific port if their source IP address is currently allocated to a client connected to that port.

Support on this switch

On this switch, Access Control Lists (ACLs) based on DHCP snooping can be used with access groups to filter IP packets. For instance, IP traffic on untrusted ports can be limited to packets matching valid DHCP lease information stored in the DHCP snooping database. Quality of Service (QoS) configuration can also be applied to these ACLs.

The DHCP snooping feature is enabled or disabled per VLAN, and several of the related configuration settings are applied per port. If there are multiple VLANs on a port, all the VLANs will be subject to the same per-port settings.

Operation

Table 80-1 on page 80.7 shows the filtering that is applied by DHCP snooping on a switch with the following DHCP filtering configuration for untrusted ports:

- DHCP snooping is enabled on all VLANs (**service dhcp-snooping** command on page 81.24, **ip dhcp snooping** command on page 81.9)
- ARP security (**arp security** command on page 81.2) is enabled on all VLANs
- MAC address verification is enabled on the switch (**ip dhcp snooping verify mac-address** command on page 81.21; enabled by default), and all DHCP clients are directly connected to the switch.
- Access Control Lists allow IP packets that match the source IP address and MAC address of a valid lease entry in the DHCP snooping database, and deny other IP packets (**access-list** commands in **Chapter 59, IPv4 Hardware Access Control List (ACL) Commands**).
- DHCP requests containing DHCP Relay Agent Option 82 info are not allowed (**ip dhcp snooping agent-option allow-untrusted** command on page 81.11 this is disabled by default).
- Log messages and SNMP notifications are enabled for DHCP snooping and ARP security violations (**ip dhcp snooping violation** command on page 81.22, **arp security violation** command on page 81.3, **snmp-server enable trap** command on page 95.19).

Table 80-1: DHCP filtering on the switch

When the switch ...	And ...	Then the switch ...
DHCP packets		
Receives a DHCP BOOTP packet on a trusted port		Forwards the DHCP packet.
	The packet contains a valid IP address lease for a client, and the maximum number of leases for the client port has not been reached.	Adds or updates a lease entry in the DHCP snooping database.
	The maximum number of leases for the client port has been reached.	Drops the DHCP packet, generates a log message for the violation, generates an SNMP notification (trap), and does not add a lease entry to the database.
A lease entry in the DHCP snooping database expires		Removes the expired entry from the database.
Receives a DHCP BOOTP request packet on an untrusted port	The source MAC address and client hardware address match.	
Receives a DHCP BOOTP request packet on an untrusted port	The source MAC address and client hardware address do not match.	Drops the packet, generates a log message for the violation, and sends an SNMP notification (trap).
Receives a DHCP BOOTP request packet on an untrusted port	The packet contains DHCP Relay Agent Option 82 info.	Drops the DHCP packet, generates a log message for the violation, and sends an SNMP notification (trap).
Receives a DHCP BOOTP reply packet on an untrusted port		Drops the DHCP packet, generates a log message for the violation, and sends an SNMP notification (trap).
IP packets		
Receives an IP packet on a trusted port		Forwards the IP packet.
Receives an IP packet on an untrusted port	Its source MAC address, IP address, and receiving port match a valid lease entry in the DHCP snooping database.	Forwards the IP packet.
Receives an IP packet on an untrusted port	Its source MAC address, IP address, and receiving port do not match a valid lease entry in the DHCP snooping database.	Drops the packet. Does not generate a log message or an SNMP notification.
ARP packets		
Receives an ARP request on a trusted port		Forwards the ARP packet.
Receives an ARP request on an untrusted port	Its source MAC address, IP address, and receiving port match a valid entry in the DHCP snooping database	Forwards the ARP packet.
Receives an ARP request on an untrusted port	Its source MAC address, IP address, and receiving port do not match an entry in the DHCP snooping database	Drops the packet, generates a log message for the violation, and sends an SNMP notification (trap).

ARP Security

ARP security prevents ARP spoofing. ARP spoofing occurs when devices send fake, or 'spoofed', ARP messages to an Ethernet LAN. This makes it possible for an unauthorized host to claim to be an authorized host. The unauthorized host can then intercept traffic intended for the authorized host, and can access the wider network.

Spoofed ARP messages contain the IP address of an authorized host, with a MAC address which does not match the real MAC address of the host. When ARP security is enabled for DHCP snooping, the switch checks ARP packets sourced from untrusted ports against the entries in the DHCP snooping binding database. If it finds a matching entry, it forwards the ARP packet as normal. If it does not find a matching entry, it drops the ARP packet. This ensures that only trusted clients (with a recognized IP address and MAC address) can generate ARP packets into the network. ARP security is not applied to packets received on trusted ports.

ARP security is disabled by default, and can be enabled on VLANs to ensure that on untrusted ports, only trusted clients (with a recognized IP address and MAC address) can generate ARP packets into the network. ARP security is applied to both dynamic and static DHCP snooping entries. For static DHCP entries without a MAC address defined, ARP security compares only the IP address details.

MAC Address Verification

When MAC address verification is enabled, the switch forwards DHCP packets received on untrusted ports only if the source MAC address and client hardware address match. MAC address verification is enabled by default.

DHCP Snooping Violations

Packets violating DHCP snooping or ARP security checks (if these are enabled) are automatically dropped. The switch can also be configured to send SNMP notifications (atDhcpsnTrap and atArpsecTrap), to generate log messages, or to shut down the link on which the packet was received.

If the switch is configured to send notifications for DHCP snooping or ARP security violations, the rate is limited to one notification per second. If there are any further violations within a second, no notifications are sent for them. After one second, the switch only sends further notifications if the source MAC address and/or the violation reason are different from previous notifications. (If log messages are also generated for ARP security and DHCP snooping violations, you can see a record of all violations in the log, even if notifications were not sent for all of them.)

Interactions with Other Features

DHCP snooping interacts with other switch features as follows:

- Ports in trunk mode

The DHCP snooping feature is enabled or disabled per VLAN, and several of the related configuration settings are applied to ports. If there are multiple VLANs on a port, all the VLANs will be subject to the same per-port settings.
- DHCP relay

The switch cannot use DHCP snooping to filter IP traffic from a DHCP relay device. DHCP snooping ([service dhcp-snooping command on page 81.24](#)) and the DHCP relay agent option ([ip dhcp-relay agent-option command on page 91.15](#)) cannot both be enabled on the switch at the same time.
- DHCP snooping can be configured with port provisioning.
- Authentication

DHCP snooping cannot be enabled on a switch that is configured for web authentication ([auth-web enable command on page 68.29](#)), roaming authentication ([auth roaming enable command on page 68.17](#), [auth roaming disconnected command on page 68.15](#)), or guest VLAN authentication ([auth guest-vlan command on page 68.8](#)), or vice versa.
- Link aggregators

DHCP snooping can operate over switch ports, and over static and dynamic (LACP) link aggregators (channel groups). If a switch port is added to an aggregator, DHCP snooping configuration is applied to the aggregator; configuration of the original switch port is not preserved. If the switch port is then removed from the aggregator, it returns to default DHCP snooping settings.
- Private VLANs

Private VLANs are not supported for DHCP snooping.

Configuration

This section provides a general configuration procedure for DHCP snooping.

Configure DHCP Snooping

Note that if a port in trunk mode has multiple VLANs attached, then the DHCP snooping configuration settings for the port apply to all the VLANs.

Table 80-2: General configuration procedure for DHCP snooping

Enable DHCP snooping		
1.	<code>awplus# configure terminal</code>	Enter Global Configuration mode.
2.	<code>awplus(config)# service dhcp-snooping</code>	Enable DHCP snooping on the switch. Default: disabled
3.	<code>awplus(config)# interface <vid-list></code>	Enter Interface Configuration mode for the VLANs to enable DHCP snooping on.
4.	<code>awplus(config-if)# ip dhcp snooping</code>	Enable DHCP snooping on these VLANs. Default: disabled
5.	<code>awplus(config-if)# exit</code>	Return to Global Configuration mode.
6.	<code>awplus(config-if)# interface <port-list></code>	Enter Interface Configuration mode for ports connected to the trusted network. The port(s) connected to the DHCP server(s) must be configured as trusted ports.
7.	<code>awplus(config-if)# ip dhcp snooping trust</code>	Set these ports to be trusted ports. Default: untrusted
8.	<code>awplus(config-if)# exit</code>	Return to Global Configuration mode.
9.	<code>awplus(config)# interface <port-list></code>	If you want to allow more than one DHCP lease for any ports, enter Interface Configuration mode for the required ports. The default is likely to be suitable for edge ports; on an aggregation switch, you may need to increase the maximum number of leases for ports connected to other switches and/or for multiple VLANs. Note that you cannot change this setting once DHCP snooping ACLs are attached to these interfaces.

Table 80-2: General configuration procedure for DHCP snooping(cont.)

10.	<pre>awplus(config-if)# ip dhcp snooping max-bindings <0-520></pre>	Change the maximum number of leases for these ports. Default: 1
11.	<pre>awplus(config-if)# exit</pre>	Return to Global Configuration mode.
Configure DHCP filtering		
12.	<pre>awplus(config)# access-list hardware <name></pre>	Create a hardware access list, and enter Hardware Access List Configuration mode to configure it. See the access-list hardware (named) command on page 59.20 .
13.	<pre>awplus(config-ip-hw-acl)# [<seqnum>] permit ip dhcpsnooping any [<seqnum>] deny ip any any awplus(config-ip-hw-acl)# [<seqnum>] permit ip dhcpsnooping any mac dhcpsnooping any [<seqnum>] deny ip any any mac any any</pre>	Configure the hardware access list to permit traffic with <i>source IP address</i> matching valid entries in the DHCP snooping database, and to deny other traffic. (The last filter applied to the ports by any access list must be the filter that denies all other traffic.) OR Configure the hardware access list to permit traffic with <i>source IP address and source MAC address</i> matching valid entries in the DHCP snooping database, and to deny other traffic. (The last filter applied to the ports by any access list must be the filter that denies all other traffic.) See the (access-list hardware IP protocol filter) command on page 59.25 .
14.	<pre>awplus(config-ip-hw-acl)# exit</pre>	Return to Global Configuration mode.
15.	<pre>awplus(config)# interface <port-list></pre>	Enter Interface Configuration mode for the ports to add the DHCP snooping access list to. Typically this would be all untrusted ports.
16.	<pre>awplus(config-if)# access-group <name></pre>	Add the hardware-based access list(s) to these ports. The <i>name</i> in this command is the name of the access list specified in Step 12 .
17.	<pre>awplus(config-if)# exit</pre>	Return to Global Configuration mode.

Table 80-2: General configuration procedure for DHCP snooping(cont.)

Configure ARP security		
18.	<pre>awplus(config)# interface <vid-list></pre>	<p>Enter Interface Configuration mode for the VLANs to enable ARP security on.</p> <p>Default: disabled</p>
19.	<pre>awplus(config-if)# arp security</pre>	<p>Enable ARP security on particular VLANs if required. On untrusted ports, ARP security forwards ARP packets that have a source IP address and MAC address matching a dynamic entry in the DHCP snooping database, or an IP address matching a static entry. It drops other ARP packets, and treats them as ARP security violations.</p> <p>Default: disabled</p>
20.	<pre>awplus(config-if)# exit</pre>	<p>Return to Global Configuration mode.</p>
Configure DHCP Relay Agent Option 82		
21.	<pre>awplus(config)# no ip dhcp snooping agent-option</pre>	<p>If you do not want the switch to insert DHCP Relay Agent Option 82 information into DHCP packets received on untrusted ports, or to remove this information from DHCP packets transmitted on untrusted ports, disable the DHCP Relay Agent Option 82 agent option.</p> <p>Default: enabled if DHCP snooping is enabled.</p>
22.	<pre>awplus(config)# ip dhcp snooping agent-option allow- untrusted</pre>	<p>If there are edge switches that add the DHCP Relay Agent Option 82 information to DHCP packets, and that are connected to untrusted ports on this switch, you may wish to enable this switch to forward these packets, and the associated DHCP reply packets, without changing the DHCP Relay Agent Option 82 information in them.</p> <p>Default: disabled.</p>
23.	<pre>awplus(config)# interface <port-list></pre>	<p>Enter Interface Configuration mode for one or more ports to add a Subscriber ID for.</p>
24.	<pre>awplus(config-if)# ip dhcp snooping subscriber-id [<sub- id>]</pre>	<p>Add the Subscriber ID for these ports. The Subscriber ID is included in DHCP Relay Agent Option 82 information.</p> <p>Default: no Subscriber ID.</p>
25.	<pre>awplus(config)# interface <interface-list></pre>	<p>Enter Interface Configuration mode for one or more VLANs to add a Circuit ID for.</p>

Table 80-2: General configuration procedure for DHCP snooping(cont.)

26.	<pre>awplus(config-if)# ip dhcp snooping agent-option circuit- id vlantriplet</pre>	Specify the Circuit ID for the VLAN or group of VLANs as the VLAN ID and port number. Default: VLAN ID and Ifindex number.
27.	<pre>awplus(config)# interface <interface-list></pre>	Enter Interface Configuration mode for one or more VLANs to add a Remote ID for.
28.	<pre>awplus(config-if)# ip dhcp snooping agent-option remote- id <remote-id></pre>	Specify the Remote ID for the VLAN or group of VLANs as an alphanumeric (ASCII) string, 1 to 63 characters in length. Default: the switch's MAC address.
29.	<pre>awplus(config-if)# exit</pre>	Return to Global Configuration mode.
Configure MAC address verification		
30.	<pre>awplus(config)# no ip dhcp snooping verify mac-address</pre>	If not required, disable MAC address verification. Default: enabled
Configure the DHCP snooping database		
31.	<pre>awplus(config)# ip dhcp snooping database {nvs flash usb}</pre>	If required, change the location of the file to which the switch writes the dynamic entries from the DHCP snooping database. Default: nvs (non-volatile storage)
32.	<pre>awplus(config)# no ip dhcp snooping delete-by-client</pre>	By default, the switch deletes DHCP lease entries from the DHCP snooping database when it receives matching DHCP release messages. Disable these deletions if required, so that lease entries remain in the database until they expire. Default: enabled—entries are deleted when leases are released.
33.	<pre>awplus(config)# ip dhcp snooping delete-by-linkdown</pre>	If required, set the switch to delete dynamic entries from the DHCP snooping database when their ports go down. Default: disabled—entries remain if links go down.
34.	<pre>awplus(config)# ip source binding <ipaddr> [<macaddr>] vlan <vid> interface <port></pre>	You can actively add, modify, or remove static entries from the DHCP snooping database.

Table 80-2: General configuration procedure for DHCP snooping(cont.)

35.	<pre>awplus# ip dhcp snooping binding <ipaddr> [<macaddr>] vlan <vid> interface <port> expiry <expiry-time></pre>	You can actively add or remove dynamic entries from the DHCP snooping database. These changes affect the current database and backup file, but are not stored in the running configuration.
Configure violation actions		
36.	<pre>awplus(config)# interface <port-list></pre>	Enter Interface Configuration mode for the ports for which you want to configure actions in response to DHCP snooping or ARP security violations.
37.	<pre>awplus(config-if)# ip dhcp snooping violation {log trap link-down} ... arp security violation {log trap link- down} ...</pre>	<p>If required, set the switch to generate an SNMP notification (trap), to generate a log message, and/or to block traffic on the port on which a DHCP snooping and/or ARP security violation is detected.</p> <p>Default: By default, if a packet does not match the DHCP snooping and ARP security restrictions, the packet is dropped, but no other action is taken.</p>
38.	<pre>awplus(config-if)# exit</pre>	Return to Global Configuration mode.
39.	<pre>awplus(config)# snmp-server enable trap dhcpsnooping</pre>	<p>In order to send SNMP notifications:</p> <ul style="list-style-type: none"> ■ set the action for violations to trap (Step 37) ■ configure SNMP—see Chapter 95, SNMP Commands ■ set the SNMP server to enable DHCP snooping notifications (by default notifications are disabled on the SNMP server). <p>The port connecting the switch to the SNMP manager should be set as a trusted port (Step 7 on page 80.10).</p>
40.	<pre>awplus(config)# exit</pre>	Return to Privileged Exec mode.
Check the configuration		
41.	<pre>awplus# show ip dhcp snooping show ip dhcp snooping interface [<port-list>] show ip dhcp snooping acl show arp security show arp security interface [<port- list>] show running-config dhcp</pre>	Check the DHCP snooping configuration.

Table 80-2: General configuration procedure for DHCP snooping(cont.)

Troubleshooting DHCP snooping		
42.	awplus# show ip dhcp snooping binding	Check all entries in the DHCP snooping database.
43.	awplus# show ip source binding	Check the static entries in the DHCP snooping database.
44.	awplus# show ip dhcp snooping statistics [detail] [interface <interface-list> clear ip dhcp snooping statistics [interface <port-list>	Check DHCP snooping statistics.
45.	awplus# show arp security statistics [detail] [interface <port-list> clear arp security statistics [interface <port-list>	Check ARP security statistics.
46.	awplus# debug ip dhcp snooping {all acl db packet [detail]} show debugging ip dhcp snooping debug arp security show debugging arp security	Enable debug output for DHCP snooping and/or ARP security.
47.		If you have not already set the switch to log DHCP snooping and ARP security violations, you can do this for troubleshooting purposes. See Step 37 on page 80.14 .
48.	awplus# show log	Display the contents of the buffered log, including any DHCP snooping log and debug messages. (See also Chapter 10, Logging Commands .)

Disabling DHCP Snooping

If you disable DHCP snooping on the whole switch ([no service dhcp-snooping command on page 81.24](#)), all the DHCP snooping configuration is removed, except for the Access Control Lists (ACL). Any ACLs on a port that permit traffic matching DHCP snooping entries and block other traffic, will block all traffic if DHCP snooping is disabled on the port. If you disable DHCP snooping either on the whole switch or on particular VLANs ([no ip dhcp snooping command on page 81.9](#)), you must also remove any DHCP snooping ACLs from the ports to maintain connectivity ([no access-group command on page 59.4](#)).

Related Features

In addition to configuring DHCP snooping as described in [Table 80-2](#), consider whether you also need to configure the following:

- VLANs—see [Chapter 16, VLAN Introduction](#) and [Chapter 17, VLAN Commands](#)
- Additional ACL filters—see [Chapter 58, Access Control Lists Introduction](#) and [Chapter 60, IPv4 Software Access Control List \(ACL\) Commands](#)
- QoS—see [Chapter 63, Quality of Service \(QoS\) Introduction](#) and [Chapter 64, QoS Commands](#)
- SNMP—[Chapter 94, SNMP Introduction](#) and [Chapter 95, SNMP Commands](#)

Chapter 81: DHCP Snooping Commands

Command List	81.2
arp security	81.2
arp security violation	81.3
clear arp security statistics	81.4
clear ip dhcp snooping binding	81.5
clear ip dhcp snooping statistics	81.6
debug arp security	81.7
debug ip dhcp snooping	81.8
ip dhcp snooping	81.9
ip dhcp snooping agent-option	81.10
ip dhcp snooping agent-option allow-untrusted	81.11
ip dhcp snooping agent-option circuit-id vlantriplet	81.12
ip dhcp snooping agent-option remote-id	81.13
ip dhcp snooping binding	81.14
ip dhcp snooping database	81.15
ip dhcp snooping delete-by-client	81.16
ip dhcp snooping delete-by-linkdown	81.17
ip dhcp snooping max-bindings	81.18
ip dhcp snooping subscriber-id	81.19
ip dhcp snooping trust	81.20
ip dhcp snooping verify mac-address	81.21
ip dhcp snooping violation	81.22
ip source binding	81.23
service dhcp-snooping	81.24
show arp security	81.26
show arp security interface	81.27
show arp security statistics	81.28
show debugging arp security	81.30
show debugging ip dhcp snooping	81.31
show ip dhcp snooping	81.32
show ip dhcp snooping acl	81.33
show ip dhcp snooping agent-option	81.35
show ip dhcp snooping binding	81.37
show ip dhcp snooping interface	81.38
show ip dhcp snooping statistics	81.40
show ip source binding	81.43

Command List

This chapter gives detailed information about the commands used to configure DHCP snooping. For detailed descriptions of related ACL commands, see [Chapter 59, IPv4 Hardware Access Control List \(ACL\) Commands](#). For more information about DHCP snooping, see [Chapter 80, DHCP Snooping Introduction and Configuration](#).

DHCP snooping can operate on static link aggregators (e.g., sa2) and dynamic link aggregators (e.g. po3) link aggregators, as well as switch ports (e.g., port1.1.2).

arp security

Use this command to enable ARP security on untrusted ports in the VLANs, so that the switch only responds to/forwards ARP packets if they have recognized IP and MAC source addresses.

Use the **no** variant of this command to disable ARP security on the VLANs.

Syntax `arp security`
`no arp security`

Default Disabled

Mode Interface Configuration (VLANs)

Usage Enable ARP security to provide protection against ARP spoofing. DHCP snooping must also be enabled on the switch ([service dhcp-snooping command on page 81.24](#)), and on the VLANs ([ip dhcp snooping command on page 81.9](#)).

Example To enable ARP security on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# arp security
```

Related Commands [arp security violation](#)
[show arp security](#)
[show arp security interface](#)
[show arp security statistics](#)

arp security violation

Use this command to specify an additional action to perform if an ARP security violation is detected on the ports. ARP security must also be enabled ([arp security command on page 81.2](#)).

Use the **no** variant of this command to remove the specified action, or all actions. Traffic violating ARP security will be dropped, but no other action will be taken.

Syntax `arp security violation {log|trap|link-down} ...`
`no arp security violation [log|trap|link-down] ...`

Parameter	Description
log	Generate a log message. To display these messages, use the show log command on page 10.38 .
trap	Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the snmp-server enable trap command on page 95.19 . Notifications are limited to one per second and to one per source MAC and violation reason. Additional violations within a second of a notification being sent will not result in further notifications. Default: disabled.
link-down	Shut down the port that received the packet. Default: disabled.

Default When the switch detects an ARP security violation, it drops the packet. By default, it does not perform any other violation actions.

Mode Interface Configuration (switch ports, static or dynamic aggregated links)

Usage When the switch detects an ARP security violation on an untrusted port in a VLAN that has ARP security enabled, it drops the packet. This command sets the switch to perform additional actions in response to ARP violations.

If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the [no shutdown command on page 12.14](#).

Example To send SNMP notifications for ARP security violations on ports 1.1.1 to 1.1.8, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.1.1-port1.1.8
awplus(config-if)# arp security violation trap
```

Related Commands [arp security](#)
[show arp security interface](#)
[show arp security statistics](#)
[show log](#)
[snmp-server enable trap](#)

clear arp security statistics

Use this command to clear ARP security statistics for the specified ports, or for all ports.

Syntax `clear arp security statistics [interface <port-list>]`

Parameter	Description
<code><port-list></code>	The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The ports may be switch ports, or static or dynamic link aggregators.

Mode Privileged Exec

Example To clear statistics for ARP security on interface port1.1.1, use the command:

```
awplus# clear arp security statistics interface port1.1.1
```

Related Commands [arp security violation](#)
[show arp security](#)
[show arp security statistics](#)

clear ip dhcp snooping binding

Use this command to remove one or more DHCP Snooping dynamic entries from the DHCP Snooping binding database. If no options are specified, all entries are removed from the database.

Caution  If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.

Syntax `clear ip dhcp snooping binding [<ipaddr>] [interface <port-list>]
[vlan <vid-list>]`

Parameter	Description
<ipaddr>	Remove the entry for this client IP address.
<port-list>	Remove all entries for these ports. The port list may contain switch ports, and static or dynamic link aggregators (channel groups).
<vid-list>	Remove all entries associated with these VLANs.

Mode Privileged Exec

Usage This command removes dynamic entries from the database. Note that dynamic entries can also be deleted by using the **no** variant of the [ip dhcp snooping binding command on page 81.14](#).

Dynamic entries can individually be restored by using the [ip dhcp snooping binding command](#).

To remove static entries, use the **no** variant of the [ip source binding command on page 81.23](#).

Example To remove a dynamic lease entry from the DHCP snooping database for a client with the IP address 192.168.1.2, use the command:

```
awplus# clear ip dhcp snooping binding 192.168.1.2
```

Related Commands [ip dhcp snooping binding](#)
[ip source binding](#)
[show ip dhcp snooping binding](#)

clear ip dhcp snooping statistics

Use this command to clear DHCP snooping statistics for the specified ports, or for all ports.

Syntax `clear ip dhcp snooping statistics [interface <port-list>]`

Parameter	Description
<code><port-list></code>	The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The port list can contain switch ports, or static or dynamic link aggregators.

Mode Privileged Exec

Example To clear statistics for the DHCP snooping on interface port1.1.1, use the command:

```
awplus# clear ip dhcp snooping statistics interface port1.1.1
```

Related Commands

- [clear arp security statistics](#)
- [show ip dhcp snooping](#)
- [show ip dhcp snooping statistics](#)

debug arp security

Use this command to enable ARP security debugging.

Use the **no** variant of this command to disable debugging for ARP security.

Syntax `debug arp security`
`no debug arp security`

Default Disabled

Mode Privileged Exec

Example To enable ARP security debugging, use the commands:

```
awplus# debug arp security
```

Related Commands [show debugging arp security](#)
[show log](#)
[terminal monitor](#)

debug ip dhcp snooping

Use this command to enable the specified types of debugging for DHCP snooping.

Use the **no** variant of this command to disable the specified types of debugging.

Syntax `debug ip dhcp snooping {all|acl|db|packet [detail]}`
`no debug ip dhcp snooping {all|acl|db|packet [detail]}`

Parameter	Description
all	All DHCP snooping debug.
acl	DHCP snooping access list debug.
db	DHCP snooping binding database debug.
packet	DHCP snooping packet debug. For the no variant of this command, this option also disables detailed packet debug, if it was enabled.
detail	Detailed packet debug.

Default Disabled

Mode Privileged Exec

Example To enable access list debugging for DHCP snooping, use the commands:

```
awplus# debug ip dhcp snooping acl
```

Related Commands [debug arp security](#)
[show debugging ip dhcp snooping](#)
[show log](#)
[terminal monitor](#)

ip dhcp snooping

Use this command to enable DHCP snooping on one or more VLANs.

Use the **no** variant of this command to disable DHCP snooping on the VLANs.

Syntax `ip dhcp snooping`
`no ip dhcp snooping`

Default DHCP snooping is disabled on VLANs by default.

Mode Interface Configuration (VLANs)

Usage For DHCP snooping to operate on a VLAN, it must:

- be enabled on the particular VLAN by using this command
- be enabled globally on the switch by using the [service dhcp-snooping](#) command on [page 81.24](#)
- have at least one port connected to a DHCP server configured as a trusted port by using the [ip dhcp snooping trust](#) command on [page 81.20](#)

Any ACLs on a port that permit traffic matching DHCP snooping entries and block other traffic, will block all traffic if DHCP snooping is disabled on the port. If you disable DHCP snooping on particular VLANs using this command, you must also remove any DHCP snooping ACLs from the ports to maintain connectivity ([no access-group](#) command on [page 59.4](#)).

Examples To enable DHCP snooping on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ip dhcp snooping
```

To disable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ip dhcp snooping
```

Related Commands [ip dhcp snooping trust](#)
[service dhcp-snooping](#)
[show ip dhcp snooping](#)

ip dhcp snooping agent-option

Use this command to enable DHCP Relay Agent Option 82 information insertion on the switch. When this is enabled, the switch:

- inserts DHCP Relay Agent Option 82 information into DHCP packets that it receives on untrusted ports
- removes DHCP Relay Agent Option 82 information from DHCP packets that it sends to untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 insertion.

Syntax `ip dhcp snooping agent-option`
`no ip dhcp snooping agent-option`

Default DHCP Relay Agent Option 82 insertion is enabled by default when DHCP snooping is enabled.

Mode Global Configuration

Usage DHCP snooping must also be enabled on the switch ([service dhcp-snooping command on page 81.24](#)), and on the VLANs ([ip dhcp snooping command on page 81.9](#)).

If a subscriber ID is configured for the port ([ip dhcp snooping subscriber-id command on page 81.19](#)), the switch includes this in the DHCP Relay Agent Option 82 information it inserts into DHCP packets received on the port.

Example To disable DHCP Relay Agent Option 82 on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping agent-option
```

Related Commands [ip dhcp snooping](#)
[ip dhcp snooping agent-option allow-untrusted](#)
[ip dhcp snooping subscriber-id](#)
[service dhcp-snooping](#)
[show ip dhcp snooping](#)

ip dhcp snooping agent-option allow-untrusted

Use this command to enable DHCP Relay Agent Option 82 information reception on untrusted ports. When this is enabled, the switch accepts incoming DHCP packets that contain DHCP Relay Agent Option 82 information on untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 information reception on untrusted ports.

Syntax ip dhcp snooping agent-option allow-untrusted
no ip dhcp snooping agent-option allow-untrusted

Default Disabled

Mode Global Configuration

Usage If the switch is connected via untrusted ports to edge switches that insert DHCP Relay Agent Option 82 information into DHCP packets, you may need to allow these DHCP packets through the untrusted ports, by using this command.

When this is disabled (default), the switch treats incoming DHCP packets on untrusted ports that contain DHCP Relay Agent Option 82 information as DHCP snooping violations: it drops them and applies any violation action specified by the [ip dhcp snooping violation](#) command on page 81.22. The switch stores statistics for packets dropped; to display these statistics, use the [show ip dhcp snooping statistics](#) command on page 81.40.

Example To enable DHCP snooping Option 82 information reception on untrusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping agent-option allow-untrusted
```

Related Commands [ip dhcp snooping agent-option](#)
[ip dhcp snooping violation](#)
[show ip dhcp snooping](#)
[show ip dhcp snooping statistics](#)

ip dhcp snooping agent-option circuit-id vlantriplet

Use this command to specify the Circuit ID sub-option of the DHCP Relay Agent Option 82 field as the VLAN ID and port number. The Circuit ID specifies the switch port and VLAN ID that the client-originated DHCP packet was received on.

Use the **no** variant of this command to set the Circuit ID to the default, the VLAN ID and Ifindex (interface number).

Syntax `ip dhcp snooping agent-option circuit-id vlantriplet`
`no ip dhcp snooping agent-option circuit-id`

Default By default, the Circuit ID is the VLAN ID and Ifindex (interface number).

Mode Interface Configuration for a VLAN interface.

Usage The Circuit ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled (**ip dhcp snooping agent-option** command on page 81.10; enabled by default), and
- DHCP snooping is enabled on the switch (**service dhcp-snooping**) and on the VLAN to which the port belongs (**ip dhcp snooping**)

Examples To set the Circuit ID to `vlantriplet` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option circuit-id
vlantriplet
```

To return the Circuit ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option circuit-id
```

Related Commands **ip dhcp snooping agent-option**
ip dhcp snooping agent-option remote-id
show ip dhcp snooping
show ip dhcp snooping agent-option

ip dhcp snooping agent-option remote-id

Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field. The Remote ID identifies the device that inserted the Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the switch's MAC address.

Use the **no** variant of this command to set the Remote ID to the default, the switch's MAC address.

Syntax `ip dhcp snooping agent-option remote-id <remote-id>`
`no ip dhcp snooping agent-option remote-id`

Parameter	Description
<code><remote-id></code>	An alphanumeric (ASCII) string, 1 to 63 characters in length. If the Remote ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed.

Default The Remote ID is set to the switch's MAC address by default.

Mode Interface Configuration for a VLAN interface.

Usage The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled ([ip dhcp snooping agent-option command on page 81.10](#); enabled by default), and
- DHCP snooping is enabled on the switch ([service dhcp-snooping](#)) and on the VLAN to which the port belongs ([ip dhcp snooping](#))

Examples To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option remote-id
myid
```

To return the Remote ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option remote-id
```

Related Commands [ip dhcp snooping agent-option](#)

[show ip dhcp snooping](#)
[show ip dhcp snooping agent-option](#)

ip dhcp snooping binding

Use this command to manually add a dynamic-like entry (with an expiry time) to the DHCP snooping database. Once added to the database, this entry is treated as a dynamic entry, and is stored in the DHCP snooping database backup file. This command is not stored in the switch's running configuration.

Use the **no** variant of this command to delete a dynamic entry for an IP address from the DHCP snooping database, or to delete all dynamic entries from the database.

Caution  If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.

Syntax

```
ip dhcp snooping binding <ipaddr> [<macaddr>] vlan <vid> interface
<port> expiry <expiry-time>

no ip dhcp snooping binding [<ipaddr>]
```

Parameter	Description
<ipaddr>	Client's IP address.
<macaddr>	Client's MAC address in HHHH.HHHH.HHHH format.
<vid>	The VLAN ID for the entry, in the range 1 to 4094.
<port>	The port the client is connected to. The port can be a switch port, or a static or dynamic link aggregation (channel group).
<expiry-time>	The expiry time for the entry, in the range 5 to 2147483647 seconds.

Mode Privileged Exec

Usage Note that dynamic entries can also be deleted from the DHCP snooping database by using the [clear ip dhcp snooping binding command on page 81.5](#).

To add or remove static entries from the database, use the [ip source binding command on page 81.23](#).

Example To restore an entry in the DHCP snooping database for a DHCP client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.1.6 of vlan6, and with an expiry time of 1 hour, use the commands:

```
awplus# ip dhcp snooping binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.1.6 expiry 3600
```

Related Commands

- [clear ip dhcp snooping binding](#)
- [ip source binding](#)
- [show ip dhcp snooping binding](#)

ip dhcp snooping database

Use this command to set the location of the file to which the dynamic entries in the DHCP snooping database are written. This file provides a backup for the DHCP snooping database.

Use the **no** variant of this command to set the database location back to the default, **nvs**.

Syntax `ip dhcp snooping database {nvs|flash|usb}`
`no ip dhcp snooping database`

Parameter	Description
nvs	The switch checks the database and writes the file to non-volatile storage (NVS) on the switch at 2 second intervals if it has changed.
flash	The switch checks the database and writes the file to Flash memory on the switch at 60 second intervals if it has changed.
usb	The switch checks the database and writes the file to a USB storage device installed in the switch at 2 second intervals if it has changed.

Default NVS

Mode Global Configuration

Usage If the location of the backup file is changed by using this command, a new file is created in the new location, and the old version of the file remains in the old location. This can be removed if necessary (hidden file: **.dhcp.dsn.gz**).

Example To set the location of the DHCP snooping database to non-volatile storage on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping database nvs
```

Related Commands [show ip dhcp snooping](#)

ip dhcp snooping delete-by-client

Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when it receives a valid DHCP release message with matching IP address, VLAN ID, and client hardware address on an untrusted port, and to discard release messages that do not match an entry in the database.

Use the **no** variant of this command to set the switch to forward DHCP release messages received on untrusted ports without removing any entries from the database.

Syntax `ip dhcp snooping delete-by-client`
`no ip dhcp snooping delete-by-client`

Default Enabled: by default, DHCP lease entries are deleted from the DHCP snooping database when matching DHCP release messages are received.

Mode Global Configuration

Usage DHCP clients send a release message when they no longer wish to use the IP address they have been allocated by a DHCP server. Use this command to enable DHCP snooping to use the information in these messages to remove entries from its database immediately. Use the **no** variant of this command to ignore these release messages. Lease entries corresponding to ignored DHCP release messages eventually time out when the lease expires.

Examples To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when a matching release message is received, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-client
```

To set the switch to forward and ignore the content of any DHCP release messages it receives, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-client
```

Related Commands [show ip dhcp snooping](#)

ip dhcp snooping delete-by-linkdown

Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when its port goes down. If the port is part of an aggregated link, the entries in the database are only deleted if all the ports in the aggregated link are down.

Use the **no** variant of this command to set the switch not to delete entries when ports go down.

Syntax `ip dhcp snooping delete-by-linkdown`
`no ip dhcp snooping delete-by-linkdown`

Default Disabled: by default DHCP Snooping bindings are not deleted when an interface goes down.

Mode Global Configuration

Usage If this command is enabled in a stack, and the master goes down and is replaced by a new master, entries in the DHCP snooping database for ports on the master are removed, unless they are part of link aggregators that are still up.

Examples To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-linkdown
```

To set the switch *not* to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-linkdown
```

Related Commands [show ip dhcp snooping](#)

ip dhcp snooping max-bindings

Use this command to set the maximum number of DHCP lease entries that can be stored in the DHCP snooping database for each of the ports. Once this limit has been reached, no further DHCP lease allocations made to devices on the port are stored in the database.

Use the **no** variant of this command to reset the maximum to the default, 1.

Syntax `ip dhcp snooping max-bindings <0-520>`
`no ip dhcp snooping max-bindings`

Parameter	Description
<0-520>	The maximum number of bindings that will be stored for the port in the DHCP snooping binding database. If 0 is specified, no entries will be stored in the database for the port.

Default The default for maximum bindings is 1.

Mode Interface Configuration (port)

Usage The maximum number of leases cannot be changed for a port while there are DHCP snooping Access Control Lists (ACL) associated with the port. Before using this command, remove any DHCP snooping ACLs associated with the ports. To display ACLs used for DHCP snooping, use the [show ip dhcp snooping acl command on page 81.33](#).

In general, the default (1) will work well on an edge port with a single directly connected DHCP client. If the port is on an aggregation switch that is connected to an edge switch with multiple DHCP clients connected through it, then use this command to increase the number of lease entries for the port.

If there are multiple VLANs configured on the port, the limit is shared between all the VLANs on this port. For example, the default only allows one lease to be stored for one VLAN. To allow connectivity for the other VLANs, use this command to increase the number of lease entries for the port.

Example To set the maximum number of bindings to be stored in the DHCP snooping database to 10 per port for ports 1.1.1 to 1.1.8, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1-port1.1.8
awplus(config-if)# ip dhcp snooping max-bindings 10
```

Related Commands [access-group](#)
[show ip dhcp snooping acl](#)
[show ip dhcp snooping interface](#)

ip dhcp snooping subscriber-id

Use this command to set a Subscriber ID for the ports.

Use the **no** variant of this command to remove Subscriber IDs from the ports.

Syntax `ip dhcp snooping subscriber-id [<sub-id>]`
`no ip dhcp snooping subscriber-id`

Parameter	Description
<sub-id>	The Subscriber ID; an alphanumeric (ASCII) string 1 to 50 characters in length. If the Subscriber ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed.

Default No Subscriber ID.

Mode Interface Configuration (port)

Usage The Subscriber ID sub-option is included in the DHCP Relay Agent Option 82 field of client DHCP packets forwarded from a port if:

- a Subscriber ID is specified for the port using this command, and
- DHCP snooping Option 82 information insertion is enabled (**ip dhcp snooping agent-option** command on page 81.10; enabled by default), and
- DHCP snooping is enabled on the switch (**service dhcp-snooping**) and on the VLAN to which the port belongs (**ip dhcp snooping**)

Examples To set the Subscriber ID for port 1.1.3 to **room_534**, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# ip dhcp snooping subscriber-id room_534
```

To remove the Subscriber ID from port 1.1.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# no ip dhcp snooping subscriber-id
```

Related Commands **ip dhcp snooping agent-option**
show ip dhcp snooping interface

ip dhcp snooping trust

Use this command to set the ports to be DHCP snooping trusted ports.

Use the **no** variant of this command to return the ports to their default as untrusted ports.

Syntax `ip dhcp snooping trust`
`no ip dhcp snooping trust`

Default All ports are untrusted by default.

Mode Interface Configuration (port)

Usage Typically, ports connecting the switch to trusted elements in the network (towards the core) are set as trusted ports, while ports connecting untrusted network elements are set as untrusted. Configure ports connected to DHCP servers as trusted ports.

Example To set switch ports 1.1.1 and 1.1.2 to be trusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1-port1.1.2
awplus(config-if)# ip dhcp snooping trust
```

Related Commands [show ip dhcp snooping interface](#)

ip dhcp snooping verify mac-address

Use this command to verify that the source MAC address and client hardware address match in DHCP packets received on untrusted ports.

Use the **no** variant of this command to disable MAC address verification.

Syntax `ip dhcp snooping verify mac-address`
`no ip dhcp snooping verify mac-address`

Default Enabled—source MAC addresses are verified by default.

Mode Global Configuration

Usage When MAC address verification is enabled, the switch treats DHCP packets with source MAC address and client hardware address that do not match as DHCP snooping violations: it drops them and applies any other violation action specified by the [ip dhcp snooping violation command on page 81.22](#). To bring the port back up again after any issues have been resolved, use the [no shutdown command on page 12.14](#).

Example To disable MAC address verification on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping verify mac-address
```

Related Commands [ip dhcp snooping violation](#)
[show ip dhcp snooping](#)
[show ip dhcp snooping statistics](#)

ip dhcp snooping violation

Use this command to specify the action the switch will take when it detects a DHCP snooping violation by a DHCP packet on the ports.

Use the **no** variant of this command to disable the specified violation actions, or all violation actions.

Syntax `ip dhcp snooping violation {log|trap|link-down} ...`
`no ip dhcp snooping violation [{log|trap|link-down} ...]`

Parameter	Description
log	Generate a log message. To display these messages, use the show log command on page 10.38 . Default: disabled.
trap	Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the snmp-server enable trap command on page 95.19 . Notifications are limited to one per second and to one per source MAC and violation reason. Default: disabled.
link-down	Set the port status to link-down. Default: disabled.

Default By default, DHCP packets that violate DHCP snooping are dropped, but no other violation action is taken.

Mode Interface Configuration (port)

Usage If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the [no shutdown command on page 12.14](#).

IP packets dropped by DHCP snooping filters do not result in other DHCP snooping violation actions.

Example To set the switch to send an SNMP notification and set the link status to link-down if it detects a DHCP snooping violation on switch ports 1.1.1 to 1.1.4, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.1.1-port1.1.4
awplus(config-if)# ip dhcp snooping violation trap link-down
```

Related Commands [show ip dhcp snooping interface](#)
[show log](#)
[snmp-server enable trap](#)

ip source binding

Use this command to add or replace a static entry in the DHCP snooping database.

Use the **no** variant of this command to delete the specified static entry or all static entries from the database.

Syntax `ip source binding <ipaddr> [<macaddr>] vlan <vid> interface <port>`
`no ip source binding [<ipaddr>]`

Parameter	Description
<ipaddr>	Client's IP address. If there is already an entry in the DHCP snooping database for this IP address, then this command replaces it with the new entry.
<macaddr>	Client's MAC address in HHHH.HHHH.HHHH format.
<vid>	The VLAN ID associated with the entry.
<port>	The port the client is connected to.

Mode Global Configuration

Usage This command removes static entries from the database.

To remove dynamic entries, use the [clear ip dhcp snooping binding](#) command on page 81.5 or the **no** variant of the [ip dhcp snooping binding](#) command on page 81.14.

Examples To add a static entry to the DHCP snooping database for a client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.1.6 of vlan6, use the command:

```
awplus# configure terminal
awplus(config)# ip source binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.1.6
```

To remove the static entry for IP address 192.168.1.2 from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding 192.168.1.2
```

To remove all static entries from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding
```

Related Commands [clear ip dhcp snooping binding](#)
[ip dhcp snooping binding](#)
[show ip dhcp snooping binding](#)
[show ip source binding](#)

service dhcp-snooping

Use this command to enable the DHCP snooping service globally on the switch. This must be enabled before other DHCP snooping configuration commands can be entered.

Use the **no** variant of this command to disable the DHCP snooping service on the switch. This removes all DHCP snooping configuration from the running configuration, except for any DHCP snooping maximum bindings settings ([ip dhcp snooping max-bindings command on page 81.18](#)), and any DHCP snooping-based Access Control Lists (ACLs), which are retained when the service is disabled.

Syntax `service dhcp-snooping`
`no service dhcp-snooping`

Default DHCP snooping is disabled on the switch by default.

Mode Global Configuration

Usage For DHCP snooping to operate on a VLAN, it must be enabled on the switch by using this command, and also enabled on the particular VLAN by using the [ip dhcp snooping command on page 81.9](#).

For DHCP snooping to operate on a VLAN, it must:

- be enabled globally on the switch by using this command
- be enabled on the particular VLAN by using the [ip dhcp snooping command on page 81.9](#)
- have at least one port connected to a DHCP server configured as a trusted port by using the [ip dhcp snooping trust command on page 81.20](#)

If you disable the DHCP snooping service by using the **no** variant of this command, all DHCP snooping configuration (including ARP security, but excluding maximum bindings and ACLs) is removed from the running configuration, and the DHCP snooping database is deleted from active memory. If you re-enable the service, the switch:

- repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (in NVS by default—see the [ip dhcp snooping database command on page 81.15](#)). The lease expiry times are updated.

The DHCP snooping service cannot be enabled on a switch that is configured with any of the following features, or vice versa:

- web authentication ([auth-web enable command on page 68.29](#))
- roaming authentication ([auth roaming enable command on page 68.17](#), [auth roaming disconnected command on page 68.15](#))
- guest VLAN authentication ([auth guest-vlan command on page 68.8](#)).
- DHCP relay agent option ([ip dhcp-relay agent-option command on page 91.15](#))

Any ACLs on a port that permit traffic matching DHCP snooping entries and block other traffic, will block all traffic if DHCP snooping is disabled on the port. If you disable DHCP snooping on the switch using this command, you must also remove any DHCP snooping ACLs from the ports to maintain connectivity ([no access-group command on page 59.4](#)).

Examples To enable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# service dhcp-snooping
```

To disable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# no service dhcp-snooping
```

Related Commands [ip dhcp snooping](#)

show arp security

Use this command to display ARP security configuration.

Syntax show arp security

Mode User Exec and Privileged Exec

Example To display ARP security configuration on the switch use the command:

```
awplus# show arp security
```

Figure 81-1: Example output from the show arp security command

```
awplus# show arp security
ARP Security Information:
Total VLANs enabled ..... 2
Total VLANs disabled ..... 11
vlan1 ..... Disabled
vlan2 ..... Disabled
vlan3 ..... Disabled
vlan4 ..... Disabled
vlan5 ..... Disabled
vlan100 ..... Disabled
vlan101 ..... Disabled
vlan102 ..... Disabled
vlan103 ..... Disabled
vlan104 ..... Disabled
vlan105 ..... Enabled
vlan1000 ..... Disabled
vlan1001 ..... Enabled
```

Table 81-1: Parameters in the output from the show arp security command

Parameter	Description
Total VLANs enabled	The number of VLANs that have ARP security enabled.
Total VLANs disabled	The number of VLANs that have ARP security disabled.

Related Commands

- arp security
- show arp security interface
- show arp security statistics

show arp security interface

Use this command to display ARP security configuration for the specified ports or all ports.

Syntax `show arp security interface [<port-list>]`

Parameter	Description
<port-list>	The ports to display ARP security information about. The port list can include switch ports, and static or dynamic aggregated links.

Mode User Exec and Privileged Exec

Example To display ARP security configuration for ports, use the command:

```
awplus# show arp security interface
```

Figure 81-2: Example output from the show arp security interface command

```
awplus#show arp security interface
Arp Security Port Status and Configuration:
  Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
  KEY:  LG = Log
        TR = Trap
        LD = Link down

Port          Action
-----
port1.1.1    -- -- --
port1.1.2    -- -- --
port1.1.3    LG TR LD
port1.1.4    LG -- --
port1.1.5    LG -- --
port1.1.6    LG TR --
port1.1.7    LG -- LD
...
```

Table 81-2: Parameters in the output from the show arp security interface command

Parameter	Description
Action	The action the switch takes when it detects an ARP security violation on the port.
Port	The port. Parentheses indicate that ports are configured for provisioning.
LG, Log	Generate a log message
TR, Trap	Generate an SNMP notification (trap).
LD, Link down	Shut down the link.

Related Commands

show log
snmp-server enable trap

show arp security statistics

Use this command to display ARP security statistics for the specified ports or all ports.

Syntax `show arp security statistics [detail] [interface <port-list>]`

Parameter	Description
detail	Display detailed statistics.
interface <port-list>	Display statistics for the specified ports.

Mode User Exec and Privileged Exec

Example To display the brief statistics for the ARP security, use the command:

```
awplus# show arp security statistics
```

Figure 81-3: Example output from the show arp security statistics command

```
awplus# show arp security statistics
DHCP Snooping ARP Security Statistics:
  Interface      In      In
  Interface      Packets Discards
  -----
  port1.1.3      20      20
  port1.1.4      30      30
  port1.1.12     120     0
```

Table 81-3: Parameters in the output from the show arp security statistics command

Parameter	Description
Interface	A port name. Parentheses indicate that ports are configured for provisioning.
In Packets	The total number of incoming APR packets that are processed by DHCP Snooping ARP Security
In Discards	The total number of ARP packets that are dropped by DHCP Snooping ARP Security.

Figure 81-4: Example output from the show arp security statistics detail command

```
awplus#show arp security statistics detail

DHCP Snooping ARP Security Statistics:

Interface ..... port1.1.3
  In Packets ..... 20
  In Discards ..... 20
  No Lease ..... 20
  Bad Vlan ..... 0
  Bad Port ..... 0

show ip dhcp snooping acl

Use this command to display information about the Access Control Lists (ACL) that are using the DHCP snooping database.

Syntax `show ip dhcp snooping acl`
`show ip dhcp snooping acl [detail|hardware] [interface`
 `[<interface-list>]]`

Parameter	Description
detail	Detailed DHCP Snooping ACL information.
hardware	DHCP Snooping hardware ACL information.
interface	ACL Interface information.
<interface-list>	The interfaces to display information about.

Mode User Exec and Privileged Exec

Example To display DHCP snooping ACL information, use the command:

```
awplus# show ip dhcp snooping acl
```

Figure 81-8: Example output from the show ip dhcp snooping acl command

```
awplus#show ip dhcp snooping acl
DHCP Snooping Based Filters Summary:
```

Interface	Bindings	Maximum Bindings	Template Filters	Attached Hardware Filters
port1.1.1	1	520	0	0
port1.1.2	1	3	2	6
port1.1.3	1	2	4	8
port1.1.4	1	2	7	14
port1.1.5	0	2	6	12
port1.1.6	0	1	0	0
port1.1.7	0	1	0	0
port1.1.8	0	1	0	0
port1.1.9	0	1	0	0
port1.1.10	0	1	0	0
port1.1.11	0	1	0	0
port1.1.12	0	1	0	0

To display DHCP snooping hardware ACL information, use the command:

```
awplus# show ip dhcp snooping acl hardware
```

Figure 81-9: Example output from the show ip dhcp snooping acl hardware command

```
awplus#show ip dhcp snooping acl detail interface hardware

show ip dhcp snooping agent-option

Use this command to display DHCP snooping Option 82 information for all interfaces, a specific interface or a range of interfaces.

Syntax `show ip dhcp snooping agent-option [interface <interface-list>]`

Parameter	Description
interface	Specify the interface.
<interface-list>	The name of the interface or interface range.

Mode User Exec and Privileged Exec

Examples To display DHCP snooping Option 82 information for all interfaces, use the command:

```
awplus# show ip dhcp snooping agent-option
```

To display DHCP snooping Option 82 information for port1.1.1, use the command:

```
awplus# show ip dhcp snooping agent-option interface
port1.1.1
```

To display DHCP snooping Option 82 information for vlan1, use the command:

```
awplus# show ip dhcp snooping agent-option interface vlan1
```

To display DHCP snooping Option 82 information for port1.1.1, port1.1.2 and ports in the range from port1.2.10 to port1.2.15, use the command:

```
awplus# show ip dhcp snooping agent-option interface
port1.1.1,port1.1.2,port1.2.10-port1.2.15
```

Output **Figure 81-11: Example output from the show ip dhcp snooping agent-option command**

```
awplus#show ip dhcp snooping agent-option

show ip dhcp snooping interface

Use this command to display information about DHCP snooping configuration and leases for the specified ports, or all ports.

Syntax `show ip dhcp snooping interface [<port-list>]`

Parameter	Description
<port-list>	The ports to display DHCP snooping configuration information for. If no ports are specified, information for all ports is displayed.

Mode User Exec and Privileged Exec

Example To display DHCP snooping information for all ports, use the command:

```
awplus# show ip dhcp snooping interface
```

Figure 81-13: Example output from the show ip dhcp snooping interface command

```
awplus#show ip dhcp snooping interface
DHCP Snooping Port Status and Configuration:
  Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
  Action: LG = Log

Table 81-6: Parameters in the output from the show ip dhcp snooping statistics command

Parameter	Description
Interface	The interface name.
In Packets	The total number of incoming packets that are processed by DHCP Snooping.
In BOOTP Requests	The total number of incoming BOOTP Requests.
In BOOTP Replies	The total number of incoming BOOTP Replies.
In Discards	The total number of incoming packets that have been discarded.
Invalid BOOTP Information	Packet contained invalid BOOTP information, such as an invalid BOOTP.OPCode.
Invalid DHCP ACK	A DHCP ACK message was discarded, for reasons such as missing Server Option or Lease Option.
Invalid DHCP Release or Decline	A DHCP Release or Decline message was discarded, for reasons such as mismatch between received interface and current binding information.
Invalid IP/UDP Header	A problem was detected in the IP or UDP header of the packet.
Max Bindings Exceeded	Accepting the packet would cause the maximum number of bindings on a port to be exceeded.
Option 82 Insert Error	An error occurred while trying to insert DHCP Relay Agent Option 82 information.

Table 81-6: Parameters in the output from the show ip dhcp snooping statistics command(cont.)

Parameter	Description
Option 82 Received Invalid	The DHCP Relay Agent Option 82 information received did not match the information inserted by DHCP Snooping.
Option 82 Received On Untrusted Port	A packet containing DHCP Relay Agent Option 82 information was received on an untrusted port.
Option 82 Transmit On Untrusted Port	A packet containing DHCP Relay Agent Option 82 information was to be sent on an untrusted port.
Reply Received On Untrusted Port	A BOOTP reply was received on an untrusted port.
Source MAC/CHADDR Mismatch	The L2 Source MAC address of the packet did not match the client hardware address field (BOOTP.CHADDR).
Static Entry Already Exists	An entry could not be added as a static entry already exists.

VRRP Introduction

This chapter describes the Virtual Router Redundancy Protocol (VRRP) feature provided by the switch, and how to configure the switch to participate in a virtual router. For detailed VRRP command descriptions, examples and output, see [Chapter 83, VRRP Commands](#).

One function of a switch is to act as a gateway to the WAN for hosts on a LAN. On larger LANs, two or more switches may act as the gateway, and hosts use a dynamic routing protocol, such as RIP or OSPF, to determine the gateway switch to use as the next hop in order to reach a specific IP destination. However, there are a number of factors, such as administrative or processing overhead or even support for the protocols, which may make it undesirable to use a dynamic routing protocol. One alternative is to use static routing; however, if the statically configured first hop switch fails, the hosts on the LAN are unable to communicate with those on the WAN.

The Virtual Router Redundancy Protocol is defined in RFC 5798 (Virtual Router Redundancy Protocol (VRRP) Version 3 for IPv4 and IPv6). It provides a solution to the problem by combining two or more physical switches into a logical grouping called a **virtual router (VR)**. The physical switches then operate together to provide a single logical gateway for hosts on the LAN.

A virtual router is configured as the host's gateway and comprises a number of physical routers. The hosts can only see the virtual router so the number of physical routers that make up the virtual router is transparent. If physical routers in the virtual router fail, then traffic to and from the hosts will still be forwarded, so long as there is at least one functioning physical router, no configuration changes will be required by the hosts.

The VRRP virtual router comprises a master router and a number of backup routers. The master router is the router responsible for forwarding packets between the hosts and the remote network. It is also responsible for informing backup router of its presence. Should the master router fail, then one of the backup routers takes over the master router role.

The virtual router uses a special reserved MAC address, which is called VRRP virtual MAC. This MAC address is returned by the master router of the virtual router in any ARP responses relating to the gateway IP address, regardless of which device is acting as the master router. By using this unified MAC address across routers, host maintain connectivity with the remote network if a router fails with a backup taking over a master.

Note If there are PIM-SM routers using VRRP the Bootstrap Router (BSR) function will not work properly.

Virtual Router Redundancy Protocol

The virtual router has a virtual MAC address that is known by all its participating switches or routers. The virtual MAC address is derived from the virtual router identifier - a user-defined value from 1 to 255. At the network level, all hosts on the LAN are configured with a common IP address that is used as the first hop. This IP address is typically owned by the virtual router's preferred individual switch or router. When available, this device performs the duties of the virtual router, and is referred to as the **master**. The switch that owns the IP address associated with the virtual router is referred to as the **preferred master**. When a virtual router is configured so that none of the participating switches owns the IP address, the virtual router has no preferred master.

When a switch takes the role of master for a virtual router, it is responsible for the following:

- Responding to ARP and Neighbor solicitation packets that contain IP addresses associated with the virtual router. The ARP reply or Neighbor response contains the virtual MAC address of the virtual router so that the hosts on the LAN associate the virtual MAC address with their configured first-hop IP address. Note that with VRRPv3 supporting both IPv4 and IPv6, the IP address in this context can be an IPv4 or an IPv6 address.
- Forwarding packets with a destination link layer MAC address equal to the virtual router MAC address.
- The VRRPv3 accept mode is enabled by default in the AlliedWare Plus VRRPv3 implementation. This enables a VRRP master to accept packets addresses to the virtual router IP address even if this IP address is not owned by the VRRP master.
- Broadcasting advertisement packets at regular intervals (at the specified advertisement interval) to inform backup switches that it is still acting as the master switch.

Each of the other switches participating in the virtual router is considered to be a backup switch. A switch can be a member of several different virtual routers on one LAN, but each virtual router must have a unique identifier (VRID). When a switch has the role of backup for a virtual router, it must be able to perform the following tasks:

- Receive advertisement packets from the master and check that the information contained in them is consistent with their own configuration; ignoring and discarding advertisement packets that do not match.
- Assume the role of master for the virtual router if an advertisement packet is not received for a given period, (the master-down time), based on the specified advertisement interval, (for example: **awplus(config-router)# advertisement-interval 5** will set the advertisement-interval to 5 seconds). The master-down time is approximately three times the advertisement interval.
- Assume the role of master if it receives an advertisement packet from another switch with a lower priority than its own, and if preempt mode is on.

If a VRRP instance is running on a VLAN interface and the VLAN interface goes down, then the VRRP instance, whether it is a VRRP master or a VRRP backup, moves to an INIT state. During the INIT state the VRRP instance on the VLAN interface cannot receive traffic, and will not be active until the VLAN interface is up.

 **Note** When using VRRPv3 with VCStacking, ensure that the VRRPv3 advertisement-interval is configured to a longer time than the VCStacking failover time. If the VRRPv3 advertisement-interval is shorter than the VCStacking failover time, then a VRRPv3 failover will also occur whenever a VCStacking failover occurs. Use seconds not centiseconds to ensure interoperability with VRRPv2.

VRRP Configuration for IPv4

VRRP for IPv4 is disabled by default. Once you have defined a virtual router session, you must enable VRRP to make the session operational for a given interface. You can then enable or disable the virtual router as shown:

To enable VRRP

<code>awplus(config)#</code>	
<code>router vrrp 1 vlan2</code>	Create a new VRRP session on the router, specify the virtual router ID (VRID) for the session, and specify the interface (<code>vlan2</code>) that will participate in virtual routing.
<code>awplus(config-router)#</code>	
<code>enable</code>	Enable the VRRP session on the switch.
<code>awplus(config-router)#</code>	
<code>exit</code>	Return to the Global Configuration mode.
<code>awplus(config)#</code>	Global Configuration mode prompt.

To disable VRRP

<code>awplus(config)#</code>	
<code>router vrrp 1 vlan2</code>	Specify an existing VRRP session, specify the virtual router ID (VRID) for the session, and specify the interface (<code>vlan2</code>) that will participate in virtual routing.
<code>awplus(config-router)#</code>	
<code>disable</code>	Disable the VRRP session on the switch.
<code>awplus(config-router)#</code>	
<code>exit</code>	Return to the Global Configuration mode.
<code>awplus(config)#</code>	Global Configuration mode prompt.

A virtual router must be defined on at least two switches before it operates correctly. Use the following steps to configure virtual routing on a switch. Note that this example assumes that VLAN 2 already exists on the switch. See [“Configuring VLANs” on page 16.3](#).

To configure virtual routing on a switch

<code>awplus#</code>	
<code>configure terminal</code>	Enter the Global Configuration mode.
<code>awplus(config)#</code>	
<code>router vrrp 1 vlan2</code>	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (<code>vlan2</code>) that will participate in virtual routing.

To configure virtual routing on a switch(cont.)

awplus(config-router)# virtual-ip 10.10.10.50 master	Set the virtual IP address for the VRRP session. Define the default state (master or backup) of the VRRP router within the virtual router. This sets the default master priority value of 255 without needing to issue a priority command separately.
awplus(config-router)# enable	Enable the VRRP session on the switch.
awplus(config-router)# exit	Return to the Global Configuration mode.
awplus(config)#	Global Configuration mode prompt.

To destroy a virtual router on the LAN, it must be removed from all participating switches. Use the following commands to remove a virtual router so that the switch no longer participates in virtual routing.

To remove the virtual router VRRP 1 from a switch

awplus# configure terminal	Enter the Global Configuration mode.
awplus(config)# no router vrrp 1 vlan2	Remove the VRRP session on the switch for the specified interface <code>vlan2</code> .
awplus(config-router)# exit	Return to the Global Configuration mode.
awplus(config)#	Global Configuration mode prompt.

Alternatively, you can simply disable the virtual router and retain the configuration.

To disable the router and retain the configuration

awplus# configure terminal	Enter the Global Configuration mode.
awplus(config)# router vrrp 1 vlan2	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (<code>vlan2</code>) used for virtual routing.
awplus(config-router)# disable	Disable the VRRP session on the switch.
awplus(config-router)# exit	Return to the Global Configuration mode.
awplus(config)#	Global Configuration prompt.

VRRP election and preempt for IPv4

If the switch that is the current VRRP master becomes unavailable, the master role is taken by the switch with the next highest priority. The priority is a value from 1 to 255, with a default of 100. The value 255 is reserved for the switch that owns the virtual router's IP address. The new master takes over all the responsibilities of the original master.

By default, when a switch becomes available that has a higher priority than the master, this switch takes over as master. This is referred to as **preempt mode** and can be set **on** or **off**. Even with preempt mode **off**, the switch that owns the IP address always becomes the master when available. Preempt mode should be the same for all switches in the virtual router.

If two switches are configured with the same priority and a conflict occurs when they both transition to master simultaneously, the one with the highest IP address has higher priority. Due to timing differences the conflict may not always occur and simply the first switch to respond will become the master.

Hosts on the LAN can continue sending packets to the virtual MAC address they originally associated with the first hop IP address, even though the switch that owns the IP address is not currently available. When the original switch becomes available again, and if it is a preferred switch (i.e. it owns the virtual router IP address) then it resumes the role of master.

Use the following commands to set the priority and preempt mode when you create the virtual router:

To set the priority and preempt mode for VRRP 1

awplus#	
<code>configure terminal</code>	Enter the Global Configuration mode.
awplus(config)#	
<code>router vrrp 1 vlan2</code>	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (<code>vlan2</code>) used for virtual routing.
awplus(config-router)#	
<code>priority 255</code>	Set the VRRP priority for the switch
awplus(config-router)#	
<code>preempt-mode true</code>	Select the preempt mode for VRRP 1. Note only select preempt mode to true if this has been set to false. Preempt is true by default.
awplus(config-router)#	
<code>enable</code>	Enable the VRRP session on the switch.
awplus(config-router)#	
<code>exit</code>	Return to the Global Configuration mode.
awplus(config)#	Global Configuration prompt

The advertisement interval determines the rate that the master sends its advertisement packets. This rate must be the same value for all switches in the virtual router. The default advertisement interval of 1second can be used for most networks. However, you can modify this interval by using the **advertisement-interval** command, as shown in the following procedure:

To set the advertisement interval to 5 seconds on VRRP1

<code>awplus#</code>	
<code>configure terminal</code>	Enter the Global Configuration mode.
<code>awplus(config#</code>	
<code>router vrrp 1 vlan2</code>	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (vlan2) used for virtual routing.
<code>awplus(config-router)#</code>	
<code>advertisement-interval 5</code>	Set the advertisement interval to 5 seconds.

VRRP Configuration for IPv6

VRRP for IPv6 is disabled by default. Once you have defined a virtual router session, you must enable VRRP to make the session operational for a given interface. You can then enable or disable the virtual router as shown:

To enable VRRP

<code>awplus(config)#</code>	
<code>router ipv6 vrrp 1 vlan2</code>	Create a new VRRP session on the router, specify the virtual router ID (VRID) for the session, and specify the interface (vlan2) that will participate in virtual routing.
<code>awplus(config-router)#</code>	
<code>enable</code>	Enable the VRRP session on the switch.
<code>awplus(config-router)#</code>	
<code>exit</code>	Return to the Global Configuration mode.
<code>awplus(config)#</code>	Global Configuration mode prompt.

To disable VRRP

<code>awplus(config)#</code>	
<code>router ipv6 vrrp 1 vlan2</code>	Specify an existing VRRP session, specify the virtual router ID (VRID) for the session, and specify the interface (vlan2) that will participate in virtual routing.
<code>awplus(config-router)#</code>	
<code>disable</code>	Disable the VRRP session on the switch.
<code>awplus(config-router)#</code>	
<code>exit</code>	Return to the Global Configuration mode.
<code>awplus(config)#</code>	Global Configuration mode prompt.

A virtual router must be defined on at least two switches before it operates correctly. Use the following steps to configure virtual routing on a switch. Note that this example assumes that VLAN 2 already exists on the switch. See [“Configuring VLANs” on page 16.3](#).

To configure virtual routing on a switch

<code>awplus#</code>	
<code>configure terminal</code>	Enter the Global Configuration mode.
<code>awplus(config)#</code>	
<code>router ipv6 vrrp 1 vlan2</code>	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (vlan2) that will participate in virtual routing.

To configure virtual routing on a switch(cont.)

<pre>awplus(config-router)# virtual-ipv6 fe80::1 master</pre>	<p>Set the virtual IP address for the VRRP session. Define the default state (master or backup) of the VRRP router within the virtual router. This sets the default master priority value of 255 without needing to issue a priority command separately.</p> <p>Note that <code>fe80::1</code> is an IPv6 link-local address. AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798.</p> <p>See the Usage note for the virtual-ipv6 command for implementation information about link-local addresses in AlliedWare Plus.</p>
<pre>awplus(config-router)# enable</pre>	<p>Enable the VRRP session on the switch.</p>
<pre>awplus(config-router)# exit</pre>	<p>Return to the Global Configuration mode.</p>
<pre>awplus(config)#</pre>	<p>Global Configuration mode prompt.</p>

To destroy a virtual router on the LAN, it must be removed from all participating switches. Use the following commands to remove a virtual router so that the switch no longer participates in virtual routing.

To remove the virtual router VRRP 1 from a switch

<pre>awplus# configure terminal</pre>	<p>Enter the Global Configuration mode.</p>
<pre>awplus(config)# no router ipv6 vrrp 1 vlan2</pre>	<p>Remove the VRRP session on the switch for the specified interface <code>vlan2</code>.</p>
<pre>awplus(config-router)# exit</pre>	<p>Return to the Global Configuration mode.</p>
<pre>awplus(config)#</pre>	<p>Global Configuration mode prompt.</p>

Alternatively, you can simply disable the virtual router and retain the configuration.

To disable the router and retain the configuration

<code>awplus#</code>	
<code>configure terminal</code>	Enter the Global Configuration mode.
<code>awplus(config)#</code>	
<code>router ipv6 vrrp 1 vlan2</code>	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (<code>vlan2</code>) used for virtual routing.
<code>awplus(config-router)#</code>	
<code>disable</code>	Disable the VRRP session on the switch.
<code>awplus(config-router)#</code>	
<code>exit</code>	Return to the Global Configuration mode.
<code>awplus(config)#</code>	Global Configuration prompt.

VRRP election and preempt for IPv6

If the switch that is the current VRRP master becomes unavailable, the master role is taken by the switch with the next highest priority. The priority is a value from 1 to 255, with a default of 100. The value 255 is reserved for the switch that owns the virtual router's IP address. The new master takes over all the responsibilities of the original master.

By default, when a switch becomes available that has a higher priority than the master, this switch takes over as master. This is referred to as **preempt mode** and can be set **on** or **off**. Even with preempt mode **off**, the switch that owns the IP address always becomes the master when available. Preempt mode should be the same for all switches in the virtual router.

If two switches are configured with the same priority and a conflict occurs when they both transition to master simultaneously, the one with the highest IP address has higher priority. Due to timing differences the conflict may not always occur and simply the first switch to respond will become the master.

Hosts on the LAN can continue sending packets to the virtual MAC address they originally associated with the first hop IP address, even though the switch that owns the IP address is not currently available. When the original switch becomes available again, and if it is a preferred switch (i.e. it owns the virtual router IP address) then it resumes the role of master.

Use the following commands to set the priority and preempt mode when you create the virtual router:

To set the priority and preempt mode for VRRP 1

awplus# configure terminal	Enter the Global Configuration mode.
awplus(config)# router ipv6 vrrp 1 vlan2	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (vlan2) used for virtual routing.
awplus(config-router)# priority 255	Set the VRRP priority for the switch
awplus(config-router)# preempt-mode true	Select the preempt mode for VRRP 1. Note only select preempt mode to true if this has been set to false. Preempt is true by default.
awplus(config-router)# enable	Enable the VRRP session on the switch.
awplus(config-router)# exit	Return to the Global Configuration mode.
awplus(config)#	Global Configuration prompt

The advertisement interval determines the rate that the master sends its advertisement packets. This rate must be the same value for all switches in the virtual router. The default advertisement interval of 1second can be used for most networks. However, you can modify this interval by using the **advertisement-interval** command, as shown in the following procedure:

To set the advertisement interval to 5 seconds on VRRP1

<code>awplus#</code>	
<code>configure terminal</code>	Enter the Global Configuration mode.
<code>awplus(config#</code>	
<code>router ipv6 vrrp 1 vlan2</code>	Select the VRRP session on the switch, specify the VRID for the session, and specify the interface (vlan2) used for virtual routing.
<code>awplus(config-router)#</code>	
<code>advertisement-interval 5</code>	Set the advertisement interval to 5 seconds.

VRRP debugging

VRRP debugging displays data that is useful for troubleshooting. To enable or disable debugging use the following commands:

To select and deselect VRRP debugging

```
awplus#  
configure terminal Enter the Global Configuration mode.  
-----  
awplus(config)#  
debug vrrp [all|events|packet] Enable the selected debugging type.  
-----  
awplus(config)#  
no debug vrrp [all|events|packet] Disable the selected debugging type.  
-----
```

It is important that all switches involved in a virtual router are configured with the same values for the following:

- VRRP virtual router identifier
- IP address
- advertisement interval
- preempt mode
- authentication type
- password

Inconsistent configuration causes advertisement packets to be rejected and the virtual router cannot perform properly.

VRRP Configuration Examples

The following examples show how to configure a virtual router in a LAN:

- **VRRP Preferred Master with Backup Configuration**
- **VRRP Circuit Failover Configuration**
- **VRRPv2 to VRRPv3 Transition Configuration**
- **VRRP IPv6 Configuration Example**

VRRP Preferred Master with Backup Configuration

This example show how to configure a basic virtual router with a preferred master and a backup.

Switch_A owns the IP address of the virtual router, and always assumes the role of master whenever it is available. Switch_B is the backup, and assumes the role of master, backing up this IP address if A becomes unavailable.

Step 1: Configure Switch_A

At this point we assume that you have already created VLAN 2 on Switch_A. See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLANs.

Configure an IP address on VLAN 2

awplus#	
configure terminal	Enter the Global Configuration mode.

awplus(config)#	
hostname Switch_A	Assign the host name Switch_A.

Switch_A(config)#	
interface vlan2	Specify the interface (vlan2) that will participate in virtual routing to first configure an IP address for vlan2.

Switch_A(config-if)#	
ip address 192.168.1.1/24	Specify the IP address and mask for interface vlan2.

Create the Master Virtual Router

Switch_A(config)#	
spanning-tree mode stp	Configure STP for interfaces on Switch_A.

Switch_A(config)#	
router vrrp 1 vlan2	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (vlan2) that will participate in virtual routing.

Switch_A(config-router)#	
virtual-ip 192.168.1.1 master	Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router.

Switch_A(config-router)#	
enable	Enable the VRRP session on the router.

Switch_A(config-router)#	
exit	Exit the Router Configuration mode and enter the Global Configuration mode.

Switch_A(config)#	
exit	Exit the Global Configuration mode and enter the Privileged Exec mode.

Switch_A#	Privileged Exec mode prompt.
-----------	------------------------------

Step 2: Configure Switch_B

At this point we assume that you have already created VLAN 2 on Switch_B. See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLANs.

Configure an IP address on VLAN 2

```

awplus#
configure terminal Enter Global Configuration mode.
awplus(config)#
hostname Switch_B Assign the host name Switch_B.
Switch_B(config)#
interface vlan2 Specify the interface (vlan2) that will
participate in virtual routing.
Switch_B(config)#
ip address 192.168.1.2/24 Specify the IP address and mask for interface

```

Create the Backup Virtual Router

```

Switch_B(config)#
router vrrp 1 vlan2 Create a new VRRP session on the router, specify
the VRID for the session, and specify the interface
(vlan2) that will participate in virtual routing.
Switch_B(config-router)#
virtual-ip 192.168.1.1 Set the virtual IP address for the VRRP session.
backup Define the default state of the VRRP router within
the virtual router.
Switch_B(config-router)#
enable Enable the VRRP session on the router.
Switch_B(config-router)
exit Exit the Interface Configuration mode and enter
the Global Configuration mode.
Switch_B(config)#
exit Return to the Privileged Exec mode.
Switch_B# Privileged Exec mode prompt.

```

Commands Used **enable (VRRP)**
router vrrp (interface)
virtual-ip

Validation **show vrrp**
Commands

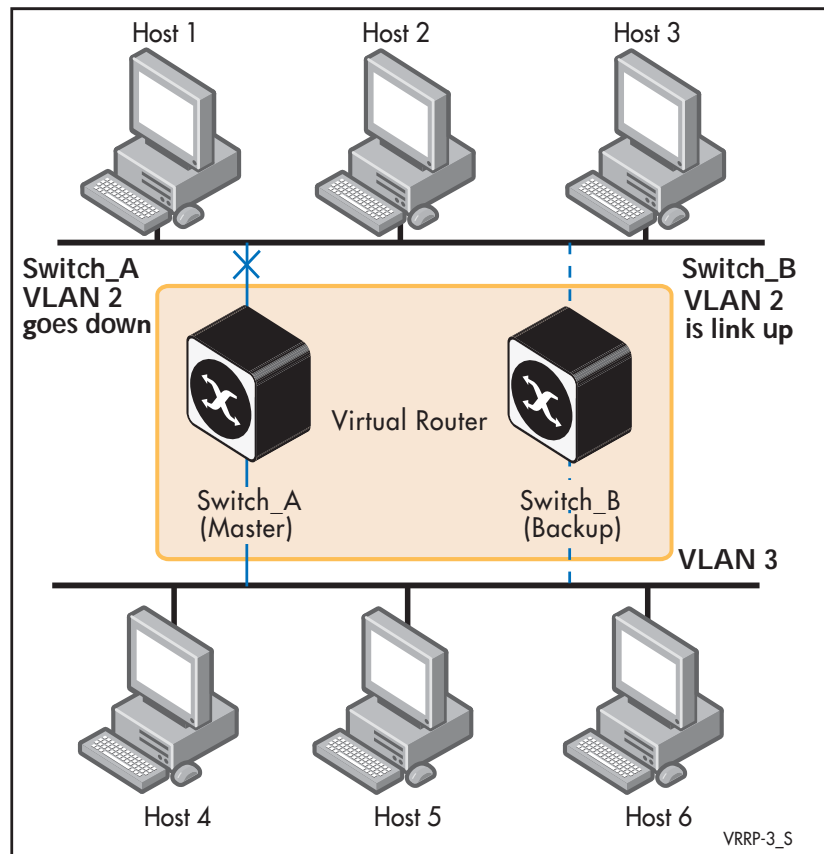

VRRP Circuit Failover Configuration

This example shows how to configure a circuit-failover on a virtual router. This example configures redundancy between Switch_A and Switch_B for hosts on VLAN 2 and VLAN 3.

The need for VRRP Circuit Failover arose because VRRPv2 was unable to track the gateway interface status. The AlliedWare Plus VRRP Circuit Failover feature provides a dynamic failover of an entire circuit in the event that one of the members of the group fails.

This introduces the concept of a circuit, where two or more Virtual Routers on a single system are grouped. In the event of a failure occurring a Virtual Router performs the Master to Backup transition and notifies the other Virtual Routers. These are then forced into the Master to Backup transition, so that both incoming and outgoing packets are routed through the same gateway router, eliminating the problem for NAT environments.

To configure VRRP Circuit Failover, each circuit is configured to have a corresponding priority delta value, which is passed to VRRP when a failure occurs. The priority of each Virtual Router on the circuit is decremented by the priority delta value, which causes the Virtual Router Master to Virtual Router Backup transition. In this example, two switches Switch_A and Switch_B are configured as backup routers with different priorities. The priority delta value is configured to be greater than the difference of both the priorities.

Switch_A is configured to have a priority of 100, and Switch_B is configured to have a priority of 90. Switch_A with a greater priority is the Virtual Router Master. The priority delta value is 20, greater than 10 (100 minus 90). On Switch_A, when vlan2 fails, the priority of Switch_A becomes 80 (100 minus 20). Since Switch_B has a greater priority (90) than Switch_A, Switch_B becomes the Virtual Router Master, and routing of packets continues without interruption. When this Virtual Router Backup (Switch_A) is up again, it regains its original priority (100), and becomes the Virtual Router Master again.

See also the [circuit-failover](#) command description in [Chapter 83, VRRP Commands](#).

Step 1: Configure Switch_A

At this point we assume that you have already created VLAN 2 on VR1.
See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLANs.

Configure an IP address on VLAN 2

```
awplus#  
configure terminal
```

 Enter the Global Configuration mode.

```
awplus(config)#  
hostname Switch_A
```

 Assign the host name Switch_A.

```
Switch_A(config)#  
interface vlan2
```

 Specify the interface (vlan2) that will participate in virtual routing to first configure an IP address for vlan2.

```
Switch_A(config-if)#  
ip address 192.168.1.1/24
```

 Specify the IP address and mask for interface vlan2.

Configure an IP address on VLAN 3

```
Switch_A(config-if)#  
exit
```

 Exit the Interface Configuration mode and enter the Global Configuration mode.

```
Switch_A(config)#  
interface vlan3
```

 Specify the interface (vlan3) that will participate in virtual routing to first configure an IP address for vlan3.

```
Switch_A(config-if)#  
ip address 192.168.2.1/24
```

 Specify the IP address and mask for interface vlan3.

Create the Master Virtual Router

<pre>Switch_A(config)# router vrrp 1 vlan2</pre>	<p>Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (vlan2) that will participate in virtual routing.</p>
<pre>Switch_A(config-router)# virtual-ip 192.168.1.1 backup</pre>	<p>Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router.</p>
<pre>Switch_A(config-router)# priority 100</pre>	<p>Set the VRRP priority to 100 as the default priority for a backup virtual router.</p>
<pre>Switch_A(config-router)# preempt-mode true</pre>	<p>Set preempt mode to true to specify that the highest priority will own the virtual IP address when there is a failure and will function as the backup virtual router.</p>
<pre>Switch_B(config-router)# advertisement-interval 5</pre>	<p>Configure the default value for the advertisement interval. The configurable range for the advertisement interval is 1-10.</p>
<pre>Switch_A(config-router)# circuit-failover vlan2 20</pre>	<p>Configure circuit failover to 20 on Switch_A. This configures a priority delta value, greater than the difference of priorities on master and backup routers. This priority delta value is subtracted from the current VR Master Router priority value.</p>
<pre>Switch_A(config-router)# enable</pre>	<p>Enable the VRRP session on the router.</p>
<pre>Switch_A(config-router)# exit</pre>	<p>Exit the Router Configuration mode and enter the Global Configuration mode.</p>
<pre>Switch_A(config)# exit</pre>	<p>Exit the Global Configuration mode and enter the Privileged Exec mode.</p>
<pre>Switch_A#</pre>	<p>Privileged Exec mode prompt.</p>
<pre>Switch_A# copy running-config startup- config</pre>	<p>Copy the contents of the running-configuration to the startup-configuration.</p>

Step 2: Configure Switch_B

At this point we assume that you have already created VLAN2 on Switch_B. See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLANs.

Configure an IP address on VLAN 2

```
awplus#  
configure terminal  Enter Global Configuration mode.  
-----  
awplus(config)#  
hostname Switch_B  Assign the host name Switch_B.  
-----  
Switch_B(config)#  
interface vlan2    Specify the interface (vlan2) that will  
                  participate in virtual routing.  
-----  
Switch_B(config-if)#  
ip address 192.168.1.2/24  Specify the IP address and mask for the interface
```

Configure an IP address on VLAN 3

```
Switch_B(config-if)#  
exit  Exit the Interface Configuration mode and enter  
      the Global Configuration mode.  
-----  
Switch_B(config)#  
interface vlan3    Specify the interface (vlan3) that will  
                  participate in virtual routing.  
-----  
Switch_B(config-if)#  
ip address 192.168.2.2/24  Specify the IP address and mask for the interface
```

Create the Backup Virtual Router

Switch_B(config)# router vrrp 1 vlan2	Create a new VRRP session on the router, specify the VRID for the session, and specify the interface (vlan2) that will participate in virtual routing.
Switch_B(config-router)# virtual-ip 192.168.1.1 backup	Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router.
Switch_B(config-router)# priority 90	Set the VRRP priority to 90 (less than 100) because Switch_B is the backup virtual router .
Switch_B(config-router)# preempt-mode true	Set preempt mode to true to specify that the highest priority will own the virtual IP address when there is a failure and will function as the backup virtual router.
Switch_B(config-router)# advertisement-interval 5	Configure the default value for the advertisement interval. The configurable range for the advertisement interval is 1-10.
Switch_B(config-router)# enable	Enable the VRRP session on the router.
Switch_A(config-router)# exit	Exit the Router Configuration mode and enter the Global Configuration mode.
Switch_A(config)# exit	Exit the Global Configuration mode and enter the Privileged Exec mode.
Switch_A#	Privileged Exec mode prompt.
Switch_A# copy running-config startup-config	Copy the contents of the running-configuration to the startup-configuration.

Commands Used

- advertisement-interval
- circuit-failover
- enable (VRRP)
- preempt-mode
- priority
- router vrrp (interface)
- virtual-ip

Validation Commands

- show vrrp

VRRPv2 to VRRPv3 Transition Configuration

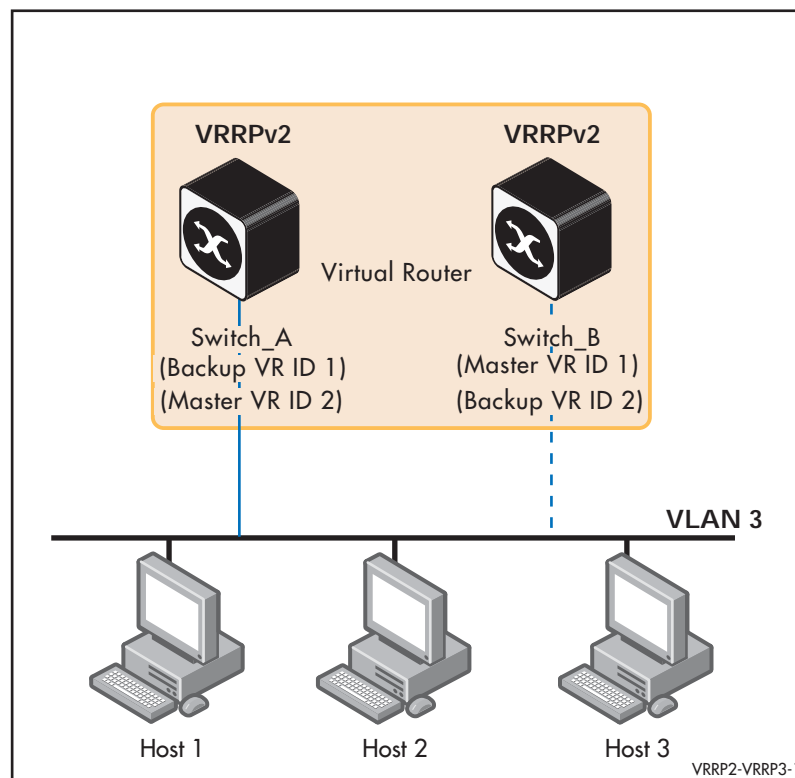

This example shows how to configure the transition from VRRPv2 to VRRPv3 on a virtual router. This example configures VRRPv3 from VRRPv2 on Switch_A and Switch_B for hosts on VLAN 3. See also the **transition-mode** command in [Chapter 83, VRRP Commands](#).

Transition mode allows interoperability for IPv4 VRRP instances between VRRPv2 and VRRPv3 virtual routers. RFC 5798 for VRRPv3 allows a VRRPv3 virtual router to send both VRRPv2 and VRRPv3 advertisements. Note that this feature is only for IPv4 interoperability. Note that when **transition-mode** is set to true then VRRPv3 will also accept and process VRRPv2 advertisement packets received should there be a VRRPv2 master on the network.

You should upgrade your VRRPv2 virtual routers to VRRPv3 as a long term solution and only use transition mode for a staged VRRPv2 to VRRPv3 roll out. Transition mode is disabled by default and is enabled by issuing the **transition-mode true** command.

Note that you should ensure that the advertisement interval for a VRRPv2 instance is configured to greater than 1 second (100 centiseconds). If the advertisement interval is configured to less than 1 second (100 centiseconds) then ensure the VRRPv2 virtual router has a lower priority with the **priority** command than the VRRPv2/VRRPv3 virtual router.

When you configure a VRRPv3 instance with **transition-mode true** also configure it as the VRRP master instance, either by configuring it to own the IP address or with a high priority. Also configure the advertisement interval to whole seconds to maintain compatibility with VRRPv2 hosts. All matching VRRP instances should be configured with the same advertisement interval to eliminate master instance contention on VRRP startup as well.

Follow the steps listed over the page to disable VRRPv2 on Switch_A before saving the running and startup configurations then rebooting Switch_A to upgrade to VRRPv3.

Note that after upgrading Switch_A to VRRPv3 you can leave Switch_B running VRRPv2, or you can upgrade Switch_B to VRRPv3. Running VRRPv3 on both is highly recommended. The above illustration shows both Switch_A and Switch_B running VRRPv2 to upgrade.

Follow **Step 1** to upgrade Switch_A from VRRPv2 to VRRPv3 and follow **Step 2** to upgrade Switch_B from VRRPv2 to VRRPv3. You can follow **Step 1** only if Switch_B is not upgraded. Only Switch_A needs transition-mode enabled to upgrade then disabled after upgrading.

Step 1: Upgrade Switch_A from VRRPv2 to VRRPv3

At this point we assume that you have already copied the current release of AlliedWare Plus with VRRPv3 to flash and only need to make this release the boot version and restart. We also assume that you have already created VLAN 3 on Switch_B. See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLAN 3 as needed.

Disable VRRPv2 on Switch_A and enable VRRPv3 on Switch_A

Switch_A#	
<code>configure terminal</code>	Enter the Global Configuration mode for Switch_A.
Switch_A(config)#	
<code>router vrrp 1 vlan3</code>	Select the VRRPv2 backup session on the router, specify the VRID for the session (1), and specify the interface (vlan3).
Switch_A(config-router)#	
<code>disable</code>	Disable the VRRPv2 backup on Switch_A.
Switch_A(config-router)#	
<code>exit</code>	Exit the Router Configuration mode and enter the Global Configuration mode.
Switch_A(config)#	
<code>router vrrp 2 vlan3</code>	Select the VRRPv2 master session on the router, specify the VRID for the session (2), and specify the interface (vlan3).
Switch_A(config-router)#	
<code>disable</code>	Disable the VRRPv2 master on Switch_A.
Switch_A(config-router)#	
<code>exit</code>	Exit the Router Configuration mode and enter the Global Configuration mode.
Switch_A(config)#	
<code>exit</code>	Exit the Global Configuration mode and enter the Privileged Exec mode.
Switch_A#	
<code>copy running-config startup-config</code>	Copy the contents of the running-configuration to the startup-configuration.
Switch_A#	
<code>configure terminal</code>	Enter the Global Configuration mode.
Switch_A(config)#	
<code>reload</code>	Restart Switch_A to load the AlliedWare Plus release with VRRPv3 as configured with the boot system command earlier.

Switch_A(config)# router vrrp 1 vlan3	Enter Router Configuration mode for the backup VRRPv3 session on the router, specifying the VRID for the session (1), and specifying the interface (vlan3).
Switch_A(config-router)# transition-mode true	Set transition mode to true to turn on transition mode enabling VRRPv2 and VRRPv3 advertisement on VRRPv3.
Switch_A(config-router)# enable	Enable the VRRPv3 backup on Switch_A.
Switch_A(config)# router vrrp 2 vlan3	Create a VRRPv3 master session on the router, specify the VRID for the session (2), and specify the interface (vlan3).
Switch_A(config-router)# transition-mode true	Set transition mode to true to turn on transition mode enabling VRRPv2 and VRRPv3 advertisement on VRRPv3.
Switch_A(config-router)# enable	Enable the VRRPv3 master on Switch_A.
Switch_A(config-router)# exit	Exit the Router Configuration mode and enter the Global Configuration mode.
Switch_A(config)# exit	Exit the Global Configuration mode and enter the Privileged Exec mode.
Switch_A# copy running-config startup-config	Copy the contents of the running-configuration to the startup-configuration.

The above illustration shows Switch_A running VRRPv3 and Switch_B running VRRPv2. Note that Switch_A running VRRPv3 with **transition-mode true** configured sends both VRRPv3 and VRRPv2 advertisements. This is an interim solution for IPv4 VRRPv2 and VRRPv3 interoperability. Only VRRPv3 should be used on both devices for IPv6 use.

Step 2: Upgrade Switch_B from VRRPv2 to VRRPv3

At this point we assume that you have already copied the current release of AlliedWare Plus with VRRPv3 to flash and only need to make this release the boot version and restart. We also assume that you have already created VLAN 3 on Switch_B. See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLAN 3 as needed.

Disable VRRPv2 on Switch_B and enable VRRPv3 on Switch_B

```
Switch_B#
configure terminal  Enter the Global Configuration mode for Switch_B.

Switch_B(config)#
router vrrp 1 vlan3  Select the VRRPv2 master session on the router,
                    specify the VRID for the session (1), and specify the
                    interface (vlan3).

Switch_B(config-router)#
disable            Disable the VRRPv2 master on Switch_B.

Switch_B(config-router)#
exit              Exit the Router Configuration mode and enter the
                  Global Configuration mode.

Switch_B(config)#
router vrrp 2 vlan3  Select the VRRPv2 backup session on the router,
                    specify the VRID for the session (2), and specify the
                    interface (vlan3).
```

Switch_B(config-router)# disable	Disable the VRRPv2 backup on Switch_B.
Switch_B(config-router)# exit	Exit the Router Configuration mode and enter the Global Configuration mode.
Switch_B(config)# exit	Exit the Global Configuration mode and enter the Privileged Exec mode.
Switch_B# copy running-config startup-config	Copy the contents of the running-configuration to the startup-configuration.
Switch_B# configure terminal	Enter the Global Configuration mode.
Switch_B(config)# reload	Restart Switch_A to load the AlliedWare Plus release with VRRPv3 as configured with the boot system command earlier.
Switch_B(config)# router vrrp 1 vlan3	Enter Router Configuration mode for the master VRRPv3 session on the router, specifying the VRID for the session (1), and specifying the interface (vlan3).
Switch_B(config-router)# enable	Enable the VRRPv3 master on Switch_B.
Switch_B(config-router)# exit	Exit the Router Configuration mode and enter the Global Configuration mode.
Switch_B(config)# router vrrp 2 vlan3	Enter Router Configuration mode for the backup VRRPv3 session on the router, specifying the VRID for the session (2), and specifying the interface (vlan3).
Switch_B(config-router)# enable	Enable the VRRPv3 backup on Switch_B.
Switch_B(config-router)# exit	Exit the Router Configuration mode and enter the Global Configuration mode.
Switch_B(config)# exit	Exit the Global Configuration mode and enter the Privileged Exec mode.
Switch_B# copy running-config startup-config	Copy the contents of the running-configuration to the startup-configuration.

The above illustration shows both Switch_A and Switch_B running VRRPv3. Note that transition mode should be turned off Switch_A once VRRPv3 is active on both to stop Switch_A from continuing to send VRRPv2 and VRRPv3 advertisements to Switch_B.

```

Switch_A#
configure terminal Enter the Global Configuration mode for Switch_A.
Switch_A(config)#
router vrrp 1 vlan3 Enter Router Configuration mode for the backup
                    VRRPv3 session on the router, specifying the VRID for
                    the session (1), and specifying the interface (vlan3).
Switch_A(config-router)#
transition-mode false Set transition mode to false to turn off transition
                      mode now VRRPv3 is on Switch_A and Switch_B.
Switch_A(config-router)#
exit Exit the Router Configuration mode and enter the
     Global Configuration mode.
Switch_A(config)#
router vrrp 2 vlan3 Enter Router Configuration mode for the master
                    VRRPv3 session on the router, specifying the VRID for
                    the session (2), and specifying the interface (vlan3).
Switch_A(config-router)#
transition-mode false Set transition mode to false to turn off transition
                      mode now VRRPv3 is on Switch_A and Switch_B.

```

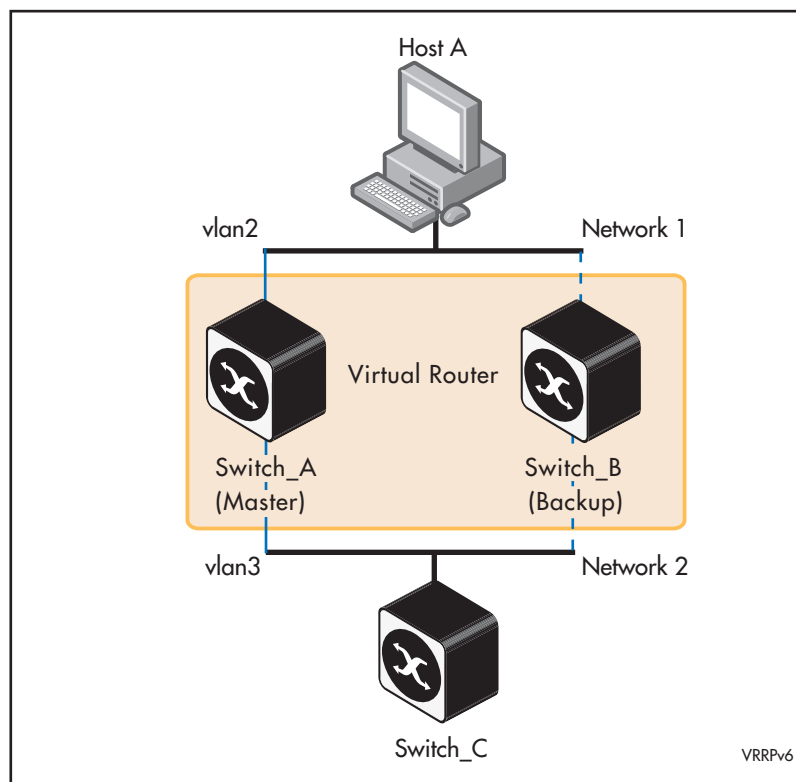

Commands Used **disable (VRRP)**
 enable (VRRP)
 router vrrp (interface)
 transition-mode

VRRP IPv6 Configuration Example

This section shows a Virtual Router Redundancy Protocol IPv6 (VRRPv3) configuration example. For detailed VRRP command descriptions, configuration command examples and relevant sample show command output, see [Chapter 83, VRRP Commands](#).

VRRPv3 eliminates the risk of a single point of failure inherent in a static default routing environment. VRRPv3 specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the devices configured with VRRPv3 on a LAN.

In this example, VRRPv3 is enabled on Switch_A, the Master Virtual Router, and on Switch_B, the Backup Virtual Router. In Switch_A, the static routes are redistributed.

Switch_A owns the IP address of the virtual router, and always assumes the role of master whenever it is available. Switch_B is the backup, and assumes the role of master, backing up this IP address if A becomes unavailable. No authentication is used for this simple virtual router.

See the sample output following the sample command configuration tables for each device. See relevant VRRP show commands that are useful to validate configurations.

AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798. Note in the command examples, fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over a backup router, the IPv6 link-local address of the router is used by VRRPv3.

Step 1: Configure Switch_A (Master Virtual Router)

At this point we assume that you have already created VLAN 2 and VLAN 3 on Switch_A. See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLANs.

Configure IPv6 addresses on VLAN 2 and VLAN 3

```
awplus#  
configure terminal Enter the Global Configuration mode.
```

```
awplus(config)#  
hostname Switch_A Assign a host name to Switch_A.
```

```
Switch_A(config)#  
interface vlan2 Specify the interface (vlan2) that will  
participate in virtual routing to first  
configure an IP address for vlan2.
```

```
Switch_A(config-if)#  
ipv6 address 2001:db8::1/64 Specify the IPv6 address and mask for  
interface vlan2.
```

```
Switch_A(config-if)#  
exit Return to Global Configuration mode.
```

```
Switch_A(config)#  
interface vlan3 Specify the interface (vlan3) that will  
participate in virtual routing to first  
configure an IP address for vlan3.
```

```
Switch_A(config-if)#  
ipv6 address 2001:db8::2/64 Specify the IPv6 address and mask for  
interface vlan3.
```

```
Switch_A(config-if)#  
exit Return to Global Configuration mode.
```

Create the Master Virtual Router on Switch_A

<pre>Switch_A(config)# router ipv6 vrrp 1 vlan2</pre>	Create a new VRRPv3 session on Switch_A, specify the VRID for the session, and specify the interface (vlan2) that will participate in virtual routing.
<pre>Switch_A(config-router)# virtual-ipv6 fe80::1 master</pre>	<p>Set the virtual IP address for the VRRPv3 session. Define the default state of the VRRPv3 router within the virtual router.</p> <p>Note that fe80::1 is an IPv6 link-local address. AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798.</p> <p>See the Usage note for the virtual-ipv6 command for implementation information about link-local addresses in AlliedWare Plus.</p>
<pre>Switch_A(config-router)# advertisement-interval 5</pre>	Configure the default value for the advertisement interval. The configurable range for the advertisement interval is 1-10.
<pre>Switch_A(config-router)# priority 255</pre>	Configure the default priority value of 255 when the device is the Master Virtual Router.
<pre>Switch_A(config-router)# preempt-mode true</pre>	Set the preempt-mode to true for Switch_A. The default preempt mode ensures that the highest priority switch available always takes the master role.
<pre>Switch_A(config-router)# enable</pre>	Enable the VRRPv3 session on Switch_A.
<pre>Switch_A(config-router)# exit</pre>	Exit the Router Configuration mode and enter the Global Configuration mode.
<pre>Switch_A(config)# exit</pre>	Return to Privileged Exec mode.
<pre>Switch_A# copy running-config startup- config</pre>	Copy the running-config to the startup-config to enable this configuration to execute after restarting Switch_A.

Step 2: Configure Switch_B (Backup Virtual Router)

At this point we assume that you have already created VLAN 2 and VLAN 3 on Switch_B. See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLANs.

Configure IPv6 addresses on VLAN 2 and VLAN 3

```
awplus#  
configure terminal Enter the Global Configuration mode.
```

```
awplus(config)#  
hostname Switch_B Assign a host name to Switch_B.
```

```
Switch_B(config)#  
interface vlan2 Specify the interface (vlan2) that will  
participate in virtual routing to first  
configure an IP address for vlan2.
```

```
Switch_B(config-if)#  
ipv6 address 2001:db8::1/64 Specify the IPv6 address and mask for  
interface vlan2.
```

```
Switch_B(config-if)#  
exit Return to Global Configuration mode.
```

```
Switch_B(config)#  
interface vlan3 Specify the interface (vlan3) that will  
participate in virtual routing to first  
configure an IP address for vlan3.
```

```
Switch_B(config-if)#  
ipv6 address 2001:db8::2/64 Specify the IPv6 address and mask for  
interface vlan3.
```

```
Switch_B(config-if)#  
exit Return to Global Configuration mode.
```

Create the Master Virtual Router on Switch_B

<pre>Switch_B(config)# router ipv6 vrrp 1 vlan2</pre>	Create a new VRRPv3 session on Switch_B, specify the VRID for the session, and specify the interface (vlan2) that will participate in virtual routing.
<pre>Switch_B(config-router)# virtual-ipv6 fe80::1 backup</pre>	<p>Set the virtual IP address for the VRRP session. Define the default state of the VRRP router within the virtual router.</p> <p>Note that fe80::1 is an IPv6 link-local address. AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798.</p> <p>See the Usage note for the virtual-ipv6 command for implementation information about link-local addresses in AlliedWare Plus.</p>
<pre>Switch_B(config-router)# advertisement-interval 5</pre>	Configure the default value for the advertisement interval. The configurable range for the advertisement interval is 1-10.
<pre>Switch_B(config-router)# priority 100</pre>	Configure the priority value of 100 when the device is the Backup Virtual Router.
<pre>Switch_B(config-router)# preempt-mode true</pre>	Set the preempt-mode to true for Switch_B. The default preempt mode ensures that the highest priority switch available always takes the master role.
<pre>Switch_B(config-router)# enable</pre>	Enable the VRRPv3 session on Switch_B.
<pre>Switch_B(config-router)# exit</pre>	Exit the Router Configuration mode and enter the Global Configuration mode.
<pre>Switch_B(config)# exit</pre>	Exit the Global Configuration mode and enter the Privileged Exec mode.
<pre>Switch_B# copy running-config startup- config</pre>	Copy the running-config to the startup-config to enable this configuration to execute after restarting Switch_B.

Step 3: Configure Host_A

At this point we assume that you have already created VLAN 2 and VLAN 3 on Host_A. See [“Configuring VLANs” on page 16.3](#) for detailed information about creating VLANs.

Configure an IPv6 address on VLAN 2 and a static IPv6 route to reach Switch_C on VLAN 3

awplus#	
configure terminal	Enter the Global Configuration mode.
<hr/>	
awplus(config)#	
hostname Host_A	Assign the host name to Host_A.
<hr/>	
Host_A(config)#	
interface vlan2	Specify the interface (vlan2) that will participate in virtual routing to first configure an IP address for vlan2.
<hr/>	
Host_A(config-if)#	
ipv6 address 2001:db8::1/64	Specify the IPv6 address and mask for interface vlan2.
<hr/>	
Host_A(config-if)#	
exit	Return to Global Configuration mode.
<hr/>	
Host_A(config)#	
ipv6 route 2001:db8::/64	Configure an IPv6 static route to reach interface vlan3 of Host_A.
<hr/>	
Host_A(config)#	
exit	Return to Privileged Exec mode.
<hr/>	
Host_A#	
copy running-config startup-config	Copy the running-config to the startup-config to enable this configuration to execute after restarting Host_A.

Step 4: Configure Switch_C

At this point we assume that you have already created VLAN 2 and VLAN 3 on Switch_B. See “Configuring VLANs” on page 16.3 for detailed information about creating VLANs..

Configure IPv6 addresses on VLAN 2 and VLAN 3

awplus#	
configure terminal	Enter the Global Configuration mode.
awplus(config)#	
hostname Switch_C	Assign the host name Switch_C.
Switch_C(config)#	
interface vlan2	Specify the interface (vlan2) that will participate in virtual routing to first configure an IP address for vlan2.
Switch_C(config-if)#	
ipv6 address 2001:db8::1/64	Specify the IPv6 address and mask for interface vlan2.
Switch_C(config-if)#	
exit	Return to Global Configuration mode.
Switch_C(config)#	
interface vlan3	Specify the interface (vlan3) that will participate in virtual routing to first configure an IP address for vlan3.
Switch_C(config-if)#	
ipv6 address 2001:db8::2/64	Specify the IPv6 address and mask for interface vlan3.
Switch_C(config-if)#	
exit	Return to Global Configuration mode.
Switch_C(config)#	
exit	Return to Privileged Exec mode.
Switch_C#	
copy running-config startup-config	Copy the running-config to the startup-config to enable this configuration to execute after restarting Switch_C.

Commands Used advertisement-interval
enable (VRRP)
preempt-mode
priority
router ipv6 vrrp (interface)
virtual-ipv6

Validation Commands show vrrp ipv6

VRRPv3 Configuration Validation Commands and Output:

Switch_A To display information about the configured VRRPv3 session, to validate configuration as the Master Virtual Router following the earlier configuration steps, enter the command:

```
Switch_A# show vrrp ipv6 vlan2
```

Output **Figure 82-1: Example output from the show vrrp ipv6 vlan2 command on Switch_A**

```
Switch_A#show vrrp ipv6 vlan2
VrId <2>
State is Master
Virtual IP is 2001:db8::1 (Owner)
Interface is vlan2
Priority is 255
Advertisement interval is 1 sec
Preempt mode is TRUE
```

Switch_B To display information about the configured VRRPv3 session, to validate configuration as the Backup Virtual Router following the earlier configuration steps, enter the command:

```
Switch_B# show vrrp ipv6 vlan2
```

Output **Figure 82-2: Example output from the show vrrp ipv6 vlan2 command on Switch_B**

```
Switch_B#show vrrp ipv6 vlan2
VrId <2>
State is Backup
Virtual IP is 2001:db8::1 (Not-owner)
Interface is vlan2
Priority is 100
Advertisement interval is 1 sec
Preempt mode is TRUE
```

Then disable the Master Virtual Router and validate the Backup Virtual Router takes over:

Shutdown the interface on the Master Virtual Router so the Backup Virtual Router takes over:

```
Switch_A#
configure terminal
```

Specify the interface (vlan2) that will participate in virtual routing to first configure an IP address for vlan2.

```
Switch_A(config)#
interface vlan2
```

Specify the interface (vlan2) that will participate in virtual routing to first configure an IP address for vlan2.

```
Switch_A(config)#
shutdown
```

Shutdown the interface (vlan2) that participates as the Master Virtual Router on Switch_A. This will make Switch_B, which is configured as the Backup Virtual Router, become the Master Virtual Router.

Switch_A To validate Switch_A is not the Master Virtual Router after a shutdown on interface vlan2, so Switch_B will take over as Master Virtual Router from Switch_A, enter the command:

```
Switch_A# show vrrp ipv6 vlan2
```

Output **Figure 82-3: Example output from the show vrrp ipv6 vlan2 command on Switch_A**

```
Switch_A#show vrrp ipv6 vlan2
VrId <2>
State is Initialize
Virtual IP is 2001:db8::1 (Owner)
Interface is vlan2
Priority is 255
Advertisement interval is 1 sec
Preempt mode is TRUE
```

Switch_B To validate Switch_B is the Master Virtual Router after a shutdown on interface vlan2 on Switch_A, so Switch_B takes over as the Master Virtual Router, enter the command:

```
Switch_B# show vrrp ipv6 vlan2
```

Output **Figure 82-4: Example output from the show vrrp ipv6 vlan2 command on Switch_B**

```
Switch_B#show vrrp ipv6 vlan2
VrId <2>
State is Master
Virtual IP is 2001:db8::1 (Not-owner)
Interface is vlan2
Priority is 100
Advertisement interval is 1 sec
Preempt mode is TRUE
```

Command List

This chapter provides an alphabetical reference for commands used to configure the Virtual Router Redundancy Protocol (VRRP). For more information, see [Chapter 82, VRRP Introduction and Configuration](#).

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

accept-mode

Use this command to configure accept mode for a master virtual router. If the accept-mode is set to **true**, then the switch will reply to ping, telnet, and ssh requests to the virtual IP address. The switch will reply even if it does not own the virtual IP address.

If the accept-mode is set to **false**, then the switch will not reply to requests from ping, telnet, or ssh.

Syntax `accept-mode {true|false}`

Parameter	Description
<code>true</code>	Accept-mode is enabled.
<code>false</code>	Accept-mode is disabled.

Default The default is **true**.

Mode Router Configuration

Usage For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4](#).

For VRRPv3 IPv6 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP IPv6 Configuration Example” on page 82.28](#).

Examples The example below shows you how to configure accept-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# accept-mode true
```

The example below shows you how to configure accept-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# accept-mode false
```

The example below shows you how to configure `accept-mode` as `true` for VRRPv3 VR ID 3 on `vlan1`:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# accept-mode true
```

The example below shows you how to configure `accept-mode` as `false` for VRRPv3 VR ID 3 on `vlan1`:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# accept-mode false
```

Related Commands [router vrrp \(interface\)](#)
[router ipv6 vrrp \(interface\)](#)

advertisement-interval

Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

Syntax advertisement-interval [*<1-255>* | csec *<1-4095>*]
no advertisement-interval

Parameter	Description
<i><1-255></i>	Specifies the advertisement interval in seconds.
csec	Use centiseconds instead of seconds for the advertisement interval.
<i><1-4095></i>	Specifies the advertisement interval in centiseconds.

Default The default advertisement interval is 1 second.

Mode Router Configuration

Usage Note when using VRRP with VCStacking, ensure the VRRP advertisement-interval is larger than the VCStacking failover time to avoid VCStacking failovers causing VRRP failovers.

See the **Virtual Router Redundancy Protocol** section in **Chapter 82, VRRP Introduction and Configuration** about setting the advertisement-interval when configuring VRRP.

See the **VRRPv2 to VRRPv3 Transition Configuration** section in **Chapter 82, VRRP Introduction and Configuration** about using seconds for VRRPv2 host compatibility whenever you use **transition-mode** to upgrade or transition from VRRPv2 to VRRPv3.

For VRRPv3 IPv4 configuration details, see **Chapter 82, VRRP Introduction and Configuration** and the section **"VRRP Configuration for IPv4"** on page 82.4.

For VRRPv3 IPv6 configuration details, see **Chapter 82, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example"** on page 82.28.

Note  When using VRRPv3 with VCStacking, ensure that the VRRPv3 advertisement-interval is configured to a longer time than the VCStacking failover time. If the VRRPv3 advertisement-interval is shorter than the VCStacking failover time, then a VRRPv3 failover will also occur whenever a VCStacking failover occurs. Use seconds not centiseconds to ensure interoperability with VRRPv2.

Example The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

Related Commands [router vrrp \(interface\)](#)
[router ipv6 vrrp \(interface\)](#)

circuit-failover

Use this command to enable the VRRP circuit failover feature. See the [VRRP Circuit Failover Configuration](#) in [Chapter 82, VRRP Introduction and Configuration](#).

Use the **no** variant of this command to disable this feature.

Syntax `circuit-failover <interface> <1-253>`
`no circuit-failover [<interface> <1-253>]`

Parameter	Description
<interface>	The interface of the router that is monitored. Interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface.
<1-253>	Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.

Mode Router Configuration

Example The example below shows you how to configure circuit failover on interface vlan2 for the VRRP IPv4 session with VR ID 1, where interface vlan2 is considered the monitored interface:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan2 30
```

The example below shows you how to remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

The example below shows you how to configure circuit failover on interface vlan2 for the VRRPv3 IPv6 session with VR ID 2, where interface vlan2 is considered the monitored interface:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 2 vlan2
awplus(config-router)# circuit-failover vlan2 30
```

The example below shows you how to remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

Related Commands [router vrrp \(interface\)](#)
[router ipv6 vrrp \(interface\)](#)

debug vrrp

Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

Syntax debug vrrp [all]
no debug vrrp [all]

Mode Privileged Exec and Global Configuration

Usage For VRRPv3 debugging details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP debugging” on page 82.13](#).

Examples The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

Related Commands [show debugging vrrp](#)
[undebug vrrp](#)

debug vrrp events

Use this command to specify debugging options for VRRP event troubleshooting.

Use the **no** variant of this command to disable this function.

Syntax `debug vrrp events`

`no debug vrrp events`

Mode Privileged Exec and Global Configuration

Usage The **debug vrrp events** command enables the display of debug information related to VRRP internal events.

For VRRPv3 debugging details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP debugging” on page 82.13](#).

Examples The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

Related Commands [show debugging vrrp](#)
[undebug vrrp events](#)

debug vrrp packet

Use this command to specify debugging options for VRRP packets.

Use the **no** variant of this command to disable this function.

Syntax `debug vrrp packet [send|recv]`
`no debug vrrp packet [send|recv]`

Parameter	Description
send	Specifies the debug option set for sent packets.
recv	Specifies the debug option set for received packets.

Mode Privileged Exec and Global Configuration

Usage The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

For VRRPv3 debugging details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP debugging” on page 82.13](#).

Examples The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

Related Commands [show debugging vrrp](#)
[undebug vrrp packet](#)

disable (VRRP)

Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the [enable \(VRRP\)](#) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

Syntax `disable`

Mode Router Configuration

Usage For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4](#).

For VRRPv3 IPv6 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP IPv6 Configuration Example” on page 82.28](#).

Example The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

Related Commands [enable \(VRRP\)](#)
[router vrrp \(interface\)](#)
[router ipv6 vrrp \(interface\)](#)
[show vrrp](#)

enable (VRRP)

Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make an changes to the VRRP configuration, first disable the router from participating in virtual routing using the **disable (VRRP)** command.

Syntax enable

Mode Router Configuration

Usage You must configure the virtual IP address and define the interface for the VRRP session (using the **virtual-ip** or **virtual-ipv6** and the **router vrrp (interface)** or **router ipv6 vrrp (interface)** commands) before using this command.

For VRRPv3 IPv4 configuration details, see **Chapter 82, VRRP Introduction and Configuration** and the section **“VRRP Configuration for IPv4” on page 82.4**.

For VRRPv3 IPv6 configuration details, see **Chapter 82, VRRP Introduction and Configuration** and the section **“VRRP IPv6 Configuration Example” on page 82.28**.

Example The example below shows you how to enable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

The example below shows you how to enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

Related Commands **disable (VRRP)**
router vrrp (interface)
router ipv6 vrrp (interface)
show vrrp
virtual-ip
virtual-ipv6

preempt-mode

Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

Syntax `preempt-mode {true|false}`

Parameter	Description
<code>true</code>	Preemption is enabled.
<code>false</code>	Preemption is disabled.

Default The default is **true**.

Mode Router Configuration

Usage When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority backup router will take over the master role from a lower priority backup. Preempt mode on **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available take over for the backup virtual router that was elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled, the backup virtual router that is currently elected as the master virtual router does not transition to backup virtual router again whenever the alternate backup router with a higher priority becomes available.

See [“VRRP election and preempt for IPv6” on page 82.11](#) for further information on preempt mode.

For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4](#).

For VRRPv3 IPv6 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP IPv6 Configuration Example” on page 82.28](#).

Examples The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

Related Commands [circuit-failover](#)
[priority](#)
[router vrrp \(interface\)](#)
[router ipv6 vrrp \(interface\)](#)

priority

Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless **preempt-mode** is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

Syntax `priority <1-255>`
`no priority`

Parameter	Description
<1-255>	The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>.

Default Defaults for priority are: **master router** = 255; **backup** = 100.

Mode Router Configuration

Usage Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a value of 1 through 254.

For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4](#).

For VRRPv3 IPv6 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP IPv6 Configuration Example” on page 82.28](#).

Examples The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

Related Commands [circuit-failover](#)
[preempt-mode](#)

router vrrp (interface)

Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

Syntax

```
router vrrp <vrid> <interface>
no router vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	<1-255> The ID of the virtual router VRRP IPv4 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages.

Mode Global Configuration

Usage Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4](#).

Examples The example below shows you how to enable a VRRP session with VR ID 5 on vlan1:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRP session with VR ID 5 on vlan1:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
awplus(config)#
```

router ipv6 vrrp (interface)

Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

Syntax `router ipv6 vrrp <vrid> <interface>`
`no router ipv6 vrrp <vrid> <interface>`

Parameter	Description
<code><vrid></code>	<code><1-255></code> The ID of the virtual router VRRPv3 IPv6 session to create.
<code><interface></code>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

Mode Global Configuration

Usage Use the required `<interface>` placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

For VRRPv3 IPv6 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP IPv6 Configuration Example” on page 82.28](#).

Examples The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
awplus(config)#
```

Related Commands [advertisement-interval](#)

show debugging vrrp

Use this command to display the set VRRP debugging option. Use the **terminal monitor** command to display output on the console otherwise debug output is in the log file.

For information on output options, see **“Controlling “show” Command Output” on page 1.35**.

For VRRPv3 debugging details, see **Chapter 82, VRRP Introduction and Configuration** and the section **“VRRP debugging” on page 82.13**.

Syntax show debugging vrrp

Mode User Exec and Privileged Exec

Example The example below shows you how to display VRRP debugging:

```
awplus# show debugging vrrp
```

Related Commands [debug vrrp](#)
[debug vrrp events](#)
[debug vrrp packet](#)

show running-config router vrrp

Use this command to show the running configuration for VRRP IPv4.

For information on output options, see **“Controlling “show” Command Output” on page 1.35**.

For VRRPv3 IPv4 configuration details, see **Chapter 82, VRRP Introduction and Configuration** and the section **“VRRP Configuration for IPv4” on page 82.4**.

Syntax show running-config router vrrp

Mode Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

Example The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

Output **Figure 83-1: Example output from the show running-config router vrrp command**

```
!  
router vrrp 2 vlan2  
  circuit-failover vlan2 2  
  advertisement-interval 4  
  preempt-mode true  
!
```

show running-config router ipv6 vrrp

Use this command to show the running configuration for VRRPv3 IPv6.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

For VRRPv3 IPv6 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP IPv6 Configuration Example” on page 82.28](#).

Syntax `show running-config router vrrp`

Mode Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

Example The example below shows you how to display the running configuration for VRRPv3 IPv6:

```
awplus# show running-config router ipv6 vrrp
```

Output **Figure 83-2: Example output from the show running-config router ipv6 vrrp command**

```
!  
router ipv6 vrrp 3 vlan3  
  virtual-ip fe80::202:b3ff:fed5:983e master  
  circuit-failover vlan3 3  
  advertisement-interval 6  
  preempt-mode false  
!
```

show vrrp

Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4](#).

Syntax `show vrrp [brief]`

Parameter	Description
brief	Brief summary of VRRP sessions.

Mode User Exec and Privileged Exec

Example To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

Output [Figure 83-3: Example output from the show vrrp command](#)

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
State: AdminUp - Master
Virtual IP address: 192.168.1.2 (Not-owner)
Priority is 100
Advertisement interval: 100 centiseconds
Preempt mode: TRUE
Multicast membership on IPv4 interface vlan2: JOINED
Transition mode: FALSE
Accept mode: FALSE
Master address: 192.168.1.3
```

Figure 83-4: Example output from the show vrrp brief command

```
awplus#show vrrp brief
Interface      Grp  Prio  Own  Pre  State      Master addr  Group addr
vlan10         1    200   N    P    Master     192.168.10.4 192.168.10.253
vlan10         2    150   N    P    Backup    192.168.10.4 192.168.10.254
vlan11         3    200   N    P    Master     192.168.11.4 192.168.11.253
vlan11         4    150   N    P    Backup    192.168.11.4 192.168.11.254
```

Related Commands [enable \(VRRP\)](#)
[disable \(VRRP\)](#)

show vrrp ipv6

Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

For VRRPv3 IPv6 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP IPv6 Configuration Example” on page 82.28](#).

Syntax `show vrrp ipv6 [<interface>]`

Parameter	Description
<code><interface></code>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

Mode User Exec and Privileged Exec

Example To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

Output [Figure 83-5: Example output from the show vrrp ipv6 vlan2 command](#)

```
awplus#show vrrp ipv6 vlan2
VrId <1>
State is Master
Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
Interface is vlan2
Priority is 255
Advertisement interval is 4 sec
Preempt mode is FALSE
```

Related Commands [enable \(VRRP\)](#)
[disable \(VRRP\)](#)

show vrrp counters

This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4.](#)

Syntax show vrrp counters

Mode User Exec and Privileged Exec

Usage The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

 **Note** Note that the counters displayed with this commands are the same counters as described in RFC 2787 (Copyright (C) The Internet Society (2000). All Rights Reserved) except for the Monitored Circuit Up and Monitored Circuit Down counters which are additions beyond the MIB.

Example To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 83-6: Example output from the show vrrp counters command

```
awplus#show vrrp counters
VRRP Global Counters:
  Checksum Errors .... 230
  Version Errors ..... 0
  VRID Errors ..... 230

VRRP IPv4 counters for VR 10/vlan10:
  Master Transitions ..... 0
  Received Advertisements ... 0
  Internal Errors ..... 0
  TTL Errors ..... 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ..... 0
  Received Invalid Type ..... 0
  Address List Errors ..... 0
  Packet Length Errors ..... 0
  Monitored Circuit Up ..... 0
  Monitored Circuit Down..... 0

VRRP IPv4 counters for VR 100/vlan100:
  Master Transitions ..... 1
  Received Advertisements ... 1614
  Internal Errors ..... 0
  TTL Errors ..... 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ..... 0
  Received Invalid Type ..... 0
  Address List Errors ..... 0
  Packet Length Errors ..... 0
  Monitored Circuit Up ..... 0
  Monitored Circuit Down..... 2
```

Table 83-1: Global counters with descriptions for the show vrrp counters command:

Counter	Description
Checksum Errors	The total number of VRRP packets received with an invalid VRRP checksum value.
Version Errors	The total number of VRRP packets received with an unknown or unsupported version number.
VRID Errors	The total number of VRRP packets received with an invalid VRID for this virtual router.

Table 83-2: Per VR counters with descriptions for the show vrrp counters command:

Counter	Description
Master Transitions	The total number of times that this virtual router's state has transitioned to MASTER.
Received Advertisements	The total number of VRRP advertisements received by this virtual router.
Internal Errors	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
TTL Errors	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
Received Priority 0 Pkt	The total number of VRRP packets received by the virtual router with a priority of '0'.
Sent Priority 0 Pkt	The total number of VRRP packets sent by the virtual router with a priority of '0'.
Received Invalid Type	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
Address List Errors	The total number of packets received for which the address list does not match the locally configured list for the virtual router.
Packet Length Errors	The total number of packets received with a packet length less than the length of the VRRP header.
Monitored Circuit Up	The total number of times the monitored circuit has generated the UP event.
Monitored Circuit Down	The total number of times the monitored circuit has generated the down event.

show vrrp (session)

Use this command to display information for a particular VRRP session.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4.](#)

Syntax `show vrrp <vrid> <interface>`

Parameter	Description
<code><vrid></code>	<code><1-255></code> The virtual router ID for which to display information. Session must already exist.
<code><interface></code>	The interface to display information about, for instance, <code>vlan2</code> .

Mode User Exec and Privileged Exec

Usage See the below sample output from the `show vrrp` command displaying information about VRRP session 1 configured on `vlan2`. Output shows that a Virtual IP address has been set.

```
awplus# show vrrp 1 vlan2
```

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
Interface is vlan2
State is Initialize
Virtual IP address is 10.10.11.250 (Not IP owner)
Priority is 100
Advertisement interval is 1 sec
Preempt mode is TRUE
```

See the below sample output from the `show vrrp` command displaying information about VRRP session 1 configured on `vlan3`. Output shows a Virtual IP address has not been set.

```
awplus# show vrrp 1 vlan3
```

```
awplus#show vrrp 1 vlan3
Address family IPv4
VrId <1>
Interface is vlan3
State is Initialize
Virtual IP address is unset
Priority is 100
Advertisement interval is 1 sec
Preempt mode is TRUE
```

Example The following command shows information about VRRP session 5 for interface **vlan2**.

```
awplus# show vrrp 5 vlan2
```

transition-mode

Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the **advertisement-interval** should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

Syntax transition-mode {true|false}

Parameter	Description
true	Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3.
false	Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.

Default The default is **false**.

Mode Router Configuration

Usage See [“VRRPv2 to VRRPv3 Transition Configuration” on page 82.22](#) for further information about configuring transition mode to upgrade from VRRPv2 to VRRPv3.

For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4](#).

For VRRPv3 IPv6 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP IPv6 Configuration Example” on page 82.28](#).

Examples The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

Related Commands [router vrrp \(interface\)](#)

undebug vrrp

Use this command to disable all VRRP debugging.

Syntax `undebug vrrp all`

Mode Privileged Exec

Example The example below shows you how to disable all VRRP debugging:

```
awplus# undebug vrrp all
```

Related Commands [debug vrrp](#)

undebug vrrp events

Use this command to disable debugging options for VRRP event troubleshooting.

Syntax `undebug vrrp events`

Mode Privileged Exec

Example The example below shows you how to disable VRRP event debugging:

```
awplus# undebug vrrp events
```

Related Commands [debug vrrp events](#)

undebg vrrp packet

Use this command to disable debugging options for VRRP packets.

Syntax `undebg vrrp packet [send|recv]`

Parameter	Description
send	Disable the debug option set for sent packets.
recv	Disable the debug option set for received packets.

Mode Privileged Exec

Examples The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebg vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebg vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebg vrrp packet
```

Related Commands [debug vrrp packet](#)

virtual-ip

Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

Syntax `virtual-ip <ip-address> [master|backup|owner]`
`no virtual-ip`

Parameter	Description
<code><ip-address></code>	The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.
<code>master</code>	Sets the default state of the VRRP router within the Virtual Router as master . For master, the router must own the Virtual IP address. Specify the owner option before using master option.
<code>backup</code>	Sets the default state of the VRRP router within the Virtual Router as backup .
<code>owner</code>	Sets the IPv6 address of the VRRP router within the Virtual Router as the owner . Specify this before using the master option.

Mode Router Configuration

Usage The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv6 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the [vrrp vmac](#) command to enable and disable this feature.

For VRRPv3 IPv4 configuration details, see [Chapter 82, VRRP Introduction and Configuration](#) and the section [“VRRP Configuration for IPv4” on page 82.4](#).

Examples The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

Related Commands **router vrrp (interface)**
 enable (VRRP)
 vrrp vmac

virtual-ipv6

Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the IPv6 address specified is an IPv6 link-local address. See the **Usage** note below for further information.

Use the **no** variant of this command to disable this feature.

Syntax `virtual-ipv6 <ipv6-address> [master|backup|owner]`
`no virtual-ipv6`

Parameter	Description
<code><ipv6-address></code>	The virtual IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X. This is an IPv6 link-local address. See the Usage note below for further information.
<code>master</code>	Sets the default state of the VRRPv3 router within the Virtual Router as master . For master, the router must own the Virtual IP address. Specify the owner option before using master option.
<code>backup</code>	Sets the default state of the VRRPv3 router within the Virtual Router as backup .
<code>owner</code>	Sets the IPv6 address of the VRRPv3 router within the Virtual Router as the owner . Specify this before using the master option.

Mode Router Configuration

Usage The VRRP master and owner of the virtual IPv6 address for the VRRPv3 session only responds to the packets destined to the virtual IPv6 address. The VRRP master that is not an owner of the virtual IPv6 address for the VRRPv3 session does not respond to the packets destined to the virtual IPv6 address, but forwards packets with a VMAC as the destination address. See the **vrrp vmac** command to enable and disable this feature.

AlliedWare Plus only supports one IPv6 virtual IP address per virtual router ID as per VRRPv3 RFC 5798. Note in the command examples `fe80::1` is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over a backup router, the IPv6 link-local address of the router is used by VRRPv3.

For VRRPv3 IPv6 configuration details, see **Chapter 82, VRRP Introduction and Configuration** and the section **"VRRP IPv6 Configuration Example" on page 82.28**.

Examples The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as owner of the virtual IPv6 address:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 owner
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

Related Commands [router ipv6 vrrp \(interface\)](#)
[enable \(VRRP\)](#)
[vrrp vmac](#)

vrrp vmac

Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form: 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

Syntax vrrp vmac {enable|disable}

Mode Global Configuration

Examples To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

Introduction

Ethernet Protection Switching Ring (EPSR) is a protection system that prevents loops within Ethernet ring based topologies. EPSR offers a rapid detection and recovery time (in the order of 50 ms, depending on configuration) if a link or node fails. This rapid recovery time makes EPSR a more effective alternative to spanning tree options when using ring-based topologies to create high speed resilient Layer 2 networks.

Ring Components and Operation

EPSR operates only on ring-based topologies. An EPSR ring comprises a series of nodes (Ethernet bridges) connected end to end. The figure below shows a basic ring configuration. A ring comprises one master node and a number of transit nodes. Each node connects to the ring via two ports. On the master node one port is configured to be the primary port and the other, the secondary port.

Figure 84-1: Simple EPSR ring configuration

EPSR instances and domains

Each physical EPSR ring contains one or more EPSR domains. An EPSR instance can be thought of as a component of an EPSR ring domain that exists on a single node. A set of instances across the whole ring is called a "domain." Therefore a ring whose individual nodes each have two instances results in a two domain ring. Each instance contains a control VLAN and a number of data VLANs.

The EPSR control VLAN and its associated data VLANs form a Ring Domain. Although a physical ring can have more than one domain, each domain must operate as a separate logical group of VLANs and must have its own master node. This means that several domains may share the same physical network, but must operate as logically separate VLAN groups.

Control VLAN The function of the control VLAN is to monitor the ring domain and maintain its operational functions. To do this it transmits and monitors operational healthcheck messages using EPSR healthcheck control frames. The control VLAN carries no user data.

Caution  Specifying the Access Control List (ACL) filter action, `send-to-cpu`, could result in EPSR healthcheck messages and other control packets being dropped.

Data VLAN The data VLAN carries the user data around the ring. Several data VLANs can share a common control VLAN.

Master node The master node controls the ring operation. It issues healthcheck messages at regular intervals from its primary port and monitors their arrival back at its secondary port - after they have circled the ring. Under normal operating conditions the master node's secondary port is always in the blocking state to all data VLAN traffic. This is to prevent data loops forming within the ring. This port however, operates in the forwarding state for the traffic on the control VLAN. Loops do not occur on the control VLAN because the control messages stop at the secondary port, having completed their path around the ring.

Transit nodes The transit nodes operate as conventional Ethernet bridges, but with the additional capability of running the EPSR protocol. This protocol requires the transit nodes to forward the healthcheck messages from the master node, and respond appropriately when a ring fault is detected. The fault condition procedure is explained in **“Fault Detection and Recovery” on page 84.4.**

Fault Detection and Recovery

EPSR uses the following methods to detect outages in a node or a link in the ring:

- Master node polling fault detection
- Transit node unsolicited fault detection

Master node polling

The master node issues healthcheck messages from its primary port as a means of checking the condition of the EPSR network ring. These messages are sent at regular periods, controlled by the **hellotime** parameter of the **epsr command on page 85.4**. A failover timer is set each time a healthcheck message leaves the master node's primary port. The timeout value for this timer is set by the **failover** parameter of the **epsr command on page 85.4**. If the failover timer expires before the transmitted healthcheck message is received by the master node's secondary port, the master node assumes that there is a fault in the ring, and implements its fault recovery procedures. Because this method relies on a timer expiry, its operation is inherently slower than the "transit node unsolicited detection method" described next.

Transit node unsolicited

Transit node unsolicited fault detection relies on transit nodes detecting faults at their interfaces, and immediately notifying master nodes about the break. When a transit node detects a connectivity loss, it sends a "links down" message over its good link. Because a link spans two nodes, both nodes send the "links down" message back to the master node. These nodes also change their state from "links up" to "links down," and change the state of the port connecting to the broken link, from "forwarding" to "blocking."

Fault Recovery

When the master node detects an outage in the ring by using its detection methods, it does the following:

1. Declares the ring to be in a "failed" state.
2. Unblocks its secondary port to enable the data VLAN traffic to pass between its primary and secondary ports.
3. Flushes its own forwarding database (FDB) for (only) the two ring ports.
4. Sends an EPSR Ring-Down-Flush-FDB control message to all the transit nodes, via both its primary and secondary ports.

Transit nodes respond to the Ring-Down-Flush-FDB message by flushing their forward databases for each of their ring ports. As the data starts to flow in the ring's new configuration, each of the nodes (master and transit) re-learn their Layer 2 addresses. During this period, the master node continues to send health check messages over the control VLAN. This situation continues until the faulty link or node is repaired. For a multi-domain ring, this process occurs separately for each domain within the ring.

The following figure shows the flow of control frames under fault conditions.

Figure 84-2: EPSR Fault Detection Messages

Restoring Normal Operation

Transit nodes Once a fault in the ring or node has been rectified, the transit nodes that span the previously faulty link section detect that link connectivity has returned. They then move their appropriate ring port state, from Links-Down to Pre-Forwarding, and await the Ring-Up-Flush control message from the master node.

Once these transit nodes receive the Ring-Up-Flush message, they:

- flush their forward databases for both their ring ports.
- change the state of their ports from blocking to forwarding, which allows data to flow through their previously blocked ring ports.

 **Note** The transit nodes do not enter the forward state until they have received the Ring-Up-Flush message. This prevents the possibility of a loop condition occurring caused by the transit nodes moving into the forwarding state before the master node secondary port can return to the blocking state. During such a period, the ring would have no ports blocked.

Master node With the link restored, the healthcheck messages that are sent from the primary port of the master node now complete the loop and arrive at the master node's secondary port. The master node restores normal conditions as follows:

1. Declares the ring to be in a "complete" state.
2. Blocks its secondary port for data (non-control) traffic.
3. Flushes its forwarding database for its two ring ports.
4. Sends a Ring-Up-Flush-FDB message from its primary port, to all transit nodes.

Managing Rings with Two Breaks

To restore a link with two breaks you need to run the EPSR Enhanced Recovery feature. Consider the network shown below:

Figure 84-3: EPSR Ring with Two Breaks

In this situation the ring will attempt to recover as previously described in **“Fault Recovery” on page 84.4**. This will result in the split-ring operation shown in **Figure 84-4 on page 84.8**.

Figure 84-4: EPSR Split Ring

In this operational mode each portion of the ring operates as an independent link layer broadcast domain each containing the original data VLANs and control VLAN.

Recovery When One Break is Restored

Figure 84-5 on page 84.9 shows a ring with the link between nodes A and B restored. At this point the ring's behavior will depend on whether the `epsr enhancedrecovery enable` command on page 85.7 has been set.

Figure 84-5: EPSR Ring with One Link Restored

Enhanced Recovery Disabled

With the enhanced recovery feature disabled, the Hello messages will now reach the remaining ring break; however from a users perspective, the ring will remain as shown in the split state shown in Figure 84-4.

Enhanced Recovery Enabled

With the enhanced recovery feature enabled, switch nodes A and B are able to detect the restored link, and will place all their ring ports in the forwarding state. Although the ring will remain in the "failed" state because of the remaining break; communication between the nodes is restored. The network then operates as shown in Figure 84-6.

Figure 84-6: EPSR Operation in Partially Recovered State

Configuration Examples

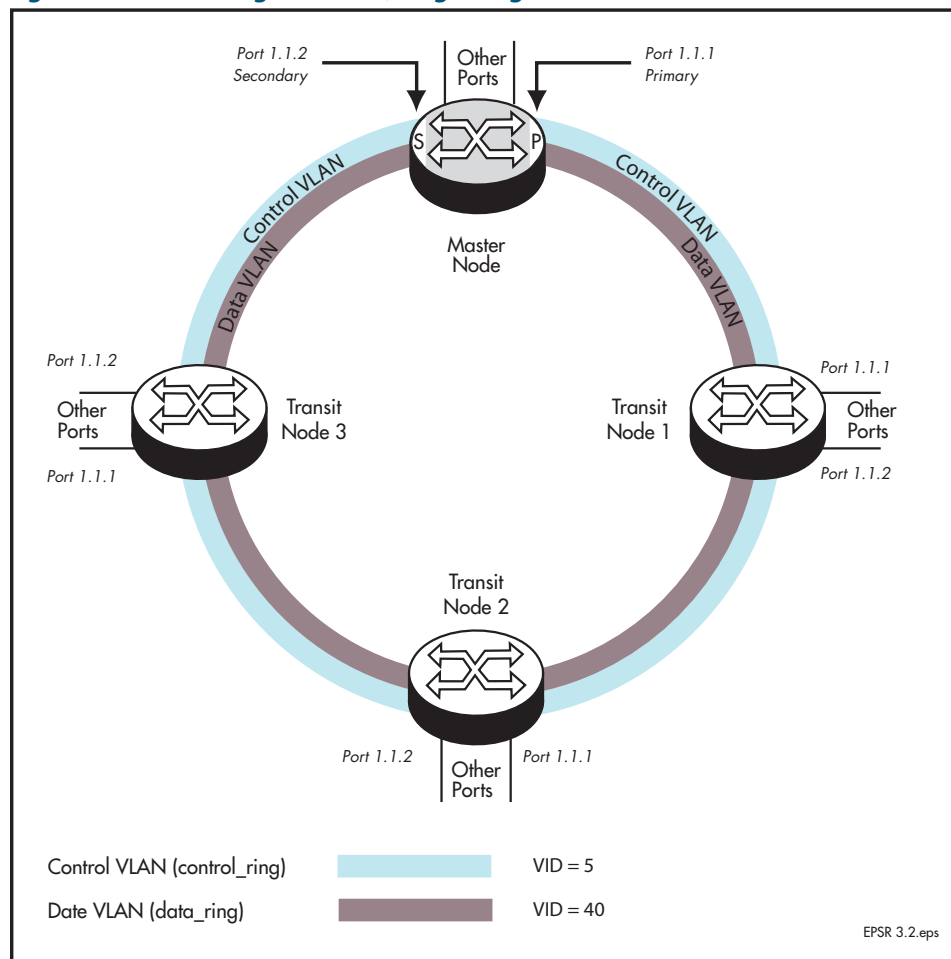

This section describes how to configure EPSR in following ways:

- **Single Domain, Single Ring Network**
- **Single Ring, Dual Domain Network**
- **EPSR and Spanning Tree Operation**

Single Domain, Single Ring Network

This example shows a simple single ring, single domain configuration with no connecting lobes.

Figure 84-7: EPSR single domain, single ring network

Configure the Master Node

Step 1: Create the control and data VLANs on the Master Node

```
awplus#  
configure terminal Enter the Global Configuration mode.  
awplus(config)#  
vlan database Enter the VLAN Configuration mode.  
awplus(config-vlan)#  
vlan 5 name control_vlan state enable Enable VLAN 5 called control_vlan on the Master  
Node. Specifying the enable state allows forwarding of  
frames on the VLAN-aware node.  
awplus(config-vlan)#  
vlan 40 name data_vlan state enable Enable VLAN 40 called data_vlan on the Master  
Node. Specifying the enable state allows forwarding of  
frames on the VLAN-aware node.  
awplus(config-vlan)#  
exit Exit the VLAN Configuration mode and enter the Global  
Configuration mode.
```

Step 2: Add port1.1.1 to these VLANs

```
awplus(config)#  
interface port1.1.1 Specify the interface (port1.1.1) that you are  
configuring and enter the Interface Configuration  
mode.  
awplus(config-if)#  
switchport mode trunk Set the switching characteristics of this port to Trunk  
mode.  
awplus(config-if)#  
switchport trunk allowed vlan add 5 Enable VLAN 5 on this port.  
awplus(config-if)#  
switchport trunk allowed vlan add 40 Enable VLAN 40 on this port.  
awplus(config-if)#  
exit Exit the Interface mode and enter the Global  
Configuration mode.
```

Step 3: Add port 1.1.2 to these VLANs

<code>awplus(config)#</code>	
<code>interface port1.1.2</code>	Specify the interface (port 1.1.2) that you are configuring and enter the Interface Configuration mode.

<code>awplus(config-if)#</code>	
<code>switchport mode trunk</code>	Set the switching characteristics of this port to Trunk mode.

<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 5</code>	Enable VLAN 5 on this port.

<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 40</code>	Enable VLAN 40 on this port.

<code>awplus(config-if)#</code>	
<code>exit</code>	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 4: Create the EPSR Instance called "blue" on the master node, make VLAN 5 the control VLAN and port 1.1.1 the primary port

<code>awplus(config)#</code>	
<code>epsr configuration</code>	Enter the EPSR Configuration mode.

<code>awplus(config-epsr)#</code>	
<code>epsr blue mode master controlvlan 5</code>	Create an EPSR instance called blue on vlan 5.
<code>primaryport port1.1.1</code>	Make vlan 5 the control VLAN. Make port 1.1.1 the primary port. Make this node the master.

Step 5: Add a data VLAN to the EPSR Instance called "blue" on the Master Node

<code>awplus(config-epsr)#</code>	
<code>epsr blue datavlan 40</code>	On epsr instance called blue make vlan 40 the data VLAN.

Step 6: Enable the EPSR Instance called "blue" on the Master Node

<code>awplus(config-epsr)#</code>	
<code>epsr blue state enable</code>	Enable the EPSR instance named blue.

<code>awplus(config-epsr)#</code>	
<code>exit</code>	Exit the EPSR Configuration mode.

Now you can configure the transit nodes.

Step 7: Create the Control and Data VLANs on a Transit Node

<code>awplus#</code>	
<code>configure terminal</code>	Enter the Global Configuration mode.
<hr/>	
<code>awplus(config)#</code>	
<code>vlan database</code>	Enter the VLAN Configuration mode.
<hr/>	
<code>awplus(config-vlan)#</code>	
<code>vlan 5 name control_vlan state enable</code>	Enable VLAN 5 called <code>control_vlan</code> on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
<hr/>	
<code>awplus(config-vlan)#</code>	
<code>vlan 40 name data_vlan state enable</code>	Enable VLAN 40 called <code>data_vlan</code> on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
<hr/>	
<code>awplus(config-vlan)#</code>	
<code>exit</code>	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 8: Add port1.1.1 to the VLANs

<code>awplus(config)#</code>	
<code>interface port1.1.1</code>	Specify the interface (<code>port1.1.1</code>) that you are configuring and enter the Interface Configuration mode.
<hr/>	
<code>awplus(config-if)#</code>	
<code>switchport mode trunk</code>	Set the switching characteristics of this port to Trunk mode.
<hr/>	
<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 5</code>	Enable VLAN 5 on this port.
<hr/>	
<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 40</code>	Enable VLAN 40 on this port.
<hr/>	
<code>awplus(config-if)#</code>	
<code>exit</code>	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 9: Add port1.1.2 to the VLANs

<code>awplus(config)#</code>	
<code>interface port1.1.2</code>	Specify the interface (port1.1.2) that you are configuring and enter the Interface Configuration mode.

<code>awplus(config-if)#</code>	
<code>switchport mode trunk</code>	Set the switching characteristics of this port to Trunk mode.

<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 5</code>	Enable VLAN 5 on this port.

<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 40</code>	Enable VLAN 40 on this port.

<code>awplus(config-if)#</code>	
<code>exit</code>	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 10: Create the EPSR Instance called "blue" on a transit node, make VLAN 5 the control VLAN

<code>awplus(config)#</code>	
<code>epsr configuration</code>	Enter the EPSR Configuration mode.

<code>awplus(config-epsr)#</code>	
<code>epsr blue mode transit controlvlan 5</code>	Create an EPSR instance called blue on vlan5. Make vlan5 the control VLAN. Make this node a transit node.

Step 11: Add a data VLAN to the EPSR Instance called "blue" on the transit node

<code>awplus(config-epsr)#</code>	
<code>epsr blue datavlan 40</code>	On the EPSR instance called blue make vlan40 the data VLAN.

Step 12: Enable the EPSR Instance called "blue" on the transit node

<code>awplus(config-epsr)#</code>	
<code>epsr blue state enable</code>	Enable the EPSR instance named blue.

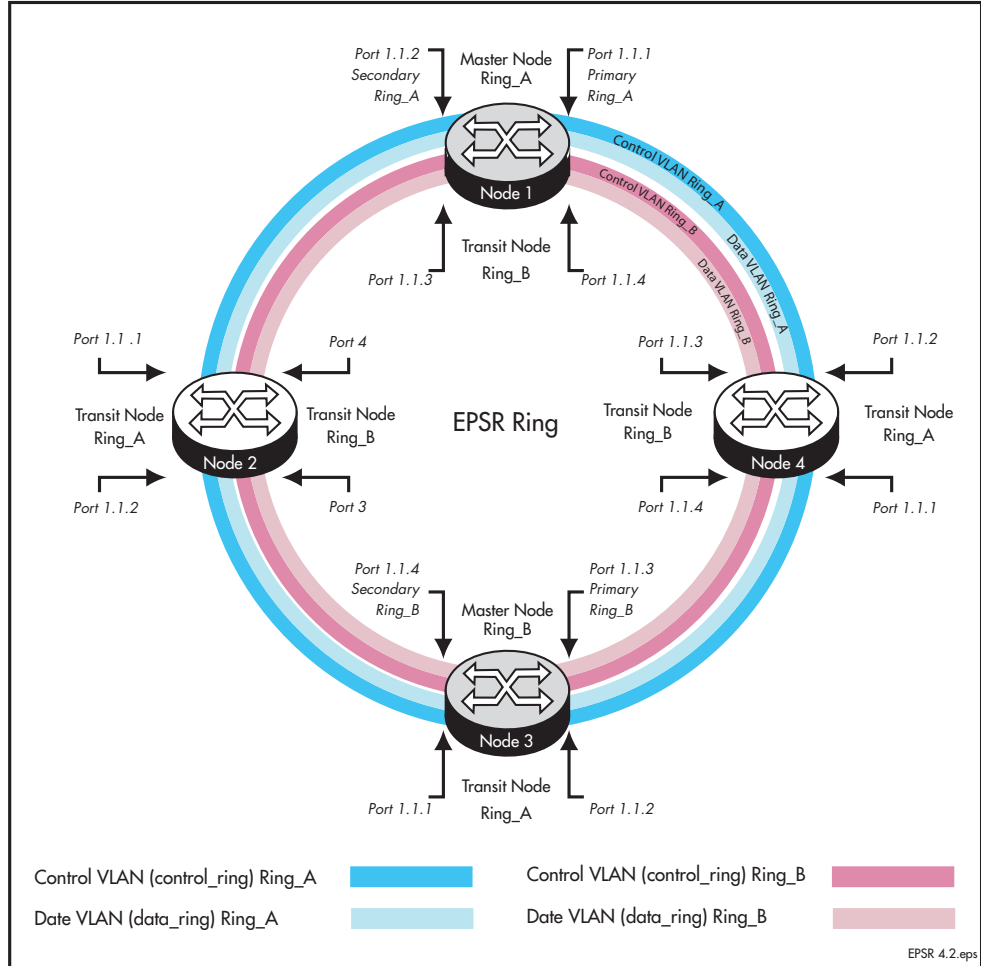

<code>awplus(config-epsr)#</code>	
<code>exit</code>	Exit the EPSR Configuration mode.

Now you can use the same procedure to configure the remaining transit nodes.

Single Ring, Dual Domain Network

This example shows an EPSR configuration where two EPSR domains share the same physical ring. This configuration enables two sets of users to run totally separate Layer 2 networks. Better load distribution around the ring can be achieved by configuring different nodes to be the master for each ring.

Figure 84-8: EPSR single ring network, two domain network.

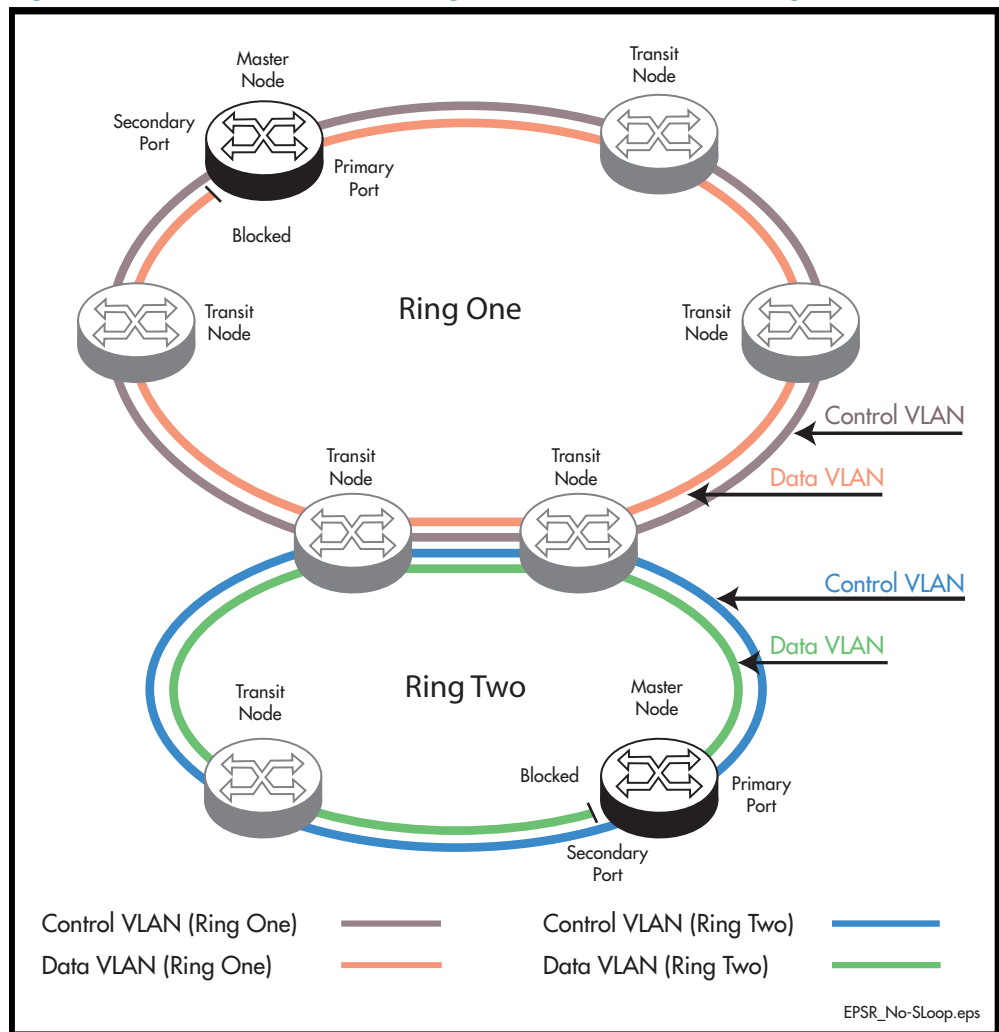

Interconnected Rings

This example shows an EPSR configuration where two rings share a common segment. This configuration will operate as two independent rings, providing that there is no data VLAN sharing between the two rings. If a break occurs in either ring then, each ring will implement its own independent recovery procedures. If a break occurs in the common segment, then each Master node will unblock its secondary port using the normal fault recovery procedure.

Where data VLANs are shared between the rings a fault condition known as "SuperLoop" can occur. The next section deals with superloops and how to manage them.

Figure 84-9: Interconnected EPSR Rings with No Data VLAN Sharing

Superloop Protection

Careful attention must be paid when creating EPSR networks with interconnecting links, to avoid an error condition known as superloops. This sections explains what superloops are and how to prevent them.

What is a an EPSR Superloop?

An EPSR superloop is a data loop whose path traverses more than a single EPSR ring. This fault condition usually occurs when there is a break in a physical segment that is shared by the two rings. For a superloop condition to occur, the two physical rings must share some of their data VLANs. **Figure 84-10 on page 84.18** shows an EPSR ring with a superloop condition caused by a break in the common ring segment. **Figure 84-11 on page 84.19** shows the Superloop data path ring caused by the broken common ring segment. The superloop condition occurs because both rings detect the ring segment break and as a result both master nodes unblock their secondary ports.

Figure 84-10: Interconnected EPSR Rings with Data VLAN Sharing

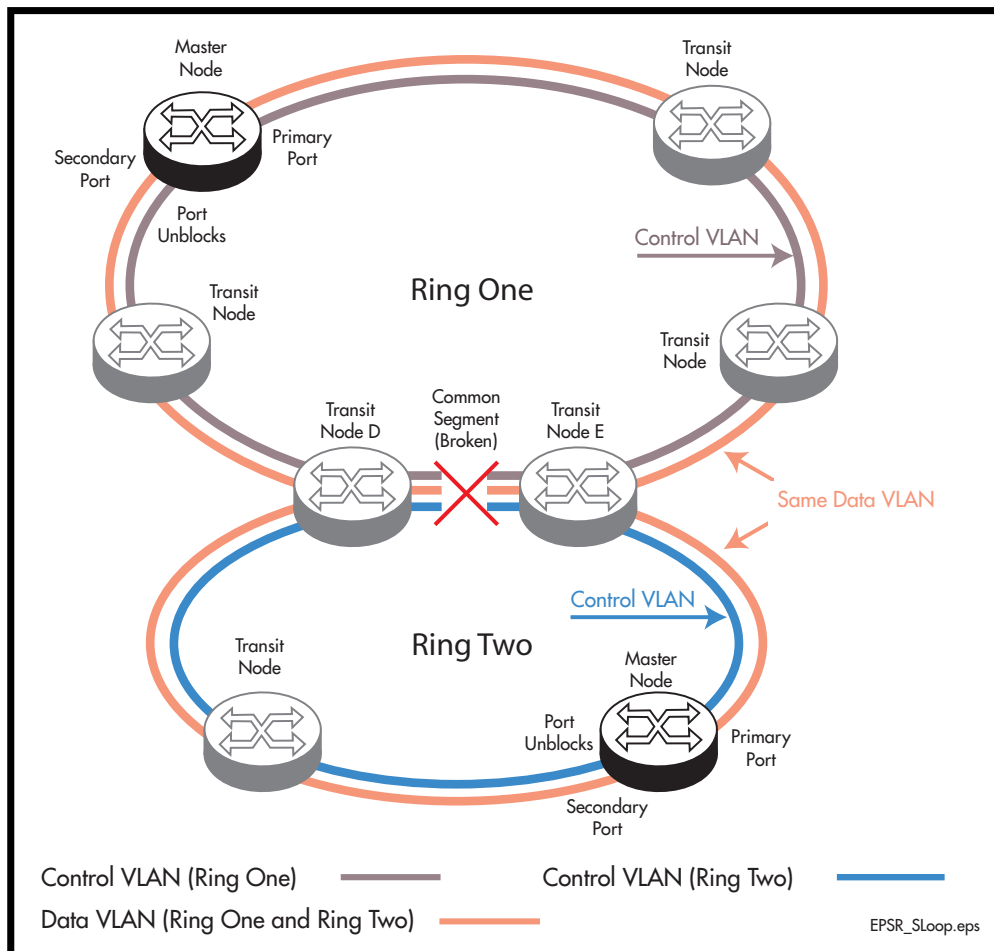

Figure 84-11: EPSR Superloop data path caused by a broken common ring segment

EPSR Superloop Prevention

Alliedware Plus version 5.4.2 onwards contains mechanisms to prevent superloops forming. The Superloop prevention facility enables rings to be assigned priority level between 0 and 127, with 1 representing the lowest priority and 127 the highest. Level 0 (the default setting) applies the functionality of no Superloop prevention. Enabling superloop prevention changes the way the EPSR nodes respond under fault conditions.

Superloop prevention is enabled for an EPSR ring instance by setting the **epsr priority command** on [page 85.10](#). Setting a priority value greater than 0 applies superloop prevention to that particular instance. How the superloop function is applied will depend on the role of the node within the ring, i.e. whether it is a master node or a transit node, and its physical location within the ring. Here is how the functions of Superloop prevention modify the nodal behavior for a particular ring instance:

- A master node with its epsr priority set to zero will consider the superloop function to be turned off.
- A master node with its epsr priority set within the range 1-127 will consider the superloop function to be enabled, and will change its behavior in the following ways.
 - « It will **not** unblock its secondary port following the expiry of the Master Node Hello message timer. However, a ring-down-flush message will still be sent.
 - « It **will** only unblock its secondary port when it receives a Links Down message from a transit node.
- A transit node that is not connect to a shared link will be unaffected by having its epsr priority set for any of its instances.
- A transit node that is connected to a shared link will change its behavior in the following ways:
 - « It will compare its priority settings applied to each of the instances sharing the common link. So for the network of [Figure 84-10 on page 84.18](#) Transit Node D

will compare the priority setting for Ring One, with the priority setting for Ring Two.

If the shared link fails, the transit node will only issue a **Transit Node Links Down message** on the ring that is configured with the highest priority.

The result of these behavior changes is that when the shared link fails, only the master node located on the higher priority ring will unblock its secondary port; because this is the only master node that will receive the **Transit Node Links Down message**. Note also that the master node will receive these messages from the transit nodes at either end of the broken shared link (Nodes D and E). This concept is illustrated in

Figure 84-12: EPSR behavior under fault conditions with Superloop enabled

For this process to work requires certain configuration rules to be obeyed.

Configuration Rules for Superloop Protected EPSR Rings

The following configuration rules are advised when configuring EPSR rings that share one or more common segments.

- Allocate a priority order to each of the interconnected rings, with 127 being the highest priority and 1 the lowest.
- A higher priority ring can have its master node located in any position; although, where possible, avoid connecting a common segment to the secondary port of a master node.
- Do not locate the master node on a segment that is shared with a higher priority ring, but you “can” locate it on a common segment that is shared with a lower priority ring. In this situation however, the port that connects to the common segment must be configured as the primary port.

For example, in **Figure 84-12**, the upper portion of Node D could be configured as a Master Node of the upper ring (having a priority of 120), but its lower portion must be configured as a Transit Node (having the lower priority of 60).

- On the transit nodes that connect to shared links, allocate the ring’s priority to the ports that connect to each ring. Note that both of these nodes “must” be set to the same priority value.

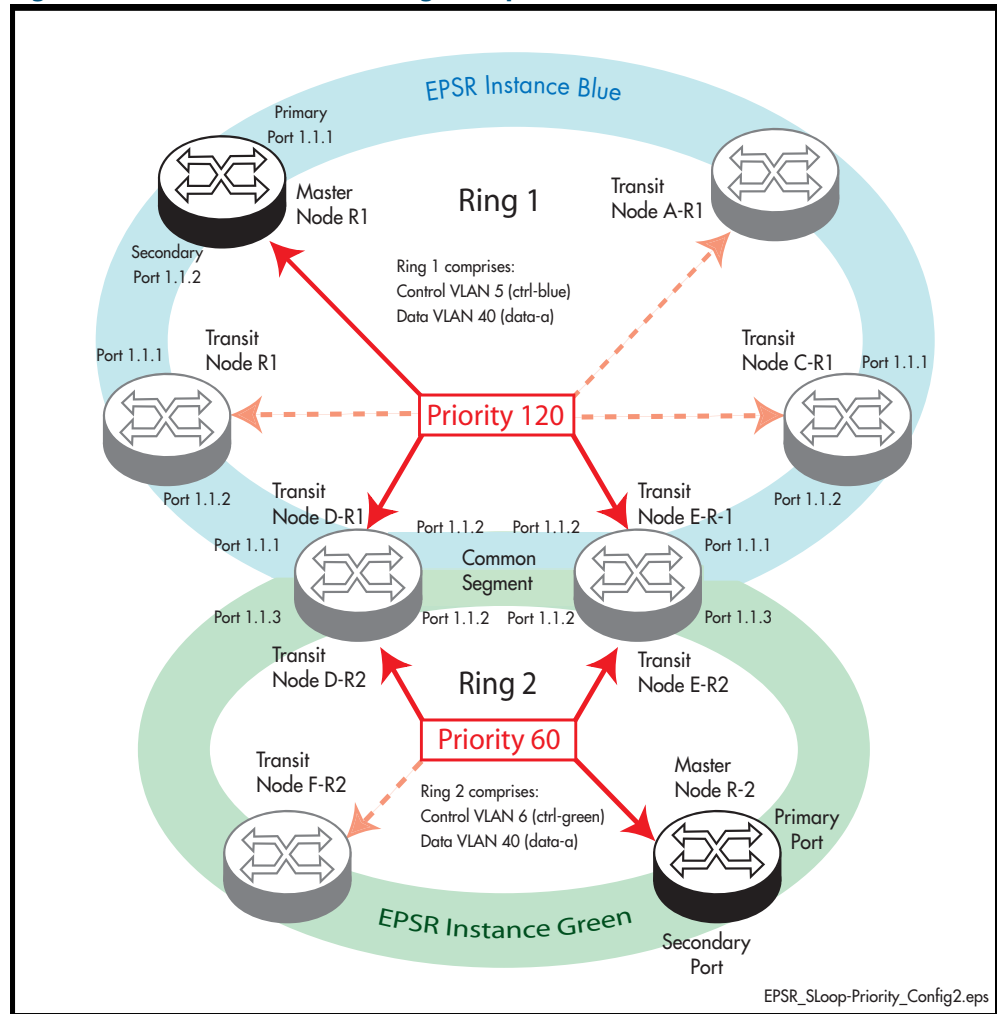

Note  For good practice, we advise that you set all nodes within a ring to the priority assigned to that ring. So, for the network of **Figure 84-12** each of the nodes that form part of the upper ring would be configured with a priority of 120, and each of the nodes that form the lower ring would all be configured with a priority of 60.

Configuring a Basic Superloop Protected Two Ring EPSR Network

Configuration Example

This section shows how to configure a basic EPSR network such as that shown in **Figure 84-13** below.

Figure 84-13: EPSR Two Shared Ring Example

The configuration suggested comprises the following basic steps:

- **“On Ring 1 - Configure the Master Node R-1” on page 84.23**
- **“On Ring 1 - Configure the Transit Nodes A to C” on page 84.25**
- **“On Ring 2 - Configure the Master Node R-2” on page 84.27**
- **“On Rings 1 and 2 - Configure the Transit Nodes D and E” on page 84.29**
- **“On Ring 2 - Configure the Transit Node F” on page 84.35**

On Ring 1- Configure the Master Node R-1

Step 1: Create the control and data VLANs (Configure on the Master Node R-1)

awplus#	
configure terminal	Enter the Global Configuration mode.
awplus(config)#	
vlan database	Enter the VLAN Configuration mode.
awplus(config-vlan)#	
vlan 5 name ctrl-blue state enable	Enable VLAN 5 called ctrl-blue on the Master Node R-1. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
awplus(config-vlan)#	
vlan 40 name data-a state enable	Enable VLAN 40 called data-a on the Master Node R-1. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
awplus(config-vlan)#	
exit	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add the control VLAN (ctrl-blue) to the Ring Ports

awplus(config)#	
interface port1.1.1,port1.1.2	Specify the ports (port1.1.1 and port 1.1.2) that you are configuring and enter the Interface Configuration mode.
awplus(config-if)#	
switchport mode trunk	Set the switching characteristics of these ports to Trunk mode.
awplus(config-if)#	
switchport trunk allowed vlan add 5	Enable VLAN 5 on these ports.
awplus(config-if)#	
switchport trunk native vlan none	Remove the native VLAN from these ring ports.

Step 3: Create the EPSR Instance called “blue”, make VLAN 5 the control VLAN and port 1.1.1 the primary port (Configure on the Master Node R-1)

```
awplus(config)#
epsr configuration Enter the EPSR Configuration mode.

awplus(config-epsr)#
epsr blue mode master controlvlan 5 Create an EPSR instance called blue on vlan 5.
primaryport port1.1.1 Make vlan 5 the control VLAN.
Make port 1.1.1 the primary port.
Make this node the master.
```

Step 4: Add a data VLAN to the EPSR Instance called “blue” (Configure on the Master Node R-1)

```
awplus(config-epsr)#
epsr blue datavlan 40 On epsr instance called blue data-a the data VLAN.
```

Step 5: Assign a priority to the ring instance (Configure on the Master Node R-1)

```
awplus(config-epsr)#
epsr blue priority 120 Set the ring instance priority to the value selected for
the ring. The priority value selected is 120.
```

```
awplus(config-epsr)#
exit Exit the EPSR Configuration mode.
```

Step 6: Enable the EPSR Instance called “blue” (Configure on the Master Node R-1)

```
awplus(config-epsr)#
epsr blue state enable Enable the EPSR instance named blue.
```

```
awplus(config-epsr)#
exit Exit the EPSR Configuration mode.
```

Step 7: Add port1.1.1 to these VLANs (Configure on the Master Node R-1)

```
awplus(config)#
interface port1.1.1,port1.1.2 Specify the EPSR ring ports (port1.1.1 and
port1.1.2) that you are configuring and enter the
Interface Configuration mode.
```

```
awplus(config-if)#
switchport trunk allowed vlan add 40 Enable VLAN 40 on this port.
```

```
awplus(config-if)#
exit Exit the Interface mode and enter the Global
Configuration mode.
```

On Ring 1 - Configure the Transit Nodes A to C

Step 1: Create the control and data VLANs (on Transit Nodes A to C)

awplus# configure terminal	Enter the Global Configuration mode.
awplus(config)# vlan database	Enter the VLAN Configuration mode.
awplus(config-vlan)# vlan 5 name ctrl-blue state enable	Enable VLAN 5 called ctrl-blue on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
awplus(config-vlan)# vlan 40 name data-a state enable	Enable VLAN 40 called data-a on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
awplus(config-vlan)# exit	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add the EPSR control vlan (ctrl-blue) to EPSR ring ports

awplus(config)# interface port1.1.1, port1.1.2	Specify the two ring ports (port1.1.1 and port1.1.2) that you are configuring and enter the Interface Configuration mode.
awplus(config-if)# switchport mode trunk	Set the switching characteristics of this port to Trunk mode.
awplus(config-if)# switchport trunk allowed vlan add 5	Enable VLAN 5 on these ports.
awplus(config-if)# switchport trunk native vlan none	Remove the native VLAN from the ring ports.

Step 3: Create the EPSR Instance called "blue", make VLAN 5 the control VLAN (on Transit Nodes A to C)

awplus(config)# epsr configuration	Enter the EPSR Configuration mode.
awplus(config-epsr)# epsr blue mode transit controlvlan 5	Create an EPSR instance called blue on vlan 5. Make vlan 5 the control VLAN. Make this node a transit node.

Step 4: Add a data VLAN to the EPSR Instance called "blue" (on Transit Nodes A to C)

```
awplus(config-epsr)#
epsr blue datavlan 40
```

On the EPSR instance called blue make vlan 40 the data VLAN.

Step 5: Assign a priority to the ring instance (on Transit Nodes A to C)

This step is mandatory on transit nodes that connect to a common segment, and good practice on other transit nodes.

```
awplus(config-epsr)#
epsr blue priority 120
```

Set the ring instance priority to the priority selected for the ring 120.

Step 6: Enable the EPSR Instance called "blue" (on Transit Nodes A to C)

```
awplus(config-epsr)#
epsr blue state enable
```

Enable the EPSR instance named blue.

```
awplus(config-epsr)#
exit
```

Exit the EPSR Configuration mode.

Step 7: Add the physical ports 1.1.1 to VLAN 40 (on Transit Nodes A to C)

```
awplus(config)#
interface port1.1.1,port1.1.2
```

Specify the physical ring ports (port1.1.1 and port1.1.2) that you are configuring and enter the Interface Configuration mode.

```
awplus(config-if)#
switchport trunk allowed vlan add 40
```

Enable VLAN 40 on this port.

```
awplus(config-if)#
exit
```

Exit the Interface mode and enter the Global Configuration mode.

On Ring 2 - Configure the Master Node R-2

Step 1: Create the control and data VLANs (Configure on the Master Node R-2)

awplus# configure terminal	Enter the Global Configuration mode.
awplus(config)# vlan database	Enter the VLAN Configuration mode.
awplus(config-vlan)# vlan 6 name ctrl-green state enable	Enable vlan 6 called ctrl-green on the Master Node R-2. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
awplus(config-vlan)# vlan 40 name data-a state enable	Enable VLAN 40 called data-a on the Master Node R-2. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
awplus(config-vlan)# exit	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add the control VLAN (ctrl-green) to the Ring Ports

awplus(config)# interface port1.1.1,port1.1.2	Specify the ports (port1.1.1 and 1.1.2) that you are configuring, and enter the Interface Configuration mode.
awplus(config-if)# switchport mode trunk	Set the switching characteristics of these ports to Trunk mode.
awplus(config-if)# switchport trunk allowed vlan add 6	Enable vlan 6 on these ports.
awplus(config-if)# switchport trunk native vlan none	Remove the native VLAN from these ring ports.

Step 3: Create the EPSR Instance called “green”, make vlan 6 the control VLAN and port1.1.1 the primary port (Configure on the Master Node R-2)

```
awplus(config)#
  epsr configuration  Enter the EPSR Configuration mode.

awplus(config-epsr)#
  epsr green mode master controlvlan 6  Create an EPSR instance called green on vlan 6.
  primaryport port1.1.1                Make vlan 6 the control VLAN.
                                       Make port 1.1.1 the primary port.
                                       Make this node the master.
```

Step 4: Add a data VLAN to the EPSR Instance called “green” (Configure on the Master Node R-2)

```
awplus(config-epsr)#
  epsr green datavlan 40  On epsr instance called green make vlan 40 the
                          data VLAN.
```

Step 5: Assign a priority to the ring instance (Configure on the Master Node R-2)

This step is mandatory on transit nodes that connect to a common segment, and good practice on other transit nodes.

```
awplus(config-epsr)#
  epsr green priority 60  Set the ring instance priority to the value selected for
                          the ring. The priority value selected is 60.
```

Step 6: Enable the EPSR Instance called “green” (Configure on the Master Node R-2)

```
awplus(config-epsr)#
  epsr green state enable  Enable the EPSR instance named green.

awplus(config-epsr)#
  exit  Exit the EPSR Configuration mode.
```

Step 7: Add ports 1.1.1 and 1.1.2 to these VLANs (Configure on the Master Node R-2)

<pre>awplus(config)# interface port1.1.1,port1.1.2</pre>	Specify the ports (port1.1.1 and port 1.1.2) that you are configuring and enter the Interface Configuration mode.
<pre>awplus(config-if)# switchport mode trunk</pre>	Set the switching characteristics of these ports to Trunk mode.
<pre>awplus(config-if)# switchport trunk allowed vlan add 40</pre>	Enable VLAN 40 on this port
<pre>awplus(config-if)# exit</pre>	Exit the Interface mode and enter the Global Configuration mode.

On Rings 1 and 2 - Configure the Transit Nodes D and E

Step 1: Create the control and data VLANs (on Transit Nodes D and E)

<pre>awplus# configure terminal</pre>	Enter the Global Configuration mode.
<pre>awplus(config)# vlan database</pre>	Enter the VLAN Configuration mode.
<pre>awplus(config-vlan)# vlan 5 name ctrl-blue state enable</pre>	Enable VLAN 5 called ctrl-blue on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
<pre>awplus(config-vlan)# vlan 40 name data-a state enable</pre>	Enable VLAN 40 called data-a on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
<pre>awplus(config-vlan)# vlan 6 name ctrl-green state enable</pre>	Enable VLAN 6 called ctrl-green on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
<pre>awplus(config-vlan)# exit</pre>	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Add physical port1.1.1 to these VLANs (on Transit Nodes D and E)

<code>awplus(config)#</code>	
<code>interface port1.1.1</code>	Specify the physical interface (<code>port1.1.1</code>) that you are configuring and enter the Interface Configuration mode.
<code>awplus(config-if)#</code>	
<code>switchport mode trunk</code>	Set the switching characteristics of this port to Trunk mode.
<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 5</code>	Enable VLAN 5 on this port.
<code>awplus(config-if)#</code>	
<code>switchport trunk native vlan none</code>	Remove the native VLAN.
<code>awplus(config-if)#</code>	
<code>exit</code>	Exit the Interface mode and enter the Global Configuration mode.

Step 3: Add physical port port1.1.2 to these VLANs (on Transit Nodes D and E)

<code>awplus(config)#</code>	
<code>interface port1.1.2</code>	Specify the physical interface (<code>port1.1.2</code>) that you are configuring and enter the Interface Configuration mode.
<code>awplus(config-if)#</code>	
<code>switchport mode trunk</code>	Set the switching characteristics of this port to Trunk mode.
<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 5</code>	Enable VLAN 5 (ctrl-blue) on this port.
<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 6</code>	Enable VLAN 6 (ctrl-green) on this port.
<code>awplus(config-if)#</code>	
<code>switchport trunk native vlan none</code>	Remove the native VLAN.
<code>awplus(config-if)#</code>	
<code>exit</code>	Exit the Interface mode and enter the Global Configuration mode.

Step 4: Add physical port1.1.3 to these VLANs (on Transit Nodes D and E)

<code>awplus(config)#</code>	
<code>interface port1.1.3</code>	Specify the physical interface (<code>port1.1.3</code>) that you are configuring and enter the Interface Configuration mode.
<code>awplus(config-if)#</code>	
<code>switchport mode trunk</code>	Set the switching characteristics of this port to Trunk mode.

```
awplus(config-if)#
switchport trunk allowed vlan add 6
```

Enable VLAN 6 on this port.

```
awplus(config-if)#
switchport trunk native vlan none
```

Remove the native VLAN.

```
awplus(config-if)#
exit
```

Exit the Interface mode and enter the Global Configuration mode.

Step 5: Create the EPSR Instance called "blue" on a transit node, make VLAN 5 the control VLAN (on Transit Nodes D and E)

```
awplus(config)#
epsr configuration
```

Enter the EPSR Configuration mode.

```
awplus(config-epsr)#
epsr blue mode transit controlvlan 5
```

Create an EPSR instance called blue on vlan 5. Make vlan 5 the control VLAN. Make this node a transit node.

Step 6: Add a data VLAN to the EPSR Instance called "blue" (on Transit Nodes D and E)

```
awplus(config-epsr)#
epsr blue datavlan 40
```

On the EPSR instance called blue make vlan 40 the data VLAN.

Step 7: Assign a priority to the ring instance (on Transit Nodes D and E)

This step is mandatory on transit nodes that connect to a common segment, and good practice on other transit nodes.

```
awplus(config-epsr)#
epsr blue priority 120
```

Set the ring instance priority to 120 - the value selected for the ring.

```
awplus(config-epsr)#
exit
```

Exit the EPSR Configuration mode.

Step 8: Enable the EPSR Instance called "blue" (on Transit Nodes D and E)

```
awplus(config-epsr)#
epsr blue state enable
```

Enable the EPSR instance named blue.

Step 9: Create the EPSR Instance called “green” on a transit node, make VLAN 6 the control VLAN (on Transit Nodes D and E)

```
awplus(config-epsr)#  
epsr green mode transit controlvlan 6
```

Create an EPSR instance called green on
vlan 6.
Make vlan 6 the control VLAN.
Make this node a transit node.

Step 10: Add a data VLAN to the EPSR Instance called "green" (on Transit Nodes D and E)

```
awplus(config-epsr)#
epsr green datavlan 40
```

On the EPSR instance called `green` make `vlan 40` the data VLAN.

Step 11: Assign a priority to the ring instances (on Transit Nodes D and E)

This step is mandatory on transit nodes that connect to a common segment, and good practice on other transit nodes.

```
awplus(config-epsr)#
epsr green priority 60
```

Set the ring instance priority to 60 - this being the priority selected for the ring.

```
awplus(config-epsr)#
exit
```

Exit the EPSR Configuration mode.

Step 12: Enable the EPSR Instance called "green" (on Transit Nodes D and E)

```
awplus(config-epsr)#
epsr green state enable
```

Enable the EPSR instance named `green`.

```
awplus(config-epsr)#
exit
```

Exit the EPSR Configuration mode.

Step 13: Add the physical port 1.1.1 to these VLANs (on Transit Nodes D and E)

```
awplus(config)#
interface port1.1.1
```

Specify the physical interface (`port1.1.1`) that you are configuring and enter the Interface Configuration mode.

```
awplus(config-if)#
switchport mode trunk
```

Set the switching characteristics of this port to Trunk mode.

```
awplus(config-if)#
switchport trunk allowed vlan add 40
```

Enable VLAN 40 on this port.

```
awplus(config-if)#
exit
```

Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 14: Add the physical port 1.1.2 to these VLANs (on Transit Nodes D and E)

<pre>awplus(config)# interface port1.1.2</pre>	Specify the physical interface (port1.1.2) that you are configuring and enter the Interface Configuration mode.
<pre>awplus(config-if)# switchport mode trunk</pre>	Set the switching characteristics of this port to Trunk mode.
<pre>awplus(config-if)# switchport trunk allowed vlan add 40</pre>	Enable VLAN 40 on this port.
<pre>awplus(config-if)# exit</pre>	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 15: Add the physical port 1.1.3 to these VLANs (on Transit Nodes D and E)

<pre>awplus(config)# interface port1.1.3</pre>	Specify the physical interface (port1.1.3) that you are configuring and enter the Interface Configuration mode.
<pre>awplus(config-if)# switchport mode trunk</pre>	Set the switching characteristics of this port to Trunk mode.
<pre>awplus(config-if)# switchport trunk allowed vlan add 40</pre>	Enable VLAN 40 on this port.
<pre>awplus(config-if)# exit</pre>	Exit the Interface Configuration mode and enter the Global Configuration mode.

On Ring 2 - Configure the Transit Node F

Step 1: Create the control and data VLANs (on Transit Node F)

awplus#	
configure terminal	Enter the Global Configuration mode.
awplus(config)#	
vlan database	Enter the VLAN Configuration mode.
awplus(config-vlan)#	
vlan 6 name ctrl-green state enable	Enable VLAN 6 called ctrl-green on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
awplus(config-vlan)#	
vlan 40 name data-a state enable	Enable VLAN 40 called data-a on the Transit Node. Specifying the enable state allows forwarding of frames on the VLAN-aware node.
awplus(config-vlan)#	
exit	Exit the VLAN Configuration mode and enter the Global Configuration mode.

Step 2: Create the EPSR Instance called "green" on a transit node, make VLAN 6 the control VLAN (on Transit Node F)

awplus(config)#	
epsr configuration	Enter the EPSR Configuration mode.
awplus(config-epsr)#	
epsr green mode transit controlvlan 6	Create an EPSR instance called green on vlan 6. Make vlan 6 the control VLAN. Make this node a transit node.

Step 3: Add a data VLAN to the EPSR Instance called "green" (on Transit Node F)

awplus(config-epsr)#	
epsr green datavlan 40	On the EPSR instance called green make vlan 40 the data VLAN.

Step 4: Enable the EPSR Instance called "green" (on Transit Node F)

awplus(config-epsr)#	
epsr green state enable	Enable the EPSR instance named green.

Step 5: Assign a priority to the ring instance (on Transit Node F)

This step is mandatory on transit nodes that connect to a common segment, and good practice on other transit nodes.

```
awplus(config-epsr)#
epsr green priority 120
```

Set the ring instance priority to the priority selected for the ring 120.

```
awplus(config-epsr)#
exit
```

Exit the EPSR Configuration mode.

Step 6: Add the physical port1.1.1 to VLANs 6 and 40 (on Transit Node F)

```
awplus(config)#
interface port1.1.1
```

Specify the physical interface (port1.1.1) that you are configuring and enter the Interface Configuration mode.

```
awplus(config-if)#
switchport mode trunk
```

Set the switching characteristics of this port to Trunk mode.

```
awplus(config-if)#
switchport trunk allowed vlan add 6
```

Enable VLAN 6 on this port.

```
awplus(config-if)#
switchport trunk allowed vlan add 40
```

Enable VLAN 40 on this port.

```
awplus(config-if)#
switchport trunk native vlan none
```

Remove the native VLAN

```
awplus(config-if)#
exit
```

Exit the Interface mode and enter the Global Configuration mode.

Step 7: Add the physical port 1.1.2 to VLANs 6 and 40 (on Transit Node F)

<pre>awplus(config)# interface port1.1.2</pre>	Specify the interface (port1.1.2) that you are configuring and enter the Interface Configuration mode.
<pre>awplus(config-if)# switchport mode trunk</pre>	Set the switching characteristics of this port to Trunk mode.
<pre>awplus(config-if)# switchport trunk allowed vlan add 6</pre>	Enable VLAN 6 on this port.
<pre>awplus(config-if)# switchport trunk allowed vlan add 40</pre>	Enable VLAN 40 on this port.
<pre>awplus(config-if)# switchport trunk native vlan none</pre>	Remove the native VLAN
<pre>awplus(config-if)# exit</pre>	Exit the Interface Configuration mode and enter the Global Configuration mode.

Sample Show Output

For the above network configuration, running the command **show epsr** on node R1 will display the following output when operating normally. Note the blocked state of its secondary port.

Figure 84-14: Output from the show epsr command run on Master Node R1 - with Ring 1 - EPSR Instance blue operating normally

```

EPSR Information
-----
Name .....blue
Mode .....Master
Status .....Enabled
State .....Complete
Control Vlan .....5
Data VLAN(s) .....40
Interface Mode .....Ports Only
Primary Port .....port1.1.1
  Status .....Forwarding
  Is On Common Segment .....No
  Blocking Control .....Physical
Secondary Port .....port1.1.2
  Status .....Blocked
  Is On Common Segment .....No
  Blocking Control .....Physical
Hello Time .....1 s
Failover Time .....2 s
Ring Flap Time .....0 s
Trap .....Enabled
Enhanced Recovery .....Disabled
Priority .....120
-----

```

If a fault occurs somewhere within the blue network ring the Master Node-R1 would respond by placing its secondary port into the forwarding state. Figure **Figure 84-15** displays its resultant state. Note that the state of its secondary port has now moved from Blocked, Forwarding.

Figure 84-15: Output from the show epsr command run on Master Node R2, where a break exists within the Ring 1 - EPSR instance blue.

```

EPSR Information
-----
Name .....blue
Mode .....Master
Status .....Enabled
State .....Failed
Control Vlan .....6
Data VLAN(s) .....40
Interface Mode .....Ports Only
Primary Port .....port1.1.1
  Status .....Forwarding
  Is On Common Segment .....No
  Blocking Control .....Physical
Secondary Port .....port1.1.2
  Status .....Forwarding
  Is On Common Segment .....No
  Blocking Control .....Physical
Hello Time .....1 s
Failover Time .....2 s
Ring Flap Time .....0 s
Trap .....Enabled
Enhanced Recovery .....Disabled
Priority .....60
-----

```

If a fault occurs in the common segment of the ring then the Master Node-R2 being on the lower priority ring would detect a timeout of its transmitted Healthcheck Message. It would also detect the absence of the expected **Ring Down Flush** message, see **Figure 84-16**. The Master node then assumes that there is a break somewhere in the Common Segment, and will display the status shown in **Figure 84-17**.

Figure 84-16: EPSR behavior with a faulty common segment and Superloop enabled

Note that the secondary port on Master Node-L2 remains in the blocked state; its state now appears in show output as being as blocked (for superloop prevention), See **Figure 84-17**.

The Master-L1 on the blue ring will also detect a timeout in the healthcheck message, but because ring 1 has the higher priority (of 120), it will receive a Links Down message from each of the Transit Nodes (D and E) that connect to the common segment. As a result, the state of the Master Node will be as shown in Figure **Figure 84-17**; note particularly the change in its Secondary Port status.

Figure 84-17: Output from the show epsr command run on Master Node L2 (green)

```

EPSR Information
-----
Name .....green
Mode .....Master
Status .....Enabled
State .....Failed
Control Vlan .....6
Data VLAN(s) .....40
Interface Mode .....Ports Only
Primary Port .....port1.1.1
  Status .....Forwarding
  Is On Common Segment .....No
  Blocking Control .....Physical
Secondary Port .....port1.1.2
  Status .....Blocked (for superloop prevention)
  Is On Common Segment .....No
  Blocking Control .....Physical
Hello Time .....1 s
Failover Time .....2 s
Ring Flap Time .....0 s
Trap .....Enabled
Enhanced Recovery .....Disabled
Priority .....60
-----

```

Adding a new data VLAN to a functioning superloop topology

This example shows how to add another data VLAN called **data-b** to the superloop topology. We recommend that you apply the configuration steps in the order shown.

1. Add VLAN to the common segment (for both instances)
2. Add VLAN to blue master
3. Add VLAN to other blue transits
4. Add VLAN to green master
5. Add VLAN to other green transits

On Ring 1 EPSR Instance Blue - Configure each of the Transit Nodes that Connect to the Common Segment

Select one of the transit nodes that connects to the common segment, and carry out the following steps:

Step 1: Add VLAN 50 to the VLAN database and set its state to enable

```

awplus#
configure terminal Enter terminal config mode
awplus(config)#
vlan database Enter the EPSR Configuration mode.
awplus(config-epsr)#
vlan 50 name data-b enable Create vlan 50, name it data-b and enable it.

```

Step 2: Add the VLAN 50 to the EPSR Instances called "blue" and "green" on the transit nodes

```

awplus(config)#
epsr configuration Enter the EPSR Configuration mode.
awplus(config-epsr)#
epsr blue datavlan 50 On the EPSR instance called blue add vlan 50 as a
data VLAN.
awplus(config-epsr)#
epsr green datavlan 50 On the EPSR instance called green add vlan 50 as a
data VLAN.

```

Step 3: Add the common physical port (port1.1.2 in this example) to VLAN 50

```

awplus(config)#
interface port1.1.2 Specify the physical interface (port1.1.2) that you
are configuring and enter the Interface Configuration
mode.
awplus(config-if)#
switchport trunk allowed vlan add 50 Enable VLAN 50 on this port.
awplus(config-if)#
exit Exit the Interface mode and enter the Global
Configuration mode.

```

Step 4: Add physical port1.1.1 to VLAN 50

<code>awplus(config)#</code>	
<code>interface port1.1.1</code>	Specify the interface (port1.1.1) that you are configuring and enter the Interface Configuration mode.

<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 50</code>	Enable VLAN 50 on this port.

<code>awplus(config-if)#</code>	
<code>exit</code>	Exit the Interface Configuration mode and enter the Global Configuration mode.

Step 5: Add physical port1.1.3 to VLAN 50

<code>awplus(config)#</code>	
<code>interface port1.1.3</code>	Specify the interface (port1.1.3) that you are configuring and enter the Interface Configuration mode.

<code>awplus(config-if)#</code>	
<code>switchport trunk allowed vlan add 50</code>	Enable VLAN 50 on this port.

<code>awplus(config-if)#</code>	
<code>exit</code>	Exit the Interface Configuration mode and enter the Global Configuration mode.

Select the next transit node that connects to the common segment, and repeat the above steps:

On Ring 1 EPSR Instance Blue - Add VLAN 50 to the Master Node

Carry out this process using the same basic procedure shown in of Steps 1 to 5

On Ring 1 EPSR Instance Blue - Add VLAN 50 to the Transit Nodes

Carry out this process using the same basic procedure shown in of Steps 1 to 5

On Ring 2 EPSR Instance Green - Add VLAN 50 to the Master Node

Carry out this process using the same basic procedure shown in of Steps 1 to 5

On Ring 2 EPSR Instance Green - Add VLAN 50 to the remaining Transit Node

Carry out this process using the same basic procedure shown in of Steps 1 to 5

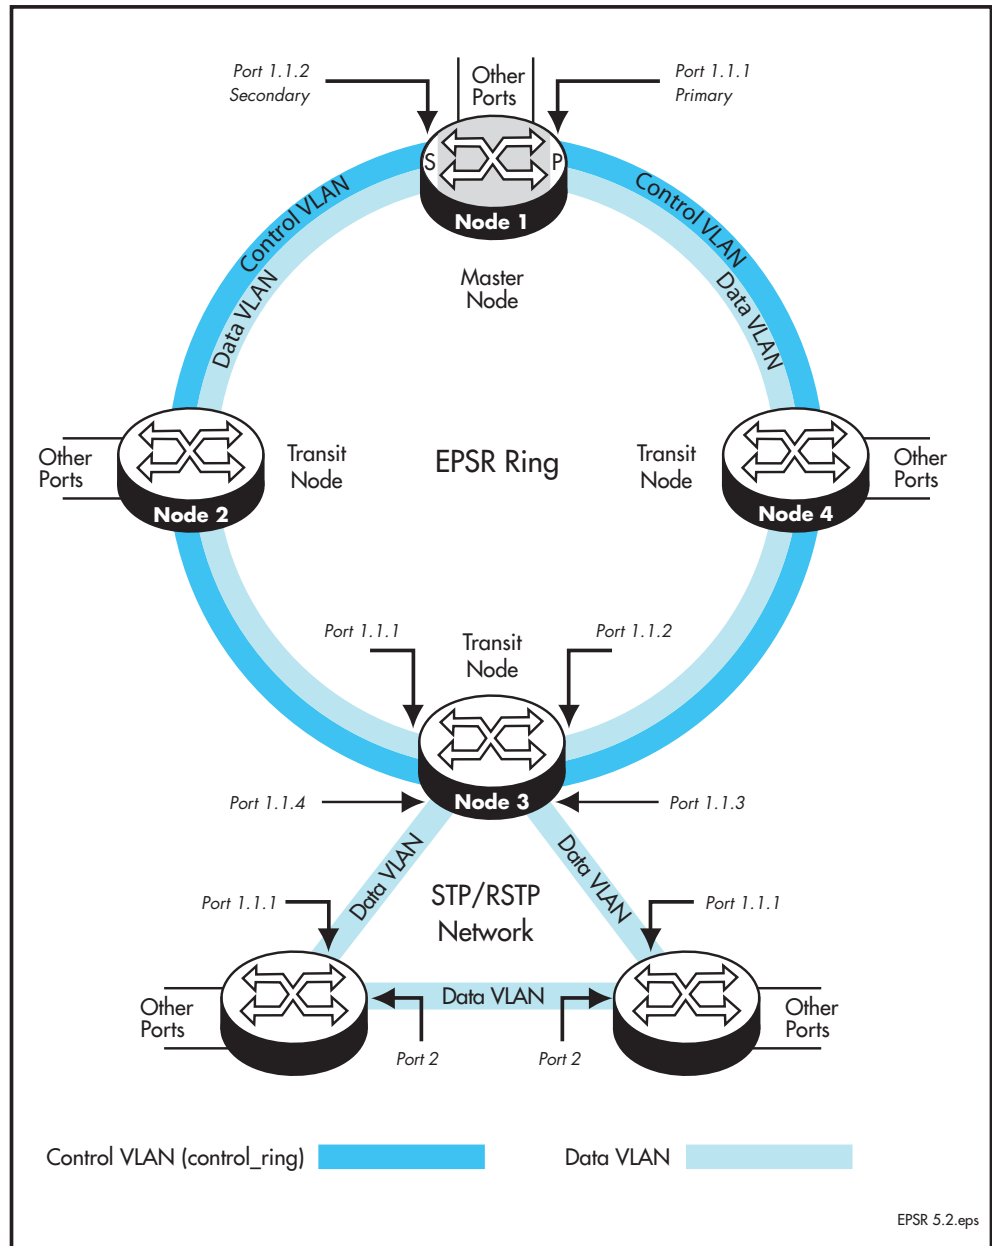

EPSR and Spanning Tree Operation

EPSR and the Spanning Tree protocol (STP) address data loop prevention, although they do it differently. EPSR is manually configured to explicitly identify which links are broken in the defined ring, whereas STP/RSTP calculates where to break links based on user-provided values (metrics) that are compared to determine the “best” (or lowest cost) paths for data traffic.

At the practical level you can use these two techniques to create complementary hybrid EPSR /STP configurations. This configuration might have a high speed fibre loop topology backbone-controlled and managed using EPSR. Lobes could extend out from each loop node into a user mesh network. Any loops in this mesh network would be controlled and managed using STP/RSTP. Note that EPSR and STP cannot share the same ports.

The following figure shows a basic combined EPSR / STP network.

Figure 84-18: EPSR and spanning tree operation

Command List

This chapter provides an alphabetical reference for commands used to configure EPSR. For more information, see [Chapter 84, EPSR Introduction and Configuration](#).

For information about modifying or redirecting the output from **show** commands to a file, see

[“Controlling “show” Command Output” on page 1.35.](#)

debug epsr

This command enables EPSR debugging.

The **no** variant of this command disables EPSR debugging.

Syntax

```
debug epsr {info|msg|pkt|state|timer|all}
no debug epsr {info|msg|pkt|state|timer|all}
```

Parameter	Description
info	Send general EPSR information to the console. Using this parameter with the no debug epsr command will explicitly exclude the above information from being sent to the console.
msg	Send the decoded received and transmitted EPSR packets to the console. Using this parameter with the no debug epsr command will explicitly exclude the above packets from being sent to the console.
pkt	Send the received and transmitted EPSR packets as raw ASCII text to the console. Using this parameter with the no debug epsr command will explicitly exclude the above packets from being sent to the console.
state	Send EPSR state transitions to the console. Using this parameter with the no debug epsr command will explicitly exclude state transitions from being sent to the console.
timer	Send EPSR timer information to the console. Using this parameter with the no debug epsr command will explicitly exclude timer information from being sent to the console.
all	Send all EPSR debugging information to the console. Using this parameter with the no debug epsr command will explicitly exclude any debugging information from being sent to the console.

Mode Privileged Exec and Global Configuration

Examples To enable state transition debugging, use the command:

```
awplus# debug epsr state
```

To disable EPSR packet debugging, use the command:

```
awplus# no debug epsr pkt
```

Related Commands [undebbug epsr](#)

epsr

This command sets the timer values for an EPSR instance. It is only valid for master nodes.

Syntax `epsr <epsr-name> {hellotime <1-32767>|failovertime <2-65535>|ringflaptime <0-65535>}`

`no epsr <epsr-name>`

Caution Using the “no” variant of this command will remove the specified EPSR instance.

Parameter	Description
<code><epsr-name></code>	Name of the EPSR instance.
<code>hellotime <1-32767></code>	The number of seconds between the transmission of health check messages.
<code>failovertime <2-65535></code>	The number of seconds that a master waits for a returning health check message before entering the failed state. The failover time should be greater than twice the hellotime. This is to force the master node to wait until it detects the absence of two sequential healthcheck messages before entering the failed state.
<code>ringflaptime <0-65535></code>	The minimum number of seconds that a master must remain in the failed state.

Mode EPSR Configuration

Examples To set the hellotimer to 5 seconds for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue hellotime 5
```

To delete the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue
```

- [show epsr](#)

epsr configuration

Use this command to enter EPSR Configuration mode so that EPSR can be configured.

Syntax `epsr configuration`

Mode Global Configuration

Example To change to EPSR mode, use the command:

```
awplus(config)# epsr configuration
```

Related Commands `epsr mode master controlvlan primaryport`
`epsr`
`show epsr`

epsr datavlan

This command adds a data VLAN or a range of VLAN identifiers to a specified EPSR instance.

The **no** variant of this command removes a data vlan or data vlan range from an EPSR instance.

Syntax `epsr <epsr-name> datavlan {<vlanid>|<vlanid-range>}`
`no epsr <epsr-name> datavlan {<vlanid>|<vlanid-range>}`

Parameter	Description
<code><epsr-name></code>	Name of the EPSR instance.
<code>datavlan</code>	Adds a data VLAN to be protected by the EPSR instance.
<code><vlanid></code>	The VLAN's VID - a number between 1 and 4094 excluding the number selected for the control VLAN.
<code><vlanid-range></code>	Specify a range of VLAN identifiers using a hyphen to separate identifiers.

Mode EPSR Configuration

Usage We suggest setting the `epsr controlvlan` to `vlan2` using the **epsr mode master controlvlan primaryport** and **epsr mode transit controlvlan** commands, then setting the EPSR data VLAN between to be a value 3 and 4094 using the **epsr datavlan** command.

Examples To add `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan3
```

To add `vlan2` and `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan2-vlan3
```

To remove `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan3
```

To remove `vlan2` and `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan2-vlan3
```

Related Commands **epsr mode master controlvlan primaryport**
epsr mode transit controlvlan
show epsr

epsr enhancedrecovery enable

This command enables EPSR's enhanced recovery mode. Enhanced recovery mode enables a ring to apply additional recovery procedures when a ring with more than one break, partially mends. For more information see, "[Managing Rings with Two Breaks](#)" on [page 84.7](#).

The **no** variant of this command disables the enhancedrecovery mode.

Syntax `epsr <epsr-name> enhancedrecovery enable`
 `no epsr <epsr-name> enhancedrecovery enable`

Parameter	Description
<code><epsr-name></code>	Name of the EPSR instance.

Default Default is enhancedrecovery mode disabled.

Mode EPSR Configuration

Example To apply enhanced recovery on the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue enhancedrecovery enable
```

Related Commands [show epsr](#)

epsr mode master controlvlan primaryport

This command creates a master EPSR instance

Syntax `epsr <epsr-name> mode master controlvlan <2-4094> primaryport <port>`

Parameter	Description
<code><epsr-name></code>	Name of the EPSR instance.
<code>mode</code>	Determines the node is acting as a master.
<code>master</code>	Sets switch to be the master node for the named EPSR ring.
<code>controlvlan</code>	The VLAN that will transmit EPSR control frames.
<code><2-4094></code>	VLAN id.
<code>primaryport</code>	Primary port for the EPSR instance.
<code><port></code>	The primary port. The port may be a switch port (e.g. <code>port1.1.4</code>) or a static channel group (e.g. <code>sa3</code>). It cannot be a dynamic (LACP) channel group.

Note  The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch. However, we advise against this because in certain situations it can produce unpredictable results. If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port. EPSR does not support Dynamic link aggregation (LACP).

Mode EPSR Configuration

Example To create a master EPSR instance called `blue` with `vlan2` as the control VLAN and `port1.1.1` as the primary port, use the command:

```
awplus(config-epsr)# epsr blue mode master controlvlan vlan2
primaryport port1.1.1
```

Related Commands [epsr mode transit controlvlan](#)
[show epsr](#)

epsr mode transit controlvlan

This command creates a transit EPSR instance.

Syntax `epsr <epsr-name> mode transit controlvlan <2-4094>`

Parameter	Description
<code><epsr-name></code>	Name of the EPSR instance.
<code>mode</code>	Determines the node is acting as a transit node.
<code>transit</code>	Sets switch to be the transit node for the named EPSR ring.
<code>controlvlan</code>	The VLAN that will transmit EPSR control.
<code><2-4094></code>	VLAN id.

Note  The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch. However, we advise against this because in certain situations it can produce unpredictable results. If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port. EPSR does not support Dynamic link aggregation (LACP).

Mode EPSR Configuration

Example To create a transit EPSR instance called `blue` with `vlan2` as the control VLAN, use the command:

```
awplus(config-epsr)# epsr blue mode transit controlvlan vlan2
```

Related Commands [epsr mode master controlvlan primaryport](#)
[epsr mode transit controlvlan](#)
[show epsr](#)

epsr priority

This command sets the priority of an EPSR instance on an EPSR node. Priority is used to prevent superloops forming under fault conditions with particular ring configurations. Setting a node to a value greater than one, also has the effect of turning on **superloop protection**.

The **no** variant of this command returns the priority of the EPSR instance back to its default value of 0, which also disables EPSR Superloop prevention.

Syntax `epsr <epsr-name> priority <0-127>`
`no <epsr-name> priority`

Parameter	Description
<code><epsr-name></code>	Name of the EPSR instance.
<code>priority</code>	The priority of the ring instance selected by the <code>epsr-name</code> parameter.
<code><0-127></code>	The priority to be applied (0 is the lowest priority and represents no superloop protection).

Default The default priority of an EPSR instance on an EPSR node is 0. The negated form of this command resets the priority of an EPSR instance on an EPSR node to the default value.

Mode EPSR Configuration

Example To set the priority of the EPSR instance called `blue` to the highest priority (127), use the command:

```
awplus(config-epsr)# epsr blue priority 127
```

To reset the priority of the EPSR instance called `blue` to the default (0), use the command:

```
awplus(config-epsr)# no epsr blue priority
```

Related Commands [epsr configuration](#)

epsr state

This command enables or disables an EPSR instance.

Syntax `epsr <epsr-name> state {enabled|disabled}`

Parameter	Description
<code><epsr-name></code>	The name of the EPSR instance.
<code>state</code>	The operational state of the ring.
<code>enabled</code>	EPSR instance is enabled.
<code>disabled</code>	EPSR instance is disabled.

Mode EPSR Configuration

Example To enable the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue state enabled
```

Related Commands [epsr mode master controlvlan primaryport](#)
[epsr mode transit controlvlan](#)

epsr trap

This command enables SNMP traps for an EPSR instance. The traps will be sent when the EPSR instance changes state.

The **no** variant of this command disables SNMP traps for an EPSR instance. The traps will no longer be sent when the EPSR instance changes state.

Syntax

```
epsr <epsr-name> trap
no epsr <epsr-name> trap
```

Parameter	Description
<epsr-name>	Name of the EPSR instance.
trap	SNMP trap for the EPSR instance.

Mode EPSR Configuration

Example To enable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue trap
```

To disable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue trap
```

Table 85-1: Parameters displayed in the output of the show epsr command

Parameter on Master Node	Parameter on Transit Node	Description
Name	Name	The name of the EPSR instance.
Mode	Mode	The mode in which the EPSR instance is configured - either Master or Transit
Status	Status	Indicates whether the EPSR instance is enabled or disabled
State	State	Indicates state of the EPSR instance's state machine. Master states are: Idle, Complete, and Failed. Transit states are Links-Up, Links-Down, and Pre-Forwarding.
Control Vlan	Control Vlan	Displays the VID of the EPSR instance's control VLAN.
Data VLAN(s)	Data VLAN(s)	The VID(s) of the instance's data VLANs.
Interface Mode	Interface Mode	Whether the EPSR instance's ring ports are both physical ports (Ports Only) or are both static aggregators (Channel Groups Only).
Primary Port	First Port	The EPSR instance's primary ring port.
- Status	- Status	Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port because it does not have physical control of it.
	- Direction	The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"

Table 85-1: Parameters displayed in the output of the show epsr command

Parameter on Master	Parameter on Transit	Description(cont.)
- Is On Common Segment	- Is On Common Segment	Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment.
- Blocking Control	- Blocking Control	Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs.
Secondary Port	Second Port	The EPSR instance's secondary port.
- Status	- Status	Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port, because it does not have physical control of it. Note that on a master configured for SuperLoop Prevention (non-zero priority) its secondary ring port can be physically forwarding, but logically blocking. This situation arises when it is not the highest priority node in the topology (and so does not receive LINKS-DOWN messages upon common segment breaks) and a break on a common segment in its ring is preventing reception of its own health messages.
	- Direction	The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"
- Is On Common Segment	- Is On Common Segment	Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment
- Blocking Control	- Blocking Control	Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs
Hello Time		The EPSR instance's setting for the interval between transmissions of health check messages (in seconds)
Failover Time		The time (in seconds) the EPSR instance waits to receive a health check message before it decides the ring is down
Ring Flap Time		The minimum time the EPSR instance must remain in the failed state
Trap	Trap	Whether the EPSR instance has EPSR SNMP traps enabled
Enhanced Recovery	Enhanced Recovery	Whether the EPSR instance has enhanced recovery mode enabled
SLP Priority	SLP Priority	The EPSR instance's priority (for SuperLoop Prevention)

Introduction

The Allied Telesis Management Framework (AMF) is a suite of features that combine to simplify network management across all supported network switches from the core to the edge.

AMF also provides simplified switch recovery and firmware upgrade management. The primary function of AMF is to reduce the management and maintenance overhead on a network, while improving on responsiveness and handling of switch failures within the network.

This chapter provides a conceptual introduction to AMF together with its benefits, together with configuration guidelines showing how to use AMF in practical networks. For more information on the commands used in this chapter, see the chapter, **“AMF Commands” on page 87.1.**

AMF Supported Products and Software Versions.

The following list shows which Allied Telesis switches are capable of running AMF and indicates those capable of operating as Master Nodes

A feature licence is required for each AMF master node in the AMF network. AMF master node licences are available for the SBx8100 and SBx908 platforms. A licence is not required for AMF member nodes.

- SwitchBlade™ x8100 family (Master Node capability 40 user license - version 5.4.3)
- SwitchBlade™ x908 series switches (Master Node capability 40 user license - version 5.4.3)
- x900 series switches (Network node capability - version 5.4.3)
- x610 series switches (Network node capability - version 5.4.3)
- x510 series switches (Network node capability - version 5.4.3)
- IX5-28GPX switches (Network node capability - version 5.4.3-3.7)

key benefits of AMF

The key benefits of AMF include its unified command-line, simple configuration backup and recovery process, and time-saving rolling firmware upgrade.

Unified command-line

The conventional means of configuring and controlling AlliedWare Plus (AW+) switches is to use their text-based command-line interface (CLI). In existing networks, the CLI is available via a serial console port and also to remote login sessions such as SSH.

AMF, extends this facility by adding the capability to control either a network portion, or an entire network, of AW+ switches by using a single (unified) CLI session. Using the unified CLI, a network administrator can nominate all nodes or a subset of nodes within the AMF network to comprise an entity known as a “**working-set**”. Commands can then be executed concurrently across all switching nodes within the defined working-set as if they were a single unit. Any existing configuration or diagnostic actions can thus be applied to multiple devices using a single command sequence, thus reducing maintenance costs and configuration complexity, while still retaining complete flexibility in network design and control.

Currently AMF supports a network of up to 42 nodes. In addition multiple AMF networks can exist side by side across a single physical network. Note that AMF treats a Virtual Chassis Stack (VCStack) as a single node.

Configuration backup and recovery

An AMF network comprises up to two master nodes and 40 member nodes. The master nodes use external storage to automatically backup the complete configuration information for all their member nodes, including boot configuration, firmware, licenses, and user scripts.

If an AMF member node should fail, the AMF process will automatically recognize and reconfigure an unconfigured replacement (standby) unit, completely recreating the stored configuration of the failed unit into the replacement unit. The new unit will then reboot and resume service, without any need for user intervention beyond physical hardware replacement and cable connection. In this way AMF provides a complete zero-touch recovery solution.

Rolling firmware upgrade

Installing Firmware upgrades on a production network is typically an infrequent but sensitive and labour-intensive process. AMF is able to roll-out upgrades to a user-selected subset of nodes. All that needs to be entered is target group of nodes, and the location where the new firmware is stored; t AMF will then take care of the rest. Nodes are upgraded in a serial fashion, with each node tested before continuing the upgrade on the next node.

If an upgrade fails on a particular node, the upgrade process is automatically terminated and that node will revert to its previous firmware version. In this way firmware updates are almost completely hands-free, whilst also providing confidence that a bad update will not result in loss of service.

AMF Terminology

This section contains a glossary of terminology used to describe AMF networking.

Network name The AMF network name is used to determine the AMF network a node belongs to. All nodes within an AMF network must be configured with the same AMF name.

Node AMF members are commonly referred to as nodes. A node can be a single switch, or a VCStack.

Master nodes AMF master nodes are user defined and form the core domain of the AMF network. They are:

- responsible for performing file system backups of all nodes in the AMF network.
- required before an AMF network can form; at least one must be present.

AMF master nodes are supported on SBx908 and SBx8100 platforms; an AMF licence is required for each master. Only one AMF master license is required even if two CFCs - Controller Fabric Cards (SBx8100 only) are installed. The license is for the chassis, not the CFC.

Note  Although AMF regards a VCStack as a single AMF device; the VCStack must have consistent licensing on all stack members. Therefore, in a VCStack containing two switches; two AMF master licenses would be required for the stack to operate as an AMF master.

- Where more than one AMF master node exists in an AMF network, it is important to note that each master operates completely independently of the other, and that there is no synchronization between them.
- multiple master nodes can be used to provide master-node redundancy, with each master being able to operate as a master node for the network. But, there is no synchronization of status or data files between the masters. The behavior of a master node is not changed at all by the presence of other master nodes. However where a backup up config is to be loaded to a switch, and the config versions differ between AMF masters, the most recent version of the config will be selected for downloading.

Network name The AMF network name is used to identify the AMF network to which a node belongs. therefore all nodes within a single AMF network must be configured with the same AMF name.

Node AMF members are commonly referred to as nodes. A node can be either a single switch, or a VCStack.

Master nodes AMF master nodes are user defined by configuration. They then form the core domain of the AMF network. Aspects of master node functionality include:

- responsibility for performing file system backups of all nodes in the AMF network.
- an essential requirement for the formation of an AMF network. That is, at least one master node must be present for an AMF network to exist.

AMF master nodes are supported on SBx908 and SBx8100 platforms; an AMF licence is required for each master. Only one AMF master license is required even if two CFCs are installed. The license is for the chassis, not the CFC.

-
- Note**  A VCStack needs to have consistent licensing on all stack members. Therefore, an AMF master license would be required on both devices in an SBx908 stack.
- When more than one AMF master node exists in an AMF network, it is important to know that these operate completely independently of each other, and there is no synchronization between AMF master nodes.
 - For redundancy, you can have multiple master nodes, each acting as a master for the network. But, there is no synchronization of status or data files between the masters. The behavior of a master node is not changed at all by the presence of other master nodes.
-

AMF members are commonly referred to as nodes. A node can be either a single switch, or a VCStack.

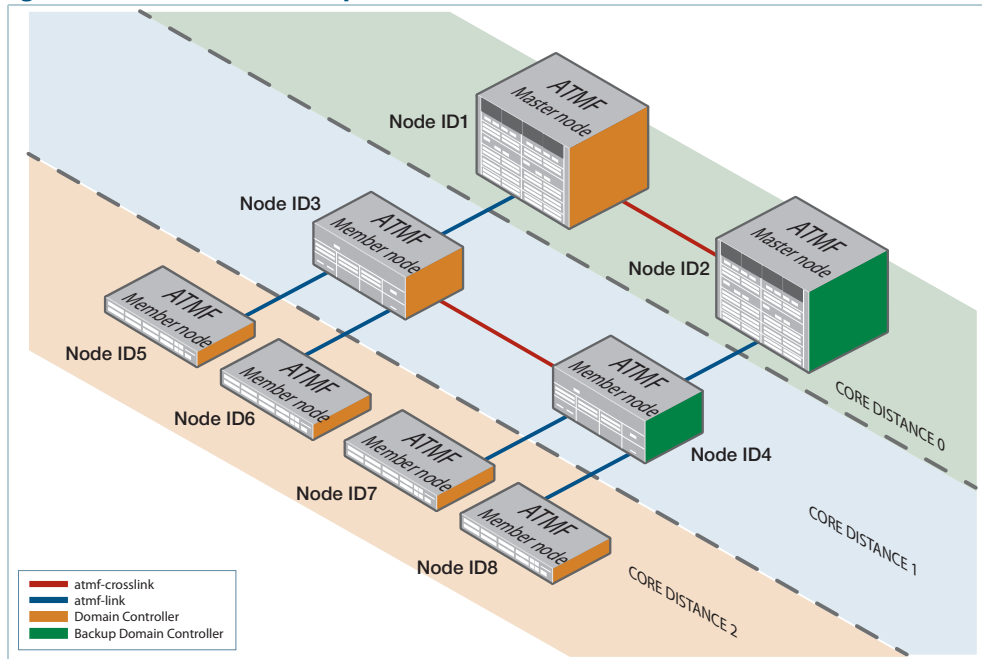

Domains Every AMF node belongs to an AMF domain, which may be comprised of multiple nodes or only a single node. AMF master nodes are included in the core domain, and all other domains are rooted in the core domain. AMF domains are determined by AMF crosslinks, (see **“Crosslinks” on page 86.6**). All nodes connected via AMF crosslinks are part of the same domain, and nodes connected via regular AMF links will be part of a higher or lower domain depending on whether they are closer to or further away from the core domain. Nodes within a domain must be connected in either a chain or ring topology

This means that a maximum of two crosslinks should be configured on any single node. The advantage of an AMF domain is that two links from a domain to a single higher level domain (closer to the core) will provide redundant AMF links. It is recommended that an AMF domain should only be connected to a single higher level domain, though it may be connected to multiple lower level domains.

-
- Note**  We recommend a maximum number of 12 nodes per domain for SBx8100, x908, x900, x610, and x510 switches.
-

Core distance This is the distance (hop count) between a particular domain and its Core domain. The Core domain has a Core distance of 0, and the maximum recommended Core distance in an AMF network is 8.

Figure 86-1: Core distance hop-counts between domains

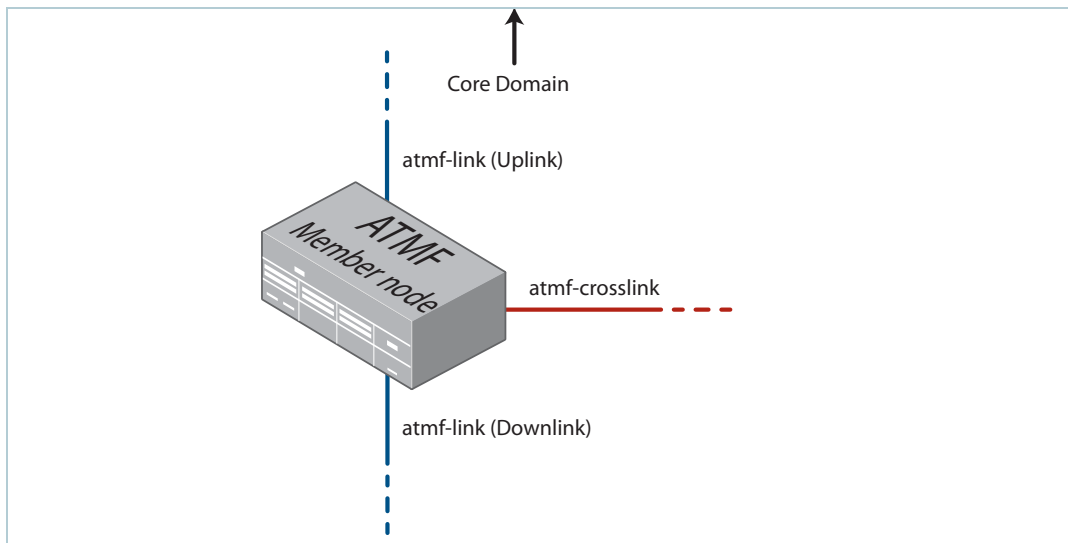

Links This is the distance (hop count) between a domain and the Core domain. The Core domain has a Core distance of 0, and the maximum recommended Core distance in an AMF network is 8.

AMF links are used to pass AMF management traffic between nodes, but can also be used to carry other network traffic. Configuring an interface as an atmf-link will automatically put the port into trunk mode. An AMF link must have at least one tagged VLAN, or have a native VLAN defined. An AMF link can be either a single link or a static aggregator. For more information on trunk mode see **“Configuring VLANs” on page 16.3**.

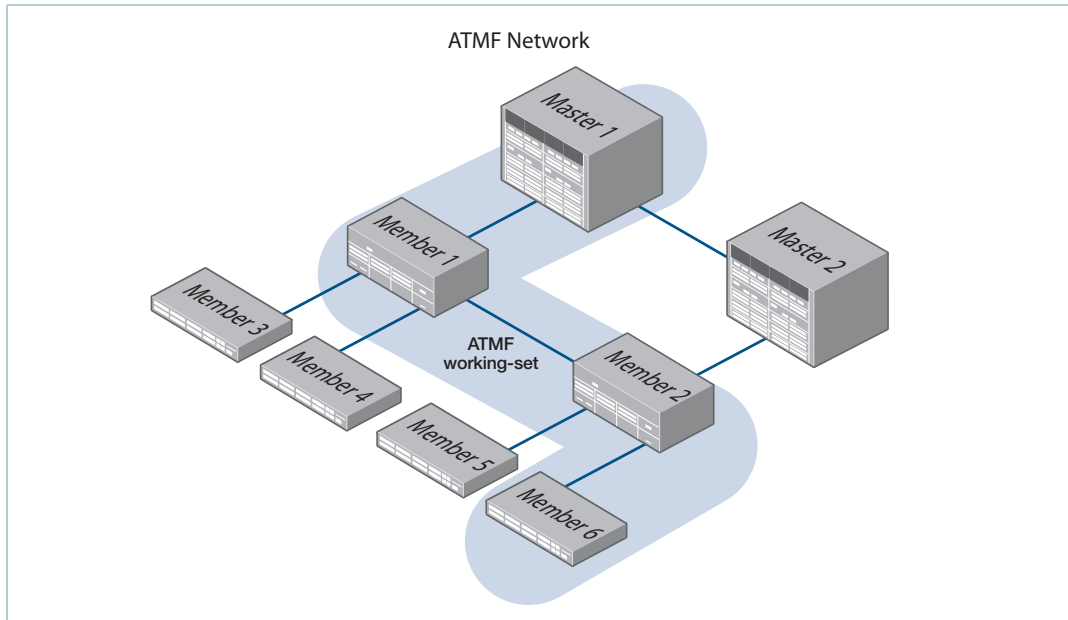

Crosslinks AMF crosslinks are used to connect AMF nodes to other AMF nodes within the same AMF domain. AMF master nodes must be connected using AMF crosslinks to ensure they are part of the core domain. Configuring an interface as an atmf-crosslink will automatically put the port into trunk mode. A crosslink can be either a single link or a static aggregator

Figure 86-2: AMF Uplinks, Downlinks, and Crosslinks

Working-set An AMF working-set is a set of nodes, which is either arbitrarily user defined, or one of the pre-defined working-set groups. Specifying or selecting a working-set allows CLI commands to be executed on all nodes within the selected working-set with a single command. A working-set can be defined, selected and configured from any node within an AMF network.

Figure 86-3: AMF Working-set

AMF network guidelines

Retention and use of the 'manager' username

The default **username** for an Alliedware Plus login is **manager**, with a documented default **password**. Users should change this password on all their nodes to provide login security. In order to centrally manage nodes undergoing automated node recovery, or to expand the network by adding a new unconfigured node, it will be necessary to login with the default manager username.

It is possible to add new usernames and passwords to nodes, but to retain the ability to centrally manage the network, usernames should be uniformly configured across all AMF nodes within the AMF network.

Loop-free data plane

The current version of AMF does not control the data plane, so it is a requirement that the network is configured such that the data plane (i.e. the paths defined by the data VLANs) is kept loop free.

 **Note** Currently AMF does not support the use of STP on links between AMF nodes. Use of STP with redundant network links has the potential to block AMF control connections, and also could lead to periods of traffic leakage during the start of automatic node recovery. Hence, if there are physical loops in any of the data VLANs in the network, then EPSR must be used as the protection mechanism for those loops.

Aggregators

Dynamic Aggregators (LACP) cannot be used on ports configured as AMF links or cross-links. Therefore any aggregated links in an AMF network need to be configured as static aggregators.

VCStacks

If any VCStacks are included as AMF nodes it is a requirement that the VCS virtual MAC feature is enabled to ensure correct operation of the AMF network. If the VCStack is running as an AMF master node it is also a requirement that removable external storage media is installed in both stack members.

AMF external removable media

All AMF master nodes require external storage media (e.g. USB memory stick, SD card) to be installed. This external storage is used to hold a backup of all relevant files from all nodes within the AMF network, including other master nodes, so it must be large enough to be able to accommodate all of the backed up files. Files that are backed up include all configuration files, release files, and scripts, but not core dumps, exception logs, or technical support files.

Typically a 4GB capacity external media device would be of sufficient size to hold backups for a 40 node AMF network.

When using Dual CFCs (Controller Fabric Card) in a SBx8100, a memory stick is required in both CFCs.

AMF interaction with QoS and ACLs

It's important that ACL and QoS rules do not block any traffic on VLANs 4091 and 4092 because they are the default AMF control VLANs. Similarly, ACL and QoS rules should not block any Layer 3 traffic on 172.31.0.* or 172.31.128.* as these are the default AMF management traffic subnets. Packets with protocol type 0xfbbae and BPDU packets that use the MAC address: 0180.c200.002e should also not be blocked.

Note The AMF control VLANs and AMF management subnets can be manually changed

With AMF enabled, the number of ACLs on the x510 switch decreases from 249 to 248. If this is an issue, then you can disable AMF, which will allow the previous maximum of 249.

Enabling AMF on the x610 switch provides 2048 ACLs.

NTP and AMF

AMF uses NTP to synchronize the system clocks across nodes within the network. For this to operate there must either be one or more external NTP servers configured on the network, or one single AMF node must be configured as the NTP 'master' using the **ntp master** command on page 89.6.

Note It is invalid to have an NTP master configured on an AMF node anywhere in the network if any external NTP servers exist, because this will prevent clock synchronization.

If there is no external server, and instead the network has a node configured with the command: **ntp master**, the following commands will work as expected:

```
awplus(config)# atmf working set group all
awplus(config)# clock set 16:51:00 24 Aug 2012
```

The **clock set** command may also be used prior to configuring an external NTP server to get the network roughly up to the correct time, so that NTP will synchronize faster.

The primary function of NTP within an AMF network is to ensure that time and date stamps on backups are consistent across member nodes within the backup. This is particularly important in an AMF network that has multiple AMF master nodes, to ensure that node recovery is performed with the most up to date backup.

Configuring AMF

The following configuration example uses a simplified network to explain the steps required to configure AMF.

Simple AMF example with a single master

Table 86-1: Configure the AMF Master node

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	(awplus#)	configure terminal
Set the host name	awplus(config)#	hostname AMF_Master
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name.	AMF_Master(config)#	atmf network-name atmf1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the switch to be the AMF master.		
	AMF_Master(config)#	atmf master
An AMF network must have at least one master configured. A licence is required for each AMF master in the AMF network. If an AT-x8100 with dual CFCs is configured as an AMF master a licence is only required on the CFC master, as the licence will be synchronized across CFCs. If an AT-x908 VCStack is configured as an AMF master, a licence is required to be installed on both stack members.		
Step 4. Configure the data VLANs.		
	AMF_Master(config)#	vlan database
	AMF_Master(config-vlan)#	vlan 2-3
Step 5. Disable RSTP globally (this is enabled by default).		
	AMF_Master(config)#	no spanning-tree rstp enable
Step 6. Configure ports as AMF-links.		
	AMF_Master(config)#	interface port1.1.1-1.1.2
	AMF_Master(config-if)#	switchport atmf-link
Step 7. Configure data VLANs on AMF-links as required.		
	AMF_Master(config-if)#	switchport trunk allowed vlan add 2-3
Step 8. Save the configuration and reboot the switch.		
	AMF_Master#	copy running-config startup-config
Building configuration...[OK]		
	AMF_Master#	reload
Are you sure you want to reboot the whole chassis? (y/n): y		

Table 86-2: Configure the first member node (Member1)

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	(awplus#)	configure terminal
Set the host name	awplus(config)#	hostname Member1
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name to atmf1.	Member1(config)#	atmf network-name atmf1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the data VLANs		
Enter the VLAN Configuration mode	Member1(config)#	vlan database
Create VLANs 2 and 3	Member1(config-vlan)#	vlan 2-3
Step 4. Disable RSTP globally (this is enabled by default).		
	Member1(config)#	no spanning-tree rstp enable
Step 5. Configure ports as AMF-links.		
Enter Interface Configuration mode for ports 1.1.1 to 1.1.3	Member1(config)#	interface port1.1.1-1.1.3
Configure these ports as AMF links	Member1(config-if)#	switchport atmf-link
Step 6. Configure data VLANs on the AMF-links as required.		
Set VLANs 2 to 3 to be data VLANs	Member1(config-if)#	switchport trunk allowed vlan add 2-3
Step 7. Configure AMF-crosslink		
Enter the Interface Configuration mode for port 1.1.2	Member1(config)#	interface port1.1.2
Set this port to be an ATMF crosslink	Member1(config-if)#	switchport atmf-crosslink
	Member1(config-if)#	switchport trunk native vlan none
Note that AMF links and crosslinks do not need to be configured with data VLANs and can be used solely to provide AMF management VLAN redundancy.		
Step 8. Save the configuration and reboot the switch.		
	Member1#	copy running-config startup-config
Building configuration...[OK]		

Table 86-2: Configure the first member node (Member1)(cont.)

Description	Prompt	Command
	Member1#	reload
Are you sure you want to reboot the whole chassis? (y/n):		y

Table 86-3: Configure the first member node (Member2)

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	awplus#)	configure terminal
Set the host name	awplus(config)#	hostname Member2
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name to atmf1.	Member2(config)#	atmf network-name atmf1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the data VLANs		
Enter the VLAN Configuration mode	Member2(config)#	vlan database
Create VLANs 2 and 3	Member2(config-vlan)#	vlan 2-3
Step 4. Disable RSTP globally (this is enabled by default).		
	Member2(config)#	no spanning-tree rstp enable
Step 5. Configure ports as AMF-links.		
Enter Interface Configuration mode for ports 1.1.1 to 1.1.3	Member2(config)#	interface port1.1.1-1.1.3
Configure these ports as AMF links	Member2(config-if)#	switchport atmf-link
Step 6. Configure data VLANs on the AMF-links as required.		
Set VLANs 2 to 3 to be data VLANs	Member2(config-if)#	switchport trunk allowed vlan add 2-3
Step 7. Configure AMF-crosslink		
Enter the Interface Configuration mode for port 1.1.2	Member2(config)#	interface port1.1.2
Set this port to be an ATMF crosslink	Member2(config-if)#	switchport atmf-crosslink
	Member2(config-if)#	switchport trunk native vlan none
Note that AMF links and crosslinks do not need to be configured with data VLANs and can be used solely to provide AMF management VLAN redundancy.		
Step 8. Save the configuration and reboot the switch.		
	Member2#	copy running-config startup-config

Table 86-3: Configure the first member node (Member2)(cont.)

Description	Prompt	Command
Building configuration...[OK]	Member2#	reload
Are you sure you want to reboot the whole chassis? (y/n):		y

Table 86-4: Configure the first member node (Member3)

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	(awplus#)	configure terminal
Set the host name	awplus(config)#	hostname Member3
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name to atm1.	Member3(config)#	atmf network-name atm1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the data VLANs		
Enter the VLAN Configuration mode	Member3(config)#	vlan database
Create VLANs 2 and 3	Member3(config-vlan)#	vlan 2-3
Step 4. Disable RSTP globally (this is enabled by default).		
	Member3(config)#	no spanning-tree rstp enable
Step 5. Configure ports as AMF-links.		
Enter Interface Configuration mode for ports 1.0.1 to 1.0.3	Member3(config)#	interface port1.0.1-1.0.3
Configure these ports as AMF links	Member3(config-if)#	switchport atmf-link
Step 6. Configure data VLANs on the AMF-links as required.		
Set VLANs 2 to 3 to be data VLANs	Member3(config-if)#	switchport trunk allowed vlan add 2-3
Step 7. Configure AMF-crosslink		
Enter the Interface Configuration mode for port 1.0.2	Member3(config)#	interface port1.0.2
Set this port to be an ATMF crosslink	Member3(config-if)#	switchport atmf-crosslink
	Member3(config-if)#	switchport trunk native vlan none
Note that AMF links and crosslinks do not need to be configured with data VLANs and can be used solely to provide AMF management VLAN redundancy.		
Step 8. Save the configuration and reboot the switch.		
	Member3#	copy running-config startup-config

Table 86-4: Configure the first member node (Member3)(cont.)

Description	Prompt	Command
Building configuration...[OK]	Member3#	reload
Are you sure you want to reboot the whole chassis? (y/n):		y

Table 86-5: Configure the first member node (Member4)

Description	Prompt	Command
Step 1. Set the host name.		
Enter Global Configuration mode	(awplus#)	configure terminal
Set the host name	awplus(config)#	hostname Member4
Note that host names are used as the AMF node name and must be unique within the AMF network.		
Step 2. Set the AMF network name.		
Set the AMF network name to atmf1.	Member4(config)#	atmf network-name atmf1
Note that the AMF network name must be the same on all nodes within the AMF network, and the device must be rebooted before the AMF network name takes effect.		
Step 3. Configure the data VLANs		
Enter the VLAN Configuration mode	Member4(config)#	vlan database
Create VLANs 2 and 3	Member4(config-vlan)#	vlan 2-3
Step 4. Disable RSTP globally (this is enabled by default).		
	Member4(config)#	no spanning-tree rstp enable
Step 5. Configure ports as AMF-links.		
Enter Interface Configuration mode for ports 1.0.1 to 1.0.3	Member4(config)#	interface port1.0.1-1.0.3
Configure these ports as AMF links	Member4(config-if)#	switchport atmf-link
Step 6. Configure data VLANs on the AMF-links as required.		
Set VLANs 2 to 3 to be data VLANs	Member4(config-if)#	switchport trunk allowed vlan add 2-3
Step 7. Configure AMF-crosslink		
Enter the Interface Configuration mode for port 1.0.2	Member4(config)#	interface port1.0.2
Set this port to be an ATMF crosslink	Member4(config-if)#	switchport atmf-crosslink
	Member4(config-if)#	switchport trunk native vlan none
Note that AMF links and crosslinks do not need to be configured with data VLANs and can be used solely to provide AMF management VLAN redundancy.		

Table 86-5: Configure the first member node (Member4)(cont.)

Description	Prompt	Command
Step 8. Save the configuration and reboot the switch.		
	Member4#	copy running-config startup-config
Building configuration...[OK]	Member4#	reload
Are you sure you want to reboot the whole chassis? (y/n):		y

Verifying the AMF network

To check that all nodes have joined the AMF network use the [show atmf command on page 87.30](#) with the summary parameter. You can run this command from any node in the AMF network:

```
AMF_Master#show atmf summary
ATMF Summary Information:
ATMF Status       : Enabled
Network Name      : atmf1
Node Name         : AMF_Master
Role              : Master
Current ATMF Nodes : 5
AMF_Master#
```

The **Current ATMF Nodes** field in the output above shows that all 5 nodes have joined the AMF network.

Use the [show atmf command on page 87.30](#) with the nodes parameter, to check information on individual nodes:

```
AMF_Master#show atmf nodes
Node Information:
 * = Local device
SC = Switch Configuration:
  C = Chassis   S = Stackable  N = Standalone
Node          Device          ATMF          Node
Name          Type            Master        SC   Parent      Depth
-----
* AMF_Master   AT-SBx81CFC400    Y             C    none        0
Member1       SwitchBlade x908         N     S    AMF_Master  1
Member2       SwitchBlade x908         N     S    AMF_Master  1
Member4       x510-52GTX       N     S    Member2     2
Member3       x510-52GTX       N     S    Member2     2
Current ATMF node count 5
```

Note The *Parent* field refers to the parent *domain* and not the upstream device. In the example output above, Member2 is the domain controller for the parent domain for Member3 and Member4.

Using the AMF network

AMF backups

AMF backups are an essential part of AMF network operation. They are the mechanism by which AMF master nodes update their records of the AMF network. By default, AMF master nodes are configured to perform automatic scheduled backups of the entire AMF network once per day at 3.00am. AMF backups are stored on external removable media such as USB Flash sticks, or SD cards). It is therefore a requirement that all AMF masters have external removable media installed with sufficient capacity to hold all of the relevant files stored in the Flash by every node in the AMF network.

Typically a 4GB capacity external media storage would be of sufficient size to hold backups for a 40 node AMF network.

The AMF node backup system has been designed such that the external media used to store the backup data can still be used to store other data, however care needs to be taken to ensure that enough space is reserved for future AMF backups.

- AMF requires up to 128MB backup space for SBx8100 nodes and up to 64MB backup space for other nodes. The output from the [show atmf backup command on page 87.35](#) will provide warnings if capacity on the backup media falls below a safe level

Here is some example outputs of the show atmf [show atmf backup](#) command showing a backup media space warning:

```
master1#show atmf backup
Scheduled Backup ..... Disabled
  Schedule ..... 1 per day starting at 12:45
  Next Backup Time .... 25 May 2012 12:45
Backup Media ..... SD (Total 3827.0MB, Free 7.1MB)
                          WARNING: Space on backup media is below 64MB
Current Action ..... Idle
  Started ..... -
  Current Node ..... -
```

Safe removal of external storage media

Removing external storage media, or rebooting the master node, while an AMF backup is underway could potentially cause corruption to files in the backup. Although files damaged as a result of mishandling backup media will be replaced during the next backup cycle, if the file system on the media becomes damaged it may require reformatting before being inserted into the AMF master. To avoid any damage to the AMF backup files or file system it is recommended that the following procedure is followed before rebooting or removing any external storage media from an AMF master.

1. Disable backups to prevent a scheduled backup from occurring while the card is being removed.
2. Terminate any backup already in process.
3. Verify that it is safe to remove the media by checking for a Disabled scheduler and Idle backup.

Here is an example output showing the safe external storage media removal procedure:

```
master1#conf t
master1(config)#no atmf backup enable
master1(config)#exit
master1#atmf backup stop
master1#show atmf backup

Scheduled Backup ..... Disabled
  Schedule ..... 1 per day starting at 12:45
  Next Backup Time .... 25 May 2012 12:45
Backup Media ..... SD (Total 3827.0MB, Free 3257.1MB)
Current Action ..... Idle
  Started ..... -
  Current Node ..... -
```

Once the media has been reinstalled, ensure that the backup scheduler is re-enabled.

Performing a manual backup

Whenever a new device is added to the AMF network or when the configuration has changed on a member node, it is always advisable to perform a manual backup from the AMF master in order to ensure the removable media installed on the master node has an up to date backup of all nodes within the AMF.

To perform a manual backup of the entire AMF network, on the AMF master enter the command **atmf backup now** command on page 87.5:

```
Master1# atmf backup now

Master1(config)# atmf backup enable

Master1(config)# exit
```

To perform an immediate manual backup of the entire AMF network, on AMF Master1, enter the command **atmf backup now**:

To check the status of the AMF backup use the **show atmf backup** command on page 87.35.

Here is an example output from the **show atmf backup** entered during a backup:

```
AMF_Master#show atmf backup
Scheduled Backup ..... Enabled
Schedule ..... 1 per day starting at 03:00
Next Backup Time .... 14 Dec 2012 03:00
Backup Media ..... USB (Total 3692.6MB, Free 1782.7MB)
Current Action ..... Doing manual backup
Started ..... 13 Dec 2012 05:20
Current Node ..... Member1
```

Node Name	Date	Time	In ATMF	On Media	Status
AMF_Master	13 Dec 2012	05:20:16	Yes	Yes	Good
Member1	-	-	Yes	Yes	-
Member2	-	-	Yes	No	-
Member3	-	-	Yes	No	-
Member4	-	-	Yes	No	-

Here is an example output from the **show atmf backup** entered after the backup has completed:

```
AMF_Master#show atmf backup
Scheduled Backup ..... Enabled
Schedule ..... 1 per day starting at 03:00
Next Backup Time .... 13 Dec 2012 03:00
Backup Media ..... USB (Total 3692.6MB, Free 1651.1MB)
Current Action ..... Idle
Started ..... -
Current Node ..... -
```

Node Name	Date	Time	In ATMF	On Media	Status
ATMF_Master	13 Dec 2012	05:20:16	Yes	Yes	Good
Member1	13 Dec 2012	05:20:27	Yes	Yes	Good
Member2	13 Dec 2012	05:20:40	Yes	Yes	Good
Member3	13 Dec 2012	05:20:52	Yes	Yes	Good
Member4	13 Dec 2012	05:21:08	Yes	Yes	Good

 **Note** The file system used by the AMF backup does not support the backing up of files that have the same name but have different case (e.g. "test.txt" and "TEST.txt"), and only one of these files will be stored in the backup. For this reason it is recommended that all files on a node have unique file names.

Backups on VCStacks running as AMF masters

When a VCStack or SBx8100 with dual CFCs is running as an AMF master node, it is important to note that an AMF backup will only occur on the external removable media installed in the VCS master (or Active CFC). This means that following a failover event, the new VCS master will not have an AMF backup stored on its external storage media, and will not be able to provide configuration backup and recovery when required.

To avoid this situation, the recommended solution is to use trigger scripts to automatically perform a manual backup of the AMF network following a failover event.

Example manual backup activation script called **triggered-atmfbackup.scp**:

To perform a manual backup of the entire AMF network, on the AMF master enter the **atmf backup now** command on page 87.5:

```
enable
wait 180
atmf backup now
```

Note There is a syntax difference between the configuration commands required to create the necessary trigger on the SBx8100 and SBx908.

Example This example shows a trigger script configuration for the SBx8100:

```
awplus# conf t
awplus(config)# trigger 1
awplus(config)# type chassis active-CFC-fail
awplus(config)# script 1 triggered-atmfbackup.scp
```

This example shows a trigger script configuration for the SBx908:

```
awplus# conf t
awplus(config)# trigger 1
awplus(config)# type chassis active-CFC-fail
awplus(config)# script 1 triggered-atmfbackup.scp
```

If there are multiple AMF master nodes in the network, you may also want to use a trigger script or perform a manual backup of all master nodes whenever there is a failover event to ensure that all backups are up to date. Create an **atmf working-set** group which contains all master nodes, and then use the **atmf atmf working-set** command in the trigger script to execute the manual backup on all nodes within the working set group.

To create a working-set containing all AMF master nodes, first manually select all AMF masters using the **atmf atmf working-set** command:

```
Master# atmf working-set Master1,Master2
awplus(config)# trigger 1
Master1,Master2 Working set join
atmf1[2]#
```

Next, create a user defined working-set group containing the nodes in the current working-set using the **atmf group (membership)** command:

```
atmf1[2]# conf t
atmf1[2](config)# atmf group AMF_masters
```

Here is an example manual backup activation script called `atmfbackup_all_masters.scp`:

```
enable
wait 180
atmf working-set group AMF_masters
atmf backup now
```

Node recovery

Automatic node recovery

AMF has been designed so that when a node fails it can be replaced with an unconfigured device of the same type, and AMF will automatically upgrade and configure the new device from the most recent backup. Often the replacement device will be a factory default, brand new “out of the box” device, but it may be that you want to replace the failed unit with one that has been previously used elsewhere. In this instance it is necessary to return the replacement device to a “clean” state so that AMF can recognize it as a suitable replacement, and begin automatic recovery. (See section “A “Clean” node” on page 28)

When a failed node is replaced with an unconfigured device, AMF immediately disables forwarding on the device, shuts down all non-AMF ports, and applies the AMF safe configuration. (See section “AMF safe configuration” on page 31.) AMF then checks whether any of the AMF master nodes has a valid backup for the replacement node, and if it finds one it begins to attempt automatic node recovery. Once automatic node recovery has completed, it will then reboot the replacement node which will then rejoin the AMF network with identical files and configuration, to the failed node it replaced.

Here is some example console output showing automatic node recovery.

Caution No changes should be made to the device's configuration while a node recovery is underway. A log message will appear on the console or other logged in session indicating when recovery has finished (whether successfully or with errors). This message can also be found by viewing the log with the [show log](#).

```
23:03:15 awplus ATMF[863]: ATMF network detected
23:03:15 awplus ATMF[863]: ATMF safe config applied (forwarding disabled)
23:03:25 awplus ATMF[863]: Shutting down all non ATMF ports
23:03:26 x510_1 ATMF[863]: Automatic node recovery started
23:03:26 x510_1 ATMF[863]: Attempting to recover as x510_1
23:03:26 x510_1 ATMF[863]: Checking master node availability
23:03:32 x510_1 ATMF[863]: Master has joined. 2 members in total.
23:03:32 x510_1 ATMF[863]: x908_VCS_2 has joined. 3 members in total.
23:03:32 x510_1 ATMF[863]: x908_VCS_1 has joined. 4 members in total.
23:03:37 x510_1 ATMF[2950]: Retrieving recovery data from master node Master
23:05:18 x510_1 ATMF[2950]: File recovery from master node succeeded. Node will
now reboot
Flushing file system buffers...
Unmounting any remaining filesystems...
Restarting system.
```

A “Clean” node

The recommended procedure for returning a device to a “clean” state is to remove any pre-existing boot configuration, including any backup boot configuration, and delete all configuration files from Flash. If the device you are cleaning has previously had VCStack enabled, it is also necessary to delete the stacking configuration file.

Example

```

atmf1[2]# configure terminal
atmf1[2](config)# no boot config-file
                  no boot config-file backup
                  exit
                  delete force *.cfg
                  delete force .configs/stk.conf

```

Any user created folders in Flash will have to be removed. Firstly, identify if any user created folders exist.

```

cd flash:
dir
...
0 drwx Aug 20 2012 15:01:44 example_dir/
...

```

A folder is identified as having permissions **drwx**. Once you have identified them, any user created folder and its contents should be removed.

```
rmdir force example_dir
```

In addition, any external media installed in the device should be physically removed. If you are unable to remove the external media from the device then make sure any autoboot.txt files are removed from the external media. This may be achieved with one of the following command examples:

```

delete force card:autoboot.txt
delete force usb:autoboot.txt

```

Note The procedure above contains the minimum requirements to return a device to a clean state in order for AMF automatic node recovery to work. However, it should be noted that any other user files that remain in Flash will be overwritten during the automatic recovery process. If there are any files stored in the Flash of the replacement device that need to be retained, these files should be backed up prior to installing the device into the AMF network.

Manual node recovery

There are certain situations where, for a number of different reasons, automatic recovery may fail. Automatic recovery has been deliberately designed to be cautious in its approach to recovering a node and for reasons such as:

- The backup stored on the AMF masters not having a “Good” status
- The replacement device is of a different type to the node being replaced

When these situations occur, automatic node recovery may fail.

If automatic node recovery fails, the replacement device will have AMF safe configuration mode applied, (see section [“AMF safe configuration” on page 31](#)). If automatic node recovery fails, you may wish to proceed with manual node recovery, which can be initiated by entering the following command:

```
atmf recover {<node_name>} {<master_node_name>}
```

Where:

- **node_name** is the host name of the device you wish to recover.
- **master_node_name** is the host name of the AMF master that contains the backup you want to use for the recovery.

Here is an example showing manual recovery:

```
awplus#atmf recover x510_1 Master
This command will erase ALL flash contents. Continue node recovery? (y/n)y
Manual node recovery successfully initiated
x510_1#23:15:32 x510_1 ATMFFSR[8477]: Retrieving recovery data from master node
Master
23:17:17 x510_1 ATMFFSR[8477]: Manual node recovery completed
x510_1#
```

 **Note** The manual recovery command will bypass the usual checks performed by automatic node recovery, it is important to be confident that the backup configuration stored on the specified AMF master is correct prior to executing the command.

If the replacement device is of a different type to the one stored in the backup on the specified AMF master node, the incompatible release file from the backup will not be copied to the replacement device. Instead, the existing release on the replacement device will be used, in order to ensure the device is able to join the AMF network and function correctly.

Node recovery on VCStacks

Node recovery on VCStacks that are part of an AMF network is somewhat different to node recovery of standalone devices. This is because VCStack has its own node recovery mechanism which has different requirements to AMF.

Typically a failure on a VCStack will only affect one stack member.

- The replacement device is running a compatible firmware version
- The Stack ID on the replacement device is set to the same ID as the device being replaced
- The replacement device is installed with the same licences as other stack members

Then, VCStack will synchronize the configuration and firmware.

In the extremely unlikely situation of needing to replace an entire VCStack that is a member of an AMF network, you can use AMF automatic node recovery to first recover stack ID 1, which will become the VCstack master.

 **Note** The replacement device which will become the VCStack master must be a clean unit, (see the section [“A “Clean” node” on page 28](#)).

The procedure for recovering an entire stack is as follows:

1. Connect a **clean** device to the AMF network, and power it on. The connections into the AMF network should be between the appropriately configured AMF links on the neighboring node, and the ports previously configured as AMF links in the backup for the failed node configuration.
2. The AMF network should detect the replacement device and begin automatic node recovery. Wait until automatic node recovery completes and check that the replacement device has come up correctly as VCStack ID 1, and that the configuration is correct.
3. Configure the next replacement device as VCStack ID 2. Ensure it is installed with a compatible release and the same set of licences that exist on ID 1. Connect the VCStack cables and power it on.
4. VCStack ID 1 should detect ID 2 and synchronize the configuration and firmware release. Once this has completed, check that the VCStack has formed correctly, and then connect the remaining network connections.

For any additional VCStack members, repeat the last two steps, ensuring that the VCStack ID is set to the next sequential value for each additional device that is added to the VCStack.

AMF safe configuration

If, for any reason, AMF automatic node recovery fails, AMF contains a safety net feature which puts the replacement node into a safe configuration state. This is to prevent an unconfigured device from joining the network and creating loops.

How can I tell if my device has had AMF safe configuration applied?

A log message will be generated when AMF safe configuration is applied. This message will appear in the log some time after the startup sequence.

The message will also be output to the console or any connected VTY session.

What does safe config do?

The components of the AMF safe configuration are:

- A special VLAN is created in the disabled state and given the name `atmf_node_recovery_safe_vlan`. The index of this VLAN is determined dynamically to ensure it does not conflict with AMF management VLANs which are detected through the AMF network.
- All ports are removed from their default VLAN membership (VLAN 1).
- All ports are set as tagged members of the safe VLAN.
- Additionally, all ports that are not an AMF link or cross-link are shutdown. The links and crosslinks are detected by AMF and added to the dynamic configuration. This is done to ensure correct behavior of static aggregators and Layer 3 protocols configured on the neighboring devices.

See below for example output of the `show vlan` command with the `brief` parameter set for a device in AMF safe configuration mode:

```
awplus#sh vlan brief

VLAN ID  Name                Type    State  Member ports  (u)-Untagged, (t)-Tagged
=====  =====
1        default             STATIC  ACTIVE
4090     atmf_node_recovery_safe_vlan
                STATIC  SUSPEND  port1.0.1(t)  port1.0.2(t)  port1.0.3(t)
                port1.0.4(t)  port1.0.5(t)  port1.0.6(t)
                port1.0.7(t)  port1.0.8(t)  port1.0.9(t)
                port1.0.10(t) port1.0.11(t)
                port1.0.12(t) port1.0.13(t)
                port1.0.14(t) port1.0.15(t)
                port1.0.16(t) port1.0.17(t)
                port1.0.18(t) port1.0.19(t)
                port1.0.20(t) port1.0.21(t)
                port1.0.22(t) port1.0.23(t)
                port1.0.24(t)
```

See below for an example excerpt from the **show running-config** command on page 7.32 for a device in AMF safe configuration mode:

```
awplus#show running-config
...
!
vlan database
vlan 4090 name atmf_node_recovery_safe_vlan
vlan 4090 state disable
!
interface port1.0.1-1.0.4
shutdown
switchport
switchport mode trunk
switchport trunk allowed vlan add 4090
switchport trunk native vlan none
!
interface port1.0.5
switchport
switchport atmf-link
switchport mode trunk
switchport trunk allowed vlan add 4090
switchport trunk native vlan none
!
interface port1.0.6-1.0.24
shutdown
switchport
switchport mode trunk
switchport trunk allowed vlan add 4090
switchport trunk native vlan none
!
...
```

How can I undo a safe configuration?

If your node has had AMF safe configuration applied, you can use normal CLI configuration commands to modify the running-configuration to whatever configuration is required.

See below for an example of returning a device from AMF safe configuration to default VLAN and port settings. Note - In this example a 24-port device has been used.

```
awplus# conf t
atmf1[2](config)# interface port1.0.1-port1.0.24
atmf1[2](config-if)# switchport trunk native vlan 1
atmf1[2](config-if)# switchport trunk allowed vlan remove 4090
atmf1[2](config-if)# switchport mode access
% port1.0.5 has ATMF link configured so
mode cannot be changed
```

```
atmf1[2](config-if)# no shutdown
atmf1[2](config-if)# exit
atmf1[2](config-if)# vlan database
atmf1[2](config-if)# no vlan 4090
atmf1[2](config-if)# end
```

In order to retain connectivity to the AMF network, AMF link and crosslink settings should not be changed. In the example above you can see that port 1.0.5 is an automatically configured ATMF link. You can see the error message indicating it was skipped by the [switchport mode access command on page 17.17](#), because AMF links must be in trunk mode.

Caution

No changes should be made to the device's configuration while a node recovery is underway. A log message will appear on the console or other logged in session indicating when recovery has finished (whether successfully or with errors). This message can also be found by viewing the log with the [show log command on page 10.38](#).

Adding a preconfigured device to the network

In many cases when a new device is to be added to the network, a user will want to fully pre-configure it before connecting it to the network. This is for the obvious reason that it is generally not a good idea to have an unconfigured device connected to the network.

With AMF it is possible to perform this pre-configuration by cloning the configuration from the backup of an existing AMF node. The cloned configuration will be applied in a safe way to the similar node that you wish to join the AMF network. In this way a node can be added to the network without the need to construct the configuration elements that are common to another node.

There are two methods that can be used to achieve this:

1. By connecting an unconfigured clean node (see section [“A “Clean” node” on page 86.28](#)), to the AMF network. Wait for automatic node recovery to fail and the AMF safe configuration to be applied. Then use the **atmf recover** command, followed by the node name of a similar node, to replicate the desired configuration to the new unit.
2. By preconfiguring the new device with the AMF network name, a node name, and an AMF link prior to connecting it to the AMF network. Then use the **atmf recover** command followed by the node name of a similar node, to replicate the desired configuration to the new switch.

In both methods it is necessary to configure an AMF link on the neighboring node that is to be connected to the new node, so the new node will be able to join the AMF network.

Note

We recommend that you select the donor node to be as close as possible to the new node, and for it to contain the same number of ports or if applicable, has the same XEMs installed in the same bays. This will limit the number of manual changes that will be required to the replicated configuration of the new node.

If using the first method described above, it is safe to connect ports other than the AMF link. This is because forwarding will be disabled and all ports administratively shutdown when the AMF safe configuration is applied.

If using the second method described above, it is important to only connect the atmf-link until the configuration can be appropriately edited and the node rebooted. Following this procedure ensures that there is no possibility of creating loops by having an unconfigured node connected to the network.

The example below shows a clean node that has been connected to a port on a neighboring AMF node that configured as an atmf-link. AMF detects the new node and attempts automatic node recovery, but because the new node is not present in the backup stored on the AMF master, the automatic recovery fails and the AMF safe configuration is applied:

```
04:26:36 awplus ATMF[846]: ATMF network detected
04:26:36 awplus ATMF[846]: ATMF safe config applied (forwarding disabled)
04:26:46 awplus ATMF[846]: Shutting down all non ATMF ports
04:26:46 awplus ATMF[846]: host_0000_cd28_08cd has left. 0 member in total.
04:26:46 awplus ATMF[846]: host_0000_cd28_08cd has joined. 1 member in total.
04:26:46 awplus ATMF[846]: No identity found for this device so automatic node
recovery is not possible
04:26:53 awplus ATMF[846]: x510_1 has joined. 2 members in total.
04:26:53 awplus ATMF[846]: Master has joined. 3 members in total.
04:26:53 awplus ATMF[846]: x908_VCS_2 has joined. 4 members in total.
04:26:53 awplus ATMF[846]: x908_VCS_1 has joined. 5 members in total.
```

Once automatic recovery has failed you can now use the **atmf recover** command to replicate the configuration from the designated similar node:

```
awplus#atmf recover x510_2
This command will erase ALL flash contents. Continue node recovery? (y/n)y

Manual node recovery successfully initiated

awplus#04:38:24 awplus ATMFFSR[15686]: Retrieving recovery data from master node
Maste
r
04:40:11 awplus ATMFFSR[15686]: Manual node recovery completed
```

When the recovery has completed, the new node will be configured to boot from the cloned configuration, but the configuration will not be applied to the node until it is rebooted. This way the configuration can be appropriately modified using the AlliedWare Plus in built editor before the unit is rebooted and the configuration applied.

Using the unified CLI with working-sets

The unified CLI is a central component of AMF. It provides users with a configuration and display interface that can control the entire AMF network from a single point. Control of the nodes within an AMF network is provided through the **atmf working-set** command.

The working-set An AMF working-set is a set of nodes, which is either arbitrarily user defined or one of the pre-defined working-set groups. Specifying or selecting a working-set allows CLI commands to be executed on all nodes within the selected working-set with a single command. A working-set can be defined, selected and configured from any node within an AMF network.

By default, when you first log into a node that is part of an AMF network, you are implicitly placed into the working-set group local, a working-set which only contains the local node. In this instance the CLI prompt when you log in will look the same as on any other AlliedWare plus device.

```

Node1# atmf working-set Node1,Node2
Working set join
atmf1[2]#
  
```

Working-set AMF contains the ability to have working-set groups, so that it is not always necessary to use a comma separated list to specify a working-set.

AMF working-set groups can be split into two types:

- Automatic
- User-defined

Automatic working-set groups

There are three automatic working-set groups that will exist on every AMF network:

1. All—all nodes within the AMF network.
2. Current—the current working-set of nodes. This group is useful for adding additional nodes to the current working-set.
3. Local—the local device

In any AMF network there will also be a number of other automatic working-set groups that are dependent on the platform types which exist within the network. To see the platform dependent automatic working-set groups that exist on the AMF network use the command **show atmf group** with the automatic parameter:

```

x908_VCS_1#show atmf group members automatic

Retrieving Automatic groups from:
x510_1 Master x908_VCS_2 x908_VCS_1

ATMF Group membership

Automatic      Total
Groups         Members  Members
poe            1       Master
x510           1       x510_1
SBx8100        1       Master
x900           2       x908_VCS_2 x908_VCS_1
  
```

To select a working-set group use the **atmf working-set** command with the group parameter, followed by the group name. You can specify a single group, a comma separated list of groups, or even a comma separated list of individual nodes, followed by a comma separated list of groups:

```
atmf1[3]# atmf working-set group x511Node2
Working set join
% Warning - working set is now empty
atmf1[0]#
```

User-defined working-set groups

In addition to the automatic working-set groups, it is also possible to create user-defined groups for arbitrary sets of nodes that the user may wish to group together. For example, all AMF master nodes.

To create and use a user-defined working-set group:

1. Create a working-set containing the desired nodes.
2. In global configuration mode use the command: **atmf group (membership)**

```
Master# atmf working-set Master1,Master2
Working set join
% Warning - working set is now empty
atmf1[2]# conf t
atmf1[2]# atmf group Masters
```

You can see all user-defined working-set groups that exist on the AMF network with the command **show atmf group members**

```
x908_VCS_1#show atmf group members automatic

Retrieving Automatic groups from:
x510_1 Master x908_VCS_2 x908_VCS_1

ATMF Group membership

Automatic      Total
Groups         Members  Members
poe            1        Master
x510           1        x510_1
SBx8100        1        Master
x900           2        x908_VCS_2 x908_VCS_1
```

Executing commands on working-sets

Once you have selected the desired working-set of nodes on which you wish to execute commands, in general there is no difference to executing commands on a single AlliedWare Plus device. When a command is executed that is valid for all nodes within the working-set, the output is displayed for each of the nodes separately.

Here is an example output of the **show arp** command run from a working-set:

```

atmf1[4]#show arp
=====
Master:
=====

  IP Address      MAC Address      Interface      Port      Type
172.31.0.1       eccd.6d7d.a542  ATMF           sal       dynamic
172.31.0.3       0000.cd2b.0329  ATMF           sal       dynamic
172.31.0.10      0000.cd37.0163  ATMF           sal       dynamic

=====
x510_1:
=====

  IP Address      MAC Address      Interface      Port      Type

atmf1[4]#
    
```

Some commands are invalid for nodes in a working-set

There will be some commands, however, which will only be valid to execute on some of the nodes within the working-set. In this case the command will be executed on all nodes within the working-set. However, for any node for which the command is not valid, the command execution will fail and the output displayed will indicate the nodes on which the command succeeded and nodes on which the command failed.

The following is example output of the **show card** command run from a working-set, which is only a valid command for the SBx8100 series switches:

```

atmf1[4]# show card
=====
Master:
=====

Slot Card Type           State
-----

% Invalid input detected at '^' marker.

```

Sub-configuration limitations for some nodes in a working-set

There will also be some instances where a sub-configuration mode is only valid for some of the nodes in the working-set. One example of this case would be when entering interface configuration mode for a port that exists on some members of the working-set and not on others. For example:

```

atmf1[4]# conf t
atmf1[4](config)# int port2.1.1
% Can't find interface port2.1.1
atmf1[4:2](config-if)# conf t

```

In the example above the interface **port2.1.1** exists on two of the nodes in the working-set, but doesn't exist on nodes "Master" and "x510_1". The interface configuration mode fails for these nodes and a warning message is output to indicate this. The numbers within the square brackets next to the AMF network name prompt also change. The first number indicates the total number of nodes in the working set, and the second number indicates the number of nodes in the sub-configuration mode that has been entered. Any configuration commands configured in this mode will only be executed on the nodes that successfully entered the sub-configuration mode.

Entering **exit** while in this mode will return to global configuration mode for all nodes within the working-set:

```
atmf1[4:2](config-if)# exit
atmf1[4](config)# (config)#
```

Interactive commands

There is one other command type, known as **interactive** commands, for which it is not appropriate to execute the commands simultaneously across multiple nodes within a working-set. When any interactive commands are entered from within a working-set they will be executed on the local node only.

The list of current interactive commands, including any optional parameters are:

- ping
- mtrace/mstat
- traceroute
- boot system
- boot configuration-file
- banner login
- tcpdump
- edit
- copy
- mail
- delete
- move
- terminal monitor

Rolling-reboot firmware upgrade

The Rolling-reboot firmware upgrade feature allows nodes within an AMF network to be rebooted and upgraded in a rolling sequence in order to minimize downtime and reduce the management overhead. First specify a set of nodes within the AMF network using the **atmf working-set** command, then use the **atmf reboot-rolling** command so all nodes in the specified working-set will be rebooted and upgraded one by one starting with the nodes furthest from the core domain, and ending with nodes closest to or in the core domain.

Once the rebooted node has finished running its configuration and has brought its ports up it re-joins the AMF network and the next node in the working-set is rebooted and upgraded.

Note The **atmf rolling-reboot** command can also be used to reboot a set of nodes without upgrading the firmware.

To upgrade firmware, a download URL can be selected from any media location.

Supported media locations include:

- flash:
- card:
- usb:
- tftp:
- scp:
- http:

The latest compatible release for a node will be selected from this location. Several checks are performed to ensure the upgrade will succeed. This includes checking the current node release boots from Flash and that there is enough space in Flash on this node. The new release name is updated using the **boot system** command. The old release will become the backup release file.

Note If the release file is to be copied from a remote location (e.g. via TFTP, HTTP, etc.), then the URL should specify the exact release filename without using wild card characters.

The node is rebooted and the new software version will be used. On boot up, the software release is verified. Should an upgrade fail, the upgrading unit will fail back to old software. At the completion of this command, a report is run showing the release upgrade status of each node.

Supported units include SBx8100, SBx908, x900, x610, and x510.

The **force** parameter enforces a node reboot, even though the node may not be suitable for upgrading software. This command can take a significant amount of time to complete.

Note Rolling reboot firmware upgrades can be performed on a working-set which includes the controlling node, although in this instance the user will not be presented with a summary report upon completion.

Here is an example of a Rolling Reboot firmware upgrade summary report:

```
=====
ATMF Rolling Reboot Complete
Node Name      Reboot Status  Release Name      Release Status
-----
Node1         Rebooted      x510-main-20121018-2.rel  Upgraded
Node2         Rebooted      x900-main-20121018-2.rel  Upgraded
Node3         Rebooted      x900-main-20121018-2.rel  Upgraded
Node4         Rebooted      x900-main-20121018-2.rel  Upgraded
=====
```

Performing a rolling reboot upgrade

To perform a Rolling Reboot firmware upgrade on all nodes in the AMF network, first select all nodes using the default working-set group all:

```
SBSBx8100# atmf working-set group all

SBSBx8100, SBx908-VCS1, SBx908-VCS2, x510_1, x510_2:

Working set join
```

Next, using the **atmf reboot-rolling** command, specify the path to the release files to which you wish to upgrade the nodes in the AMF network. In this example the release files are stored on the external USB storage media installed in the node controlling the rolling reboot firmware upgrade, in a directory called "rel". Note that because the node controlling the rolling reboot firmware upgrade is included in the nodes to be upgraded, a message is output indicating that no summary will be available on completion.

```
csg_vcf[5]#atmf reboot-rolling usb:/rel/*.rel
Retrieving data from SBSBx8100
Retrieving data from SBx908-VCS2
Retrieving data from x510_1
Retrieving data from x510_2
Retrieving data from SBx908-VCS1

ATMF Rolling Reboot Nodes:

Node Name                Timeout
                        (Minutes)  New Release File           Status
-----
x510_2                   9          x510-main-20121203-1.rel   Release ready

AMF Naming Convention

When AMF is enabled on a switch, it will automatically be assigned a host name. If a host name has already been assigned, by using the command, "[hostname](#)" on page 8.16, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host_0016_76b1_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network switches, and accordingly apply an appropriate hostname to each switch in your AMF network.

Command List

This chapter provides an alphabetical reference for AMF commands.

atmf backup

This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Syntax `atmf backup {default|<hh:mm> frequency <1-24>}`
`no atmf backup enable`

Parameter	Description
default	Restore the default backup schedule.
<hh:mm>	Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock.
backup	Enables AMF backup to external media.
frequency <1-24>	Sets the number of times per day that backups will be taken.

Default Backups run daily at 03:00 AM, by default

Mode Global Configuration

Usage Running this command only configures the schedule. To enable the schedule, you should then apply the command **atmf backup enable** (or its “no” variant, to disable the schedule).

Example To schedule backup requests to begin at 11 pm and execute daily, use the following command:

```
VCF_1# configure terminal
VCF_1(config)# atmf backup 23:00 frequency 1
```

Caution

File names that comprise identical text, but with differing case, such as Test.txt and test.txt, will not be recognized as being different on a FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based switch. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

Related Commands [atmf backup enable](#)
[atmf backup stop](#)
[show atmf backup](#)

atmf backup enable

This command enables automatic AMF backups on the AMF master node. By default, automatic backup starts at 3:00 AM, but this schedule can be changed by the [atmf backup command on page 87.3](#). Note that backups are initiated and stored on the master nodes.

The **no** variant of this command will disable any AMF backups that have been scheduled and previously enabled.

Syntax atmf backup enable
no atmf backup enable

Parameter	Description
backup	The AMF backup process.
enable	Enables AMF backup to external media.

Default Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device, is detected.

Mode Global Configuration

Usage A warning message will appear if you run the **atmf backup enable** command with either insufficient or marginal memory availability on your external storage device.

You can use the command **“show atmf backup” on page 87.35** to check the amount of space available on your external storage device.

Example To turn on automatic AMF backup, use the following command:

```
VCF_1# configure terminal
VCF_1(config)# atmf backup enable
```

Related Commands [show atmf](#)
[show atmf backup](#)
[atmf backup](#)
[atmf backup now](#)
[atmf enable](#)

atmf backup now

This command is run only from AMF master and initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master nodes, even though the selected AMF member may not be a master node.

Syntax `atmf backup now [<nodename>]`

Parameter	Description
<code>backup</code>	The AMF backup process.
<code>now</code>	Immediately applies the command's action.
<code><nodename></code> or <code><hostname></code>	The name of the AMF member to be backed up - as set by the command " hostname " on page 8.16. Where no name has been assigned to this device, then you must apply the prefix, host underscore followed (without a space) by the MAC address of the device to be backed up. For example <code>host_0016_76b1_7a5e</code> Note that the node-name appear as the command Prompt when in Privileged Exec mode.

Default A backup is initiated for all nodes on the AMF (but stored on the master nodes).

Mode Privileged Exec

Usage Although this command will select the AMF node to be backed-up; it can only be run from an AMF master node. Note also that the backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in "**Example-4**" on page 87.6.

Example-1 In this example, an AMF member has not been assigned a host name. The following command is run on the `atmf_master_2` node to immediately backup the device - identified by its MAC address of 0016.76b1.7a5e:

```
atmf_master_2# atmf backup now host_0016_76b1_7a5e
```

Example-2 In this example, an AMF member has been assigned the host name, `office_annex`. The following command will immediately backup this device:

```
atmf_master_2# atmf backup now office_annex
```

This command is initiated on the switch named `amf_master_2` and initiates an immediate backup on the switch named `office_annex`.

Example-3 To initiate (from the `amf_master_1` node) an immediate backup of all AMF member nodes, use the following command:

```
amf_master_1# amf backup now
```

Example-4 To initiate an immediate backup of the node with the host-name “office_annex” and store the configuration on both masters, use the following process:

From the node `amf_master_1`, set the working-set to comprise only of the automatic group, master nodes.

```
amf_master_1# atmf working-set group master
```

This command returns the following display:

```
=====
atmf_master_1, atmf_master_2
=====

Working set join
```

Backup the AMF member with the host name, **office_annex** on both the master nodes as defined by the working set.

```
atmf_net[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

Related Commands

- atmf backup**
- atmf backup stop**
- hostname**
- show atmf backup**

atmf backup stop

Running this command will immediately stop a currently executing AMF backup. Note that this command can only be applied to the master node.

Syntax `atmf backup stop`

Parameter	Description
backup	The amf backup process.
stop	Immediately halts the running process.

Mode Privileged Exec

Mode This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

Example To stop a backup that is currently executing:

```
VCF-1# amf backup stop
```

Related Commands

- [atmf backup enable](#)
- [atmf backup now](#)
- [show atmf backup](#)

atmf domain vlan

The AMF domain vlan is one of the internal VLANs that are used to communicate information about the state of the AMF network between nodes. AMF uses its internal VLANs (the management VLAN and the domain VLAN) to communicate its inter nodal network status information. These VLANs must be reserved for AMF and not used for other purposes.

When an AMF network is first created all its nodes are assigned the default VID of 4091. This command enables you to change the VID from this default value.

If you assign a VLAN ID to this VLAN (i.e. change its value from the default of 4091) then you will need to do this separately on every device within the AMF. The AMF domain subnet will then be applied to this new VID when all devices within the AMF network are next rebooted.

The “no” variant of this command resets the VLAN ID to its default value of 4091.

Syntax `atmf domain vlan <2-4090>`
`no atmf domain vlan`

Parameter	Description
<code>domain vlan</code>	The VLAN that is assigned (separately) to each domain within the AMF network.
<code><2-4090></code>	The VLAN number in the range 2 to 4090.

Default The default domain VLAN ID for the AMF is 4091.

Mode Global Configuration

Usage When an AMF network is first created all its nodes are assigned a domain VLAN with a default VID of 4091. An important point conceptually is that although this VLAN then exists globally across the AMF network; it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

The VLANs involved in this process, must be reserved for AMF and cannot be used for other purposes. This command enables you to change the domain VLAN to match your network’s specific configuration.

Caution  Setting this command, then rebooting the switch will only apply the AMF VLAN for the switch being configured. The new domain vlan will not become effective for the AMF network until all its member nodes have been updated, and all its member switches rebooted.

As part of its automatic creation process, this VLAN will also be assigned an IP subnet address based on the value configured by the command “**atmf management subnet**” on [page 87.13](#). Refer to this command for more information.

Examples To change the AMF domain VLAN to 4000 use the following commands:

```
VCF-1# configure terminal
VCF-1(config)# atmf domain vlan 4000
```

To reset the AMF domain VLAN to its default of 4091, use the following commands:

```
VCF-1# configure terminal
VCF-1(config)# no atmf domain vlan
```

atmf enable

This command manually enables (turns on) the AMF feature for the switch being configured.

The “no” variant of this command disables (turns off) the AMF feature on the member node.

Syntax atmf enable
no atmf enable

Default Once AMF is configured, the AMF feature starts automatically when the switch starts up.

Mode Global Configuration

Usage Note that the switch does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your switch with any domain specific (non default) settings before enabling AMF.

Examples To turn on the AMF the feature

```
MyNode# config terminal
MyNode(config)# atmf enable
```

To turn off the AMF feature

```
MyNode(config)# no atmf enable
```

This command returns the following display:

```
% Warning: Write the config file. Enable will not become
effective until the unit reboots.

MyNode(config)#
```

atmf group (membership)

This command configures your switch to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
 - « all - All nodes in the AMF
 - « current - The current working-set
 - « local - The originating node.

Note that the Implicit Groups do not appear in show group output.
- Automatic Groups - These are defined by hardware architecture. e.g x510, x610, x900, x8100.
- User Defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x610, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Syntax `atmf group <group-list>`
`no atmf group <group-list>`

Parameter	Description
<code>group</code>	An AMF group is a named collection of AMF nodes or modules. These definitions may be pre-existing and applied via hardware generated commands, or may be manually configured, changed, or removed. Group names are case sensitive and must be less than 64 characters long.
<code><group-list></code>	A list of group names. These should be entered as a comma delimited list without spaces.

Mode Global Configuration

Usage You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group

The following example configures the switch to be members of three groups; two are company departments, and one comprises all devices located in building_2. To avoid having to run this command separately on each device that is to be added to these groups; you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the **atmf group (membership)** command to all members of the working set.

Example To specify the switch to be a member of AMF groups named, Marketing, Sales, and Building_2, use the following command:

```
VCF-1# configure terminal
VCF-1(config)# atmf group marketing,sales,building_2
```

First add the nodes "master_node1" and "member_node_1" to the working-set:

```
master_node# atmf working-set master_node1,member_node_1
```

This command returns the following output confirming that the nodes "master_node" and "node_2" are now part of the working-set:

```
=====
master_node1, member_node_1
=====

Working set join
```

```
atmf-net[2]# configure terminal
```

Add the groups building1 and sales to the working-set

```
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
```

Show the groups that are members of the working-set

```
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
=====
master_node1
=====

AMF group information

building1, sales, master, poe, x8100
```

Related Commands [show atmf group](#)
[show atmf group members](#)

atmf management subnet

This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section of this command description.

AMF uses these internal IPv4 subnets when exchanging its internodal status packets. These subnet addresses must be reserved for AMF and should be used for no other purpose.

The new management subnet will not become effective until all members of the AMF network have been updated and all its units rebooted.

Syntax `atmf management subnet <a.b.0.0>`
`no atmf management subnet`

Parameter	Description
<code>atmf management subnet</code>	A subnet that is assigned for AMF management purposes.
<code><a.b.0.0></code>	The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0 to 172.31.255.255, or 192.168.0.0 as defined in RFC1918.

Default 172.31.0.0 (Note that a subnet mask of 255.255.0.0 will automatically be applied).

Mode Global Configuration

Usage Typically a network administrator would use this command to change the default subnet address to match local network requirements.

As previously mentioned, running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the **atmf management vlan**
- 172.31.128.0/17 assigned to the **atmf domain vlan**.

Examples To change the AMF management subnet address on node VCF-1 to 172.25.0.0:

```
VCF-1# configure terminal
VCF-1(config)# atmf management subnet 172.25.0.0
```

To change the AMF management subnet address on node VCF-1 back to its default of 172.31.0.0:

```
VCF-1# configure terminal
VCF-1(config)# no atmf management subnet
```

atmf management vlan

The AMF management VLAN is created when the AMF network is first initiated and is assigned its default VID of 4092. This command enables you to change the VID from this default value.

The AMF management vlan is one of the internal VLANs that are used to communicate information about the state of the AMF network between nodes. AMF uses its internal VLANs (such as the management VLAN and the domain VLAN) to communicate its inter nodal network status information. These VLANs must be reserved for AMF and not used for other purposes.

If you assign a VLAN ID to this VLAN (i.e. change its value from the default of 4092) then you will need to do this separately on every device within the AMF. The AMF management subnet will then be applied to this new VID when all devices within the AMF network are next rebooted.

Syntax atmf management vlan <2-4090>
no atmf management vlan

Parameter	Description
atmf management vlan	The VLAN that is assigned for AMF management.
<2-4090>	The VID assigned to the AMF management VLAN.

Default The default VLAN ID for the AMF is 4092.

Note  Although the value applied by default lies outside the user configurable range. You can use the “no” form of this command to reset the VLAN to its default value.

Mode Global Configuration

Usage You can use this command to change the management VLAN to meet your network’s requirements and standards, particularly in situations where the default address value is unacceptable.

Note  This VLAN will automatically be assigned an IP subnet address based on the value configured by the command **“atmf management subnet”** on [page 87.13](#). Refer to this command description for further details.

Examples To change the AMF management VLAN to 4090 use the following commands:

```
VCF-1# configure terminal
VCF-1(config)# atmf management vlan 4090
```

To reset the AMF domain VLAN to its default of 4092, use the following commands:

```
VCF-1# configure terminal
VCF-1(config)# no atmf management vlan
```

Related Commands **atmf domain vlan**
show atmf detail

atmf master

This command configures the switch to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they “must” be connected by an AMF crosslink.

If the crosslink between two AMF masters goes down, then one of the masters will become isolated from the rest of the AMF network

The “no” variant of this command removes the switch as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

Note Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

Syntax `atmf master`
`no atmf master`

Default The switch is not configured to be an AMF master node.

Mode Global Configuration

Usage Using this command creates an AMF master group. Up to two AMF masters may be supported in a network, and they must be connected by an AMF crosslink. If the crosslink between two AMF masters fails, then one of the masters becomes isolated from the rest of the AMF network. A master node always has a distance value of 0.

Note Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

Example To specify that this node is an AMF master, use the following command:

```
VCF-1# configure terminal
VCF-1(config)# atmf master
```

Related Commands `show atmf`
`show atmf group`

atmf network-name

This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node see, [“atmf master” on page 87.17](#).

Syntax atmf network-name <name>
no atmf network-name

Parameter	Description
atmf	The Allied Telesis Management Framework feature.
network-name	A name that is assigned to an AMF network.
<name>	The AMF network name. Up to 15 printable characters can be entered for the network-name.

Mode Global Configuration

Usage This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF. This command will not take effect until the particular node is rebooted.

A switching node (master or member) be a member of only one AMF network.

Caution Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).

Example To set the AMF network name to amf_net use the command:

```
Node_1(config)# atmf network-name amf_net
```

atmf reboot-rolling

This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and has brought its ports up it re-joins the AMF network and the next node is rebooted.

By adding the url parameter, you can also upgrade your switches' software one AMF node at a time.

The force command enforces a node reboot even if a previous node does not rejoin the AMF network. In this situation the unsuitable node will time-out and the rolling reboot process stops. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

Syntax `atmf reboot-rolling [force] [<url>]`

Parameter	Description
atmf	The Allied Telesis Management Framework feature.
reboot-rolling	Initiates the rolling reboot operation.
force	Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot.
<url>	The url path to the software upgrade file.

Mode Privileged Exec

Usage You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location - based on the parameters and URL you have entered.

For example `card:/5.4.3/x*-5.4.3-*.rel` will select from the folder `card:/5.4.3` the latest file that matches the selection `x (wildcard) -5.4.3-(wildcard).rel`. Because `x*` is applied each switch type will be detected and its appropriate release file will be installed.

Other allowable entries are:

- `card:*.rel`:
Used when loading SW from SD cards.
- `tftp:ip address`:
Used when loading SW from a TFTP server.
- `usb`:
Used when loading SW from a USB flash drive.
- `flash`:
Used when loading SW from flash memory, i.e. from one x900 switch to another.
- `scp`:
Used when loading SW from a secure copy.
- `http`:
Used when loading SW from an HTTP file server site.

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the "boot system <release-name>" command, and the old release will become the backup release file.

Note  If you are using TFTP, HTTP, etc, to access a file on a remote device, then the URL should specify the exact release filename without using wild card characters.

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will fail back to old software. At the completion of this command, a report is run showing the release upgrade status of each node.

This function is supported on the following switches: AT-SBx908, SBx8100 Series, x610 Series, x510 Series and AT-IX5-28GPX. It is supported on all stack configurations.

Note  Take care when removing external media or rebooting your switches. Removing an external media while files are being written entails a significant risk of causing a file corruption.

Example-1 To reboot all x510 nodes in an AMF network, use the following commands

```
Bld2_Floor_1# atmf working-set group x510
```

This command returns the following type of screen output:

```
=====
node1, node2, node3:
=====

Working set join

AMF_NETWORK_Name[ 3 ]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depending on the parameters set.

```

Bld2_Floor_1#atmf working-set group x510

=====
SW_Team1, SW_Team2, SW_Team3:
=====

Working set join

ATMF_NETWORK[3]#atmf reboot-rolling
ATMF Rolling Reboot Nodes:

Node Name                Timeout
                          (Minutes)
-----
SW_Team1                  14
SW_Team2                   8
SW_Team3                   8
Continue the rolling reboot ? (y/n):y
=====
ATMF Rolling Reboot: Rebooting SW_Team1
=====

% SW_Team1 has left the working-set
Reboot of SW_Team1 has completed
=====
ATMF Rolling Reboot: Rebooting SW_Team2
=====

% SW_Team2 has left the working-set
Reboot of SW_Team2 has completed
=====
ATMF Rolling Reboot: Rebooting SW_Team3
=====

% SW_Team3 has left the working-set
Reboot of SW_Team3 has completed

=====
ATMF Rolling Reboot Complete
Node Name                Reboot Status
-----
SW_Team1                  Rebooted
SW_Team2                  Rebooted
SW_Team3                  Rebooted
=====
    
```

Example-2 To update firmware releases, use the following command:

```
Node_1# atmf working-set group all
ATMF_NETWORK[9]# atmf reboot-rolling card:/5.4.3/x*-5.4.3-*.rel
```

ATMF Rolling Reboot Nodes:

Node Name	Timeout (Minutes)	New Release File	Status
SW_Team1	8	x510-5.4.3-0.5.rel	Release Ready
SW_Team2	10	x510-5.4.3-0.5.rel	Release Ready
SW_Team3	8	---	Not Supported
HW_Team1	6	---	Incompatible
Bld2_Floor_1	6	x900-5.4.3-0.5.rel	Release Ready
Bld1_Floor_2	2	x610-5.4.3-0.5.rel	Release Ready
Bld1_Floor_1	4	---	Incompatible
Building_1	2	---	Incompatible
Building_2	2	x900-5.4.3-0.5.rel	Release Ready

Continue upgrading releases ? (y/n):

atmf recover

This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced. The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. The configuration file of the device being replaced is selected by the `nodename` parameter, and the master node holding the config file is specified by the parameter `<master-nodename>`.

If the `<nodename>` parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used `nodename`), then the recovery will fail.

If the `<master-nodename>` parameter is not specified then the device will poll all known AMF masters and execute an election process (based on the last successful backup and its timestamp) to determine which master node to use. If no valid backup master is found, then this command will fail.

Syntax `atmf recover [<nodename> <master-nodename>]`

Parameter	Description
<code>atmf</code>	The Allied Telesis Management Framework feature.
<code>recover</code>	Initiates the manual node recovery process.
<code><nodename></code>	The name of the device whose configuration is to be recovered or replicated.
<code><master-nodename></code>	The name of the master device that holds the required configuration information. Note that although you can omit both the <code>nodename</code> and the <code>master-nodename</code> ; you can only omit the <code>master-nodename</code> if you also omit the <code>nodename</code> .

Mode Privileged Exec

Usage No error checking occurs when this command is run, and regardless of the last backup status, the recovering node will attempt to load its configuration from the master node specified by the `master-nodename` parameter.

Note that if the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

Example To recover the AMF node named `Node_10` from the AMF master node named `Master_2`, use the following command:

```
Master_2# atmf recover Node_10 Master_2
```

Related Commands [atmf backup stop](#)
[show atmf backup](#)
[show atmf detail](#)

atmf remote-login

Use this command to remotely login to other AMF nodes in order to run commands as if a local user of that node.

Syntax `atmf remote-login [user <name>] <nodename>`

Parameter	Description
atmf	The Allied Telesis Management Framework feature.
remote-login	Remote login.
user	User login.
<name>	User name.
<nodename>	Node name.

Default Needs to be entered

Mode Privileged Exec (This command will only run at privilege level 15)

Usage You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (i.e device reboot) you will be returned to the originating node.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

Example-1 To remotely login from node Node10 to Node20 use the following command

```
Node10# atmf remote-login node20
```

Example-2 In this example, user Whitney is a valid user of node5. She can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user whitney
node3
```

Type 'exit' to return to node5#

```
node3> enable
```

Note In the above example the user name whitney is valid on both nodes.

Therefore, to prevent unauthorized access, user names should be unique across all nodes within the AMF network.

atmf working-set

The ATMF working-set command enables you to execute commands across an individually listed set (or preselected group) of AMF nodes. Group selection is made using the [atmf group \(membership\) command on page 87.11](#).

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
 - « all - All nodes in the AMF
 - « current - All nodes that comprise the current working-set
 - « local - The originating node.
- Automatic Groups - These can be defined by hardware architecture. i.e. x510, x610, x900, x8100, or by certain AMF nodal designations such as, master.

Note that the Implicit Groups do not appear in show group output.

If a node is an AMF master it will be automatically added to the master group.

Syntax `atmf working-set {[<node-list>][group{<group-list>|all|local|current}]}`

Parameter	Description
atmf	The Allied Telesis Management Framework feature.
working-set	Defines the scope of the working set.
<node-list>	A comma delimited list (without spaces) of nodes to be included in the working-set.
group	The AMF group.
<group-list>	A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups.
all	All nodes in the AMF.
local	Local node Running this command with the parameters group local will return you to the local prompt and local node connectivity.
current	Nodes in current list.

Default Needs to be entered

Mode Privileged Exec

Example-1 To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

Note This command adds the implicit group “all” to the working set; where “all” comprises all nodes in the AMF.

Displays an output screen similar to the one shown below:

```
=====
node1, node2, node3, node4, node5, node6:
=====

Working set join

ATMF_NETWORK_Name[6]#
```

Example-2 To return to the local prompt, and connectivity to only the local node; use the command:

```
ATMF_NETWORK_Name[6]# atmf working-set group local

node1#
```

Parameter definitions from the working-set command

Parameter	Definition
node1, node2 etc	The name of the nodes - as set by the hostname command on page 8.16.
ATMF_Network_Name	The name of the AMF network - as set by the atmf network-name command on page 87.18.
[6]	The number of nodes in the working-set.

clear atmf links statistics

This command resets the values of all AMF link, port, and global statistics to zero.

Syntax `clear atmf links statistics`

Mode Privilege Exec

Example To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

Related Commands [show atmf links statistics](#)

debug atmf

This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The “no” variant of this command disables either all AMF debugging information, or only the particular information as selected by the command’s parameters.

Syntax `debug atmf [all|crosslink|database|link|neighbor|packet]`
`no debug atmf [all|crosslink|database|link|neighbor|packet]`

Parameter	Description
debug	Enables the AMF debugging facility.
all	Output displays all events.
crosslink	Output displays all crosslink information.
database	Output displays only notable database events.
link	Output displays debugging information relating to uplink or downlink information.
neighbor	Output displays only notable AMF neighbor events.
packet	Output displays only notable AMF packet events.

Default All debugging facilities are disabled.

Mode User Exec and Global Configuration

Usage If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

Note  An alias to the no variant of this command - **undebug atmf** - exists elsewhere in this chapter.

Examples To debug all AMF debugging, use the command:

```
node_1# debug atmf
```

To debug all AMF link debugging, use the command:

```
node_1# debug atmf link
```

To debug all AMF facilities, use the command:

```
node_1# debug atmf all
```

To debug all AMF packets, use the command:

```
node_1# debug atmf packet
```

Related Commands [no debug all](#)

show atmf

Displays information about the current AMF node.

Syntax `show atmf [detail|summary|tech|nodes|session]`

Parameter	Description
detail	Displays detailed information about the current AMF node.
summary	Displays summary information about the current AMF node.
tech	Displays global AMF information.
nodes	Displays information about AMF network nodes.
session	Displays information on an AMF session.

Default Only summary information is displayed.

Mode User Exec and Privileged Exec

Usage AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

Example-1 To show summary information on AMF node_1 use the following command:

```
node_1 show atmf summary
```

The following figure shows some example output from running this command for a specific AMF node.

Figure 87-1: Output from the show atmf summary command

```
node_1#show atmf
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : ATMF_NET
Node Name              : node_1
Role                   : Master
Current ATMF Nodes    : 8
```

Example-2 To show detailed information on AMF node_1 use the following command:

```
node_1 show atmf detail
```

Figure 87-2: Output from the show atmf detail command

```
node_1#show atmf detail
ATMF Detail Information

Network Name           : ATMF_NET
Node Name              : node_1
Node Address           : node_1.atmf
Node ID               : 1
Node Depth            : 0
Domain State          : DomainController
Recovery State        : None

Management VLAN
VLAN ID               : 4092
Management Subnet     : 172.31.0.0
Management IP Address : 172.31.0.1
Management Mask       : 255.255.128.0

Domain VLAN
VLAN ID               : 4091
Domain Subnet         : 172.31.128.0
Domain IP Address     : 172.31.128.1
Domain Mask           : 255.255.128.0
```

Example-3 To show information specific to AMF nodes use the following command:

```
node_1 show atmf nodes
```

Figure 87-3: Output from the show atmf nodes command

```
Node Information:
* = Local device

SC = Switch Configuration:
C = Chassis  S = Stackable  N = Standalone
```

Node Name	Device Type	AMF Master	SC	Parent	Node Depth
Building_1	AT-SBx8112	Y	C	-	0
* Building_2	x900-12XT/S	Y	N	-	0
Bld1_Floor_1	SwitchBlade x908	N	S	Building_1	1
Bld1_Floor_2	x600-24Ts/XP	N	N	Building_1	1
Bld2_Floor_1	x610-24Ts-POE+	N	N	Building_1	1
SW_Team1	x510-28GPX	N	N	Bld1_Floor_2	2

```
Current AMF node count 8
```

The show AMF session command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session. For example, in the case below, node_1 and node5 have active users logged in.

Example-4 To display AMF active sessions, use the following command

```
node_1 show atmf sessions
```

Figure 87-4: Output from the show atmf sessions command

```
node_1#show atmf session

CLI Session Neighbors

Session ID                : 73518
Node Name                 : node_1

First Adjacency          : 1
Number Events             : 0
DBE Retransmit Queue Length : 0
DBE Request List Length  : 0
```

The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

Example-5 To display AMF technical information, use the following command:

```
node_1 show atmf tech
```

Figure 87-5: Output from the show atmf nodes command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : ATMF_NET
Node Name              : node_1
Role                   : Master
Current ATMF Nodes    : 8

```

Table 87-1: Parameter definitions from the show atmf command

Parameter	Definition
ATMF Status	The Node's AMF status, either Enabled or Disabled.
Network Name	The AMF network that a particular node belongs to.
Node Name	The name assigned to a particular node.
Role	The role configured for this AMF device, either Master or Member.
Current ATMF Nodes	The count of AMF nodes in an AMF Network.
Node Address	An Address used to access a remotely located node (.atmf).

Table 87-1: Parameter definitions from the show atmf command(cont.)

Parameter	Definition
Node ID	A Unique identifier assigned to a Node on an AMF network.
Node Depth	The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the ATMF network from a particular node to the zero level of the ATMF root node.
Domain State	The state of Node in a Domain in AMF network as Controller/Backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between Nodes of different domain (up/down links). <ul style="list-style-type: none"> ■ VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. ■ Management Subnet - Network prefix for the subnet. ■ Management IP Address - The IP address allocated for this traffic. ■ Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). <ul style="list-style-type: none"> ■ VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. ■ Domain Subnet. The subnet address used for this traffic. ■ Domain IP Address. The IP address allocated for this traffic. ■ Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).
Device Type	The Product Series Name.
ATMF Master	The 'Y' if the node belongs to a Core domain.
SC	The Switch Configuration, C - Chassis(SBx81series), S - Stackable (VCS) and N - Standalone.
Parent	The a Node to which the current node has an active uplink.
Node Depth	The the number of nodes in path from this node to the Core domain.

 **Note** You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **“Controlling “show” Command Output” on page 1.35.**

show atmf backup

This command displays information about AMF backup status.

Syntax show atmf backup {logs}

Parameter	Description
backup	The backup configuration.
logs	Displays detailed log information.

Mode Privileged Exec

Example To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

```
Node_1# show atmf backup
ScheduledBackup .....Enabled
Schedule.....1 per day starting at 03:00
Next Backup Time...19 May 2012 03:00
Backup Media.....SD (Total 1974.0 MB, Free197.6MB)
Current Action.....Starting manual backup
Started.....18 May 2012 10:08
CurrentNode.....atmf_testbox1

Node Name                Date           Time           In ATMF        Status
-----
atmf_testbox1            17May 2012    09:58:59      Yes            Errors
atmf_testbox2            17May 2012    10:01:23      Yes            Good

Node_1#show atmf backup logs

Log File Location: card:/atmf/officel/logs/rsync_<nodename>.log

Figure 87-6: Parameter definitions from the show atmf backup command

Parameter	Definition
Scheduled Backup	Indicates whether AMF backup scheduling is enabled or disabled.
Schedule	Displays the configured backup schedule.
Next Backup Time	Displays the date and time of the next scheduled.
Backup Media	The current backup medium in use. This will be one of USB, SD, or NONE. Note that the USB will take precedence over the SD card. Utilized and available memory (MB) will be indicated if backup media memory is present.

Figure 87-6: Parameter definitions from the show atmf backup command(cont.)

Parameter	Definition
Current Action	The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).
Started	The date and time that the currently executing task was initiated in the format DD MMM YYYY.
Current Node	The name of the node that is currently being backed up.
Node Name	The name of the node that is storing backup data - on its backup media.
Date	The date of the last backup in the format DD MMM YYYY.
Time	The time of the last backup in the format HH:MM:SS.
In ATMF	Whether the node shown is active in the AMF network, (Yes or No).
Status	The output can contain one of four values: <ul style="list-style-type: none"> ■ "-" meaning that the status file cannot be found or cannot be read. ■ "Errors" meaning that there are issues - note that the backup may still be deemed successful depending on the errors. ■ "Stopped" meaning that the backup attempt was manually aborted;. ■ "Good" meaning that the backup was completed successfully.
Log File Location	All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be: card:/amf/office/logs/rsync_amf_testbox1.log.
Log Details	The contents of the backup log file.

 **Note** You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: ["Controlling "show" Command Output" on page 1.35.](#)

Related Commands [show atmf](#)
[atmf network-name](#)

show atmf group

This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture. e.g x510, x610. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

Syntax `show atmf group [user-defined|automatic]`

Parameter	Description
group	The amf group.
user-defined	User-defined-group information display.
automatic	Automatic group information display.

Default All groups are displayed

Mode Privileged Exec

Example-1 To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF goup information
master, x510
node2#
```

This screen shows that node2 contains the groups, master and x510. Note that although the node also contains the implicit groups, these do not appear in the show output.

Example-2 The following commands (entered on node2) will display all the automatic groups within the working set containing node-1 and all nodes that have been pre-defined to contain the sysadmin group:

First define the working-set

```
Node-1# #atmf working-set node-1 group sysadmin
```

A typical output screen from this command is shown below:

```

ATMF goup information

master, poe, x8100

=====
node-1, node-2, node33, node-4, node-5, node-6:
=====

ATMF group information

sysadmin, x8100

ATMF-Test-NETWORK[6]#
    
```

This confirms that the six nodes (node_1 to node6) are now members of the working-set and that these nodes reside within the AMF-Test-Network.

Note that to run this command, you must have previously entered the **“atmf working-set” on page 87.25**. This can be seen from the network level prompt, which in this case ATM_Network[6]#.

Figure 87-7: Sample output from the show atmf group command for a working set.

```

ATMF_NETWORK[6]#show atmf group
=====
node3, node4, node5, node6:
=====

ATMF group information

edge_switches, x510
    
```

Figure 87-8: Parameter definitions from the show atmf group command

Parameter	Definition
ATMF group information	Displays a list of nodes and the groups that they belong to, for example: <ul style="list-style-type: none"> ■ master - Shows a common group name for Nodes configured as AMF masters. ■ Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture: e.g: x8100, x900, x610 etc. ■ User-defined - Arbitrary groups created by the user for AMF nodes.

show atmf group members

This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture. e.g x510, x610. Nodes that are configured as masters are automatically assigned to the master group. User can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

Syntax `show atmf group members [user-defined|automatic]`

Parameter	Description
group	The AMF group.
members	AMF group members.
user-defined	User defined group membership display.
automatic	Automatic group membership display.

Mode Privileged Exec

Example To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

Figure 87-9: Sample output from the show atmf group members command.

```

ATMF Group membership

Automatic      Total
Groups         Members  Members
-----
master         1        Building_1
poe            1        HW_Team1
x510           3        SW_Team1 SW_Team2 SW_Team3
x900           1        Bld1_Floor_2
x610           1        HW_Team1

software       3        SW_Team1 SW_Team2 SW_Team3
    
```

Figure 87-10: Parameter definitions from the show atmf group command

Parameter	Definition
Automatic Groups	Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on same Hardware type or belonging to same Master group.
User-defined Groups	Shows grouping of AMF nodes in user defined groups.
Total Members	Shows the total number of members in each group.
Members	Shows the list of AMF Nodes in each group.

Related Commands [show atmf group](#)
[show atmf](#)
[atmf group \(membership\)](#)

show atmf links brief

This commands display brief information about all the AMF links configured on the selected node.

Syntax `show atmf links [brief]`

Parameter	Description
links	AMF links.
brief	Brief summary of AMF links configuration and status.

Mode User Exec and Privileged Exec

Example To display the AMF links brief details, use the following command:

```
Building_2# show atmf links
```

or

```
Building_2# show atmf links brief
```

Figure 87-11: Sample output from the show atmf links brief command.

```

ATMF Links Brief:
-----
Local Port      Link Type      Port Status    ATMF State      Adjacent Node      Adjacent Link Ifindex  Link State
-----
sa1             Crosslink     Up             TwoWay          Building_1          4501          Forwarding
1.1.1          Downlink     Up             Full            Bld1_Floor_1       5001          Forwarding
1.1.2          Downlink     Up             Full            Bld1_Floor_2       5003          Forwarding
1.1.3          Downlink     Up             Full            Bld2_Floor_1       6101          Forwarding
    
```

Figure 87-12: Parameter definitions from the show atmf links detail command

Parameter	Definition
Local Port	Shows local port on the Node configured for AMF Network.
Link Type	Shows link type as Uplink/Downlink (Parent and child) or Cross-link (Nodes in same domain).
Port Status	Shows status of the local port on the Node as UP/DOWN.
ATMF State	Shows AMF state of the local port: <ul style="list-style-type: none"> ■ Init - Link is down. ■ Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. ■ Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. ■ OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain ■ Full - Link hello packets are sent and received from its neighbor with its own node id. ■ Shutdown - Link has been shut down by user configuration.
Adjacent Node	Shows Adjacent AMF Node to this Node.
Adjacent IfIndex	Shows interface on the Adjacent AMF Node connected to this Node.

Figure 87-12: Parameter definitions from the show atmf links detail command(cont.)

Parameter	Definition
Link State	Shows state of AMF link Forwarding/Blocking.

Note You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: [“Controlling “show” Command Output” on page 1.35.](#)

Figure 87-14: Parameter definitions from the show atmf links detail command

Parameter	Definition
Local Port	Shows local port on the Node configured for AMF Network.
Link Type	Shows link type as Uplink/Downlink (Parent and child) or Cross-link (Nodes in same domain).
Port Status	Shows status of the local port on the Node as UP/DOWN.
ATMF State	Shows AMF state of the local port: <ul style="list-style-type: none"> ■ Init - Link is down. ■ Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. ■ Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. ■ OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain ■ Full - Link hello packets are sent and received from its neighbor with its own node id. ■ Shutdown - Link has been shut down by user configuration.
Adjacent Node	Shows Adjacent ATMF Node to this Node.
Adjacent IfIndex	Shows interface on the Adjacent AMF Node connected to this Node.
Link State	Shows state of AMF link Forwarding/Blocking.
Crosslink Ports Information	Show details of all Crosslink ports on this Node: <ul style="list-style-type: none"> ■ Port - Name of the Port or static aggregation (sa<*>). ■ Ifindex - Interface index for the crosslink port. ■ VR ID - Virtual router id for the crosslink port. ■ Port Status - Shows status of the local port on the Node as UP/DOWN. ■ Port State - Same as AMF state as described above. ■ Port BPDU Receive Count - The number of AMF protocol PDU's received. ■ Adjacent Node Name - Name of the adjacent node in the domain. ■ Adjacent Ifindex - Ifindex of the adjacent node in the domain. ■ Adjacent VR ID - Virtual router id of the adjacent node in the domain. ■ Adjacent MAC - MAC address of the adjacent node in the domain. ■ Port Last Message Response - Response from the remote neighbor to our AMF last hello packet.
Link State Entries	Show all the link state database entries: <ul style="list-style-type: none"> ■ Node.Ifindex - Shows adjacent Node names and Interface index. ■ Transaction ID - Shows transaction id of the current crosslink transaction. ■ MAC Address - Shows adjacent Node MAC addresses. ■ Link State - Shows AMF states of adjacent nodes on the link.
Domain Nodes Tree	Shows all the nodes in the domain: <ul style="list-style-type: none"> ■ Node - Name of the node in the domain. ■ Links on Node - Number of crosslinks on a vertex/node. ■ Link no - Shows adjacent Node names and Interface index. ■ Forwarding State - Shows state of AMF link Forwarding/Blocking.
Crosslink Transaction Entries	Shows all the transaction entries: <ul style="list-style-type: none"> ■ Node - Name of the AMF node. ■ Transaction ID - transaction id of the node. ■ Uplink Transaction ID - transaction id of the remote node.

Figure 87-14: Parameter definitions from the show atmf links detail command(cont.)

Parameter	Definition
Uplink Information	Show all uplink entries. <ul style="list-style-type: none"> ■ Waiting for Sync - Flag if uplinks are currently waiting for synchronization. ■ Transaction ID - Shows transaction id of the local node. ■ Number of Links - Number of up downlinks in the domain. ■ Number of Local Uplinks - Number of uplinks on this node to the parent domain. ■ Originating Node - Node originating the uplink information. ■ Domain - Name of the parent uplink domain. ■ Node - Name of the node in the parent domain, that is connected to the current domain. ■ Ifindex - Interface index of the parent node's link to the current domain. ■ VR ID - Virtual router id of the parent node's link to the current domain. ■ Transaction ID - Transaction identifier for the neighbor in crosslink. ■ Flags - Used in domain messages to exchange the state: <ul style="list-style-type: none"> ■ATMF_DOMAIN_FLAG_DOWN = 0 ■ATMF_DOMAIN_FLAG_UP = 1 ■ATMF_DOMAIN_FLAG_BLOCK = 2 ■ATMF_DOMAIN_FLAG_NOT_PRESENT = 4 ■ATMF_DOMAIN_FLAG_NO_NODE = 8 ■ATMF_DOMAIN_FLAG_NOT_ACTIVE_PARENT = 16 ■ATMF_DOMAIN_FLAG_NOT_LINKS = 32 ■ATMF_DOMAIN_FLAG_NO_CONFIG = 64 ■ Domain Controller - Domain Controller in the uplink domain ■ Domain Controller MAC - MAC address of Domain Controller in uplink domain
Downlink Domain Information	Shows all the downlink entries: <ul style="list-style-type: none"> ■ Domain - Name of the downlink domain. ■ Domain Controller - Controller of the downlink domain. ■ Domain Controller MAC - MAC address of the domain controller. ■ Number of Links - Total number of links to this domain from the Node. ■ Number of Links Up - Total number of links that are in UP state. ■ Number of Links on This Node - Number of links terminating on this node. ■ Links are Blocked - 0 links are not blocked to the domain. 1 All links are blocked to the domain.
Node Transaction List	List of transactions from this downlink domain node. <ul style="list-style-type: none"> ■ Node - 0 links are not blocked to the domain. 1 All links are blocked to the domain. ■ Transaction ID - Transaction id for this node. ■ Domain List : Shows list of nodes in the current domain and their links to the downlink domain.: ■ Domain - Domain name of the downlink node. ■ Node - Name of the node in the current domain. ■ Ifindex - Interface index for the link from the node to the downlink domain. ■ Transaction ID - Transaction id of the node in the current domain. ■ Flags - As mentioned above.

Figure 87-14: Parameter definitions from the show atmf links detail command(cont.)

Parameter	Definition
Up/Downlink Ports Information	<p>Shows all the configured up and down link ports on this node:</p> <ul style="list-style-type: none"> ■ Port - Name of the local port. ■ Ifindex - Interface index of the local port. ■ VR ID - Virtual router id for the local port. ■ Port Status - Shows status of the local port on the Node as UP/DOWN. ■ Port State - AMF state of the local port. ■ Adjacent Node - Node name of the adjacent node. ■ Adjacent Internal ID - Unique node identifier of the remote node. ■ Adjacent Ifindex - Interface index for the port of adjacent AMF node. ■ Adjacent Board ID - Product identifier for the adjacent node. ■ Adjacent VR ID - Virtual router id for the port on adjacent AMF node. ■ Adjacent MAC - MAC address for the port on adjacent AMF node. ■ Adjacent Domain Controller - Node name of the Domain controller for Adjacent AMF node. ■ Adjacent Domain Controller MAC - MAC address of the Domain controller for Adjacent AMF node. ■ Port Forwarding State - Local port forwarding state Forwarding or Blocking. ■ Port BPDU Receive Count - Count of AMF protocol PDU's received. ■ Port Sequence Number - hello sequence number, incremented every time the data in the hello packet changes. ■ Port Adjacent Sequence Number - remote ends sequence number used to check if we need to process this packet or just note it arrived. ■ Port Last Message Response - response from the remote neighbor to our last hello packet.

 **Note** You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: **“Controlling “show” Command Output” on page 1.35.**

port1.0.5	Crosslink Hello Uplink	116	115
port1.0.5	Hello Link	0	0

Figure 87-17: Parameter definitions from the show atmf links statistics command

Parameter	Definition
Receive	Shows count of ATMF Protocol Packets received per message type.
Transmit	Shows the number of ATMF Protocol Packets transmitted per message type.
Database Entries	Shows number of ATMF elements existing in the distributed database.
Database Full Ages	Shows number of times the entries Aged in the database.
ATMF Packet Discards	Shows the number of discarded packets of each type: <ul style="list-style-type: none"> ■ Type0: The number of discarded crosslink hello msgs received on a non crosslink port. ■ Type1: The number of discarded tx update packets - bad checksum. ■ Type2: The number of discarded tx update bitmap packets - bad checksum. ■ Type3: The number of discarded tx update packets - neighbor not in the correct state. ■ Type4: The number of discarded update packets - bad checksum. ■ Type5: The number of discarded update packets - neighbor not in the correct state. ■ Type6: The number of discarded update bitmap packets - bad checksum. ■ Type7: The number of discarded crosslink hello msgs received on a non crosslink port. ■ Type8: The number of discarded crosslink hello msg received on a port that is not in the correct state. ■ Type9: The number of discarded crosslink domain hello msgs received on a non crosslink port. ■ Type10: The number of discarded crosslink domain hello msgs received on a port that is not in the correct state. ■ Type11: The number of crosslink uplink hello msgs received on a non crosslink port. ■ Type12: The number of discarded crosslink uplink hello msgs ignored on a port that is not in the correct state. ■ Type13: The number of messages with an incorrect name for this ATMF network. ■ Type14: The number of over-long packets received on a port. ■ Type15: The number of messages with a bad protocol version received on a port. ■ Type16: The number of messages with a bad packet checksum calculation received on a port. ■ Type17: The number of messages with a bad authentication type received on a port. ■ Type18: The number of messages with a bad simple password received on a port. ■ Type19: The number of discarded packets with an unsupported authentication type received on a port. ■ Type20: The number of discarded packets with an unknown neighbor received on a port.

 **Note** You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: [“Controlling “show” Command Output” on page 1.35.](#)

Related Commands

- [no debug all](#)
- [clear atmf links statistics](#)
- [clear atmf links statistics](#)
- [show atmf](#)

show atmf working-set

This command displays the nodes that form the current AMF working-set.

Syntax show atmf working-set

Mode Privileged Exec

Example To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

Figure 87-18: Sample output from the show atmf working-set command.

```
ATMF Working Set Nodes:
node1, node2, node3, node4, node5, node6
Working set contains 6 nodes
```

show running-config atmf

This command displays the running system information that is specific to AMF.

Syntax show running-config atmf

Mode User Exec and Global Configuration

Example To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

Note  You can manage your show output, or make it a more selective, by using a command modifier. For information on using show-command modifiers, see: [“Controlling “show” Command Output” on page 1.35.](#)

Related Commands [show running-config](#)
[no debug all](#)

switchport atmf-crosslink

This command configures the selected port or aggregated link to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. switchport mode trunk).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

The “no” variant of this command removes any crosslink that may exist for the selected port or aggregated link.

Syntax `switchport atmf-crosslink`
`no switchport atmf-crosslink`

Parameter	Description
<code>switchport</code>	The Layer 2 Interface.
<code>atmf-crosslink</code>	Sets the switchport to be an AMF crosslink.

Mode Interface Configuration

Usage Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with its parameter “**none**” selected. This is to prevent a network storm on a topology of ring connected switches.

To make a switchport 1.0.1 an ATMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.1.1
Node_1(config-if)# switchport atmf-crosslink
```

Example-2 This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

Example-2A To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

Example-2B To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

Note that the AMF management and domain VLANs are automatically added to the aggregator and the crosslink.

Related Commands [show atmf links statistics](#)

switchport atmf-link

This command enables you to configure a port or aggregator to be an AMF uplink/downlink. Running this command will automatically place the port or aggregator into trunk mode.

The “no” variant of this command removes any AMF-link that may exist for the selected port or aggregated link.

Syntax `switchport atmf-link`
`no switchport atmf-link`

Parameter	Description
<code>switchport</code>	The Layer 2 Interface
<code>atmf-link</code>	Sets the switchport to be an AMF link.

Mode Interface Configuration

Example To make a switchport 1.0.1 an ATMF crosslink, use the following commands

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

type atmf node

This command configures a trigger to be activated at an AMF node join or leave event.

Syntax type atmf node {join|leave}

Parameter	Description
type	Configure a particular type of trigger.
atmf	Manage AMF feature.
join	AMF node join event.
leave	AMF node leave event.

Mode Trigger Configuration

Example-1 To configure trigger 5 to activate at an AMF node leave event, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger) type atmf node leave
```

Example-2 The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description description "E-mail on
AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```

=====
node1:
=====

```

TR#	Type & Details	Description	Ac	Te	Tr	Repeat	#Scr	Days/Date
001	Periodic (2 min)	Periodic Status Chk	Y	N	Y	Continuous	1	smtwtfs
005	ATMF node (leave)	E-mail on ATMF Exit	Y	N	Y	Continuous	1	smtwtfs

```

=====
Node2, Node3,
=====

```

TR#	Type & Details	Description	Ac	Te	Tr	Repeat	#Scr	Days/Date
005	ATMF node (leave)	E-mail on ATMF Exit	Y	N	Y	Continuous	1	smtwtfs

Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```

=====
Node1:
=====

trigger 1
  type periodic 2
  script 1 atmf.scp
trigger 5
  type atmf node leave
  description "E-mail on ATMF Exit"
  script 1 email_me.scp
!

```

```

=====
Node2, Node3:
=====

trigger 5
  type atmf node leave
  description "E-mail on ATMF Exit"
  script 1 email_me.scp
!

```

undebug atmf

This command is an alias for the **no variant of the `debug atmf`** command on page 87.28.

Chapter 88: NTP Introduction and Configuration

Introduction	88.2
Overview	88.2
NTP on the Switch.....	88.3
Troubleshooting.....	88.4
Configuration Example	88.5

Introduction

This chapter describes the Network Time Protocol (NTP) service provided by the switch, and how to configure and monitor NTP on the switch.

NTP is a protocol for synchronizing the time clocks on a collection of network devices using a distributed client/server mechanism. NTP uses UDP (User Datagram Protocol) as the transport mechanism. NTP evolved from the Time Protocol (RFC 868) and the ICMP Timestamp message (RFC 792).

NTP provides protocol mechanisms to specify the precision and estimated error of the local clock and the characteristics of the reference clock to which it may be synchronized.

For detailed information about the commands used to configure NTP, see [Chapter 89, NTP Commands](#).

Overview

NTP uses a subnetwork with primary reference clocks, gateways, secondary reference clocks, and local hosts. These are organized into a hierarchy with the more accurate clocks near the top and less accurate ones near the bottom.

A number of primary reference clocks, synchronized to national standards, are connected to widely accessible resources (such as backbone gateways or switches) operating as primary time servers. The primary time servers use NTP between them to crosscheck clocks, to mitigate errors due to equipment or propagation failures, and to distribute time information to local secondary time servers. The secondary time servers redistribute the time information to the remaining local hosts.

The hierarchical organization and distribution of time information reduces the protocol overhead, and allows selected hosts to be equipped with cheaper but less accurate clocks. NTP provides information which organizes this hierarchy on the basis of precision or estimated error.

- An NTP entity may be in one of the following operating modes; however, the switch's implementation of NTP supports two modes: client and server.
- An NTP entity operating in a client mode sends periodic messages to its peers, requesting synchronization by its peers.
- An NTP entity enters the server mode temporarily when it receives a client request message from one of its peers, and remains in server mode until the reply to the request has been transmitted.
- An NTP entity operating in symmetric active mode sends messages announcing its willingness to synchronize and be synchronized by its peers.
- An NTP entity enters symmetric passive mode in response to a message from a peer operating in Symmetric Active mode. An NTP entity operating in this mode announces its willingness to synchronize and be synchronized by its peers.
- An NTP entity operating in broadcast mode periodically sends messages announcing its willingness to synchronize all of its peers but not to be synchronized by any of them.

The same message format is used for both requests and replies. When a request is received, the server interchanges addresses and ports, fills in or overwrites certain fields in the message, recalculates the checksum, and returns it immediately. The information included in the NTP message allows each client/ server peer to determine the timekeeping characteristics of its peers, including the expected accuracies of their clocks. Each peer uses this information and selects the best time from possibly several other clocks, updates the local clock, and estimates its accuracy.

There is no provision in NTP for peer discovery, acquisition, or authentication. Data integrity is provided by the IP and UDP checksums. No reachability, circuit-management, duplicate-detection, or retransmission facilities are provided or necessary.

By its very nature clock synchronization requires long periods of time (hours or days) and multiple comparisons in order to maintain accurate timekeeping. The more comparisons performed, the greater the accuracy of the timekeeping.

NTP on the Switch

The implementation of NTP on the switch is based on the following RFCs:

- RFC 958, Network Time Protocol (NTP)
- RFC 1305, Network Time Protocol (Version 3) Specification, Implementation and Analysis
- RFC 1510, The Kerberos Network Authentication Service (V5)

Two modes of operation are supported: client and server. The switch is in client mode most of the time where it polls the configured peer at least once every preconfigured minimum time period.

The peer that the switch refers to must be a more accurate clock source than the switch itself or another switch directly connected to a more accurate clock source. The switch operates as a secondary time server. It cannot operate as a primary time server unless the primary clock source is operating in server mode. A primary clock source usually operates in broadcast mode, which is not supported by the switch's implementation of NTP. When the switch receives a valid reply from the peer, it synchronizes its own internal clock according to the information from the reply.

If the switch receives a synchronization request from an NTP client, it temporarily changes to server mode. It replies to the request with the current time from the switch's internal clock along with other information useful for synchronization. The switch's internal clock is accurate to 0.005 seconds.

Troubleshooting

Problem The switch is not assigning the time to devices on the LAN.

- Solutions**
- Check that the NTP peer's IP address is entered correctly.
 - Check that the NTP peer can reach the switch, by pinging the switch from the NTP peer.

Problem The switch's clock does not synchronize with the NTP peer.

- Solution**
- The switch's clock can synchronize with the NTP peer only when its initial time is similar to the NTP peer's time (after setting the UTC offset). Manually set the switch's time so that it is approximately correct, and enable NTP again.
 - Check that the UTC offset is correct.

Problem The switch's time is incorrect, even though it assigns the correct time to devices on the LAN.

Solution The UTC offset is probably incorrect, or needs to be adjusted for the beginning or end of summer time.

Configuration Example

NTP requires the IP module to be enabled and configured correctly.

The switch's implementation of NTP supports two modes: client and server mode. When a synchronization request is received from a client (e.g. a PC on a LAN), the switch enters server mode and responds with time information derived from the switch's own internal clock. Periodically the switch enters client mode, sending synchronization requests to a predefined peer to synchronize its own internal clock. The peer is assumed to be a primary clock source or another switch connected directly to a primary clock source.

This example illustrates how to configure two switches, one at a Head Office and one at a Regional Office, to provide a network time service. The Head Office switch is connected to a primary time server and provides the most accurate time information. The switch at the Regional Office uses the Head Office switch as its peer to avoid the cost of an additional WAN connection but provides slightly less accurate time information.

To configure NTP on the switch, the NTP module must be enabled and an NTP peer must be defined. NTP transfers time information in UTC format.

To set the switch to automatically change the time when summer time starts and ends, enable a summer time offset setting.

Example configuration parameters for a network time service:

Site	Regional Office	Head Office
Switch Name	RG1	HO1
IP Address of Switch	10.5.35.114	10.12.25.4
IP Address of Peer	10.5.35.113	172.16.7.3

Step 1: Enable NTP and define the NTP peer.

The NTP feature must be enabled on all switches that are to provide a network time service. Each switch must have a peer defined where the switch synchronizes its own internal clock. Enable NTP on the Head Office switch and specify a primary time server as the peer by using the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 172.16.7.3
```

Note that you can also specify an IPv6 address for an NTP peer:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
```

Step 2: Configure the NTP parameters.

On each switch, the offset of local time from UTC time must be specified. In this example, both switches are in the same time zone, which is 12 hours ahead of UTC time. Use the following commands on both switches:

```
awplus(config)# clock timezone utc plus 12
```

Note that the range of offset is <0-12>.

Step 3: Check the NTP configuration.

Check the NTP configuration on each switch by using the command:

```
awplus# show ntp status
```

This command displays the following information on the Head Office switch.

```
Clock is synchronized, stratum 0, actual frequency is 0.0000  
Hz, precision is 20 reference time is 00000000.00000000  
(6:28:16.000 UTC Fri Feb 7 2036)clock offset is 0.000 msec,  
root delay is 0.000 msec root dispersion is 0.000 msec,
```

Chapter 89: NTP Commands

Command List	89.2
ntp access-group.....	89.2
ntp authenticate.....	89.3
ntp authentication-key	89.4
ntp broadcastdelay	89.5
ntp master.....	89.6
ntp peer	89.7
ntp server	89.9
ntp source	89.11
ntp trusted-key	89.13
show counter ntp.....	89.14
show ntp associations	89.16
show ntp status.....	89.17

Command List

This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see [Chapter 88, NTP Introduction and Configuration](#).

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

ntp access-group

This command creates an NTP access group, and applies a basic IP access list to it. This allows you to control access to NTP services.

The **no** variant of this command removes the configured NTP access group.

Syntax

```
ntp access-group [peer|query-only|serve|serve-only]
                [<1-99>|<1300-1999>]

no ntp access-group [peer|query-only|serve|serve-only]
```

Parameter	Description
peer	Allows time requests and NTP control queries, and allows the system to synchronize itself to a system whose address passes the access list criteria.
query-only	Allows only NTP control queries from a system whose address passes the access list criteria.
serve	Allows time requests and NTP control queries, but does not allow the system to synchronize itself to a system whose address passes the access list criteria.
serve-only	Allows only time requests from a system whose address passes the access list criteria.
<1-99>	Standard IP access list.
<1300-1999>	Expanded IP access list.

Mode Global Configuration

Example To create an NTP peer access group for an extended IP access list, use the commands:

```
awplus# configure terminal
awplus(config)# ntp access-group peer 1998
```

To disable the NTP peer access group created above, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp access-group peer
```

ntp authenticate

This command enables NTP authentication. This allows NTP to authenticate the associations with other systems for security purposes.

The **no** variant of this command disables NTP authentication.

Syntax ntp authenticate
no ntp authenticate

Mode Global Configuration

Example To enable NTP authentication, use the commands:

```
awplus# configure terminal
awplus(config)# ntp authenticate
```

To disable NTP authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authenticate
```

ntp authentication-key

This command defines each of the authentication keys. Each key has a key number, a type, and a value. Currently, the only key type supported is MD5.

The **no** variant of this disables the authentication key assigned previously using **ntp authentication-key**.

Syntax `ntp authentication-key <keynumber> md5 <key>`
`no ntp authentication-key <keynumber> md5 <key>`

Parameter	Description
<code><keynumber></code>	<code><1-4294967295></code> The key number.
<code><key></code>	The authentication key.

Mode Global Configuration

Example To define an authentication key number 134343 and a key value `mystring`, use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value `mystring`, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authentication-key 134343 md5 mystring
```

ntp broadcastdelay

Use this command to set the estimated round-trip delay for broadcast packets.

Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

Syntax `ntp broadcastdelay <delay>`
`no ntp broadcastdelay`

Parameter	Description
<code><delay></code>	<code><1-999999></code> The broadcast delay in microseconds.

Default 0 microsecond offset, which can only be applied with the **no** variant of this command.

Mode Global Configuration

Example To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

ntp master

Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source. Note that no stratum number is set by default.

Use the **no** variant of this command to stop the device being the designated NTP server.

Syntax `ntp master [<stratum>]`
`no ntp master`

Parameter	Description
<stratum>	<1-15> The stratum number defines the configured level that is set for this master within the NTP hierarchy.

Mode Global Configuration

Usage The stratum number is null by default and must be set using this command. The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: www.ntp.org/

Examples To stop the switch from being the designated NTP server use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the switch the designated NTP server with stratum number 2 use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

ntp peer

Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

Syntax

```
ntp peer {<peeraddress>|<peername>}
ntp peer {<peeraddress>|<peername>}
    [prefer] [key <key>] [version <version>]
no ntp peer {<peeraddress>|<peername>}
```

Parameter	Description
<peeraddress>	Specify the IP address of the peer, entered in the form A . B . C . D for an IPv4 address, or in the form X : XX . X for an IPv6 address.
<peername>	Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.
prefer	Prefer this peer when possible.
key <key>	<1-4294967295> Configure the peer authentication key.
version <version>	<1-4> Configure for this NTP version.

Mode Global Configuration

Examples See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv4 address of 192.0.2.23:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
awplus(config)# ntp peer 192.0.2.23 prefer
awplus(config)# ntp peer 192.0.2.23 prefer version 4
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4
awplus(config)# ntp peer 192.0.2.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv6 address of 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
awplus(config)# ntp peer 2001:0db8:010d::1 prefer
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4 key
1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4 key 1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4
awplus(config)# ntp peer 2001:0db8:010d::1 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

Related Commands [ntp server](#)
[ntp source](#)

ntp server

Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa.

Use the **no** variant of this command to remove the configured NTP server.

Syntax

```
ntp server {<serveraddress>|<servername>}
ntp server {<serveraddress>|<servername>}
    [prefer] [key <key>] [version <version>]
no ntp server {<serveraddress>|<servername>}
```

Parameter	Description
<serveraddress>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.
<servername>	Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.
prefer	Prefer this server when possible.
key <key>	<1-4294967295> Configure the server authentication key.
version <version>	<1-4> Configure for this NTP version.

Mode Global Configuration

Examples See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv4 address of 192.0.1.23:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
awplus(config)# ntp server 192.0.1.23 prefer
awplus(config)# ntp server 192.0.1.23 prefer version 4
awplus(config)# ntp server 192.0.1.23 prefer version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4
awplus(config)# ntp server 192.0.1.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.1.23, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp server 192.0.1.23
```

See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv6 address of 2001:0db8:010e::2:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
awplus(config)# ntp server 2001:0db8:010e::2 prefer
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
                    key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4 key 1234
awplus(config)# ntp server 22001:0db8:010e::2 version 4
awplus(config)# ntp server 2001:0db8:010e::2 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010e::2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

Related Commands [ntp peer](#)
 [ntp source](#)

ntp source

Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

Syntax `ntp source <source-address>`

`no ntp source`

Parameter	Description
<code><source-address></code>	Specify the IP address of the NTP source interface, entered in the form A . B . C . D for an IPv4 address, or in the form X : X : : X . X for an IPv6 address.

Default An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or is an invalid IP address.

Mode Global Configuration

Usage Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server determined by the **ntp peer** and **ntp server** commands.

Examples To configure the NTP source interface with the IPv4 address 192.0.1.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.1.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

Related Commands [ntp peer](#)
[ntp server](#)

ntp trusted-key

This command defines a list of trusted authentication keys. If a key is trusted, this system will be ready to synchronize to a system that uses this key in its NTP packets.

Use the **no** variant of this command to remove a configured trusted authentication key.

Syntax `ntp trusted-key <1-4294967295>`
`no ntp trusted-key <1-4294967295>`

Parameter	Description
<code><1-4294967295></code>	The specific key number.

Mode Global Configuration

Example To define a trusted authentication key numbered 234675, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp trusted-key 234676
```

To remove the trusted authentication key numbered 234675, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp trusted-key 234676
```

show counter ntp

This command displays packet counters for NTP.

Syntax show counter ntp

Mode User Exec and Privileged Exec

Output **Figure 89-1: Example output from the show counter ntp command**

```
NTP counters
Pkts Sent           ..... 0
Pkts Received       ..... 70958
Pkts Processed      ..... 0
Pkts current version ..... 0
Pkts old version    ..... 0
Pkts unknown version ..... 0
Pkts access denied  ..... 70958
Pkts bad length     ..... 0
Pkts bad auth       ..... 0
Pkts rate exceed    ..... 0
```

Table 89-1: Parameters in the output from the show counter ntp command

Parameter	Description
Pkts Sent	Total number of NTP client and server packets sent by your device.
Pkts Received	Total number of NTP client and server packets received by your device.
Pkts Processed	The number of packets processed by NTP. NTP processes a packet once it has determined that the packet is valid by checking factors such as the packet's authentication, format, access rights and version.
Pkts current version	The number of version 4 NTP packets received.
Pkts old version	The number of NTP packets received that are from an older version, down to version 1, of NTP. NTP is compatible with these versions and processes these packets.
Pkts unknown version	The number of NTP packets received that are an earlier version than version 1, or a higher version than version 4. NTP cannot process these packets.
Pkts access denied	The number of NTP packets received that do not match any access list statements in the NTP access-groups. NTP drops these packets.
Pkts bad length	The number of NTP packets received that do not conform to the standard packet length. NTP drops these packets.
Pkts bad auth	The number of NTP packets received that failed authentication. NTP drops these packets. Packets can only fail authentication if NTP authentication is enabled with the ntp authenticate command.
Pkts rate exceed	The number of packets dropped because the packet rate exceeded its limits.

Example To display counters for NTP, use the command:

```
awplus# show counter ntp
```

show ntp associations

Use this command to display the status of NTP associations. Use the detail option for displaying detailed information about the associations.

Syntax show ntp associations [detail]

Mode User Exec and Privileged Exec

Example See the sample output of the **show ntp associations** and **show ntp associations detail** commands displaying the status of NTP associations.

Figure 89-2: Example output from the show ntp associations command

```
awplus#show ntp associations

Introduction

This chapter describes the Dynamic Host Configuration Protocol (DHCP) support provided by your device. This includes how to configure your device to:

- act as a DHCP and BOOTP server
- act as a DHCP relay agent
- use the DHCP client to obtain IP addresses for its own interfaces

Note that you can configure your device to operate as both a DHCP relay agent and a DHCP/BOOTP server.

BOOTP

Bootstrap Protocol (BOOTP) is a UDP-based protocol that enables a booting host to dynamically configure itself without external interventions. A BOOTP server responds to requests from BOOTP clients for configuration information, such as the IP address the client should use. BOOTP is defined in RFC 951, Bootstrap Protocol (BOOTP).

RFC 1542, Clarifications and Extensions for the Bootstrap Protocol, defines extensions to the BOOTP protocol, including the behavior of a DHCP relay agent.

DHCP

DHCP is widely used to dynamically assign host IP addresses from a centralized server that reduces the overhead of administrating IP addresses. DHCP helps conserve the limited IP address space because IP addresses no longer need to be permanently assigned to hosts. DHCP centrally manages IP address assignment for a large number of subscribers.

DHCP is based on BOOTP, and is defined in RFC 2131. It extends the BOOTP mechanism by providing:

- a method for passing configuration information to hosts on a TCP/IP network
- automatic allocation of reusable network addresses
- other additional configuration options

When your device is configured as a DHCP server, it allocates IP addresses and other IP configuration parameters to clients (hosts), when the client requests them. This lets you configure your IP network without manually configuring every client. Note that each client must also be configured to receive its IP address automatically.

As well as addresses, a DHCP server assigns a wide range of parameters to clients, including subnet information and mask, domain and hostname, server addresses, keepalive times, MTUs, boot settings, encapsulation settings, time settings, and TCP settings.

DHCP is designed to interoperate with BOOTP clients and DHCP clients, without the BOOTP clients needing any change to their initialization software.

DHCP Relay Agents

DHCP relay agents pass BOOTP and DHCP messages between servers and clients. Networks where the DHCP or BOOTP server does not reside on the same IP subnet as its clients need the intermediate routers to act as relay agents. A maximum number of 400 DHCP relay agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP relay agents will not be successful.

Configuring the DHCP Server

The DHCP server uses **address pools** when responding to DHCP client requests. Address pools contains specific IP configuration details that the DHCP server can allocate to a client. You can configure multiple address pools on the device for different networks.

Note that you cannot configure DHCP Server and DHCP Relay on the same device.

To configure a pool, you must:

- **Create the Pool** and enter its configuration mode.
- **Define the Network** the pool applies to.
- **Define the Range** of IP addresses that the server can allocate to clients. You can specify multiple address ranges for each pool.
- **Set the Lease** for the clients. This defines whether the clients receive a dynamic, permanent, or static IP address.
- **Set the Options** (standard and user-defined) that the clients of a pool require when configuring their IP details.

After configuring the address pools, you can then enable the DHCP server by using the command:

```
awplus(config)# service dhcp-server
```

For networks where you do not want the server to respond to BOOTP requests, you can configure the DHCP server so that it ignores them, by using the command:

```
awplus(config)# ip dhcp bootp ignore
```

Create the Pool

A DHCP pool is identified by a name. To create a DHCP pool and enter the DHCP Configuration mode for the pool, use the command:

```
awplus(config)# ip dhcp pool <pool-name>
awplus(dhcp-config)#
```

Define the Network

Define the network that the DHCP clients are in. You can define one network per address pool. Use the following command to define the network after defining the DHCP pool first:

```
awplus(dhcp-config)# network
```

- For remote clients, set the network address to the network of the remote clients. The **network** command does not need to match a specific interface's network, because the DHCP server listens on all IP interfaces for DHCP requests.
- For locally connected clients, ensure that the desired interface has an IP address and subnet mask defined; use the **ip address IPADDR** command to set a static address. Enter the configuration mode for the pool, and set the DHCP address pool's network to match the interface's network. Pools that span multiple interfaces are possible only if the interface networks are contiguous.

Define the Range

Configure an IP address range for the pool. This range must be in the same subnet as the pool's network setting. Use the command:

```
awplus(dhcp-config)# range <ip-address> [<ip-address>]
```

The first IPv4 address specifies the **low end of the range, while the second IP address is the high end**. You can set the range to a single IP address by specifying only one IP address.

Set the Lease

The DHCP server assigns IP settings to hosts for specific times (the lease time). Each DHCP pool has one lease time setting. You can use DHCP to allocate the following types of addresses:

- A **dynamic** IP addresses
These are available to a host for a limited amount of time. When the lease expires, the server can reallocate the IP address to another device. To set the lease time for the DHCP pool so that it assigns dynamic IP addresses, use the command:

```
awplus(dhcp-config)# lease <days> <hours> <minutes>
[ <seconds>]
```

- A **permanent** IP addresses
These are available to a host for an unlimited amount of time. To set the lease time to assign permanent IP addresses, use the command:

```
awplus(dhcp-config)# lease infinite
```

- A **static** IP addresses
These are allocated to a particular client. The DHCP server recognizes the client by its MAC address. This lets you use DHCP to manage most of your network automatically, while having unchanging IP addresses on key devices such as servers. To assign a static IP address to a device, use the command:

```
awplus(dhcp-config)# host <ip-address> <mac-address>
```

BOOTP requests can be satisfied by pools with leases set to infinity.

Enable DHCP Leasequery

The DHCP Leasequery protocol (RFC 4388) allows a device or process, for example a DHCP relay agent, to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

DHCPLEASEQUERY messages support three query regimes:

- IP address
Only an IP address is supplied in the DHCPLEASEQUERY message. The DHCP server will return any information that it has on the most recent client to have been assigned that IP address.
- MAC address
Only a MAC address is supplied in the DHCPLEASEQUERY message. The DHCP server will return any information that it has on the IP address most recently accessed by a client with that MAC address. Also, the DHCP server may supply additional IP addresses that have been associated with that MAC address in different subnets.
- Client identifier option
Only a Client identifier option is supplied in the DHCPLEASEQUERY message. The DHCP server will return any information that it has on the IP address most recently accessed by a client with that Client identifier. Also, the DHCP server may supply additional IP addresses that have been associated with Client identifier in different subnets.

An AlliedWare Plus DHCP server implementing DHCP Leasequery supports all three query regimes.

If the DHCP Leasequery feature is enabled, when a DHCP relay agent needs to know the location of an IP endpoint and sends a DHCPLEASEQUERY message, the DHCP server will reply with either a DHCPLEASEACTIVE, DHCPLEASEUNASSIGNED, or DHCPLEASEUNKNOWN message.

When the DHCP server replies to a DHCPLEASEQUERY message:

- a DHCPLEASEACTIVE message allows the DHCP relay agent to determine the IP endpoint location and the remaining duration of the IP address lease
- a DHCPLEASEUNASSIGNED message indicates that there is no current active lease for the IP address, but the DHCP server does manage that IP address
- a DHCPLEASEUNKNOWN message indicates that the DHCP server supports DHCP Leasequery but has no knowledge of the query information specified in the DHCPLEASEQUERY message (e.g., IP address, MAC address, or Client identifier option)

To enable the DHCP Leasequery feature, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable the DHCP Leasequery feature, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

To display information about DHCP Leasequery messages, use either of the commands:

```
awplus# show counter dhcp-server
awplus# show ip dhcp server statistics
```

To display information about the current configuration of the DHCP server, including whether the DHCP server is configured to support DHCP Leasequery, use the command:

```
awplus# show ip dhcp server summary
```

Set the Options

DHCP allows clients to receive options from the DHCP server. Options describe the network configuration, and various services that are available on the network. Options are configured separately on each DHCP pool. You can configure both standard predefined options and user-defined options for a DHCP pool.

To create a user-defined option, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option <1-254> [name <option-
name>] [<option-type>]
```

To add a user-defined option to a DHCP address pool, use the command sequence:

```
awplus(config)# ip dhcp pool <pool-name>
awplus(dhcp-config)# option [<1-254>|<option-name>]
<option-value>
```

It is possible to add a user-defined option with the same number as an existing predefined option. If this situation occurs, the user-defined option takes precedence—that is, it overrides but does not eliminate the standard option.

You can set some pre-defined options using the following commands:

To set a subnet mask (option 1) for the address pool, use the command:

```
awplus(dhcp-config)# subnet-mask <mask>
```

To add a domain name (option 15) for the address pool, use the command:

```
awplus(dhcp-config)# domain-name <domain-name>
```

To add a default router (option 3) for the address pool, use the command:

```
awplus(dhcp-config)# default-router <ip-address>
```

To add a DNS server (option 6) for the address pool, use the command:

```
awplus(dhcp-config)# dns-server <ip-address>
```

DHCP Lease Probing

Probing is used by the DHCP server to check whether an IP address it wants to lease to a client is already being used by another host. Probing is configured on a per-DHCP pool basis. You can specify probing either by ICMP Echo Request (ping) or by ARPing. ARP probing is useful in networks where ICMP may be blocked on some devices, whereas ARP is always supported. ARP and ping probing are mutually exclusive and cannot operate concurrently within a DHCP pool.

Probing is enabled by default when a DHCP pool is created.

To enable probing if probing has previously been disabled for a DHCP pool, enter the configuration mode for the pool with the **ip dhcp pool** command and then use the command:

```
awplus(dhcp-config)# probe enable
```

The default probe type is ping. To specify the probe type as ARP, enter the configuration mode for the pool and then use the command:

```
awplus(dhcp-config)# probe type arp
```

To set the timeout value in milliseconds to wait for a response after each probe packet is sent, use the command:

```
awplus(dhcp-config)# probe timeout <50-5000>
```

To specify the number of packets sent for each lease probe, use the command:

```
awplus(dhcp-config)# probe packets <0-10>
```

To disable probing for a DHCP pool, enter the configuration mode for the pool and then use the command:

```
awplus(dhcp-config)# no probe enable
```

To display the lease probe configuration settings for a specific DHCP pool or for all DHCP pools configured on the device, use the command:

```
awplus# show ip dhcp pool [<address-pool>]
```

DHCP Relay Agent Introduction

DHCP relay agents pass BOOTP messages between servers and clients. Networks where the DHCP or BOOTP server does not reside on the same IP subnet as its clients need the routers attached to the subnet to act as DHCP relay agents.

Note that both BOOTP and DHCP use BOOTP messages, allowing DHCP relay agents to relay all their packets.

Your device's DHCP Relay Agent relays these message types:

- BOOTREQUEST messages originating from any of the device's interfaces to a user-defined destination
- BOOTREPLY messages addressed to BOOTP clients on networks directly connected to the device

The DHCP relay agent ignores BOOTREPLY messages addressed to clients on networks not directly connected to the device. The device treats these as ordinary IP packets for forwarding.

A BOOTREQUEST message is relayed via unicast.

The hops field in a BOOTP message records the number of DHCP relay agents the message has been through. If the value of the hops field exceeds a predefined threshold, the DHCP relay agent discards the message.

Configuring the DHCP Relay Agent

To enable the DHCP relay agent on your device, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

Note DHCP relay agent is enabled by default on your switch. You only need to enter a `service dhcp-relay` command if DHCP relay agent is disabled on your switch.

You must define a relay destination on one of the device's interfaces before the relay agent can relay packets. This is the path to the DHCP server. To define a relay destination on the currently specified interface, use the commands:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay server-address {<ipv4-
address>| <ipv6-address> <server-
interface>}
```

You can define more than one relay destination on your device. The following table describes how the DHCP relay agent forwards the packets.

If an interface has...	Then the relay agent relays BOOTP packets it receives on that interface to...
one relay destination defined	the relay destination.
multiple relay destinations defined	each defined relay destination.

To delete a DHCP relay destination, use the command:

```
awplus(config-if)# no ip dhcp-relay server-address {<ipv4-  
address>| <ipv6-address> <server-interface>}
```

See the [ip dhcp-relay server-address command on page 91.24](#) and the [service dhcp-relay command on page 91.38](#) for command description and command examples. DHCP servers with IPv4 and IPv6 addresses are configured with [ip dhcp-relay server-address](#).

When the 'hops' field in a BOOTP message exceeds a predefined threshold the BOOTP message is discarded. The default of the threshold is 10. To set the threshold, use the command:

```
awplus(config-if)# ip dhcp-relay maxhops <1-255>
```

To display the current configuration of the DHCP relay agent, use the command:

```
awplus# show ip dhcp-relay [interface <interface-name>]
```

DHCP Relay Agent Information Option (Option 82)

You can use DHCP Relay Agent Information Option (Option 82) to protect your switch from spoofing attacks, where untrusted hosts send requests for IP addresses to access the network. The switch relays these requests to DHCP servers and the servers send IP address leases in response. Untrusted hosts then use these IP addresses for spoofing attacks. Option 82 provides information about the location of a DHCP client for the DHCP server.

Enabling the DHCP Relay Agent Information Option feature on the switch allows the switch to insert extra information into the DHCP packets that it is relaying. This information enables accurate identification of a subscriber, as it states which interface on which relay switch the subscriber is connected to. The information is stored in an optional field in the DHCP packet header, the relay agent-information option field, with the option ID 82.

The DHCP relay agent inserts the Option 82 information into the DHCP packets that it is relaying to a DHCP server. DHCP servers that are configured to recognize Option 82 may use the information to implement IP addresses, or other parameter assignment policies, based on the network location of the client device. Alternatively, the server can simply log this information to create a detailed audit trail of the locations of the clients to which given addresses were allocated at given times.

If Option 82 insertion is enabled, then the DHCP packet flow is as follows:

- The DHCP client generates a DHCP request and broadcasts it on the network.
- The DHCP relay agent intercepts the broadcast DHCP request packet and inserts the Option 82 field in the packet.
- The DHCP relay agent unicasts the DHCP request that includes the Option 82 field to the DHCP server.
- The DHCP server receives the packet.
- If the DHCP server supports Option 82, then it echoes the Option 82 field in the DHCP reply. If the server does not support Option 82, it ignores the option and does not echo it in the reply.
- The DHCP server unicasts the reply to the relay agent.
- The relay agent removes the Option 82 field and forwards the packet to the switch port connected to the DHCP client that sent the DHCP request.

For information about DHCP Relay Agent Information Option (Option 82), see RFC 3046.

To enable the relay agent to insert its details into the Option 82 field in requests received from clients on a particular interface, use the command:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay agent-option
```

The Option 82 field contains sub-options. You can specify a value for the Remote ID sub-option, which contains information that identifies the host. To specify a value for the Remote ID, use the command:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay agent-option remote-id
<remote-id>
```

If a Remote ID value is not specified, the Remote ID sub-option is set to the switch's MAC address. You can also configure the Remote ID value as an alphanumeric string.

Note that the Option 82 agent information added by DHCP Relay differs from the information inserted by DHCP snooping (see **"DHCP Relay Agent Option 82" on page 80.4**).

Dealing with client-originated packets that already contain Option 82 information

It is possible that the requests arriving from the clients to the relay agent could already contain Option 82 data. There are two main circumstances in which this can occur:

1. A client is maliciously inserting bogus information into the packet in an attempt to subvert the process of identifying the client's location. In this case, you would want to drop the packets that contain the bogus information (or remove bogus information).
2. A Layer 2 DHCP snooping switch, that sits between the clients and the DHCP relay, is validly inserting the Option 82 information into the packets. The DHCP snooping switch is not acting as a relay agent, but is inserting the Option 82 information. In this case, you would want to forward the valid information to the DHCP server.

The action taken on packets with an Option 82 field is configurable. The command to configure this action is shown below:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay information policy
                    [append|drop|keep|replace]
```

This command sets the action that the DHCP relay should take when a received DHCP client request contains Option 82 information.

This command takes parameters that can configure the switch to:

- Leave the existing Option 82 field untouched (`keep` parameter)
- Append its own Option 82 field after the existing field (`append` parameter - use this when there is a trusted DHCP Snooping switch or another relay device between the clients and the DHCP Relay)
- Drop the packet (`drop` parameter)
- Replace the existing Option 82 information with its own (the default - `replace` parameter).

See the [ip dhcp-relay information policy](#) command on page 91.19 for a command description and command examples.

Checking Option 82 information in DHCP Server Responses

To configure the switch to check for Option 82 information in DHCP packets from servers, configure DHCP-relay agent-option checking with the Interface Configuration command:

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay agent-option checking
```

This command enables the DHCP Relay Agent to check Option 82 information in response packets returned from DHCP servers. If the information does not match the information it has configured for its own client (downstream) interface then the DHCP relay agent drops the packet.

See the [ip dhcp-relay agent-option checking](#) command on page 91.17 for a command description and command examples.

Option 82 maximum message length

Where a DHCP Relay (that has Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the Option 82 data, the DHCP relay will increase the packet size to accommodate the Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, of the [ip dhcp-relay max-message-length](#) command then the DHCP relay will drop the packet.

```
awplus(config)# interface <interface-name>
awplus(config-if)# ip dhcp-relay max-message-length <548-1472>
```

DHCPv6 Relay Agent Notification for DHCPv6 PD

DHCPv6 relay agent notification for DHCPv6 PD (prefix delegation) allows the switch configured as a DHCPv6 relay agent to find prefix delegation options by reviewing DHCPv6 RELAY-REPLY packets that are relayed by the DHCPv6 relay agent to the DHCPv6 client.

When a DHCPv6 prefix delegation option is found by the DHCPv6 relay agent, the DHCPv6 relay agent extracts information about the prefix being delegated to and inserts an IPv6 route matching the DHCPv6 prefix delegation information.

Future packets destined for that prefix sent through the DHCPv6 relay agent are forwarded based on information contained in the DHCPv6 prefix delegation information.

The IPv6 route is left in the routing table until the DHCPv6 prefix delegation lease time expires, or the DHCPv6 relay agent receives a release packet from the DHCPv6 client to release the DHCPv6 prefix delegation. No user configuration is required for this functionality. The DHCPv6 relay agent automatically manages IPv6 routes.

The IPv6 routes are added when the DHCPv6 relay agent relays a RELAY-REPLY packet. The DHCPv6 relay agent deletes the IPv6 routes when the DHCPv6 prefix delegation lease time expires, or the DHCPv6 relay agent receives a release packet from the DHCPv6 client. An IPv6 route in the routing table of the DHCPv6 relay agent is updated when the DHCPv6 prefix delegation lease time is extended.

This functionality leaves an IPv6 route on the routing table of the DHCPv6 relay agent. This IPv6 address allows unicast reverse packet forwarding (RPF) to work by allowing the switch to confirm that the IPv6 address on the DHCPv6 relay agent is not spoofed.

IPv6 routes are removed when a DHCP-DECLINE message is sent by the DHCPv6 client to the DHCPv6 relay agent.

Configuring the DHCP Client

You can configure an interface on your device with a static IP address, or with a dynamic IP address assigned using your device's DHCP client. When you use the DHCP client, it obtains the IP address for the interface, and other IP configuration parameters, from a DHCP server. To configure an interface and gain its IP configuration using the DHCP client, use the command:

```
awplus(config)# interface <ifname>
awplus(config-if)# ip address dhcp [client-id <interface>]
                    [hostname <hostname>]
```

The DHCP client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6—a list of DNS servers. This list appends the DNS servers set on your device with the **ip name-server** command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the **ip domain-name** command. Your device ignores this domain name if it has a domain list set using the **ip domain-list** command.
- Option 51—lease expiration time.

If an IP interface is configured to get its IP address and subnet mask from DHCP, the interface does not take part in IP routing until the IP address and subnet mask have been set by DHCP.

For information on configuring a static IP address on an interface, see the **ip address** command on page 27.16.

Clearing Dynamically Allocated Lease Bindings

A lease binding is the mapping of an IP address to a physical address. To clear dynamically allocated lease bindings, use the command:

```
awplus# clear ip dhcp binding {ip <ip-address>|mac <mac-
                               address>|all|pool <pool-name>|range <low-ip-address>
                               <high-ip-address>}
```

You have the option to clear either a specific lease binding, specified by IP or MAC address, or to clear several lease bindings at once. The options for clearing multiple lease bindings are:

- **all**, to clear all DHCP bindings
- **pool**, to clear a specific DHCP server address pool
- **range**, to clear a range of DHCP clients

Command List

This chapter provides an alphabetical reference for commands used to configure DHCP. For more information, see [Chapter 90, Dynamic Host Configuration Protocol \(DHCP\) Introduction](#).

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

bootfile

This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

Syntax `bootfile <filename>`

`no bootfile`

Parameter	Description
<filename>	The boot file name.

Mode DHCP Configuration

Example To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

clear ip dhcp binding

This command clears either a specific lease binding or the lease bindings specified by the command. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

Syntax `clear ip dhcp binding {ip <ip-address>|mac <mac-address>|all|pool <pool-name>|range <low-ip-address> <high-ip-address>}`

Parameter	Description
<code>ip <ip-address></code>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.
<code>mac <mac-address></code>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.
<code>all</code>	All DHCP bindings.
<code>pool <pool-name></code>	Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".
<code>range <low-ip-address> <high-ip-address></code>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.

Mode User Exec and Privileged Exec

Usage A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

Examples To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

Related Commands [show ip dhcp binding](#)

default-router

This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

Syntax `default-router <ip-address>`
`no default-router [<ip-address>]`

Parameter	Description
<code><ip-address></code>	IPv4 address of the default router, in dotted decimal notation.

Mode DHCP Configuration

Examples To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

dns-server

This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the [option command on page 91.30](#), then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

Syntax `dns-server <ip-address>`
`no dns-server [<ip-address>]`

Parameter	Description
<code><ip-address></code>	IPv4 address of the DNS server, in dotted decimal notation.

Mode DHCP Configuration

Examples To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

Related Commands [default-router](#)
[option](#)
[service dhcp-server](#)
[show ip dhcp pool](#)
[subnet-mask](#)

domain-name

This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15. Note that if you add a user-defined option 15 using the [option command on page 91.30](#), then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

Syntax domain-name <domain-name>

no domain-name

Parameter	Description
<domain-name>	The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode DHCP Configuration

Examples To add the domain name `Nerv_Office` to DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name `Nerv_Office` from DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

Related Commands [default-router](#)
[dns-server](#)
[option](#)
[service dhcp-server](#)
[show ip dhcp pool](#)
[subnet-mask](#)

host

This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

Syntax `host <ip-address> <mac-address>`

`no host <ip-address>`

`no host all`

Parameter	Description
<code><ip-address></code>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<code><mac-address></code>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH

Mode DHCP Configuration

Usage Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

Examples To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

Related Commands

- [lease](#)
- [range](#)
- [show ip dhcp pool](#)

ip address dhcp

This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1 - the subnet mask for your device.
- Option 3 - a list of default routers.
- Option 6 - a list of DNS servers. This list appends the DNS servers set on your device with the [ip name-server](#) command.
- Option 15 - a domain name used to resolve host names. This option replaces the domain name set with the [ip domain-name](#) command. Your device ignores this domain name if it has a domain list set using the [ip domain-list](#) command.
- Option 51 - lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

Syntax `ip address dhcp [client-id <interface>] [hostname <hostname>]`
`no ip address dhcp`

Parameter	Description
<code><interface></code>	The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field. Default: no default
<code><hostname></code>	The hostname for the DHCP client on this interface. Typically this name is provided by the ISP. Default: no default

Mode Interface Configuration for a VLAN interface.

Examples To set the interface `vlan10` to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
```

To stop the interface `vlan10` from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip address dhcp
```

Related Commands [ip address](#)

Validation Commands [show running-config](#)
[show running-config access-list](#)

ip dhcp bootp ignore

This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

Syntax ip dhcp bootp ignore
no ip dhcp bootp ignore

Mode Global Configuration

Examples To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

Related Commands [show ip dhcp server summary](#)

ip dhcp leasequery enable

Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see [“Enable DHCP Leasequery” on page 90.6](#).

Syntax ip dhcp leasequery enable
no ip dhcp leasequery enable

Default DHCP leasequery support is disabled by default.

Mode Global Configuration

Examples To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

Related Commands [show counter dhcp-server](#)
[show ip dhcp server statistics](#)
[show ip dhcp server summary](#)

ip dhcp option

This command creates a user-defined DHCP option. You can then use this option when configuring a DHCP pool, by using the **option** command. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

Syntax `ip dhcp option <1-254> [name <option-name>] [<option-type>]`
`no ip dhcp option [<1-254>|<option-name>]`

Parameter	Description										
<code><1-254></code>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.										
<code><option-name></code>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default										
<code><option-type></code>	The option value. You must specify a value that is appropriate to the option type: <table border="1"> <tbody> <tr> <td><code>ascii</code></td> <td>An ASCII text string</td> </tr> <tr> <td><code>hex</code></td> <td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td> </tr> <tr> <td><code>ip</code></td> <td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.</td> </tr> <tr> <td><code>integer</code></td> <td>A number from 0 to 4294967295.</td> </tr> <tr> <td><code>flag</code></td> <td>A value that either sets (to 1) or unsets (to 0) a flag: true, on, or enabled will set the flag false, off or disabled will unset the flag.</td> </tr> </tbody> </table>	<code>ascii</code>	An ASCII text string	<code>hex</code>	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	<code>ip</code>	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.	<code>integer</code>	A number from 0 to 4294967295.	<code>flag</code>	A value that either sets (to 1) or unsets (to 0) a flag: true, on, or enabled will set the flag false, off or disabled will unset the flag.
<code>ascii</code>	An ASCII text string										
<code>hex</code>	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.										
<code>ip</code>	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.										
<code>integer</code>	A number from 0 to 4294967295.										
<code>flag</code>	A value that either sets (to 1) or unsets (to 0) a flag: true, on, or enabled will set the flag false, off or disabled will unset the flag.										

Mode Global Configuration

Examples To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

Related Commands

- [subnet-mask](#)

ip dhcp pool

This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the switch will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

Syntax `ip dhcp pool <pool-name>`
`no ip dhcp pool <pool-name>`

Parameter	Description
<code><pool-name></code>	Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode Global Configuration

Example To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

Related Commands [service dhcp-server](#)

ip dhcp-relay agent-option

This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent then strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see [“DHCP Relay Agent Introduction” on page 90.9.](#) and [“DHCP Relay Agent Information Option \(Option 82\)” on page 90.10](#)

 **Note** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands **ip dhcp-relay agent-option** and **ip dhcp-relay information policy** have been configured.

Syntax `ip dhcp-relay agent-option`
`no ip dhcp-relay agent-option`

Default DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage Use this command to alter the DHCP Relay Agent Option 82 setting when your switch is the first hop for the DHCP client. To limit the maximum length of the packet, use the **ip dhcp-relay max-message-length** command.

This command cannot be enabled if DHCP snooping is enabled on your switch (**service dhcp-snooping** command on page 81.24), and vice versa.

Examples To make the DHCP Relay Agent listening on `vlan15` append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# no ip dhcp-relay agent-option
```

Related Commands **ip dhcp-relay agent-option remote-id**
ip dhcp-relay information policy
ip dhcp-relay max-message-length
service dhcp-relay

ip dhcp-relay agent-option checking

This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that **ip dhcp-relay agent-option** must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (**ip dhcp-relay agent-option**), and
- DHCP Relay Agent is enabled on the switch (**service dhcp-relay**)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see **“DHCP Relay Agent Introduction” on page 90.9.** and **“DHCP Relay Agent Information Option (Option 82)” on page 90.10**

Syntax ip dhcp-relay agent-option checking
no ip dhcp-relay agent-option checking

Mode Interface Configuration for a VLAN interface.

Examples To make the DHCP Relay Agent listening on `vlan10` check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on `vlan10` from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay agent-option checking
```

Related Commands **ip dhcp-relay agent-option**
ip dhcp-relay agent-option remote-id
ip dhcp-relay information policy
service dhcp-relay

ip dhcp-relay agent-option remote-id

Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the switch's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see [“DHCP Relay Agent Introduction” on page 90.9.](#) and [“DHCP Relay Agent Information Option \(Option 82\)” on page 90.10](#)

Syntax `ip dhcp-relay agent-option remote-id <remote-id>`
`no ip dhcp-relay agent-option remote-id`

Parameter	Description
<code><remote-id></code>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

Default The Remote ID is set to the switch's MAC address by default.

Mode Interface Configuration for a VLAN interface.

Usage The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the switch ([service dhcp-relay](#))

Examples To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

Related Commands [ip dhcp-relay agent-option](#)
[ip dhcp-relay agent-option checking](#)
[show ip dhcp-relay](#)

ip dhcp-relay information policy

This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see [“DHCP Relay Agent Introduction” on page 90.9.](#) and [“DHCP Relay Agent Information Option \(Option 82\)” on page 90.10](#)

 **Note** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands **ip dhcp-relay agent-option** and **ip dhcp-relay information policy** have been configured.

Syntax `ip dhcp-relay information policy [append|drop|keep|replace]`
`no ip dhcp-relay information policy`

Parameter	Description
append	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
drop	The DHCP Relay Agent discards the packet.
keep	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
replace	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

Mode Interface Configuration for a VLAN interface.

Examples To make the DHCP Relay Agent listening on `vlan15` drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# no ip dhcp-relay information policy
```

Related Commands [ip dhcp-relay agent-option](#)
[ip dhcp-relay agent-option checking](#)
[service dhcp-server](#)

ip dhcp-relay maxhops

This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command negation command to reset the hop count to the default.

For DHCP Relay Agent introductory information, see [“DHCP Relay Agent Introduction” on page 90.9](#). For Option 82 introductory information, see [“DHCP Relay Agent Information Option \(Option 82\)” on page 90.10](#).

Syntax `ip dhcp-relay maxhops <1-255>`
`no ip dhcp-relay maxhops`

Parameter	Description
<1-255>	The maximum hop count value.

Default The default hop count threshold is 10 hops.

Mode Interface Configuration for a VLAN interface.

Example To set the maximum number of hops to 5 for packets received on interface `vlan15`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan15
awplus(config-if)# ip dhcp-relay maxhops 5
```

Related Commands [service dhcp-relay](#)

ip dhcp-relay max-message-length

This command applies when the switch is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent introductory information, see [“DHCP Relay Agent Introduction” on page 90.9](#). For Option 82 introductory information, see [“DHCP Relay Agent Information Option \(Option 82\)” on page 90.10](#).

Syntax `ip dhcp-relay max-message-length <548-1472>`
`no ip dhcp-relay max-message-length`

Parameter	Description
<code><548-1472></code>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

Default The default is 1400 bytes.

Mode Interface Configuration for a VLAN interface.

Usage Where a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a *request* packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

Note  Before setting this command, you must first run the **ip dhcp-relay agent-option** command on page 91.15. This will allow the DHCP Relay Agent Option 82 fields to be appended.

Example To set the maximum DHCP message length to 1200 bytes for packets arriving in interface `vlan7`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets

arriving in interface vlan7, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan7
awplus(config-if)# no ip dhcp-relay max-message-length
```

Related Commands [service dhcp-relay](#)

ip dhcp-relay server-address

This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

For DHCP Relay Agent introductory information, see [“DHCP Relay Agent Introduction” on page 90.9](#). For Option 82 introductory information, see [“DHCP Relay Agent Information Option \(Option 82\)” on page 90.10](#).

Syntax

```
ip dhcp-relay server-address {<ipv4-address>|
    <ipv6-address> <server-interface>}
no ip dhcp-relay server-address {<ipv4-address>|
    <ipv6-address> <server-interface>}
```

Parameter	Description
<i><ipv4-address></i>	Specify the IPv4 address of the DHCP server for DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<i><ipv6-address></i>	Specify the IPv6 address of the DHCPv6 server for DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<i><server-interface></i>	Specify the interface name of the DHCPv6 server. The interface name for the DHCPv6 server is only required for a DHCPv6 server with an IPv6 address not an IPv4 address.

Mode Interface Configuration for a VLAN interface.

Usage For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed before the DHCP Relay Agent relays DHCP client packets to a DHCP server.

Examples To enable the DHCP Relay Agent to relay DHCP packets on interface `vlan2` to the DHCP server with the IPv4 address `192.0.2.200`, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address `192.0.2.200` from the list of servers

available to the DHCP Relay Agent on interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface `vlan10` to the DHCP server with the IPv6 address `2001:0db8:010d::1` on interface `vlan20`, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
                    2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address `2001:0db8:010d::1` on interface `vlan20` from the list of servers available to the DHCP Relay Agent on interface `vlan10`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
                    2001:0db8:010d::1 vlan20
```

lease

This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the **option** command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

Syntax `lease <days> <hours> <minutes> [<seconds>]`
`lease infinite`
`no lease`

Parameter	Description
<code><days></code>	The number of days, from 0 to 120, that the lease expiry time is configured for. Default: 1
<code><hours></code>	The number of hours, from 0 to 24, that the lease expiry time is configured for. Default: 0
<code><minutes></code>	The number of minutes, from 0 to 60, the lease expiry time is configured for. Default: 0
<code><seconds></code>	The number of seconds, from 0 to 60, the lease expiry time is configured for.
<code>infinite</code>	The lease never expires.

Default The default lease time is 1 day.

Mode DHCP Configuration

Examples To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

Related Commands [option](#)
 [service dhcp-server](#)

network (DHCP)

This command sets the network (subnet) that the DHCP address pool applies to.

The **no** variant of this command removes the network (subnet) from the DHCP address pool.

Syntax `network {<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}`
`no network`

Parameter	Description
<code><ip-subnet-address/prefix-length></code>	The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.
<code><ip-subnet-address/mask></code>	The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation.

Mode DHCP Configuration

Usage This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring.

The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

Examples To configure a network for the address pool P2, where the subnet is 192.0.2.5 and the mask is 255.255.255.0, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

Related Commands [service dhcp-server](#)
[subnet-mask](#)

next-server

This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

Syntax `next-server <ip-address>`
`no next-server`

Parameter	Description
<code><ip-address></code>	The server IP address, entered in dotted decimal notation.

Mode DHCP Configuration

Example To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

option

This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

Syntax `option [<1-254>|<option-name>] <option-value>`
`no option [<1-254>|<option-value>]`

Parameter	Description
<code><1-254></code>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.
<code><option-name></code>	Option name associated with the option.
<code><option-value></code>	The option value. You must specify a value that is appropriate to the option type:
<code>hex</code>	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
<code>ip</code>	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.
<code>integer</code>	A number from 0 to 4294967295.
<code>flag</code>	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCP Configuration

Examples To add the ASCII-type option named `tftp-server-name` to the pool `P2` and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool `P2` and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option `179` to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

probe enable

Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

Syntax probe enable
no probe enable

Default Probing is enabled by default.

Mode DHCP Pool Configuration

Examples To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

Related Commands [ip dhcp pool](#)
[probe packets](#)
[probe timeout](#)
[probe type](#)
[show ip dhcp pool](#)

probe packets

Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

Syntax `probe packets <0-10>`
`no probe packets`

Parameter	Description
<code><0-10></code>	The number of probe packets sent.

Default The default is 5.

Mode DHCP Pool Configuration

Examples To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

Related Commands [probe enable](#)
[probe timeout](#)
[probe type](#)
[show ip dhcp pool](#)

probe timeout

Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

Syntax `probe timeout <50-5000>`
`no probe timeout`

Parameter	Description
<code><50-5000></code>	Timeout interval in milliseconds.

Default The default timeout interval is 200 milliseconds.

Mode DHCP Pool Configuration

Examples To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

Related Commands [probe enable](#)
[probe packets](#)
[probe type](#)
[show ip dhcp pool](#)

probe type

Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

Syntax `probe type {arp|ping}`

`no probe type`

Parameter	Description
arp	Probe using ARP.
ping	Probe using ping.

Default The default probe type is ping.

Mode DHCP Pool Configuration

Examples To set the probe type to `arp` for the pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool P2 to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

Related Commands

- `ip dhcp pool`
- `probe enable`
- `probe packets`

range

This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

Syntax

```
range <ip-address> [<ip-address>]
no range <ip-address> [<ip-address>]
no range all
```

Parameter	Description
<ip-address>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool.

Mode DHCP Configuration

Examples To add an address range of 192.0.2.5 to 192.0.2.16 to the pool `Nerv_Office`, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

Related Commands

- [ip dhcp pool](#)
- [service dhcp-server](#)
- [show ip dhcp pool](#)

route

This command allows the DHCP server to provide static routes to clients.

Syntax `route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}`

Parameter	Description
A.B.C.D/M	Subnet for the route
A.B.C.D	Next hop for the route
both	opt249 and rft3442
opt249	Classless static route option for DHCP
rfc3442	Classless static route option for DHCP

Mode DHCP Configuration

Examples To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool pubic
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

Related Commands [ip dhcp pool](#)

service dhcp-relay

This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

Syntax `service dhcp-relay`
`no service dhcp-relay`

Mode Global Configuration

Usage A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

Default The DHCP-relay service is enabled by default.

Examples To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

Replies In	The number of DHCP Reply messages received from servers.
Relayed To Server	The number of DHCP Request messages relayed to servers.
Relayed To Client	The number of DHCP Reply messages relayed to clients.
Out To Server Failed	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
Out To Client Failed	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
Invalid hlen	The number of incoming messages dropped due to an invalid hlen field.

Table 91-2: Parameters in the output of the show counter dhcp-relay

Parameter	Description
Bogus giaddr	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
Corrupt Agent Option	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
Missing Agent Option	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
Bad Circuit ID	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
Missing Circuit ID	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
Bad Remote ID	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
Missing Remote ID	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.

Table 91-2: Parameters in the output of the show counter dhcp-relay

Parameter	Description
Option Insert Failed	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: <ul style="list-style-type: none"> ■ the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the ip dhcp-relay information policy command. ■ there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.
Note that the following parameters are only used on the Global VRF Lite instance when DHCPv6 is running	
DHCPv6 Requests In	The number of incoming DHCPv6 Request messages.
DHCPv6 Replies In	The number of incoming DHCPv6 Reply messages.
DHCPv6 Relayed to Server	The number of DHCPv6 messages relayed to the server.
DHCPv6 Relayed to Client	The number of DHCPv6 messages relayed to the client.

show counter dhcp-server

This command shows counters for the DHCP server on your device.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax show counter dhcp-server

Mode User Exec and Privileged Exec

Example To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

Output Figure 91-3: Example output from the **show counter dhcp-server** command

```
DHCP server counters
DHCPDISCOVER in          ..... 20
DHCPREQUEST in           ..... 12
DHCPDECLINE in           .....  1
DHCPRELEASE in           .....  0
DHCPINFORM in            .....  0
DHCPOFFER out            .....  8
DHCPACK out               .....  4
DHCPNAK out               .....  0
BOOTREQUEST in           .....  0
BOOTREPLY out            .....  0
```

Table 91-3: Parameters in the output of the show counter dhcp-server command

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPDECLINE in	The number of Decline messages received by the DHCP server.
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.
DHCPNAK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.
BOOTREPLY out	The number of bootp messages sent by the DHCP server to bootp clients.

Related Commands **service dhcp-server**
show ip dhcp binding
show ip dhcp server statistics
show ip dhcp pool

show dhcp lease

This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show dhcp lease [<interface>]`

Parameter	Description
<code><interface></code>	Interface name to display DHCP lease details for.

Mode User Exec and Privileged Exec

Example To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan1, use the command:

```
awplus# show dhcp lease vlan1
```

Output **Figure 91-4: Example output from the show dhcp lease command**

```

Interface vlan1
-----
IP Address:                192.168.22.4
Expires:                   13 Mar 2007 20:10:19

Related Commands [ip address dhcp](#)

show ip dhcp binding

This command shows the lease bindings that the DHCP server has allocated clients.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ip dhcp binding [<ip-address>|<address-pool>]`

Parameter	Description
<code><ip-address></code>	IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address.
<code><address-pool></code>	Name of an address pool. This displays the lease information for all clients within the address pool.

Mode User Exec and Privileged Exec

Examples To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```
awplus# show ip dhcp binding MyPool
```

Output **Figure 91-5: Example output from the show ip dhcp binding command**

```
Pool 30_2_network Network 172.16.2.0/24

show ip dhcp pool

This command displays the configuration details and system usage of the DHCP address pools configured on the device.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ip dhcp pool [<address-pool>]`

Parameter	Description
<address-pool>	Name of a specific address pool. This displays the configuration of the specified address pool only.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip dhcp pool
```

Output **Figure 91-6: Example output from the show ip dhcp pool command**

```
Pool p1 :
network: 192.168.1.0/24
address ranges:
  addr: 192.168.1.10 to 192.168.1.18
static host addresses:
  addr: 192.168.1.12      MAC addr: 1111.2222.3333
lease <days:hours:minutes:seconds> <1:0:0:0>
subnet mask: 255.255.255.0 (pool's network mask)
Probe:
  Status:      Enabled      [Enabled]
  Type:        ARP          [Ping]
  Packets:     2            [5]
  Timeout:    200 msec     [200]
Dynamic addresses:
  Total:       8
  Leased:     2
  Utilization: 25.0 %
Static host addresses:
  Total:       1
  Leased:     1
```

Output **Figure 91-7: Example output from the show ip dhcp pool command with IP address 192.168.1.12 assigned to a VLAN interface on the device:**

```

Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
        (interface addr 192.168.1.12 excluded)
        (static host addr 192.168.1.12 excluded)
  static host addresses:
    addr: 192.168.1.12      MAC addr: 1111.2222.3333
        (= interface addr, so excluded)
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:      Default Values
    Status:    Enabled      [Enabled]
    Type:      ARP          [Ping]

    Utilization: 25.0 %
  Static host addresses:
    Total:     1
    Leased:    1
    
```

Table 91-4: Parameters in the output of the show ip dhcp pool command

Parameter	Description
Pool	Name of the pool.
network	Subnet and mask length of the pool.
address ranges	Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only. Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry.
static host addresses	The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry.
lease <days:hours:minutes>	The lease duration for address allocated by this pool.
domain	The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.
subnet mask	The subnet mask sent by the pool to clients.
Probe - Status	Whether lease probing is enabled or disabled.
Probe - Type	The lease probe type configured. Either ping or ARP.
Probe - Packets	The number of packets sent for each lease probe in the range 0 to 10.

Table 91-4: Parameters in the output of the show ip dhcp pool command(cont.)

Parameter	Description
Probe - Timeout	The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.
dns servers	The DNS server addresses sent to by the pool to clients.
default-router(s)	The default router addresses sent by the pool to clients.
user-defined options	The list of user-defined options sent by the pool to clients.
Dynamic addresses - Total	The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.
Dynamic addresses - Leased	The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.
Dynamic addresses - Utilization	The percentage of IP addresses in the pool that are currently dynamically allocated to clients.
Static host addresses - Total	The number of static IP addresses configured in the pool for specific DHCP client hosts.
Static host addresses - Leased	The number of static IP addresses assigned to specific DHCP client hosts.

show ip dhcp-relay

This command shows the configuration of the DHCP Relay Agent on each interface.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ip dhcp-relay [interface <interface-name>]`

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.

Mode User Exec and Privileged Exec

Example To display the DHCP Relay Agent's configuration on the interface `vlan100`, use the command:

```
awplus# show ip dhcp-relay interface vlan100
```

Output **Figure 91-8: Example output from the show ip dhcp-relay command**

```
DHCP Relay Service is enabled

vlan100 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

show ip dhcp server statistics

This command shows statistics related to the DHCP server.

You can display the server counters using the **show counter dhcp-server** command as well as with this command.

For information on output options, see **“Controlling “show” Command Output” on page 1.35.**

Syntax show ip dhcp server statistics

Mode User Exec and Privileged Exec

Example To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

Output **Figure 91-9: Example output from the show counter dhcp server statistics command**

```
DHCP server counters
DHCPDISCOVER in          ..... 20
DHCPREQUEST in          ..... 12
DHCPCDECLINE in         ..... 1
DHCPRELEASE in          ..... 0
DHCPINFORM in           ..... 0
DHCPOFFER out           ..... 8
DHCPACK out             ..... 4
DHCPNAK out             ..... 0
BOOTREQUEST in          ..... 0
BOOTREPLY out           ..... 0
DHCPLEASEQUERY in      ..... 0
DHCPLEASEUNKNOWN out   ..... 0
DHCPLEASEACTIVE out    ..... 0
DHCPLEASEUNASSIGNED out ..... 0
```

Figure 91-10: Parameters in the output of the show counter dhcp server statistics command

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPCDECLINE in	The number of Decline messages received by the DHCP server.
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.

Figure 91-10: Parameters in the output of the show counter dhcp server statistics command(cont.)

DHCPNAK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.
BOOTREPLY out	The number of bootp messages sent by the DHCP server to bootp clients.
DHCPLEASEQUERY in	The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.
DHCPLEASEUNKNOWN out	The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEACTIVE out	The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEUNASSIGNED out	The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.

Related Commands

- [service dhcp-server](#)
- [show ip dhcp binding](#)
- [show ip dhcp pool](#)

show ip dhcp server summary

This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the [show ip dhcp pool](#) command.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ip dhcp server summary`

Mode User Exec and Privileged Exec

Example To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

Output **Figure 91-11: Example output from the show ip dhcp server summary command**

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

Related Commands [ip dhcp leasequery enable](#)
[ip dhcp pool](#)
[service dhcp-server](#)

subnet-mask

This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the **option** command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the **next-server** command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

Syntax `subnet-mask <mask>`

`no subnet-mask`

Parameter	Description
<code><mask></code>	Valid IPv4 subnet mask, in dotted decimal notation.

Mode DHCP Configuration

Examples To set the subnet mask option to 255 . 255 . 255 . 0 for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

DHCPv6 Introduction

This chapter describes the Dynamic Host Configuration Protocol for IPv6 (DHCPv6), including Prefix Delegation (PD) support, provided by your switch. It includes sample configurations to configure your switch as a DHCPv6 Server to pass configuration information to IPv6 clients, and for configuring the switch as a DHCPv6 Client, to request IPv6 addresses from a DHCPv6 Server. This chapter also includes sample configurations to configure your switch for DHCPv6 Prefix Delegation and DHCPv6 Relay Agent features.

DHCPv6 is specified in RFC 3315 “Dynamic Host Configuration Protocol for IPv6 (DHCPv6)”. IPv6 Prefix Delegation is specified in RFC 3769 “Requirements for IPv6 Prefix Delegation”. DHCPv6 Prefix Delegation is specified in RFC 3633 “IPv6 Prefix Options for Dynamic Host Configuration Protocol (DHCP) version 6”.

See the section [DHCPv6 Messages](#) for the sequence of messages sent and received between DHCPv6 Servers and DHCPv6 Clients and brief descriptions of the messages.

For the syntaxes, parameters, descriptions, defaults, and examples for all of the commands used in sample DHCPv6 configurations, refer to [Chapter 93, DHCP for IPv6 \(DHCPv6\) Commands](#) for the DHCPv6 Client Server PD commands and [Chapter 91, Dynamic Host Configuration Protocol \(DHCP\) Commands](#) for the DHCPv6 Relay commands.

 **Note** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

DHCPv6 for IPv6

DHCPv6 is used to delegate IPv6 prefixes and to allocate IPv6 addresses. It offers stateful address autoconfiguration, and complements Stateless Address Autoconfiguration (SLAAC) described in RFC 2462, IPv6 Stateless Address Autoconfiguration. Stateless Address Autoconfiguration (SLAAC) allows an IPv6-aware device to be plugged into a network, and given an IPv6 address prefix without manual configuration.

- DHCPv6 Clients first use RA messages to auto-configure themselves with any default IPv6 route(s) via gateway router(s).
- A DHCPv6 Client can then initiate DHCPv6 Prefix Delegation by including an IAPD (Identity Association for Prefix Delegation) option along with an ID in its solicit messages.
- Interface addresses can also be automatically configured that are derived from delegated prefix information.
- A DHCPv6 Server can be configured to set optional M and/or O flags in Router Advertisement (RA) messages that its sends.
- A DHCPv6 Server can be configured to notify clients that they can use a stateful address configuration protocol (for example, DHCPv6 IANA) to obtain an address by setting the single bit Managed Address Configuration (M) flag to 1 in RA messages
- A DHCPv6 Server can be configured to notify clients that they can use a stateful address configuration protocol (for example, DHCPv6) to obtain non-address configuration information such as optional DNS information plus SNTP information by setting the single bit Other Stateful Configuration (O) flag to 1 in RA messages.
- IAPD or IANA delegation pools are configured in a DHCPv6 PD (Prefix Delegation) Server. Prefixes or addresses to be allocated are stored in these delegation pools.

See the section **“DHCPv6 Client and Server Identification”** on page 92.13 for IAPD information. See the section **“DHCPv6 Messages”** on page 92.5 for solicit message information.

When the switch is configured as a DHCPv6 Server, it can:

- **delegate prefixes to IPv6 subnets.** Prefixes allow subnets to be selected, rather than a single node. Like IPv4 addresses, a proportion of the left most bits of the address can be used to indicate the subnet (using slash notation, for example, 2001:0db8:1234::/64). EUI64 suffix information can then be appended to form an IPv6 address on an interface. See also the **IPv6 EUI-64 Addressing** section in **Chapter 28, IPv6 Introduction** for further EUI-64 implementation information.
- **assign normal and temporary IPv6 addresses to devices.** An IPv6 address is a hexadecimal string, made up from eight pairs of octets separated by colons, for example 3ffe:2::0:1. Note that these pairs of octets are called segments in IPv6, and there are eight segments in an IPv6 address. Normal addresses are renewed by the server for as long as the device requires an address. Temporary addresses are assigned for a limited time (lease time) and are usually allocated for privacy reasons, as outlined in RFC 3041 “Privacy Extensions for Stateless Address Autoconfiguration in IPv6”.

DHCPv6 Prefix Delegation

DHCPv6 Prefix Delegation automates IPv6 prefix assignment in an IPv6 network, and enables user devices to automatically append their own device component for the user device portion of the IPv6 address.

This gives you the ability to centrally control IPv6 addressing used in remote sites where the IPv6 prefix information is the equivalent of the network portion of an IPv4 address.

DHCPv6 Relay is often used with between PE (Provider Edge) devices and CPE (Customer Premises Equipment) devices with DHCPv6 Prefix Delegation. Once a provider delegates prefixes to its customers, the customers can then subnet and assign the prefixes to their internal links.

Providers use the DHCPv6 feature to manage site addressing, subnet, and link updates.

- Stateless DHCPv6 does not require a DHCPv6 Server to maintain any dynamic state for clients, such as Domain Name System (DNS) server addresses. Note that only configuration information is exchanged with stateless prefix delegation.
- Stateful DHCPv6 uses a DHCPv6 Server to centrally manage IPv6 address and prefix assignment. DHCPv6 Clients get IPv6 address or prefix information from the DHCPv6 Server. DHCPv6 Clients can obtain configuration information that is not available from other protocols, such as DNS.

DHCPv6 RFCs

See the below list of DHCPv6 related RFCs:

- RFC 3315 Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Stateful DHCPv6 - DHCPv6 has been standardized by the IETF through RFC 3315.
- RFC 3633 IPv6 Prefix Options for DHCPv6
DHCPv6 Prefix Delegation (DHCPv6-PD) is an extension to DHCPv6 specified in RFC 3315.
- RFC 6276 DHCPv6 Prefix Delegation for Network Mobility (NEMO)
Specifies DHCPv6 Prefix Delegation use with a mobile router for network mobility.
- RFC 3646 DNS Configuration Options for DHCPv6.
- RFC 3736 Stateless Dynamic Host Configuration Protocol (DHCP) Service for IPv6
Stateless DHCPv6 is a combination of IPv6 Stateless Address Autoconfiguration (RFC 4862) and Dynamic Host Control Protocol for IPv6 (RFC 3315). It is a counterpart to IPv6 Stateless Address Autoconfiguration, and can be used with or without IPv6 Stateless Address Autoconfiguration to obtain configuration parameters.
- RFC 4649 Dynamic Host Configuration Protocol for IPv6 (DHCPv6) Relay Agent Remote-ID Option.
- RFC 4841 Neighbor Discovery for IP version 6 (IPv6).
- RFC 4862 IPv6 Stateless Address Autoconfiguration.
- RFC 5007 DHCPv6 Leasequery.

DHCPv6 Messages

DHCPv6 uses multicast and unicast addresses for communication. A multicast address provides the equivalent functionality to an IPv4 broadcast address. It identifies a group of interfaces, and packets are sent to all interfaces in that group. Addresses reserved for DHCPv6 messages are:

- ff02::1:2. This link-scope multicast address is used by clients to communicate with DHCPv6 servers. When the DHCPv6 module is enabled the switch listens to this address.
- ff05::1:3. This site-scope multicast address is used by clients to communicate with DHCPv6 servers. When the DHCPv6 module is enabled the switch listens to this address.

A normal DHCPv6 message exchange involves the following messages:

1. **Solicit** - sent by a DHCPv6 Client to locate DHCPv6 Servers.
2. **Advertise** - sent by a DHCPv6 server to a DHCPv6 Client in answer to the solicit message as an affirmative message that DHCPv6 Server services are available to a DHCPv6 Client .
3. **Request** - sent by a DHCPv6 Client to a DHCPv6 Server to request configuration parameters.
4. **Reply** - sent by a DHCPv6 Server to a DHCPv6 Client with configuration information.
5. **Renew** - sent by a DHCPv6 Client to a DHCPv6 Server requesting an extension to the address lifetime.

An IPv6 address may be assigned to the DHCPv6 Client for a limited or unlimited time. If the address lifetime is limited, it has a preferred lifetime and a (generally longer) valid lifetime.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Once half the time between address assignment and the preferred lifetime has passed (the T1 time), the client sends a **Renew** message to the server, requesting an extension to the address lifetime.

If the client has not received a reply after 80% of the valid lifetime has passed (the T2 time), it sends a multicast **Rebind** message to discover another DHCPv6 Server

DHCPv6 Client/Server/Relay Agent messages are exchanged over UDP ports 546 and 547. DHCPv6 Clients listen for DHCPv6 messages on UDP port 546, while DHCPv6 Servers and DHCPv6 Relay Agents listen for DHCPv6 messages on UDP port 547.

In a DHCPv6 Client/DHCPv6 Server environment, DHCPv6 messages are sent from the DHCPv6 Clients to DHCPv6 Server destination UDP port 547. DHCPv6 Servers respond to DHCPv6 Client destination UDP port 546.

In a DHCPv6 Client/DHCPv6 Relay Agent/DHCPv6 Server environment, DHCPv6 messages are sent from DHCPv6 Clients to DHCPv6 Relay Agent and DHCPv6 Server destination UDP port 547. DHCPv6 Servers respond to DHCPv6 Relay Agents via destination UDP port 547. DHCPv6 Relay Agents respond to DHCPv6 Client destination UDP port 546.

DHCPv6 Message Types

See the below list of DHCPv6 Message Types supported in AlliedWare Plus:

- **SOLICIT:**
A DHCPv6 Client sends a **SOLICIT** message to locate DHCPv6 Servers.
- **ADVERTISE:**
A DHCPv6 Server sends an **ADVERTISE** message to indicate that it is available for DHCPv6 service in response to a **SOLICIT** message received from a DHCPv6 Client.
- **REQUEST:**
A DHCPv6 Client sends a **REQUEST** message to request configuration parameters, including IPv6 addresses.
- **CONFIRM:**
A DHCPv6 Client sends a **CONFIRM** message to any available DHCPv6 Server to determine whether the IPv6 addresses it was assigned is still appropriate to the link to which the DHCPv6 Client is connected. This can happen when the DHCPv6 Client detects either a link-layer connectivity change, or if it is powered on and one or more leases are still valid. The **CONFIRM** message is used to confirm whether the DHCPv6 Client is still on the same link or whether it has been moved. The actual lease(s) are not validated; just the prefix portion of the delegated IPv6 addresses or IPv6 prefixes.
- **RENEW:**
A DHCPv6 Client sends a **RENEW** message to the DHCPv6 Server that originally provided the DHCPv6 Client's addresses and configuration parameters, to extend the lifetimes on the IPv6 addresses assigned to the DHCPv6 Client and to update other configuration parameters.
- **REBIND:**
A DHCPv6 Client sends a **REBIND** message to any available DHCPv6 Server to extend the lifetimes of the IPv6 addresses assigned to the DHCPv6 Client, and to update other configuration parameters. This message is sent after a DHCPv6 Client receives no response to a **RENEW** message.
- **REPLY:**
A DHCPv6 Server sends a **REPLY** message containing assigned IPv6 addresses and configuration parameters in response to a **SOLICIT**, **REQUEST**, **RENEW**, and **REBIND** message received from a DHCPv6 Client. A DHCPv6 Server sends a **REPLY** message containing configuration parameters in response to an **INFORMATION-REQUEST** message. A DHCPv6 Server sends a **REPLY** message in response to a **CONFIRM** message confirming or denying that the IPv6 addresses assigned to the DHCPv6 Client are appropriate to the link to which the DHCPv6 Client is connected. A DHCPv6 Server sends a **REPLY** message to acknowledge receipt of a **RELEASE** or **DECLINE** message.
- **RELEASE:**
A DHCPv6 Client sends a **RELEASE** message to the DHCPv6 Server to inform it that the DHCPv6 Client will no longer use one or more of the assigned IPv6 addresses.
- **DECLINE:**
A DHCPv6 Client sends a **DECLINE** message to a DHCPv6 Server to indicate that the DHCPv6 Client has determined that one or more IPv6 addresses assigned by the DHCPv6 Server are already in use on the link to which the DHCPv6 Client is connected.

- **RECONFIGURE:**
 A DHCPv6 Server sends a **RECONFIGURE** message to a DHCPv6 Client to inform the DHCPv6 Client that the DHCPv6 Server has new or updated configuration parameters. The DHCPv6 Client is to initiate a **RENEW/REPLY** or an **INFORMATION-REQUEST/REPLY** transaction with the DHCPv6 Server to receive updated information.
- **INFORMATION-REQUEST:**
 A DHCPv6 Client sends an **INFORMATION-REQUEST** message to a DHCPv6 Server to request configuration parameters without the assignment of any IPv6 addresses to the DHCPv6 Client.
- **RELAY-FORW:**
 A DHCPv6 Relay Agent sends a **RELAY-FORW** message to relay messages to DHCPv6 Servers, either directly or through another DHCPv6 Relay Agent. The received message, either a DHCPv6 Client message or a **RELAY-FORW** message from another DHCPv6 Relay Agent, is encapsulated in an option in the **RELAY-FORW** message.
- **RELAY-REPL:**
 A DHCPv6 Server sends a **RELAY-REPL** message to a DHCPv6 Relay Agent containing a message that the DHCPv6 Relay Agent delivers to a DHCPv6 Client. The **RELAY-REPL** message may be relayed by other DHCPv6 Relay Agents for delivery to the destination DHCPv6 Relay Agent. The DHCPv6 Server encapsulates the DHCPv6 Client message as an option in the **RELAY-REPL** message, which the DHCPv6 Relay Agent extracts and relays to the DHCPv6 Client.

DHCPv6 Client to DHCPv6 Server Messages

See the below list of DHCPv6 Messages sent from a DHCPv6 Client to a DHCPv6 Server:

- **SOLICIT**
- **REQUEST**
- **CONFIRM**
- **RENEW**
- **REBIND**
- **RELEASE**
- **DECLINE**
- **INFORMATION-REQUEST**

DHCPv6 Server to DHCPv6 Client Messages

See the below list of DHCPv6 Messages sent from a DHCPv6 Server to a DHCPv6 Client:

- **ADVERTISE**
- **REPLY**
- **RECONFIGURE**

DHCPv6 Relay to DHCPv6 Relay/Server Messages

See the below DHCPv6 Message sent from a DHCPv6 Relay to a DHCPv6 Relay/Server:

- **RELAY-FORW**

DHCPv6 Relay/Server to DHCPv6 Relay Messages

See the below DHCPv6 Message sent from a DHCPv6 Relay/Server to a DHCPv6 Relay:

- **RELAY-REPL**

DHCPv6 Renewal and Rebinding

See the below list of descriptions for DHCPv6 Renewal and Rebinding terminology:

- **T1 Timer:**
Indicates when a DHCPv6 Client must attempt to renew IPv6 addresses or prefixes.
- **T2 Timer:**
Indicates when a DHCPv6 Client must attempt to rebind IPv6 addresses or prefixes.
- **Preferred Lifetime:**
Indicates when preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
- **Valid Lifetime:**
Indicates when IPv6 addresses or prefixes must be abandoned. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
- **Client States:**
 - « **Bound:** Normal operation.
 - « **Renewing:** Renewing lease.
 - « **Rebinding:** Occurs when no reply has been received from the DHCPv6 Server.
 - « **Bound:** Receive, process, and finalize new lease.
- **Renewal Process:**
 - « Renewal T1 Timer expires (the default T1 Timer period is 50% of the lease length)
 - « DHCPv6 Client transitions from Bound to Renewing state.
 - « DHCPv6 Client sends DHCPv6 Request/Renew messages (**REQUEST/RENEW** message types)
 - « DHCPv6 Client transitions to Rebinding state
(If no reply from DHCPv6 Server and the T2 Timer expires).
 - « DHCPv6 Client transitions to Bound state
(When DHCPv6 Client receives a reply from DHCPv6 Server).

Stateful DHCPv6 Message Exchange

The sequence for stateful DHCPv6 message exchange between a DHCPv6 Client and a DHCPv6 Server is shown below in [Figure 92-1](#).

1. The DHCPv6 Client starts by sending a SOLICIT message to the DHCPv6 Server.
2. The DHCPv6 Server sends an ADVERTISE message back to the DHCPv6 Client.
3. The DHCPv6 Client sends a REQUEST message to the DHCPv6 Server.
4. The DHCPv6 Server sends a REPLY message back to the DHCPv6 Client to finish.

Figure 92-1: Stateful DHCPv6 Message Exchange Diagram

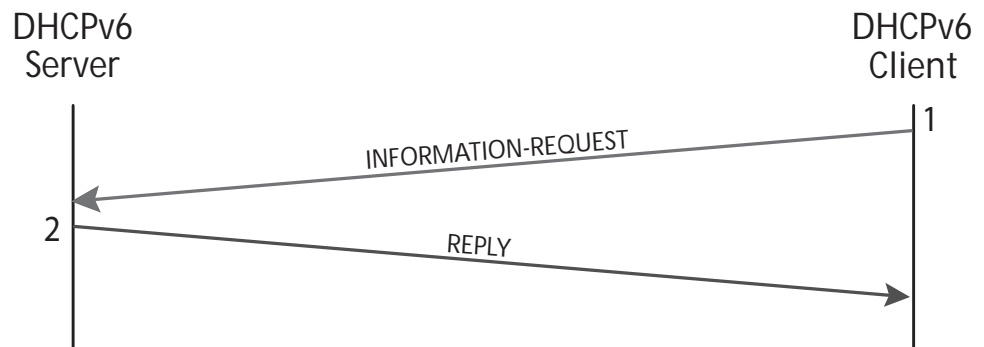

See section [“DHCPv6 Messages” on page 92.5](#) for descriptions of all DHCPv6 messages.

Stateless DHCPv6 Message Exchange

The sequence for stateless DHCPv6 message exchange between a DHCPv6 Client and a DHCPv6 Server is shown below in [Figure 92-2](#).

1. The DHCPv6 Client starts by sending an `INFORMATION-REQUEST` message to the DHCPv6 Server. This request specifically excludes the assignment of any IPv6 address.
2. The DHCPv6 Server sends a `REPLY` message back to the DHCPv6 Client to finish.

Figure 92-2: Stateless DHCPv6 Message Exchange Diagram

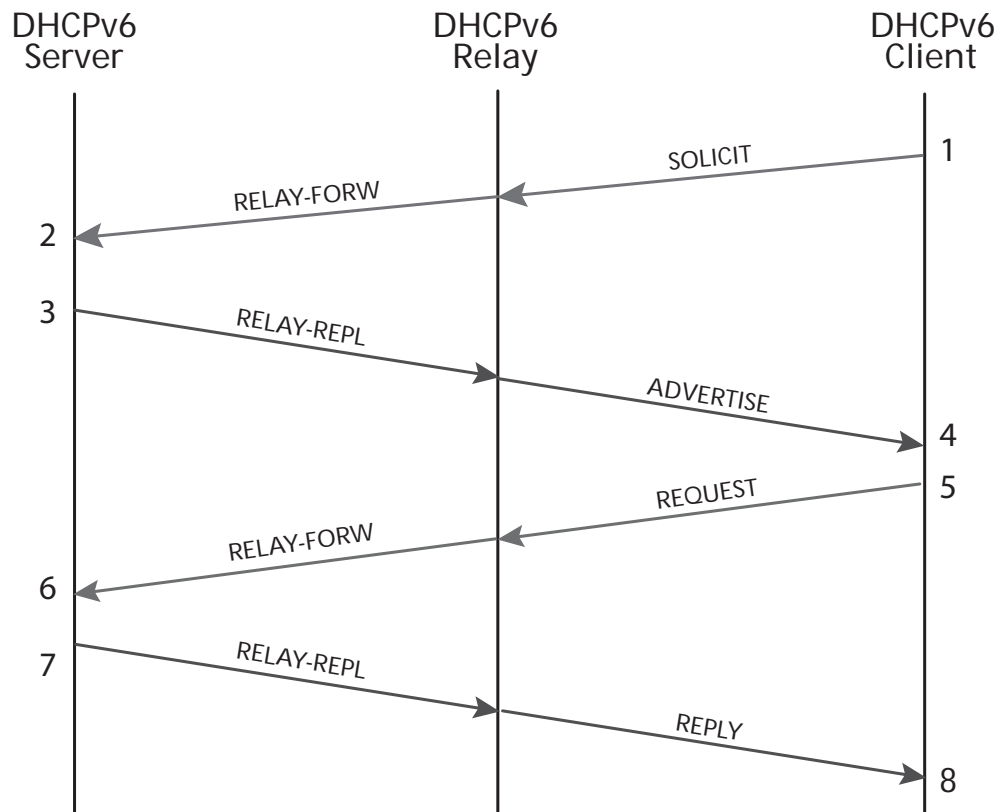

See section [“DHCPv6 Messages”](#) on page 92.5 for descriptions of all DHCPv6 messages.

DHCPv6 Relay Agent Stateful Message Exchange

The sequence for a stateful DHCPv6 message exchange between a DHCPv6 Client, a DHCPv6 Relay, and a DHCPv6 Server is shown below in **Figure 92-3**.

1. The DHCPv6 Client starts by sending a SOLICIT message to the DHCPv6 Relay.
2. The DHCPv6 Server receives a RELAY-FORW message sent from the DHCPv6 Relay.
3. The DHCPv6 Server sends a RELAY-REPL message back to the DHCPv6 Relay.
4. The DHCPv6 Client receives an ADVERTISE message sent from the DHCPv6 Relay.
5. The DHCPv6 Client sends a REQUEST message to the DHCPv6 Relay.
6. The DHCPv6 Server receives a RELAY-FORW message sent from the DHCPv6 Relay.
7. The DHCPv6 Server sends a RELAY-REPL message back to the DHCPv6 Relay.
8. The DHCPv6 Client receives a REPLY message sent from the DHCPv6 Relay to finish.

Figure 92-3: DHCPv6 Relay Agent Stateful Message Exchange Diagram

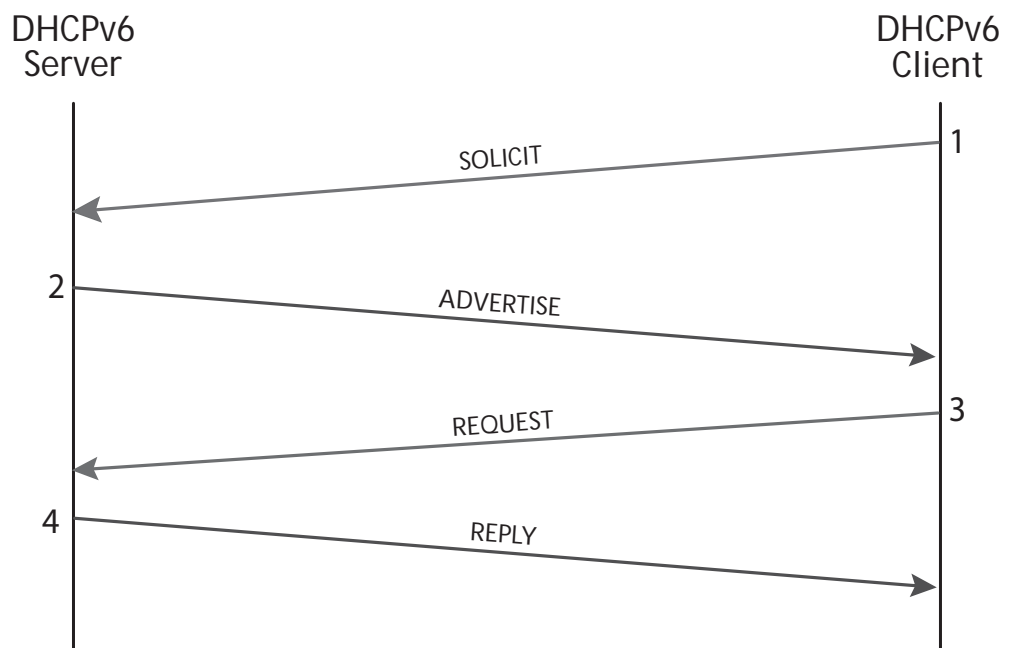

See section **“DHCPv6 Messages”** on page 92.5 for message descriptions.

DHCPv6 Prefix Delegation Message Exchange

The sequence for stateful DHCPv6 message exchange between a DHCPv6 Client and a DHCPv6 Server configured for DHCPv6 Prefix Delegation is shown below in [Figure 92-4](#).

1. The DHCPv6 Client starts by sending a SOLICIT message to the DHCPv6 Server.
2. The DHCPv6 Server sends an ADVERTISE message back to the DHCPv6 Client.
3. The DHCPv6 Client sends a REQUEST message to the DHCPv6 Server.
4. The DHCPv6 Server sends a REPLY message back to the DHCPv6 Client to finish.

Figure 92-4: DHCPv6 Prefix Delegation Message Exchange Diagram

See section [“DHCPv6 Messages”](#) on page 92.5 for descriptions of all DHCPv6 messages.

DHCPv6 Client and Server Identification

DHCPv6 Clients and Servers are identified by a DHCPv6 Unique Identifier (DUID). The DUID consists of a number, followed by a hexadecimal string that identifies the hardware type of the client and the link-layer address of the client.

DHCPv6 Unique Identifier (DUID)

A DUID identifies each DHCPv6 Client and Server, where Client and Server identifier options contain the DUID. The DUID is unique for DHCPv6 Clients and Servers. DHCPv6 uses DUIDs with link-layer addresses for client and server identifiers. The device uses the MAC address from the lowest-numbered interface to determine a DUID.

Prefixes are considered to be for different clients when a DHCPv6 Client requests two prefixes with the same DUID and with different IAIDs on different network interfaces.

Identity Associations (IAPD, IAID, and IANA)

DHCPv6 Clients use identity associations to identify each interface that is configured by DHCPv6. An interface's identity association contains the configuration settings of the interface and an Identity Association Identifier (IAID). When the client requests settings from the server for a particular interface, it includes the IAID, to identify the interface.

An Identity Association for Prefix Delegation (IAPD) is a set of IPv6 prefixes assigned to a requesting device. A requesting device may have more than one IAPD where an IAPD is assigned per interface and the device has multiple interfaces.

IAPDs are identified by IAIDs. IAIDs are chosen by requesting devices and are unique among IAPD IAIDs on requesting devices. IAIDs are consistent after reloading using information from the associated interface that is permanently attached to the device.

IAPD, IAID, and IANA use with Prefix Delegation

For subscriber LAN addressing, you can use DHCPv6 address and/or prefix delegation to provision global IPv6 addresses to subscribers on the LAN.

IAPD or IANA (Identity Association for Non-temporary Addresses) delegation pools are configured in a PD server. Prefixes or addresses to be allocated are stored in delegation pools. RA messages are first used by stateful client(s) to auto-configure themselves with any default IPv6 route(s) via gateway router(s).

When IAPD is specified, a DHCPv6 client can then initiate Prefix Delegation as a requesting device by including an IAPD option with the specified ID in **solicit** messages. Interface addresses can be automatically configured derived from delegated prefix information.

See the section [DHCPv6 Messages](#) for the sequence of messages sent and received between DHCPv6 Servers and DHCPv6 Clients and brief descriptions of the messages.

DHCPv6 Server and Client Functionality

DHCPv6 Server and Client functionality is mutually exclusive on an interface. When one of these functions is enabled and a user tries to configure a DHCPv6 Client or Server on the same interface, a message is shown to indicate whenever an interface already configured.

DHCPv6 Server Functionality

Configuration parameters for DHCPv6 Clients are configured in DHCPv6 configuration pools. A configuration pool is associated with a particular DHCPv6 Server on an interface. Prefixes that are delegated to DHCPv6 Clients can be specified as a list of assigned IPv6 prefixes for a given DHCPv6 Client or as IPv6 local prefix pools. The list of configured IPv6 prefixes or IPv6 local prefix pools are referenced and used by DHCPv6 configuration pools.

The DHCPv6 Server can provide configuration parameters that do not require the server to maintain any dynamic state for individual clients, such as DNS server addresses and domain search list options. The DHCPv6 Server can be configured for prefix delegation. DHCPv6 Server functionality can be enabled on individual IPv6-enabled VLAN interfaces.

The DHCPv6 Server maintains an automatic binding table in memory to track the assignment of some configuration parameters, such as prefixes between the server and its clients. Automatic bindings can be stored semi-permanently in non-volatile memory.

RA suppression is turned off in the DHCPv6 Server to facilitate neighbor discovery and allow clients via router solicitation to discover gateway routers on the LAN.

DHCPv6 Server Prefix Delegation Pool

A DHCPv6 Server Prefix Delegation pool is named and includes information about the configuration parameters that control assignment of prefixes to clients from the pool.

A prefix delegation pool is configured independently and is associated with the DHCPv6 Server by entering the relevant commands at the console. Each DHCPv6 Prefix Delegation pool can contain the following configuration parameters and information:

- SNTP Server IPv6 addresses.
- DNS Server IPv6 addresses.
- DHCPv6 Prefix Delegation information, including a DHCPv6 prefix pool name and available IPv6 prefixes, both with their configured preferred and valid lifetimes.

See the section [Configuring the DHCPv6 Server Delegation Pool](#) for the sequence of commands issued together with command modes, command syntaxes, and brief descriptions.

IPv6 Prefix Assignment

A DHCPv6 Server selects prefixes for assignment following a request from a DHCPv6 Client. The DHCPv6 Server selects prefixes for a DHCPv6 Client statically or dynamically. You can statically configure IPv6 prefixes, plus preferred and valid lifetimes for an IAPD, of a DHCPv6 Client as identified by its DUID.

When the delegating DHCPv6 Server receives a request from a DHCPv6 Client, it checks if there is a static binding configured for the IAPD in the message from the DHCPv6 Client. If a static binding is present, prefixes in the binding are returned to the DHCPv6 client. If no binding is found, the DHCPv6 Server can assign prefixes for the DHCPv6 client from DNS.

DHCPv6 Server assigns prefixes dynamically from an IPv6 local prefix pool. When DHCPv6 Server receives a prefix request from a DHCPv6 Client, it attempts to obtain unassigned prefixes from the IPv6 local prefix pool. After the DHCPv6 Client releases the previously assigned IPv6 prefixes, the DHCPv6 server returns them to the pool for reassignment.

Automatic Binding Table

Each DHCPv6 configuration pool has a linked automatic binding table. The automatic binding table records all IPv6 prefixes in the configuration pool that are delegated to DHCPv6 Clients. Each permanent storage to which the binding database is saved is called the database agent. Database agent binding information is stored in NVRAM so configuration information, including prefixes for DHCPv6 Clients from a DHCPv6 Server, is retained after a reload. Each binding table entry contains the following information:

- DHCPv6 Server network interface for the DHCPv6 configuration pool.
- Configuration pool for the binding table.
- Preferred and valid lifetimes per prefix.
- Prefixes delegated to each IAPD.
- IAPDs associated with the client.
- Client IPv6 address.
- Client DUID.

DHCPv6 Server creates a binding table entry when a prefix is delegated to a DHCPv6 Client from the configuration pool, and the entry is updated when the DHCPv6 Client renews, rebinds, or confirms the prefix delegation.

A binding table entry is deleted when the DHCPv6 Client releases all prefixes in the binding, all valid lifetimes expire, or when you run the **clear ipv6 dhcp binding** command. See the **show ipv6 dhcp binding** command for **clear ipv6 dhcp binding**.

The DHCPv6 Server assign prefixes dynamically from an IPv6 local prefix pool. When the DHCPv6 Server receives a prefix request from a DHCPv6 Client, then the DHCPv6 Server gets unassigned prefixes from the DHCPv6 configuration pool. Once the DHCPv6 client releases assigned prefixes, the DHCPv6 Server returns prefixes to the configuration pool.

SNTP Server Functionality

The SNTP Server Functionality gives a list of IPv6 addresses for SNTP Servers that the DHCPv6 Client can use to synchronize system time to a standard time server. The DHCPv6 Server lists the SNTP Servers for the DHCPv6 Clients to select from to synchronize timing.

See the **sntp-address** command for further SNTP information and command examples.

DHCPv6 Server and DNS for IPv6 Address Assignment

Additional options, such as the default domain and DNS name-server address, can be passed back to the DHCPv6 Client. Address pools can be assigned for use on a specific interface, or the DHCPv6 Server can automatically find the appropriate pool.

See the **dns-server (DHCPv6)** and **domain-name (DHCPv6)** commands for examples.

DHCPv6 Client Functionality

DHCPv6 Clients can request the delegation of prefixes from a DHCPv6 Server. The IPv6 prefixes acquired from a delegating DHCPv6 Server are stored in an IPv6 prefix pool. The prefixes in the IPv6 prefix pool can be used to number downstream device interfaces.

A DHCPv6 Client is enabled on an individual IPv6-enabled VLAN interface, and can also request and accept those configuration parameters that do not require a DHCPv6 Server to maintain any dynamic state for individual clients, such as DNS server addresses.

See the section [Configuring the DHCPv6 PD Client](#) for the sequence of commands issued together with command modes, command syntaxes, and brief descriptions.

DHCPv6 Server Selection by a DHCPv6 Client

A DHCPv6 Client builds a list of DHCPv6 servers by sending a **solicit** message and by receiving **advertisement** replies from DHCPv6 Servers. The replies are ranked by the DHCPv6 Client based on preference value, when DHCPv6 Servers add a preference value to their advertisement messages. For DHCPv6 Clients to obtain IPv6 prefixes from DHCPv6 Servers, only DHCPv6 Servers that advertise prefixes are considered by DHCPv6 Clients.

See the section [DHCPv6 Messages](#) for the sequence of messages sent and received between DHCPv6 Servers and DHCPv6 Clients and brief descriptions of the messages.

 **Note** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

For the syntaxes, parameters, descriptions, defaults, and examples for all of the commands used in the following DHCPv6 configurations, refer to [Chapter 93, DHCP for IPv6 \(DHCPv6\) Commands](#) for the DHCPv6 Client Server PD commands and [Chapter 91, Dynamic Host Configuration Protocol \(DHCP\) Commands](#) for the DHCPv6 Relay commands.

See the section [Configuring DHCPv6 Prefix Delegation](#) for the sequence of commands issued together with command modes, command syntaxes, and brief descriptions.

See the [PD Subdelegation System Configuration](#) section for an example network topology and configuration output to adapt for your own network configuration

Configuring DHCPv6 Prefix Delegation

See the sections listed below when configuring DHCPv6 Prefix Delegation:

- [Configuring the DHCPv6 Server Delegation Pool](#)
- [Configuring the DHCPv6 PD Client](#)

Configuring the DHCPv6 Server Delegation Pool

Perform this sequence of command entries to create and configure the DHCPv6 configuration pool and associate it with a DHCPv6 server on a VLAN interface.

Note the links in the list are for the command name in the relevant command chapter, while the links in the table below the list are for the command syntaxes showing mode.

1. [enable \(Privileged Exec mode\)](#)
2. [configure terminal](#)
3. [ipv6 dhcp pool](#)
4. [domain-name \(DHCPv6\)](#)
5. [dns-server \(DHCPv6\)](#)
6. [prefix-delegation pool](#)
7. [exit](#)
8. [interface \(to configure\)](#)
9. [ipv6 dhcp server](#)
10. [exit](#)

Table 92-1: Configuring the DHCPv6 Configuration Pool

1.	<code>awplus>enable (Privileged Exec mode)</code>	Enter Privileged Exec mode.
2.	<code>awplus#configure terminal</code>	Enter Global Configuration mode.
3.	<code>awplus(config)#ipv6 dhcp pool <DHCPv6-poolname></code>	Configure a DHCPv6 configuration information pool and enters DHCPv6 configuration mode.
4.	<code>awplus(config-dhcpv6)# domain-name <domain-name></code>	Configure a domain name for a DHCPv6 client.
5.	<code>awplus(config-dhcpv6)# dns-server <ipv6-address></code>	Specify the DNS IPv6 servers available to a DHCPv6 client.
6.	<code>awplus(config-dhcpv6)# prefix-delegation pool <DHCPv6-poolname> [lifetime {<valid-time> infinite} {<preferred-time> infinite}]</code>	Specify a named IPv6 prefix pool from which prefixes are delegated to DHCPv6 clients.

Table 92-1: Configuring the DHCPv6 Configuration Pool

7.	<code>awplus(config-dhcpv6)# exit</code>	Exit DHCPv6 configuration mode, and returns the device to Global Configuration mode.
8.	<code>awplus(config)# interface <interface-list></code>	Specify a VLAN interface, and enters Interface Configuration mode.
9.	<code>awplus(config-if)# ipv6 dhcp-server [<DHCPv6-poolname>]</code>	Enable DHCPv6 on the specified VLAN interface.
10.	<code>awplus(config-if)# exit</code>	Return to Global Configuration mode.

Configuring the DHCPv6 PD Client

General prefixes can be defined dynamically from a prefix received by a DHCPv6 prefix delegation client via IAPD. The delegated prefix is stored in a general prefix:

- Commands Applied**
- 1. enable (Privileged Exec mode)**
 - 2. configure terminal**
 - 3. interface (to configure)**
 - 4. ipv6 dhcp client pd**
 - 5. exit**

Table 92-2: Configuring the DHCPv6 Configuration Pool

1.	<code>awplus>enable (Privileged Exec mode)</code>	Enter Privileged Exec mode.
2.	<code>awplus#configure terminal</code>	Enter Global Configuration mode.
3.	<code>awplus(config)# interface <interface-list></code>	Specify a VLAN interface, and enters Interface Configuration mode.
4.	<code>awplus(config-if)# ipv6 dhcp client pd <prefix-name></code>	Enables the DHCPv6 client process and enables a request for prefix delegation through a specified VLAN interface.
5.	<code>awplus(config-if)# exit</code>	Return to Global Configuration mode.

Note that devices can be optionally configured to advertise connected routing information associated with delegated prefixes to other devices within the domain via dynamic routing protocols.

Note the following configuration examples build from a simple two device system up to a complex sub-delegation system involving multiple devices and multiple delegation pools.

Configure DHCPv6 Server/Stateful Client (Prefix)

In this example, a stateful client can obtain its interface address (via DHCPv6 IANA) and other information (such as DNS, SNTP) configured in the DHCP Server delegation pool.

- The client is allocated an address from the address prefix configured in the DHCP Server pool. A stateful client can automatically learn about any gateway router(s) on the LAN and dynamically add associated default route(s) into its routing table via next-hop link-local address of the gateway router via router advertisements.
- RA suppression is turned off in the DHCPv6 Server to facilitate neighbor discovery.

For command information, see the [address prefix](#) and [ipv6 dhcp server](#) commands on the DHCPv6 Server and the [ipv6 address dhcp](#) command on the Stateful Client.

Note **bold** configuration command entries show hostnames and interfaces. Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 92-5: DHCPv6 Server / Stateful Client configuration topology:

DHCPv6_Server Configuration (Prefix)

See the below configuration for a device with the hostname **DHCPv6_Server**:

```
hostname DHCPv6_Server
!
ipv6 dhcp pool pool1
  address prefix 2001:db8:10::/64
  dns-server 2001:db8:10::10
  domain-name example.com
  sntp address 2001:db8:10::20
!
interface vlan1
  description to_Stateful_Client
  ipv6 address 2001:db8:10::1/64
  ipv6 enable
  no ipv6 nd suppress-ra
  ipv6 nd managed-config-flag
  ipv6 nd other-config-flag
  ipv6 dhcp server pool1
!
ipv6 forwarding
```

Stateful_Client Configuration (IANA)

See the below configuration for a device with the hostname **Stateful_Client**:

```
hostname Stateful_Client
!
interface vlan1
  ipv6 address dhcp
```

Configure DHCPv6 Server/Stateful Client (Range)

In this example, a stateful client can obtain its interface address (via DHCPv6 IANA) and other information (such as DNS, SNTP) configured in the DHCP Server delegation pool.

- The client is allocated an address from the address range configured in the DHCP Server pool. A stateful client can automatically learn about any gateway router(s) on the LAN and dynamically add associated default route(s) into its routing table via next-hop link-local address of the gateway router via router advertisements.
- RA suppression is turned off in the DHCPv6 Server to facilitate neighbor discovery.

For command information, see the **address range** and **ipv6 dhcp server** commands on the DHCPv6 Server and the **ipv6 address dhcp** command on the Stateful Client.

Note **bold** configuration command entries show hostnames and interfaces. Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 92-6: DHCPv6 Server / Stateful Client configuration topology:

DHCPv6_Server Configuration (Range)

See the below configuration for a device with the hostname **DHCPv6_Server**:

```
hostname DHCPv6_Server
!

Stateful_Client Configuration (IANA)

See the below configuration for a device with the hostname **Stateful_Client**:

```
hostname Stateful_Client
!
interface vlan1
  ipv6 address dhcp
```

Configure DHCPv6 Server/Stateless Client

The Stateless Client can automatically learn about any gateway router(s) on the LAN via router solicitation. It can then dynamically add associated default route(s) into its routing table via the next-hop link-local address of the gateway router.

From RFC 4864, section 5.5.3: If the sum of the prefix length and interface identifier length does not equal 128 bits, the Prefix Information option must be ignored.

The effect is that prefix information received in an RA will not be applied to form an IPv6 address via SLAAC if the prefix is greater or less than 64. Since EUI is 64 bits in length the IPv6 Prefix of the advertising device must be 64 bits as well.

For command information, see the **address prefix** and **ipv6 dhcp server** commands on the DHCPv6 Server and the **ipv6 address autoconfig** command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces. Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 92-7: DHCPv6 Server / Stateless Client configuration topology:

DHCPv6_Server Configuration (Prefix)

```

Configure DHCPv6 Relay / Server / Client

In this example, a stateful client device (via IANA) obtains its interface address from a DHCPv6 Server pool. In this example, the DHCPv6 Client resides in a network that is remote from the DHCPv6 Server and communicates via an intermediate DHCPv6 Relay. Diagnostics command output is shown following the configuration output.

The DHCPv6 Server needs a route to the remote LAN, where the client request originates from via the appropriate next-hop. In this example, the next-hop address is the link-local address of the DHCPv6 Relay. The route could be statically configured as in this example, or dynamically learned via an IPv6 routing protocol.

Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

When a DHCPv6 Relay receives a request from the DHCPv6 Client, it sends a **relay-forward** message toward the DHCPv6 Server. The DHCPv6 Relay message includes an address from the client-facing interface in the link-address field of the **relay-forward** message. The address of the server-facing interface is used as the IPv6 source of the relay message, and the server will send any reply to that address.

The DHCPv6 Relay automatically adds a route for the delegated prefix into its routing table for the duration of the valid lease, via the interface where the PD client device resides.

When an address on the incoming interface of the DHCPv6 Server or a link address set in the incoming delegation request packet matches the link-address prefix configured in the delegation pool, the server is able to match and use the appropriate delegation pool for relayed delegation request messages.

Active bindings are stored in non-volatile memory, and are retained over a device reboot.

For more command information, see the **link-address** and **ipv6 dhcp pool** commands on the DHCPv6 Server, the **ip dhcp-relay server-address** command on the DHCPv6 Relay, and the **ipv6 address dhcp** command on the Stateful Client.

Note **bold** configuration command entries show hostnames and interfaces. Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 92-8: DHCPv6 Server / Relay / Stateful Client configuration topology:

Use the **show log** command to view additional useful information on the system log.

Real time protocol messages for diagnostic purposes can be viewed via verbose **tcpdump** for traffic traversing a VLAN, for example:

```
awplus#tcpdump -vvvni vlan1
```

Configure PD Server / PD Client / Stateless Client

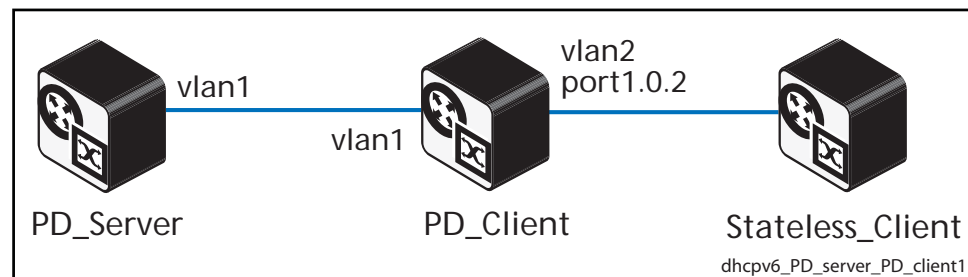

In this example, the PD Client is assigned a prefix from the PD Server via IAPD.

- PD_Client auto-configures an upstream VLAN interface **vlan1** address via SLAAC.
- PD_Client is assigned a prefix from PD_Server via IAPD.
- PD_Client auto-configures its downstream VLAN interface **vlan2** address derived from a combination the delegated prefix and eui64 suffix.
- Stateless_Client auto configures its VLAN interface address using SLAAC.

For more command information, see the **prefix-delegation pool** and **ipv6 dhcp server** commands on the DHCPv6 PD Server, the **ipv6 dhcp client pd** command on the DHCPv6 PD Client, and the **ipv6 address autoconfig** command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces. Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 92-9: PD_Server /PD_Client / Stateless_Client configuration topology:

Configure PD via DHCPv6 Relay

This example includes Prefix Delegation (IAPD) via an intermediate DHCPv6 relay. The DHCPv6 server requires a route to the remote IPv6 subnet of the DHCPv6 relay, where the source of the IA PD request originates from via the link-local address of the DHCPv6 Relay.

For detailed command information, see the [prefix-delegation pool](#) and [ipv6 dhcp server](#) commands on the DHCPv6 PD Server, the [ip dhcp-relay server-address](#) command on the DHCPv6 Relay, the [ipv6 dhcp client pd](#) command on the DHCPv6 PD Client, and the [ipv6 address autoconfig](#) command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces. Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Configure PD subdelegation with SLAAC

In this example, the PD subdelegation device acts as both a PD client on its upstream interface facing the PD server, and also recursively acts as a PD server, to sub-delegate prefixes to a downstream PD client. The PD subdelegation device also supports router solicitation on downstream interfaces to allow stateless client devices to auto configure themselves via SLAAC (Stateless Address Auto Configuration).

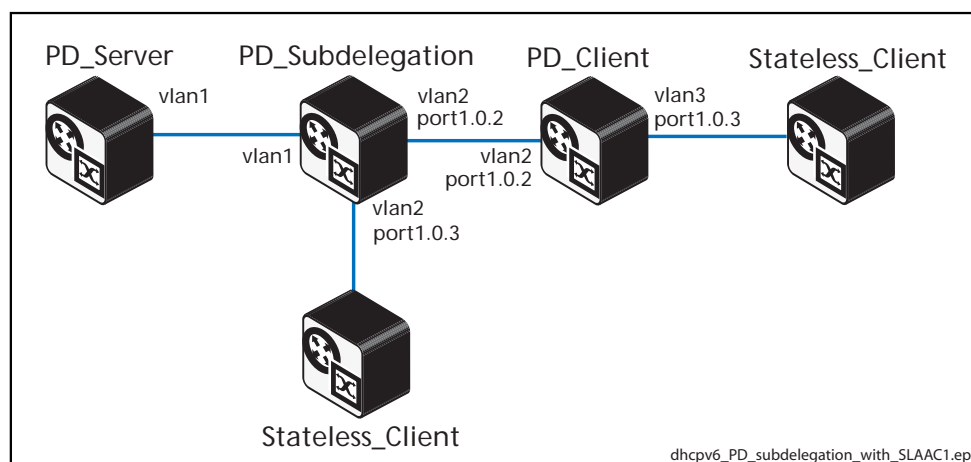

For this example, a longer prefix mask is used for each subdelegated prefix.

- The PD subdelegation device auto configures its upstream interface facing the PD server via SLAAC.
- The PD server device advertises its prefix to the PD subdelegation device. This is stored in the local address pool in the PD subdelegation device.
- The PD subdelegation device then auto configures its downstream interface based on a combination of the advertised prefix and EUI64 suffix, and advertises Router Advertisements (RAs).
- The PD subdelegation device then recursively advertises prefixes stored in its local address pool out its downstream interface to the PD client device.
- The PD client device uses SLAAC to configure its upstream **vlan2** interface. The PD client device configures its downstream **vlan3** interface based on recursively delegated prefix, and advertises RAs via **vlan3** to the attached Stateless_Client device.
- Stateless_Client devices auto configure their address and gateway router information, using SLAAC, via router solicitation and router advertisements.

For detailed command information, see the [prefix-delegation pool](#) and [ipv6 dhcp server](#) commands on the DHCPv6 PD Server and the DHCPv6 PD Subdelegation Server, the [ipv6 dhcp client pd](#) command on the DHCPv6 PD Client, and the [ipv6 address autoconfig](#) command on the Stateless Client.

Note **bold** configuration command entries show hostnames and interfaces. Also note the default VLAN interface **vlan1** is applied to all ports on a device.

Figure 92-11: PD Server / Subdelegation / Client / Stateless Client configuration topology:

PD Subdelegation System Configuration

This section provides an example of a DHCPv6 PD sub-delegating system, involving multiple delegation pools, with device configuration output listed for each of the devices configured for PD sub-delegation:

- [Stateful_Client Configuration](#)
- [Stateless_Client Configuration](#)
- [PD_Subdelegation Configuration](#)
- [PD_Client Configuration](#)
- [PD_Server1 Configuration](#)
- [PD_Server2 Configuration](#)
- [DHCPv6_Relay Configuration](#)

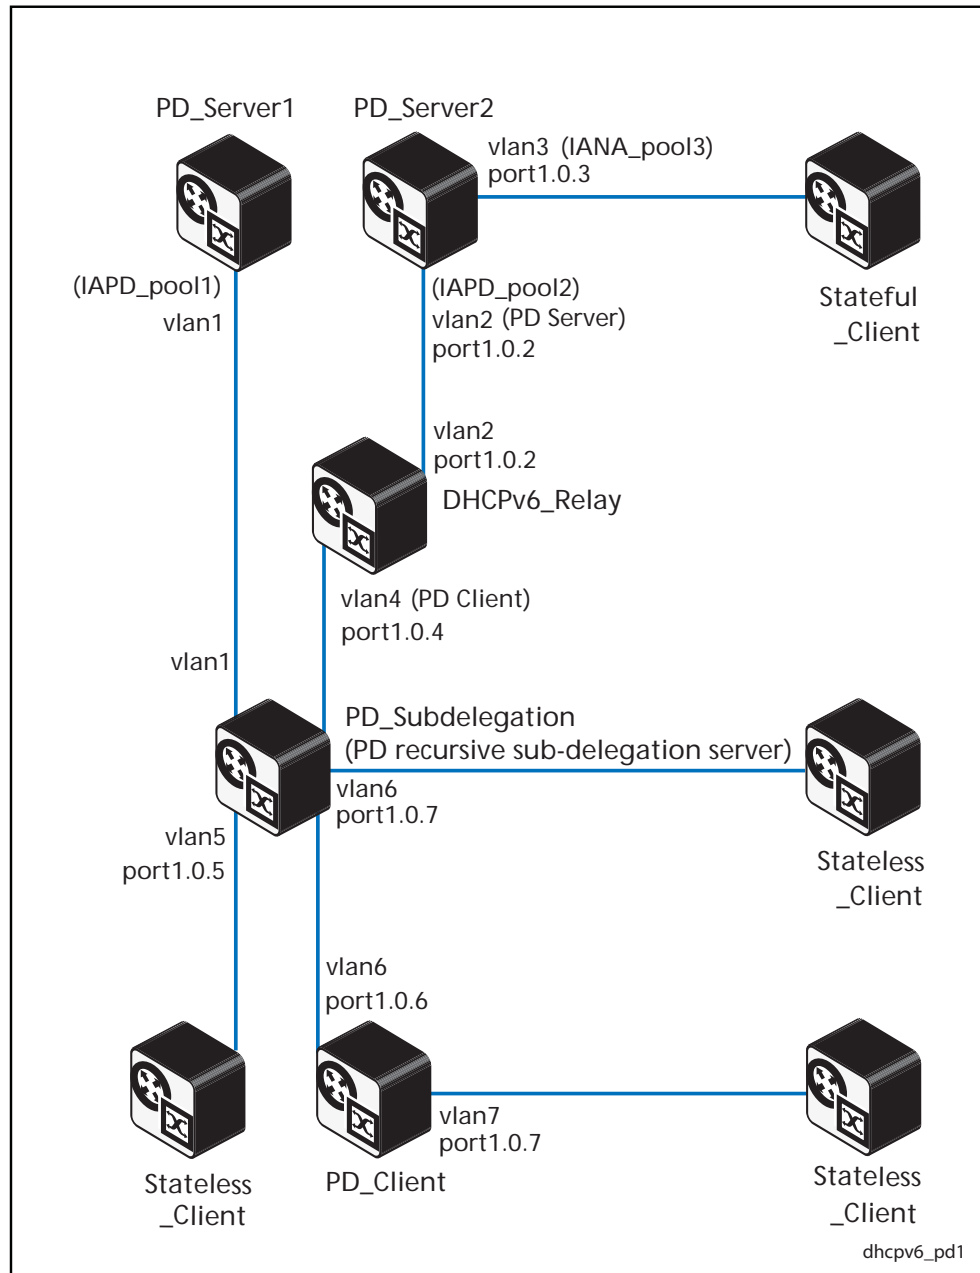

Note the functionality for configured devices in this multiple delegation pool system:

- **PD_Server1** is configured with a single IAPD delegation pool, **IAPD_pool1**.
- **PD_Server2** is configured with two pools; **IAPD_pool2** is used to delegate prefix information via intermediate **DHCPv6_Relay** to the subdelegation device via **vlan2**, and **IANA_pool3** is used to delegate address information to **Stateful_Client** via **vlan3**.
- **PD_Subdelegation** uses SLAAC to configure its upstream interfaces and acts as PD client on its upstream interfaces (**vlan1** and **vlan4**) that face each PD server.
- **PD_Subdelegation** downstream interface **vlan5** is configured based on the prefix delegated via the upstream interface **vlan1**.
- **PD_Subdelegation** downstream interface **vlan6** is configured based on the prefix delegated via upstream interface **vlan4**.
- Prefix information delegated via **PD_Client** interface **vlan4** is recursively sub-delegated via the downstream interface **vlan6** to **PD_Client**.
- Stateless clients auto configure themselves based on RAs.

Note **bold** configuration command entries show hostnames and interfaces. Also note the default VLAN interface **vlan1** is applied to all ports on a device.

For the syntaxes, parameters, descriptions, defaults, and examples for all of the commands used in the following DHCPv6 configurations, refer to [Chapter 93, DHCP for IPv6 \(DHCPv6\) Commands](#) for the DHCPv6 Client Server PD commands and [Chapter 91, Dynamic Host Configuration Protocol \(DHCP\) Commands](#) for the DHCPv6 Relay commands.

Figure 92-14: PD sub-delegation system configuration example topology:

Stateful_Client Configuration

Chapter 93: DHCP for IPv6 (DHCPv6) Commands

Command List	93.2
address prefix	93.3
address range	93.5
clear counter ipv6 dhcp-client	93.7
clear counter ipv6 dhcp-server	93.7
clear ipv6 dhcp binding	93.8
clear ipv6 dhcp client	93.9
dns-server (DHCPv6)	93.10
domain-name (DHCPv6)	93.11
ipv6 address (DHCPv6 PD)	93.12
ipv6 address dhcp	93.15
ipv6 dhcp client pd	93.16
ipv6 dhcp option	93.17
ipv6 dhcp pool	93.19
ipv6 dhcp server	93.20
ipv6 local pool	93.21
ipv6 nd prefix (DHCPv6)	93.23
link-address	93.25
option (DHCPv6)	93.27
prefix-delegation pool	93.30
show counter ipv6 dhcp-client	93.32
show counter ipv6 dhcp-server	93.33
show ipv6 dhcp	93.34
show ipv6 dhcp binding	93.35
show ipv6 dhcp interface	93.37
show ipv6 dhcp pool	93.39
sntp-address	93.41

Command List

This chapter provides an alphabetical reference for commands used to configure DHCPv6. For introductory information, see [Chapter 92, DHCP for IPv6 \(DHCPv6\) Introduction and Configuration](#).

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes. DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

 **Note** The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

address prefix

Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

Syntax `address prefix <ipv6-prefix/prefix-length>`
`[lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`
`no address prefix <ipv6-prefix/prefix-length>`

Parameter	Description
<code><ipv6-prefix/prefix-length></code>	Specify an IPv6 prefix and prefix length, The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>lifetime</code>	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional <code>lifetime</code> parameter with this command then you must also specify a <code>valid-time</code> and a <code>preferred-time</code> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<code><valid-time></code>	Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.
<code>infinite</code>	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<code><preferred-time></code>	Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Usage This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the **address range** command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the DHCPv6 Server **REPLY** packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

For more message information see the [DHCPv6 Messages](#) section and the [DHCPv6 Client and Server Identification](#) section in [Chapter 92, DHCP for IPv6 \(DHCPv6\) Introduction and Configuration](#).

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples To add IPv6 address prefix 2001:0db8:1::/48 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcpv6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcpv6)# no address prefix 2001:0db8:1::/48
```

Related Commands [address range](#)
[ipv6 dhcp pool](#)

Validation Commands [show ipv6 dhcp binding](#)
[show ipv6 dhcp pool](#)

address range

Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

Syntax

```
address range <first-ipv6-address> <last-ipv6-address>
    [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]

no address range <first-ipv6-address> <last-ipv6-address>
```

Parameter	Description
<i><first-ipv6-address></i>	Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
<i><last-ipv6-address></i>	Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
lifetime	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<i><valid-time></i>	Specify a valid lifetime in seconds in the range <5-31536000>. The default valid lifetime is 2592000 seconds.
infinite	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<i><preferred-time></i>	Specify a preferred lifetime in seconds in the range <5-31536000>. The default preferred lifetime is 604800 seconds.

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Usage Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples To add the IPv6 address range 2001:0db8:1::1 to 2001:0db8:1fff::1 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcpv6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcpv6)# no address range
```

Related Commands [address prefix](#)
[ipv6 dhcp pool](#)

Validation Commands [show ipv6 dhcp binding](#)
[show ipv6 dhcp pool](#)

clear counter ipv6 dhcp-client

Use this command in Privileged Exec mode to clear DHCPv6 client counters.

Syntax `clear counter ipv6 dhcp-client`

Mode Privileged Exec

Example To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

Related Commands [show counter ipv6 dhcp-client](#)

clear counter ipv6 dhcp-server

Use this command in Privileged Exec mode to clear DHCPv6 server counters.

Syntax `clear counter ipv6 dhcp-server`

Mode Privileged Exec

Example To clear DHCPv6 server counters, use the following command:

```
awplus# clear counter ipv6 dhcp-server
```

Related Commands [show counter ipv6 dhcp-server](#)

clear ipv6 dhcp binding

Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

Syntax `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

Parameter	Description
<code>ipv6 <prefix></code>	Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format <code>X:X::X:X</code> .
<code>duid <DUID></code>	Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.
<code>all</code>	All DHCPv6 bindings.
<code>pool <name></code>	Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".

Mode Privileged Exec

Usage A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The `clear ipv6 dhcp binding` command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the `clear ipv6 dhcp binding` command.

If the `clear ipv6 dhcp binding` command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the `clear ipv6 dhcp binding` command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

Example To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

Output **Figure 93-1: Example output from the clear ipv6 dhcp binding all command**

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

Related Commands [show ipv6 dhcp binding](#)

clear ipv6 dhcp client

Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

Syntax `clear ipv6 dhcp client <interface>`

Parameter	Description
<interface>	Specify the interface name to restart a DHCPv6 client on.

Mode Privileged Exec

Example To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

Related Commands [show ipv6 dhcp binding](#)

dns-server (DHCPv6)

Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the [option \(DHCPv6\) command on page 93.27](#), then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

Syntax `dns-server <ipv6-address>`
`no dns-server [<ipv6-address>]`

Parameter	Description
<code><ipv6-address></code>	Specify an IPv6 address of the DNS server, in hexadecimal notation in the format <code>x:x::x:x</code> . This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the <code>no dns-server</code> command without this parameter.

Mode DHCPv6 Configuration

Examples To add the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` to the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

Related Commands [ipv6 dhcp pool option \(DHCPv6\)](#)
[show ipv6 dhcp pool](#)

domain-name (DHCPv6)

Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

Syntax `domain-name <domain-name>`

`no domain-name`

Parameter	Description
<code><domain-name></code>	Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks".

Mode DHCPv6 Configuration

Mode This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre-defined option 15. Note that if you add a user-defined option 15 using the **option (DHCPv6) command on page 93.27**, then you will override any settings created with this command.

Examples To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

Related Commands [dns-server \(DHCPv6\)](#)
[option \(DHCPv6\)](#)
[show ipv6 dhcp pool](#)

ipv6 address (DHCPv6 PD)

Use this command in Interface Configuration mode for a VLAN interface to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

Syntax `ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`
`no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length>`
`[eui64]`

Parameter	Description
<code><ipv6-prefix-name></code>	The IPv6 prefix name advertised on the router advertisement message sent from the switch. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<code><ipv6-addr/prefix-length></code>	Specifies the IPv6 address to be set, for example, ::1/64. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code>[eui64]</code>	EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

Mode Interface Configuration for a VLAN interface.

Usage When specifying the eui64 parameter, the interface identifier of the IPv6 address is derived from the MAC address of the switch.

See the **IPv6 EUI-64 Addressing** section in **Chapter 28, IPv6 Introduction** for further EUI-64 implementation information.

Examples To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be `::1` for the last 64 bits.

To configure a PD prefix named `prefix1` on interface `vlan1` and then add an IPv6 address using EUI-64 identifiers, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1/64 eui64
```

In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix is created from the EUI-64 identifier of the interface for the last 64 bits.

To assign the IPv6 address `2001:0db8::a2/48` to the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address `2001:0db8::a2/48` from the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the **eui64** derived address in the prefix `2001:db8::/64` to VLAN interface

vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix 2001:db8::/32 from VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

ipv6 address dhcp

Use this command in Interface Configuration mode to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1 - the subnet mask for your switch.
- Option 3 - a list of default routers.
- Option 6 - a list of DNS servers. This list appends the DNS servers set on your switch with the **dns-server (DHCPv6)** command.
- Option 15 - a domain name used to resolve host names. This option replaces the domain name set with the **domain-name (DHCPv6)** command.
- Option 51 - lease expiration time.

Syntax `ipv6 address dhcp`
`no ipv6 address dhcp`

Mode Interface Configuration for a VLAN interface or a local loopback interface.

Examples To set the interface `vlan10` to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface `vlan10` from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ipv6 address dhcp
```

Related Commands [ipv6 address](#)

Validation Commands [show running-config](#)

ipv6 dhcp client pd

Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see [Chapter 92, DHCP for IPv6 \(DHCPv6\) Introduction and Configuration](#).

Syntax `ipv6 dhcp client pd <prefix-name>`

`no ipv6 dhcp client pd`

Parameter	Description
<code><prefix-name></code>	Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode Interface Configuration

Default Prefix delegation is disabled by default on an interface.

Usage Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required `<prefix-name>` placeholder parameter. The **ipv6 address** command can then refer to the prefixes stored in the IPv6 prefix pool.

Examples To enable prefix delegation with the prefix name `prefix-name` on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

Related Commands [clear ipv6 dhcp client](#)

show ipv6 dhcp binding

ipv6 dhcp option

Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the **option (DHCPv6)** command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

Syntax `ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]`
`no ipv6 dhcp option <1-254>|<option-name>`

Parameter	Description										
<code><1-254></code>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.										
<code><option-name></code>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default										
<code><option-type></code>	The option value. You must specify a value that is appropriate to the option type: <table border="1"> <tbody> <tr> <td><code>ascii</code></td> <td>An ASCII text string</td> </tr> <tr> <td><code>hex</code></td> <td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td> </tr> <tr> <td><code>ipv6</code></td> <td>An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code>. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.</td> </tr> <tr> <td><code>integer</code></td> <td>A number from 0 to 4294967295.</td> </tr> <tr> <td><code>flag</code></td> <td>A value that either sets (to 1) or unsets (to 0) a flag: true, on, or enabled will set the flag false, off or disabled will unset the flag.</td> </tr> </tbody> </table>	<code>ascii</code>	An ASCII text string	<code>hex</code>	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	<code>ipv6</code>	An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code> . To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.	<code>integer</code>	A number from 0 to 4294967295.	<code>flag</code>	A value that either sets (to 1) or unsets (to 0) a flag: true, on, or enabled will set the flag false, off or disabled will unset the flag.
<code>ascii</code>	An ASCII text string										
<code>hex</code>	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.										
<code>ipv6</code>	An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code> . To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.										
<code>integer</code>	A number from 0 to 4294967295.										
<code>flag</code>	A value that either sets (to 1) or unsets (to 0) a flag: true, on, or enabled will set the flag false, off or disabled will unset the flag.										

Mode Global Configuration

Examples To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

Related Commands [dns-server \(DHCPv6\)](#)
[domain-name \(DHCPv6\)](#)
[option \(DHCPv6\)](#)
[show ipv6 dhcp](#)

ipv6 dhcp pool

Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the switch will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on switches with multiple interfaces. This allows the switch to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

Syntax

```
ipv6 dhcp pool <DHCPv6-poolname>
no ipv6 dhcp pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode Global Configuration

Usage All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples To create the DHCPv6 pool named P2 and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcpv6)#
```

To delete the DHCPv6 pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

Related Commands

- [ipv6 local pool option \(DHCPv6\)](#)

ipv6 dhcp server

Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

Syntax `ipv6 dhcp-server [<DHCPv6-poolname>]`

`no ipv6 dhcp-server`

Parameter	Description
<code><DHCPv6-poolname></code>	Specify a named DHCPv6 server pool as defined with the ipv6 dhcp pool command. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode Interface Configuration

Usage The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

Examples To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface `vlan2`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

Related Commands **ipv6 dhcp pool**
show ipv6 dhcp binding
show ipv6 dhcp pool

ipv6 local pool

Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

Syntax `ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>
<ipv6-prefix/prefix-length> <assigned-length>
[exclude-local-prefix]`

`no ipv6 local pool`

Parameter	Description
<code><DHCPv6-poolname></code>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<code><delegated-prefix-name></code>	Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in "quotation marks".
<code><ipv6-prefix/prefix-length></code>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<code><assigned-length></code>	Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the <i>assigned-length</i> parameter entered cannot be less than or equal to the <i>prefix-length</i> parameter value entered. An assigned length must be longer than a prefix length.
<code>exclude-local-prefix</code>	Optional. Specify this keyword to exclude the locally assigned prefix from the pool.

Default No DHCPv6 server prefix delegation pool is configured by default.

Mode Global Configuration

Usage All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

Related Commands [ipv6 dhcp pool](#)
[show ipv6 dhcp pool](#)

ipv6 nd prefix (DHCPv6)

Use this command in Interface Configuration mode for a VLAN interface to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the VLAN interface.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

Syntax `ipv6 nd prefix <ipv6-prefix-name> <ipv6-prefix/length> {<valid-lifetime>|infinite} {<preferred-lifetime>|infinite} {off-link|no-autoconfig}`

`no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}`

Parameter	Description
<code><ipv6-prefix-name></code>	The IPv6 prefix name advertised on the router advertisement message sent from the switch. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<code><ipv6-prefix/length></code>	The IPv6 prefix and prefix length advertised on the router advertisement message sent from the switch. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64..
<code><valid-lifetime></code>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.
<code>infinite</code>	Specifying this keyword instead of entering a value for the <code><valid-lifetime></code> parameter applies an infinite valid lifetime.
<code><preferred-lifetime></code>	Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry.
<code>infinite</code>	Specifying this keyword instead of entering a value for the <code><preferred-lifetime></code> parameter applies an infinite valid lifetime.
<code>off-link</code>	Specify the IPv6 prefix off-link flag.
<code>no-autoconfig</code>	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.
<code>all</code>	Specify all prefix names and all prefixes are removed when used with the no variant of this command.

Mode Interface Configuration for a VLAN interface.

Usage This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples The following example configures the switch to issue RAs (Router Advertisements) on the VLAN interface `vlan4`, and advertises the DHCPv6 prefix name `prefix1` and the IPv6 address prefix of `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface `vlan4`, so the address prefix of `2001:0db8::/32` is not advertised from the switch.

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface `vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ipv6 nd prefix all
```

link-address

Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

Syntax `link-address <ipv6-prefix/prefix-length>`

`no link-address`

Parameter	Description
<code><ipv6-prefix/prefix-length></code>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Default No DHCPv6 Server pool configuration link address prefix is configured by default.

Mode DHCPv6 Configuration

Usage Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and **RELAY-REPL** relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

See the application of this command in the [Configuring DHCPv6 Prefix Delegation](#) section of [Chapter 92, DHCP for IPv6 \(DHCPv6\) Introduction and Configuration](#) and refer to the topology shown.

Examples To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcpv6)# address prefix 2001:0db8:2::/48
awplus(config-dhcpv6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcpv6)# no link-address
```

Related Commands [ipv6 dhcp pool](#)
[show ipv6 dhcp pool](#)

option (DHCPv6)

Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

Syntax `option [<1-254>|<option-name>] <option-value>`
`no option [<1-254>|<option-value>]`

Parameter	Description								
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.								
<option-name>	Option name associated with the option.								
<option-value>	The option value. You must specify a value that is appropriate to the option type: <table border="1" data-bbox="694 940 1420 1377"> <tbody> <tr> <td>hex</td> <td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td> </tr> <tr> <td>ipv6</td> <td>An IPv6 prefix that has the hexadecimal X:X::X:X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.</td> </tr> <tr> <td>integer</td> <td>A number from 0 to 4294967295.</td> </tr> <tr> <td>flag</td> <td>A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.</td> </tr> </tbody> </table>	hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.	ipv6	An IPv6 prefix that has the hexadecimal X:X::X:X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.	integer	A number from 0 to 4294967295.	flag	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.
hex	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.								
ipv6	An IPv6 prefix that has the hexadecimal X:X::X:X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.								
integer	A number from 0 to 4294967295.								
flag	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.								

Mode DHCPv6 Configuration

Usage You must define a DHCPv6 option using the **ipv6 dhcp option** command before using the **option (DHCPv6)** command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the X:X::X:X address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Examples To add the IPv6 type option named `sntp-server-addr` to the pool P2 and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name
                sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcpv6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcpv6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcpv6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the following commands:

```
awplus(config-dhcpv6)# option 175 2001:0db8:3001::/64
awplus(config-dhcpv6)# option 175 2001:0db8:3002::/64
awplus(config-dhcpv6)# option 175 2001:0db8:3003::/64
```

To add the option 179 to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcpv6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcpv6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcpv6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcpv6)# no option tftp-server-name
```

Related Commands **dns-server (DHCPv6)**
ipv6 dhcp option
ipv6 dhcp pool
show ipv6 dhcp pool

prefix-delegation pool

Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the **ipv6 dhcp pool** command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

Syntax `prefix-delegation pool <DHCPv6-poolname>
[lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`
`no prefix-delegation pool <DHCPv6-poolname>`

Parameter	Description
<code><DHCPv6-poolname></code>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<code>lifetime</code>	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <code>valid-time</code> and a <code>preferred-time</code> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<code><valid-time></code>	Specify a valid lifetime in seconds in the range <5-315360000>.
<code>infinite</code>	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<code><preferred-time></code>	Specify a valid lifetime in seconds in the range <5-315360000>.

Default No IPv6 local prefix pool is specified by default.

Mode DHCPv6 Configuration

Usage The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the **ipv6 local pool** command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Example This example adds DHCPv6 Prefix Delegation pool `pd_pool1` to DHCPv6 pool `pool1`:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48
56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcpv6)# prefix-delegation pool pd_pool1
```

[ipv6 local pool](#)
[show ipv6 dhcp pool](#)

show counter ipv6 dhcp-client

Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See [show counter ipv6 dhcp-server](#) for DHCPv6 server information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show counter ipv6 dhcp-client

Mode User Exec and Privileged Exec

Example To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

Output **Figure 93-2: Example output from the show counter ipv6 dhcp-client command**

```
awplus#show counter ipv6 dhcp-client
SOLICIT out          ..... 20
ADVERTISE in         ..... 12
REQUEST out          ..... 1
CONFIRM out          ..... 0
RENEW out            ..... 0
REBIND out           ..... 0
REPLY in             ..... 0
RELEASE out          ..... 0
DECLINE out          ..... 0
INFORMATION-REQUEST out ..... 0
```

Table 93-1: Parameters in the output of the show counter ipv6 dhcp-client command

Parameter	Description
SOLICIT out	Displays the count of SOLICIT messages sent by the DHCPv6 client.
ADVERTISE in	Displays the count of ADVERTISE messages received by the DHCPv6 client.
REQUEST out	Displays the count of REQUEST messages sent by the DHCPv6 client.
CONFIRM out	Displays the count of CONFIRM messages sent by the DHCPv6 client.
RENEW out	Displays the count of RENEW messages sent by the DHCPv6 client.
REBIND out	Displays the count of REBIND messages sent by the DHCPv6 client.
REPLY in	Displays the count of REPLY messages received by the DHCPv6 client.
RELEASE out	Displays the count of RELEASE messages sent by the DHCPv6 client.
DECLINE out	Displays the count of DECLINE messages sent by the DHCPv6 client.
INFORMATION-REQUEST out	Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client.

Related Commands [show counter ipv6 dhcp-server](#)

show counter ipv6 dhcp-server

Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See [show counter ipv6 dhcp-client](#) for DHCPv6 client information.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show counter ipv6 dhcp-server`

Mode User Exec and Privileged Exec

Example To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

Output **Figure 93-3: Example output from the show counter ipv6 dhcp-server command**

```
awplus#show counter ipv6 dhcp-server
SOLICIT in          ..... 20
ADVERTISE out       ..... 12
REQUEST in          ..... 1
CONFIRM in          ..... 0
RENEW in            ..... 0
REBIND in           ..... 0
REPLY out           ..... 0
RELEASE in          ..... 0
DECLINE in          ..... 0
INFORMATION-REQUEST in ..... 0
```

Table 93-2: Parameters in the output of the show counter ipv6 dhcp-server command

Parameter	Description
SOLICIT in	Displays the count of SOLICIT messages received by the DHCPv6 server.
ADVERTISE out	Displays the count of ADVERTISE messages sent by the DHCPv6 server.
REQUEST in	Displays the count of REQUEST messages received by the DHCPv6 server.
CONFIRM in	Displays the count of CONFIRM messages received by the DHCPv6 server.
RENEW in	Displays the count of RENEW messages received by the DHCPv6 server.
REBIND in	Displays the count of REBIND messages received by the DHCPv6 server.
REPLY out	Displays the count of REPLY messages sent by the DHCPv6 server.
RELEASE in	Displays the count of RELEASE messages received by the DHCPv6 server.
DECLINE in	Displays the count of DECLINE messages received by the DHCPv6 server.
INFORMATION-REQUEST in	Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server

Related Commands [show counter ipv6 dhcp-client](#)

show ipv6 dhcp

Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your switch.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ipv6 dhcp`

Mode User Exec and Privileged Exec

Usage The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The switch uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

Example To display the DUID configured on your switch, use the command:

```
awplus# show ipv6 dhcp
```

Output [Figure 93-4: Example output from the show ipv6 dhcp command](#)

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

Related Commands [ipv6 address dhcp](#)

show ipv6 dhcp binding

Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional `summary` keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on output options, see [“Controlling “show” Command Output” on page 1.35.](#)

Syntax `show ipv6 dhcp binding [summary]`

Parameter	Description
<code>summary</code>	Optional. Specify the <code>summary</code> keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes.

Mode User Exec and Privileged Exec

Example 1 To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

Output **Figure 93-5: Example output from the show ipv6 dhcp binding summary command**

```
awplus# show ipv6 dhcp binding summary
Pool Name                Number of Leased Addresses
-----
ia-nal                   3
ia-pdl                   5
Total in all Pools:     8
```

Table 93-3: Parameters in the output of the show ipv6 dhcp binding summary command

Parameter	Description
Pool Name	Displays a list of all the pool names.
Number of Leased Addresses	Displays the number of leased address entries for the pool.
Total in all Pools	Displays the total number of leased address entries for all pools.

Example 2 To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

Output Figure 93-6: Example output from the show ipv6 dhcp binding command

```
awplus#show ipv6 dhcp binding
Pool ia-nal
  Address 2002:0:3c0::1
    client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 18:38:29
    expires at 19 Sep 2012 18:38:29
Pool ia-pd1
  Prefix 2002:0:3c0::/42
    client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 18:38:29
    expires at 19 Sep 2012 18:38:29
```

Table 93-4: Parameters in the output of the show ipv6 dhcp binding command

Parameter	Description
Address	Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
Prefix	Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
DUID	DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.
IAID	Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.
preferred lifetime	The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
valid lifetime	The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
starts at	The date and time at which the valid lifetime expires.
expires at	The date and time at which the valid lifetime expires.

show ipv6 dhcp interface

Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax show ipv6 dhcp interface [<interface-name>]

Parameter	Description
<interface-name>	Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on.

Mode User Exec and Privileged Exec

Example 1 To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

Output **Figure 93-7: Example output from the show ipv6 dhcp interface command**

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
  Address 1001::3c0:1
    preferred lifetime 9000, valid lifetime 5000
    starts at 20 Jan 2012 09:21:35
    expires at 20 Jan 2012 10:25:32
vlan2 is in client (Prefix-Delegation) mode
  Prefix name pd1
    prefix 2002:0:3c0::/42
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 09:21:33
    expires at 19 Sep 2012 09:21:33
vlan3 is in server mode
  Using pool : pool-1;
  Preference : 0
```

Example 2 To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

Output **Figure 93-8: Example output from the show ipv6 dhcp interface vlan2 command**

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
  Prefix name pd1
    prefix 2002:0:3c0::/42
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 09:21:33
    expires at 19 Sep 2012 09:21:33
```

Table 93-5: Parameters in the output of the show counter dhcp-client command

Parameter	Description
is in server/ client/(Prefix- Delegation) mode	Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface.
Address	Displays the address of the DHCPv6 server on the interface.
Prefix name	Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.
Using pool	Displays the name of the pool used by the interface.
Preference	Displays the preference value for the DHCPv6 server.

Related Commands [ipv6 dhcp client pd](#)

show ipv6 dhcp pool

Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the switch.

For information on output options, see [“Controlling “show” Command Output” on page 1.35](#).

Syntax `show ipv6 dhcp pool [<DHCPv6-address-pool-name>]`

Parameter	Description
<DHCPv6-address-pool-name>	Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 dhcp pool
```

Output **Figure 93-9: Example output from the show ipv6 dhcp pool command**

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
  Address Prefix : 1001::/64
    Lifetime: 2592000(valid), 604800(preferred)
  DNS Server: 2001::1
  DNS Server: 2001::2
  Domain Name: example.com
  Domain Name: example.co.jp
  SNTP Server: 2001::5
  SNTP Server: 2001::6
  Option Code : 150
    Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
  PD Pool Name: pd1
  Prefix : 2002::/38-42
  Lifetime : 2592000(valid), 604800(preferred)
```

Table 93-6: Parameters in the output of the show ipv6 dhcp pool command

Parameter	Description
DHCPv6 Pool	Name of the DHCPv6 pool.
Address Prefix	Address prefix to the DHCPv6 pool.

Table 93-6: Parameters in the output of the show ipv6 dhcp pool command(cont.)

Parameter	Description
Address Lifetime	<p>Valid and preferred lifetimes to the DHCPv6 pool.</p> <p>Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.</p> <p>Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.</p> <p>An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.</p>
DNS Server	IPv6 address of the DNS Server
Domain name	URL for the domain name.
SNTP Server	IPv6 address of the SNTP (Simple Network Time Protocol) Server.
Option Code	DHCP Option code (see RFC 2132).
Option Value	DHCP Option value type (see RFC 2132).

Related Commands [ipv6 dhcp pool](#)

sntp-address

Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

Syntax `sntp-address <ipv6-address>`
`no sntp-address <ipv6-address>`

Parameter	Description
<code><ipv6-address></code>	Specify an SNTP Server IPv6 address, in hexadecimal notation in the format X:X::X:X.

Mode DHCPv6 Configuration

Examples The following example adds an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcpv6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcpv6)# no sntp-address 2001:0db8::/32
```

Introduction

The Simple Network Management Protocol (SNMP) is the network management protocol of choice for the Internet and IP-based internetworks.

This chapter describes the main features of SNMP Version 1 (SNMPv1), SNMP Version 2c (SNMPv2c) and Version 3 (SNMPv3). It also describes support for SNMP on the switch, and how to configure the switch's SNMP agent.

Unless a particular version of SNMP is named, "SNMP" in this chapter refers to versions SNMPv1, SNMPv2c and SNMPv3.

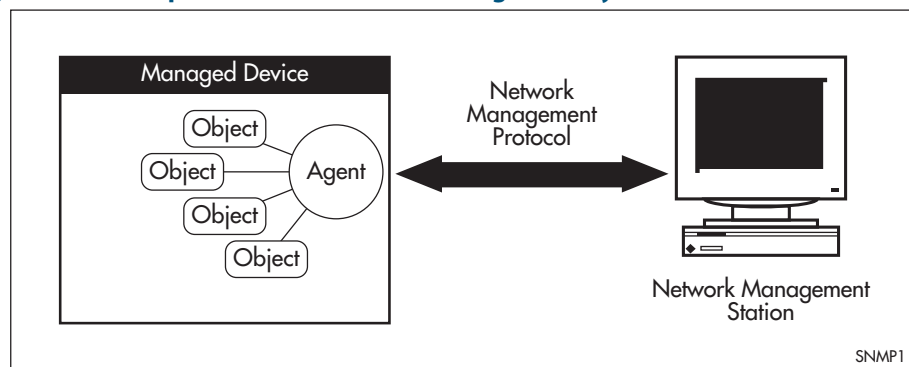

See also [Chapter 95, SNMP Commands](#) and [Chapter 96, SNMP MIBs](#).

Network Management Framework

A network management system has the following components:

- One or more **managed devices**, each containing an agent that provides the management functions. A managed device may be any computing device with a network capability, for example, a host system, workstation, terminal server, printer, router, switch, bridge, hub or repeater.
- One or more **Network Management Stations (NMS)**. An NMS is a host system running a network management protocol and network management applications, enabling the user to manage the network.
- A **network management protocol** used by the NMS and agents to exchange information.

Figure 94-1: Components of a network management system

The Internet-standard Network Management Framework is the framework used for network management in the Internet. The framework was originally defined by the following documents:

- RFC 1155, *Structure and identification of management information for TCP/IP based internets* (referred to as the SMI), details the mechanisms used to describe and name the objects to be managed.
- RFC 1213, *Management Information Base for network management of TCP/IP-based internets: MIB-II* (referred to as MIB-II), defines the core set of managed objects for the Internet suite of protocols. The set of managed objects can be extended by adding other MIBs specific to particular protocols, interfaces or network devices.
- RFC 1157, *A Simple Network Management Protocol (SNMP)*, is the protocol used for communication between management stations and managed devices.

Subsequent documents that have defined SNMPv2c are:

- RFC 1901, *Introduction to Community-based SNMPv2*
- RFC 1902, *Structure of Management Information for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1903, *Textual Conventions for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1904, *Conformance Statements for Version 2 of the Simple Network Management Protocol*
- RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1906, *Transport Mappings for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework*
- RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
- RFC 2579, *Textual Conventions for SMIv2*
- RFC 2580, *Conformance Statements for SMIv2*

Subsequent documents that have defined SNMPv3 are:

- RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework*
- RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*
- RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)*
- RFC 3413, *Simple Network Management Protocol (SNMP) Applications*
- RFC 3414, *User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)*
- RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*
- RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*
- RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*
- RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*

Structure of Management Information

The structure of management information (SMI) defines the schema for a collection of managed objects residing in a virtual store called the management information base (MIB). The information in a MIB includes administrative and operational configuration information, as well as counters of system events and activities.

The MIB is organized into a tree-like hierarchy in which nodes are each assigned an identifier consisting of a non-negative integer and an optional brief textual description.

Each managed object is represented by a leaf node and is defined by its name, syntax, access mode, status and description. It can also be specifically identified by its unique position within the tree. This position is expressed as a series of dot-delimited sub-identifiers that start at the root node and end in the sub-identifier at the particular object's leaf node. For example, in **Figure 94-2** the object named interfaces would be uniquely identified by the string of individual sub-identifiers, 1.3.6.1.2.1.2.

Figure 94-2: Top levels of the Internet-standard Management Information Base (MIB)

Objects defined in the Internet-standard MIB (MIB-II) reside in the mib(1) sub-tree.

Names

Names are used to identify managed objects, and are hierarchical in nature. An object identifier is a globally unique, authoritatively assigned sequence of non-negative integers which traverse the MIB tree from the root to the node containing the object.

Object identifiers may be represented in one of the following forms:

- Dotted notation lists the integer values found by traversing the tree from the root to the node in question, separated by dots. For example, the following identifies the MIB-II sub-tree:

```
1.3.6.1.2.1
```

The following identifies the sysDescr object in the system group of MIB-II:

```
1.3.6.1.2.1.1.1
```

- Textual notation lists the textual descriptions found by traversing the tree from the root to the node in question, separated by spaces and enclosed in braces. For following example identifies the internet sub-tree:

```
{ iso org dod 1 }
```

The name may be abbreviated to a relative form. The following example identifies the first (directory) node of the internet sub-tree:

```
{ internet 1 }
```

- Combined notation lists both the integer values and textual descriptions found by traversing the tree from the root to the node in question. The integer value is placed in parentheses after the textual description. The labels are separated by spaces and enclosed in braces. For example, the following identifies the first (directory) node in the internet sub-tree:

```
{iso(1) org(3) dod(6) internet(1) 1}
```

The name may be abbreviated to the following:

```
directory(1)
```

Since there is no effective limit to the magnitude of non-negative integers, and no effective limit to the depth of the tree, the MIB provides an unlimited name space.

An object is also usually assigned an object descriptor. The object descriptor is a unique, mnemonic, printable string intended for humans to use when discussing the MIB.

Instances

Objects are just templates for data types. An actual value that can be manipulated by an NMS is an instance of an object. An instance is named by appending an instance identifier to the end of the object's object identifier. The instance identifier depends on the object's data type:

- If the object is not a column in a table, the instance identifier is 0 (zero). For example, the instance of the sysDescr object is:

```
sysDescr.0  
or 1.3.6.1.2.1.1.1.0
```

- If the object is a column in a table, the method used to assign an instance identifier varies. Typically, the value of the index column or columns is used.

The object ifTable in MIB-II contains information about interfaces and is indexed by the interface number, ifIndex. The instance of the ifDescr object for the first interface is:

```
ifDescr.1  
or 1.3.6.1.2.1.2.2.1.2.1
```

If the index column is an IP address, the entire IP address is used as the instance identifier. The object ipRouteTable in MIB-II contains information about IP routes and is indexed by the destination address, ipRouteDest. The instance of the ipRouteNextHop object for the route 131.203.9.0 is:

```
ipRouteNextHop.131.203.9.0  
or 1.3.6.1.2.1.4.21.1.7.131.203.9.0
```

If the table has more than one index, the values of all the index columns are combined to form the instance identifier. The object tcpConnTable in MIB-II contains information about existing TCP connections and is indexed by the local IP address (tcpConnLocalAddress), the local port number (tcpConnLocalPort), the remote IP address (tcpConnRemAddress) and the remote port number (tcpConnRemPort) of the TCP connection. The instance of the tcpConnState object for the connection between 131.203.8.36,23 and 131.203.9.197,1066 is:

```
tcpConnState.131.203.8.36.23.131.203.9.197.1066  
or 1.3.6.1.2.1.6.13.1.1.131.203.8.36.23.131.203.9.197.1066
```

Syntax

The syntax of an object describes the abstract data structure corresponding to that object type. For example, INTEGER or OCTET STRING.

Access

The access mode of an object describes the level of access for the object.

Access modes for MIB objects:

Access	Description
Read-only	The object's value can be read but not set.
Read-write	The object's value can be read and set.
Write-only	The object's value can be set but not read.
Not-accessible	The object's value cannot be read or set.

Status

The status of an object describes the implementation requirements for the object.

Status values for MIB objects:

Status	Description
Mandatory	Managed devices must implement the object.
Optional	Managed devices may implement the object.
Obsolete	Managed devices need no longer implement the object.
Deprecated	Managed devices should implement the object. However, the object may be deleted from the next version of the MIB. A new object with equal or superior functionality is defined.

Description

The definition of an object may include an optional textual description of the meaning and use of the object. This description is often essential for successful understanding of the object.

The SNMP Protocol

The SNMP protocol provides a mechanism for management entities, or stations, to extract information from the Management Information Base (MIB) of a managed device.

The normal method of accessing information in a MIB is to use a Network Management Station (NMS), typically a PC or workstation, to send commands to the managed device (in this case the switch) using the SNMP protocol.

SNMP can use a number of different protocols as its underlying transport mechanism, but the most common transport protocol, and the only one supported by the switch, is UDP. Therefore the IP module must be enabled and properly configured in order to use SNMP. SNMP trap messages are sent to UDP port 162; all other SNMP messages are sent to UDP port 161. The switch's SNMP agent accepts SNMP messages up to the maximum UDP length the switch can receive.

Other transport mappings have been defined (e.g. OSI [RFC 1418], AppleTalk [RFC 1419] and IPX [RFC 1420]), but the standard transport mapping for the Internet (and the one the switch uses) is UDP. The IP module must be enabled and configured correctly. See [Chapter 27, IP Addressing and Protocol Commands](#) for detailed descriptions of the commands required to enable and configure IP.

SNMP Versions

The switch supports SNMP version 1 (SNMPv1), SNMP version 2c (SNMPv2c) and SNMP Version 3 (SNMPv3). The three versions operate similarly.

SNMPv2c updated the original protocol, and offered the following main enhancements:

- a new format for trap messages.
- the get-bulk-request PDU allows for the retrieval of large amounts of data, including tables, with one message.
- more error codes mean that error responses to set messages have more detail than is possible with SNMPv1.
- three new exceptions to errors can be returned for get, get-next and get-bulk-request messages. These are: noSuchObject, noSuchInstance, and endOfMibView.

SNMPv3 provides significant enhancements to address the security weaknesses existing in the earlier versions. This is achieved by implementing two new major features:

- Authentication - by using password hashing and time stamping.
- Privacy - by using message encryption.

Support for multiple versions of SNMP is achieved by responding to each SNMP request with a response of the same version. For example, if an SNMPv1 request is sent to the switch, an SNMPv1 response is returned. If an SNMPv2c request is sent, an SNMPv2c response is returned. Therefore, authentication and encryption functions are not invoked when messages are detected as having either an SNMPv1 or SNMPv2c protocol format.

SNMP Messages

The SNMP protocol is termed simple because it has only six operations, or messages—get, get-next, get-response, set, and trap, and SNMPv2c also has the get-bulk-request message. The replies from the managed device are processed by the NMS and generally used to provide a graphical representation of the state of the network. The two major SNMP operations available to a management station for interacting with a client are the get and set operations. The SNMP set operator can lead to security breaches, since SNMP is not inherently very secure. When forced to operate in either SNMPv1 or v2 mode, when operating with older management stations for example, care must be taken in the choice and safe-guarding of community names, which are effectively passwords for SNMP.

Polling versus Event Notification

SNMP employs a polling paradigm. A Network Management Station (NMS) polls the managed device for information as and when it is required, by sending get-request, get-next-request, and/or get-bulk-request PDUs to the managed device. The managed device responds by returning the requested information in a get-response PDU. The NMS may manipulate objects in the managed device by sending a set-request PDU to the managed device.

The only time that a managed device initiates an exchange of information is in the special case of a trap PDU. A managed device may generate a limited set of traps to notify the NMS of critical events that may affect the ability of the NMS to communicate with the managed device or other managed devices on the network, and therefore to “manage” the network. Such events include the restarting or re-initialization of a device, a change in the status of a network link (up or down), or an authentication failure.

Message Format for SNMPv1 and SNMPv2c

Table 94-1: Fields in an SNMP message

Field	Function
Version	The version of the SNMP protocol. The value is version-1 (0) for the SNMP protocol as defined in RFC 1157, or version-2c (1) for the SNMP protocol as defined in RFC 1902.
Community	The name of an SNMP community, for authentication purposes
SNMP PDU	An SNMP Protocol Data Unit (PDU).

Table 94-2: SNMP PDUs

PDU	Function
get-request	Sent by an NMS to an agent, to retrieve the value of an object.
get-next-request	Sent by an NMS to an agent, to retrieve the value of the next object in the sub-tree. A sub-tree is traversed by issuing a get-request PDU followed by successive get-next-request PDUs.
get-bulk-request	Sent by an NMS to an agent to request a large amount of data with a single message. This is for SNMPv2c messages.
set-request	Sent by an NMS to an agent, to manipulate the value of an object. SNMP PDU Version Community
get-response	Sent by an agent to an NMS in response to a get-request, get-next-request, get-bulk-response, or set-request PDU.
trap	Sent by an agent to an NMS to notify the NMS of a extraordinary event.
report	Although not explicitly defined in the RFCs, reports are used for specific purposes such as EngineID discovery and time synchronization.

Table 94-3: Generic SNMP traps

Value	Meaning
coldStart	The agent is re-initializing itself. Objects may be altered.
warmStart	The agent is re-initializing itself. Objects are not altered.
linkDown	An interface has changed state from up to down.
linkUp	An interface has changed state from down to up.
authenticationFailure	An SNMP message has been received with an invalid community name.
egpNeighborLoss	An EGP peer has transitioned to down state.

SNMP Communities (Version v1 and v2c)

A community is a relationship between an NMS and an agent. The community name is used like a password for a trivial authentication scheme. Both SNMPv1 and SNMPv2c provide security based on the community name only. The concept of communities does not exist for SNMPv3, which instead provides for a far more secure communications method using entities, users, and groups.

Caution We strongly recommend removing community membership from all SNMPv3 configured devices to prevent access to them via SNMPv1 and SNMPv2c, which could bypass the additional SNMPv3 security features.

SNMPv3 Entities

Entities comprise one of the basic components of the SNMPv3 enhanced architecture. They define the functionality and internal structure of the SNMP managers and agents. An in-depth description of entities can be found in RFC 3411, on which the following text is based. SNMPv3 defines two entity types, a manager and an agent. Both entity types contain two basic components: an SNMP engine and a set of applications.

SNMP Engine

The engine provides the basic services to support the agents component applications, in this respect it performs much of the functionality expected of the ISO Session and Presentation layers. These functions include message transmission and reception, authentication and encryption, and access control to its managed objects database (MIB). The SNMP engine comprises the following components:

- Dispatcher
- Message processing Subsystem
- Security Subsystem
- Access Control Subsystem

The only security subsystem presently supported is the user based security model (USM).

Each SNMP engine is identified by an snmpEngineID that must be unique within the management system. A one to one association exists between an engine and the entity that contains it.

Entity Applications

The following applications are defined within the agent applications:

- Command Generator
- Notification Receiver
- Proxy Forwarder
- Command Responder
- Notification Originator
- Other

SNMPv3 Message Protocol Format

Table 94-4: SNMPv3 PDUs

Value	Meaning
msgVersion	Identifies the message format to be SNMPv3.
msgID	An identifier used between SNMP entities to coordinate message requests and responses. Note that a message response takes the msgID value of the initiating message.
msgMaxSize	Conveys the maximum message size (in octets) an integer between 484 and $2^{31}-1$, supported by the sender of the message. Specified as msgFlags. A single octet whose last three bits indicate the operational mode for privacy, authentication, and report.
msgSecurityModel	An identifier used to indicate the security mode (i.e. SNMPv1, SNMPv2c or SNMPv3) to be used when processing the message. Note that although only the SNMPv3 identifier is accepted by the switch, these earlier version message formats are detected by the msgVersion field and processed appropriately.
msgAuthoritativeEngineID	The ID of the authoritative engine that relates to a particular message, i.e. the source engine ID for Traps, Responses and Reports, and the destination engine for Gets, GetNexts, Sets, and Informs.
msgAuthoritativeEngineBoots	A value that represents the number of times the authoritative engine has rebooted since its installation. Its value has the range 1 to $2^{31}-1$.
msgAuthoritativeEngineTime	The number of seconds since the authoritative engine snmpEngineBoots counter was last incremented.
msgUserName	The name of the user (principal) on whose behalf the message is being exchanged.
msgAuthenticationParameters	If the message has been authenticated, this field contains a serialized OCTET STRING representing the first 12 octets of the HMAC-MD5-96 output done over the whole message.
msgPrivacyParameters	For encrypted data, this field contains the "salt" used to create the DES encryption Initialization Vector (IV).
ContextEngineID	Within a particular administrative domain, this field uniquely identifies an SNMP entity that may realize an instance of a context with a particular contextName
ContextName	A unique name given to a context within a particular SNMP entity.

SNMPv1 and SNMPv2c

Although software levels 2.6.3 and higher support the specific facilities of SNMP v1 and v2, their documentation is available to provide backward compatibility with older network management systems. The far superior security features offered by implementing SNMPv3 should be used wherever possible.

The switch's implementation of SNMPv1 is based on RFC 1157, *A Simple Network Management Protocol (SNMP)*, and RFC 1812, *Requirements for IP Version 4 Routers*.

When the SNMP agent is disabled, the agent does not respond to SNMP request messages. The agent is disabled by default. The current state and configuration of the SNMP agent can be displayed.

SNMP MIB Views for SNMPv1 and SNMPv2c

An SNMP MIB view is an arbitrary subset of objects in the MIB. Objects in the view may be from any part of the object name space, and not necessarily the same sub-tree. An SNMP community profile is the pairing of an SNMP access mode (read-only or read-write) with the access mode defined by the MIB for each object in the view. For each object in the view, the community profile defines the operations that can be performed on the object.

Pairing an SNMP community with an SNMP community profile determines the level of access that the agent affords to an NMS that is a member of the specified community. When an agent receives an SNMP message, it checks the community name encoded in the message. If the agent knows the community name, the message is deemed to be authentic and the sending SNMP entity is accepted as a member of the community. The community profile associated with the community name then determines the sender's view of the MIB and the operations that can be performed on objects in the view.

SNMP Communities

SNMP communities were introduced into SNMPv1 and retained in version 2c. Although the switch's software still supports communities, this is to provide backward compatibility with legacy management systems. Communities should not be used where a secure network is required. Instead, use the secure network features offered by SNMPv3.

An SNMP community is a pairing of an SNMP agent with a set of SNMP application entities. Communities are the main configuration item in the switch's implementation of SNMPv1 and v2, and are defined in terms of a list of IP addresses which define the SNMP application entities (trap hosts and management stations) in the community.

Important community names act as passwords and provide minimal authentication. Any SNMP application entity that knows a community name can read the value of any instance of any object in the MIB implemented in the switch. Any SNMP application entity that knows the name of a community with write access can change the value of any instance of any object in the MIB implemented in the switch, possibly affecting the operation of the switch. For this reason, take care with the security of community names.

When a trap is generated by the SNMP agent it is forwarded to all trap hosts in all communities. The community name and manager addresses are used to provide trivial authentication. An incoming SNMP message is deemed authentic if it contains a valid community name and originated from an IP address defined as a management station for that community.

When a community is disabled, the SNMP agent behaves as if the community does not exist and generates authentication failure traps for messages directed to the disabled community.

The SNMP agent does not support a default community called “public” with read-only access, traps disabled and open access as mandated in RFC 1812, as this is a security hole open for users who wish to use the switch with minimal modification to the default configuration. The default configuration of the switch has no defined communities. Communities must be explicitly created.

SNMP authentication (for SNMPv1 and v2) is a mechanism whereby an SNMP message is declared to be authentic, that is from an SNMP application entity actually in the community to which the message purports to belong. The mechanism may be trivial or secure. The only form of SNMP authentication implemented by the switch’s SNMP agent is trivial authentication. The authentication failure trap may be generated as a result of the failure to authentication an SNMP message.

Switch interfaces can be enabled or disabled via SNMP by setting the ifAdminStatus object in the ifTable of MIB-II MIB to ‘Up(1)’ or ‘Down(2)’ for the corresponding ifIndex. If it is not possible to change the status of a particular interface the switch returns an SNMP error message.

The switch’s implementation of the ifOperStatus object in the ifTable of MIB-II MIB supports two additional values—“Unknown(4)” and “Dormant(5)” (e.g. an inactive dial-on-demand interface).

Caution  **An unauthorized person with knowledge of the appropriate SNMP community name could bring an interface up or down. Community names act as passwords for the SNMP protocol. When creating an SNMP community with write access, take care to select a secure community name and to ensure that only authorized personnel know it.**

An SNMP MIB view is a subset of objects in the MIB that pertain to a particular network element. For example, the MIB view of a hub would be the objects relevant to management of the hub, and would not include IP routing table objects, for example. The switch’s SNMP agent does not allow the construction of MIB views. The switch supports all relevant objects from all MIBs that it implements.

Note that the switch’s standard set and show commands can also be used to access objects in the MIBs supported by the switch.

Defining Management Stations within Communities

You can add management stations to a community either individually, by entering just its IP address, or you can enter a range of management stations by entering an IP address that ends with a ‘/’ character followed by a number between 1 and 32. The number that follows the ‘/’ character operates as an address mask to define a range of addresses for the management stations. The following example shows how to allocate a band of three binary addresses to a portion of the subnet 146.15.1.X

Example In this example we make provision for up to 8 possible management stations within a community called “admin”.

Step 1:

Decide on the number of management stations that you want to assign to a particular subnet, then decide how many binary digits are required to define this number of addresses. In this case we need up to 8 management stations, so we will assign 3 binary digits (3 binary digits can provide 8 different values). To assign the last 3 binary digits for management stations, we assign a prefix that is a count of all binary digits in the address minus those to be assigned as management stations. In this case the prefix is 29; this being the number of binary digits in an IP address (32) minus the number of digits assigned to the management stations (3).

Step 2:

The method used in this step depends on whether or not the community already exists.

- If the community called “admin” does not exist, create a new community called “admin” and allocate a three binary digit block of addresses to the address subnet 146.15.1.X.
- If the community called “admin” already exists, allocate a three binary digit block of addresses to an existing community called “admin” with the address subnet 146.15.1.X.

For security reasons, the common management prefix should be larger than the IP subnet. This prevents stations on one subnet from being considered valid management stations on a different subnet.

Configuration Example (SNMPv1 and v2)

This example shows how to configure the switch's SNMP agent. Two network management stations have been set up on a large network. The central NMS (IP address 192.168.11.5) monitors devices on the network and uses SNMP set messages to manage devices on the network. Trap messages are sent to this management station. The regional network management station (IP addresses 192.168.16.1) is used just to monitor devices on the network by using SNMP get messages. Link traps are enabled for all interfaces on this particular switch.

IP and VLANs must be correctly configured in order to access the SNMP agent in the switch. This is because the IP module handles both the TCP transport functions, and the UDP functions that enable datagrams to transport SNMP messages. See [Chapter 27, IP Addressing and Protocol Commands](#) for commands that enable and configure IP.

To configure SNMP Step 1: Enable the SNMP agent.

Enable the SNMP agent and enable the generation of authenticate failure traps to monitor unauthorized SNMP access. SNMP is enabled by default in AlliedWare Plus.

```
awplus(config)# snmp-server enable trap auth
```

Step 2: Create a community with write access for the central NMS.

Create a write access community called “example1rw” for use by the central network management station at 192.168.11.5 Use an ACL to give the central NMS SNMP access to the switch using that community name.

```
awplus(config)# access-list 66 permit 192.168.11.5
awplus(config)# snmp-server community example1rw rw 66
```

Care must be taken with the security of community names. Do not use the names “private” or “public” in your network because they are too obvious. Community names act as passwords and provide only trivial authentication. Any SNMP application entity that knows a community name can read the value of any instance of any object in the MIB implemented in the switch. Any SNMP application entity that knows the name of a community with write access can change the value of any instance of any object in the MIB implemented in the switch, possibly affecting the operation of the switch.

SNMP V1 or V2c provide very minimal security. If security is a concern, you should use SNMPv3.

Step 3: Create a community with read-only access for the regional NMS.

Create a read-only access community called "example2ro" for use by the regional network management station at 192.168.16.1. Use an ACL to give the regional NMS SNMP access to the switch using that community name.

```
awplus(config)# access-list 67 permit 192.168.16.1
awplus(config)# snmp-server community example2ro ro 67
```

Step 4: Enable link traps.

Enable link traps for the desired interfaces. In this example, the NSMs are in VLAN 2 and VLAN 3 and other ports are in VLAN 1 for simplicity.

```
awplus(config)# interface vlan1-3
awplus(config-if)# snmp trap link-status
```

Note that link traps on VLANs are sent when the last port in the VLAN goes down. You will only see a trap for a VLAN if the trap host is in a different VLAN.

You can also enable link traps on channel groups and switch ports. For example, to enable traps on a range of switch ports:

```
awplus(config)# int port1.1.5-1.1.7
awplus(config-if)# snmp trap link-status
```

You can also enable link traps on channel groups and switch ports. For example, to enable traps on a range of switch ports:

Step 5: Configure trap hosts.

Specify the IP address or addresses that the traps will get sent to. In this example, traps will be sent to both NMSes.

```
awplus(config)# snmp-server host 192.168.11.5 version 2c
example1rw
awplus(config)# snmp-server host 192.168.16.1 version 2c
example2ro
```

Step 6: Check the configuration.

Check that the current configuration of the SNMP communities matches the desired configuration:

```
awplus# show snmp-server
awplus# show snmp-server community
awplus# show run snmp
```

This is the output of the **show snmp-server community** command for this example:

```
SNMP community information:
Community Name ..... example1rw
Access ..... Read-write
View ..... none
Community Name ..... example2ro
Access ..... Read-only
View ..... none
```

This is the output of the **show run snmp** command for this example:

```
no snmp-server ip
snmp-server enable trap auth
snmp-server community example1rw rw 66
snmp-server community example2ro 67
snmp-server host 192.168.1.2 version 2c example1rw
snmp-server host 192.168.2.2 version 2c example2ro
!
```

Check that the interface link up/down traps have been correctly configured:

```
awplus# show interface vlan1-3
```

This is the output of the **show interface** command for this example:

```
Interface vlan1
Scope: both
Link is UP, administrative state is UP
Hardware is VLAN, address is 0009.41fd.c029
index 201 metric 1 mtu 1500
arp ageing timeout 300
<UP,BROADCAST,RUNNING,MULTICAST>
SNMP link-status traps: Sending (suppressed after 20 traps in 60 sec)
Bandwidth 1g
input packets 4061, bytes 277043, dropped 0, multicast packets 3690
output packets 190, bytes 18123, multicast packets 0 broadcast packets 0
Interface vlan2
Scope: both
Link is DOWN, administrative state is UP
Hardware is VLAN, address is 0009.41fd.c029
IPv4 address 192.168.11.50/24 broadcast 192.168.11.255
index 202 metric 1 mtu 1500
arp ageing timeout 300
<UP,BROADCAST,MULTICAST>
SNMP link-status traps: Sending (suppressed after 20 traps in 60 sec)
Bandwidth 1g
input packets 568, bytes 42309, dropped 0, multicast packets 0
output packets 183, bytes 18078, multicast packets 0 broadcast packets 0
Interface vlan3
Scope: both
Link is DOWN, administrative state is UP
Hardware is VLAN, address is 0009.41fd.c029
IPv4 address 192.168.16.50/24 broadcast 192.168.16.255
index 203 metric 1 mtu 1500
arp ageing timeout 300
<UP,BROADCAST,MULTICAST>
SNMP link-status traps: Sending (suppressed after 20 traps in 60 sec)
input packets 0, bytes 0, dropped 0, multicast packets 0
output packets 0, bytes 0, multicast packets 0 broadcast packets 0
```

SNMPv3

SNMPv3 is the third version of the Simple Network Management Protocol. The architecture comprises the following:

- entities that may be either managers, agents, or both
- a management information base (MIB)
- a transport protocol

At least one manager node runs the SNMP management software in every configuration. Managed devices such as routers, servers, and workstations are equipped with an agent software module. The agent provides access to local objects in the MIB that reflect activity and resources at the node. The agent also responds to manager commands to retrieve values from, and set values in the MIB.

SNMP MIB Views for SNMPv3

An SNMP MIB view is an arbitrary subset of objects in the MIB. Objects in the view may be from any part of the object name space, and not necessarily the same sub-tree.

SNMP Groups

Groups were introduced as part of SNMPv3. They are the means by which users are assigned their views and access control policy. Once a group has been created, users can be added to them. In practice a number of groups would be created, each with varying views and access security requirements. Users would then be added to their most appropriate groups. Each Group name and Security Level pair must be unique within a switch.

SNMP Users

Users were introduced as part of SNMPv3. From a system perspective a user is represented as an entity stored in a table that defines the access and authentication criteria to be applied to access or modify the SNMP MIB data.

 **Note** SNMP **Target Addresses** and **Target Params** in SNMPv3 are not currently supported in AlliedWare Plus software.

Configuration Example (SNMPv3)

This example shows how to configure the switch's SNMP agent. Two network management stations have been set up on a large network. The central NMS (IP address 192.168.11.5) monitors devices on the network and uses SNMP set messages to manage devices on the network. Trap messages are sent to this management station.

The IP module must be enabled and correctly configured in order to access the SNMP agent in the switch, since the IP module handles the UDP datagrams used to transport SNMP messages.

To configure SNMP **Step 1: Enable the SNMP agent.**

Enable the SNMP agent and enable the generation of authenticate failure traps to monitor unauthorized SNMP access. SNMP is enabled by default in AlliedWare Plus.

Step 2: Add SNMP views.

You can specify views using their OID or the predefined MIB name.

```
awplus(config)# snmp-server view atmib 1.3.6.1.2.14
included

awplus(config)# snmp-server view atmib alliedtelesis
included
```

Step 3: Add SNMP group.

```
awplus(config)# snmp-server group ord-user noauth read
atmib

awplus(config)# snmp-server group admin-user auth read
atmib write atmib notify atmi
```

Step 4: Add SNMP users.

Add users to the groups by using commands such as:

```
awplus(config)# snmp-server user ken admin-user auth md5
mercury
```

Using SNMP to Manage Files and Software

The Allied Telesis Enterprise MIB ([Chapter 96, SNMP MIBs](#)) includes objects for managing files and software on the switch. This section includes procedures for using MIB objects on the switch to perform some common tasks, via an SNMP management application:

- [“Copy a File to or from a TFTP Server” on page 94.20](#)
- [“Upgrade Software and Configuration Files” on page 94.22](#)

For more details about the Allied Telesis Enterprise MIB and public MIBs on the switch, see [Chapter 96, SNMP MIBs](#).

Copy a File to or from a TFTP Server

Use this procedure to copy a file (for example, a software version file) to the switch from a TFTP server, or to copy a file (for example, a configuration file) from the switch to a TFTP server. The MIB objects in this procedure reside in the module `atFilev2` { modules 600 }, with object ID 1.3.6.1.4.1.207.8.4.4.4.600. For detailed descriptions of the MIB objects used in this procedure, and other file management MIB objects, see [“AT-FILEv2-MIB” on page 96.62](#). Other MIB objects can be used in a similar way for moving and deleting files on the switch.

Table 94-5: Procedure for copying a file to or from a device using a TFTP server

Do this ...	By setting or reading this MIB object ...	Whose object ID is ...	To this value ...
1. For a standalone switch, keep the default value, 1.	<code>atFilev2SourceStackId</code>	{ <code>atFilev2Operation 1</code> }	<code><stack-id></code>
2. If the destination device is part of a stack, set the stack ID.	<code>atFilev2DestinationStackId</code>	{ <code>atFilev2Operation 4</code> }	<code><stack-id></code>
3. Set the source device.	<code>atFilev2SourceDevice</code>	{ <code>atFilev2Operation 2</code> }	4 (TFTP) or 1 (Flash)
4. Set the destination device.	<code>atFilev2DestinationDevice</code>	{ <code>atFilev2Operation 5</code> }	4 (TFTP) or 1 (Flash)
5. Set the source filename. Include the path (if any) but not the device.	<code>atFilev2SourceFileName</code>	{ <code>atFilev2Operation 3</code> }	<code><source-filename></code> e.g. <code>/awp/config/admin.cfg</code>
6. Set the destination filename. Include the path (if any) but not the device.	<code>atFilev2DestinationFileName</code>	{ <code>atFilev2Operation 6</code> }	<code><dest-filename></code> e.g. <code>/config/admin.cfg</code>

Table 94-5: Procedure for copying a file to or from a device using a TFTP server

Do this ...	By setting or reading this MIB object ...	Whose object ID is ...	To this value ...
7. Set the IP address of the TFTP server.	atFilev2TftpIPAddr	{ atFilev2Tftp_4 1 }	<ip-addr>
8. Check that no other transfer is in progress, and that the required parameters have been set.	atFilev2CopyBegin	{ atFilev2Operation 7 }	Read: idle
9. Start the file transfer.	atFilev2CopyBegin	{ atFilev2Operation 7 }	Set: 1
10 Monitor file transfer progress.	atFilev2CopyBegin	{ atFilev2Operation 7 }	Read: In progress: copying <src> --> <dst> or Success: copy <src> --> <dst> success or Failure: copy <src> --> <dst> failure: <err-msg>

Upgrade Software and Configuration Files

Use this procedure to upgrade to a new software version and boot configuration file. For detailed descriptions of the MIB objects used in this procedure, and other MIB objects for managing software installation and configuration files, see **“AT-SETUP-MIB” on page 96.43.**

Table 94-6: Procedure for upgrading to a new software version and boot configuration

Do this ...	By reading or setting this MIB object ...	Whose object ID is ...	To this value ...
1. Check that you have enough flash memory for the currently running software file, the new software version file, and any configuration scripts required.			
2. Check the version and name of the software currently running.	currSoftVersion currSoftName	1.3.6.1.4.1.207.8.4.4.4.500.2.1.1 1.3.6.1.4.1.207.8.4.4.4.500.2.1.2	Read: <software-name> <software-version>
3. If you do not already have the currently running software as a software version file in flash, save the currently running software with a file name to the flash root.	currSoftSaveToFile	1.3.6.1.4.1.207.8.4.4.4.500.2.1.4	Set: <backup-filename.rel>
4. Check that the file saved successfully. (The most common failures result from lack of flash memory space.)	currSoftSaveStatus	1.3.6.1.4.1.207.8.4.4.4.500.2.1.5	Read: <ul style="list-style-type: none"> ■ 1 (idle) - there is no release file save operation in progress ■ 2 (success) - the last release file save operation completed successfully ■ 3 (failure) - the last release file save operation failed ■ 4 (saving) - a release file save operation is currently in progress
5. Copy the new software version file to flash memory on the device	See Table 94-5 .		
6. Set the new release file to be the current release that the device will install and run the next time it restarts. Include the path.	nextBootPath	1.3.6.1.4.1.207.8.4.4.4.500.2.2.2	Set: <next-filename> e.g.: flash:/release.rel
7. Check the version of release file set to install next.	nextBootVersion	1.3.6.1.4.1.207.8.4.4.4.500.2.2.1	Read: <software-version>

Table 94-6: Procedure for upgrading to a new software version and boot configuration(cont.)

Do this ...	By reading or setting this MIB object ...	Whose object ID is ...	To this value ...
8. Set the previous release file to be the backup release that the device will install and run if the device fails to boot successfully with the new release file. Include the path.	bckpPath	1.3.6.1.4.1.207.8.4.4.4.500.2.3.2	Set: <backup-filename> e.g.: flash:/release.rel
9. Check the version of backup release file.	bckpVersion	1.3.6.1.4.1.207.8.4.4.4.500.2.3.1	Read: <software-version>
10. If necessary, copy a configuration file to the device (Table 94-5), or save the current running configuration to a file in the root directory of flash. To save the running configuration, specify the filename, but not a device or path.	See Table 94-5 . or runCnfgSaveAs	1.3.6.1.4.1.207.8.4.4.4.500.3.1.1	Set: <filename.cfg> e.g.: myconfig.cfg
11. Check and if necessary set the file the device will use for configuration when it restarts. Include the full path.	bootCnfgPath	1.3.6.1.4.1.207.8.4.4.4.500.3.2.1	Read/set: <filename.cfg> e.g.: flash:/myconfig.cfg
12. Check that a boot configuration file matching the boot configuration path exists.	bootCnfgExists	1.3.6.1.4.1.207.8.4.4.4.500.3.2.2	Read: TRUE (1) or FALSE (2)
13. Check that the default configuration file flash:/default.cfg exists.	dfltCnfgExists	1.3.6.1.4.1.207.8.4.4.4.500.3.3.2	Read: TRUE (1) or FALSE (2)
14. Restart the device.	restartDevice	1.3.6.1.4.1.207.8.4.4.4.500.1	1

Command List

This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see [Chapter 94, SNMP Introduction](#), and [Chapter 96, SNMP MIBs](#).

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

debug snmp

This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

Syntax `debug snmp [all|detail|error-string|process|receive|send|xdump]`
`no debug snmp [all|detail|error-string|process|receive|send|xdump]`

Parameter	Description
all	Enable or disable the display of all SNMP debugging information.
detail	Enable or disable the display of detailed SNMP debugging information.
error-string	Enable or disable the display of debugging information for SNMP error strings.
process	Enable or disable the display of debugging information for processed SNMP packets.
receive	Enable or disable the display of debugging information for received SNMP packets.
send	Enable or disable the display of debugging information for sent SNMP packets.
xdump	Enable or disable the display of hexadecimal dump debugging information for SNMP packets.

Mode Privileged Exec and Global Configuration

Example To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

Related Commands [show debugging snmp](#)
[terminal monitor](#)
[undebug snmp](#)

show counter snmp-server

This command displays counters for SNMP messages received by the SNMP agent.

Syntax show counter snmp-server

Mode User Exec and Privileged Exec

Example To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

Output **Figure 95-1: Example output from the show counter snmp-server command**

```
SNMP-SERVER counters
inPkts                ..... 11

UnknownPDUHandlers   ..... 0
```

Table 95-1: Parameters in the output of the show counter snmp-server command

Parameter	Meaning
inPkts	The total number of SNMP messages received by the SNMP agent.
inBadVersions	The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages. The SNMP agent on your device supports versions 1, 2C, and 3.

Table 95-1: Parameters in the output of the show counter snmp-server command

Parameter	Meaning
inBadCommunityNames	The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.
inBadCommunityUses	The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.
inASNParseErrs	The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.
inTooBig	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inNoSuchNames	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inBadValues	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inReadOnly	The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementation of the SNMP.
inGenErrs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.
inTotalReqVars	The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.
inTotalSetVars	The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.
inGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.
inGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.
inSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.
inGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.
inTraps	The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.
outPkts	The number of SNMP Messages that the SNMP agent has sent.

Table 95-1: Parameters in the output of the show counter snmp-server command

Parameter	Meaning
outTooBig	The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outNoSuchNames	The number of SNMP PDUs that the SNMP agent has generated with the value 'noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outBadValues	The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGenErrs	The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has generated.
outGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has generated.
outSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has generated.
outGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has generated.
outTraps	The number of SNMP Trap PDUs that the SNMP agent has generated.
UnSupportedSecLevels	The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent.
NotInTimeWindows	The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.
UnknownUserNames	The number of received packets that the SNMP agent has dropped because they referenced an unknown user.
UnknownEngineIDs	The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.
WrongDigest	The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.
DecryptionErrors	The number of received packets that the SNMP agent has dropped because they could not be decrypted.
UnknownSecModels	The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.
InvalidMsgs	The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.
UnknownPDUHandlers	The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.

Related Commands [show snmp-server](#)

show debugging snmp

This command displays whether SNMP debugging is enabled or disabled.

Syntax `show debugging snmp`

Mode User Exec and Privileged Exec

Example To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

Output **Figure 95-2: Example output from the show debugging snmp command**

```
Snmp (SMUX) debugging status:  
Snmp debugging is on
```

Related Commands [debug snmp](#)

show running-config snmp

This command displays the current configuration of SNMP on your device.

Syntax `show running-config snmp`

Mode Privileged Exec

Example To display the current configuration of SNMP on your device, use the command:

```
awplus# show running-config snmp
```

Output **Figure 95-3: Example output from the show running-config snmp command**

```
snmp-server contact AlliedTelesis  
snmp-server location Philippines  
snmp-server group groul auth read view1 write view1 notify view1  
snmp-server view view1 1 included  
snmp-server community public  
snmp-server user user1 group1 auth md5 password priv des  
password
```

Related Commands [show snmp-server](#)

show snmp-server

This command displays the status and current configuration of the SNMP server.

Syntax `show snmp-server`

Mode Privileged Exec

Example To display the status of the SNMP server, use the command:

```
awplus# show snmp-server
```

Output **Figure 95-4: Example output from the show snmp-server command**

```
SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ..... 0x80001f888021338e4747b8e607
```

- [show counter snmp-server](#)
- [snmp-server](#)
- [snmp-server engineID local](#)
- [snmp-server engineID local reset](#)

show snmp-server community

This command displays the SNMP server communities configured on the device. SNMP communities are specific to v1 and v2c.

Syntax `show snmp-server community`

Mode Privileged Exec

Example To display the SNMP server communities, use the command:

```
awplus# show snmp-server community
```

Output **Figure 95-5: Example output from the show snmp-server community command**

```
SNMP community information:
Community Name ..... public
Access ..... Read-only
View ..... none
```

Related Commands

- [show snmp-server](#)
- [snmp-server community](#)

show snmp-server group

This command displays information about SNMP server groups. This command is used with SNMP version 3 only.

Syntax `show snmp-server group`

Mode Privileged Exec

Example To display the SNMP groups configured on the device, use the command:

```
awplus# show snmp-server group
```

Output **Figure 95-6: Example output from the show snmp-server group command**

```
SNMP group information:
Group name ..... guireadgroup
Security Level ..... priv
Read View ..... guiview
Write View ..... none
Notify View ..... none

Group name ..... guiwritegroup
Security Level ..... priv
Read View ..... none
Write View ..... guiview
Notify View ..... none
```

Related Commands [show snmp-server snmp-server group](#)

show snmp-server user

This command displays the SNMP server users and is used with SNMP version 3 only.

Syntax `show snmp-server user`

Mode Privileged Exec

Example To display the SNMP server users configured on the device, use the command:

```
awplus# show snmp-server user
```

Output **Figure 95-7: Example output from the show snmp-server user command**

Name	Group name	Auth	Privacy
----- freddy	----- guireadgroup	----- none	----- none

Related Commands [show snmp-server snmp-server user](#)

show snmp-server view

This command displays the SNMP server views and is used with SNMP version 3 only.

Syntax `show snmp-server view`

Mode Privileged Exec

Example To display the SNMP server views configured on the device, use the command:

```
awplus# show snmp-server view
```

Output **Figure 95-8: Example output from the show snmp-server view command**

```
SNMP view information:
View Name ..... view1
OID ..... 1
Type ..... included
```

Related Commands [show snmp-server snmp-server view](#)

snmp trap link-status

Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

Syntax `snmp trap link-status`
`no snmp trap link-status`

Default By default, link status notifications are disabled.

Mode Interface Configuration

Usage The link status notifications can be enabled for the following interface types:

- switch port (e.g. port 1.0.1)
- VLAN (e.g. vlan2)
- Ethernet (e.g. eth0)
- static and dynamic link aggregation (e.g. sa2, po3)

To specify where notifications are sent, use the [snmp-server host](#) command on page 95.25. To configure the switch globally to send other notifications, use the [snmp-server enable trap](#) command on page 95.19.

Examples To enable SNMP to send link status notifications for ports 1.1.2 to 1.1.12, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2-1.1.12
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port 1.1.2, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no snmp trap link-status
```

Related Commands [show interface](#)
[snmp trap link-status suppress](#)
[snmp-server enable trap](#)
[snmp-server host](#)

snmp trap link-status suppress

Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

Syntax

```
snmp trap link-status suppress
    {time {<1-60>|default}|threshold {<1-20>|default}}
```

```
no snmp trap link-status suppress
```

Parameter	Description
time	Set the suppression timer for link status notifications.
<1-60>	The suppress time in seconds.
default	The default suppress time in seconds (60).
threshold	Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval.
<1-20>	The number of link status notifications.
default	The default number of link status notifications (20).

Default By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

Mode Interface Configuration

Usage An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface. If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

Examples To enable the suppression of link status notifications for ports 1.1.2 to 1.1.12 after 10 notifications have been sent in 40 seconds, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2-1.1.12
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To disable the suppression link status notifications for port 1.1.2, use following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no snmp trap link-status suppress
```

Related Commands [show interface](#)
 [snmp trap link-status](#)

snmp-server

Use this command to enable the SNMP agent (server) on the switch. The SNMP agent receives and processes SNMP packets sent to the switch, and generates notifications (traps) that have been enabled by the [snmp-server enable trap command on page 95.19](#).

Use the **no** variant of this command to disable the SNMP agent on the switch. When SNMP is disabled, SNMP packets received by the switch are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

Syntax `snmp-server [ip|ipv6]`
`no snmp-server [ip|ipv6]`

Parameter	Description
<code>ip</code>	Enable or disable the SNMP agent for IPv4.
<code>ipv6</code>	Enable or disable the SNMP agent for IPv6.

Default By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

Mode Global Configuration

Examples To enable SNMP on the switch for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

Related Commands **show snmp-server**
show snmp-server community
show snmp-server user
snmp-server community
snmp-server contact
snmp-server enable trap
snmp-server engineID local
snmp-server group
snmp-server host
snmp-server location
snmp-server view

snmp-server community

This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

Syntax

```
snmp-server community <community-name>
    {view <view-name>|ro|rw|<access-list>}

no snmp-server community <community-name> [{view <view-name>|<access-
list>}]
```

Parameter	Description
<community-name>	Community name. The community name is a string up to 20 characters long and is case sensitive.
view	Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.
<view-name>	View name. The view name is a string up to 20 characters long and is case sensitive.
ro	Read-only community.
rw	Read-write community.
<access-list>	<1-99> Access list number.

Mode Global Configuration

Example The following command creates an SNMP community called "public" with read only access to all MIB variables from any management station.

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

The following command removes an SNMP community called "public"

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

Related Commands

- [show snmp-server](#)
- [show snmp-server community](#)
- [snmp-server view](#)

snmp-server contact

This command sets the contact information for the system. The contact name is:

- displayed in the output of the **show system** command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

Syntax `snmp-server contact <contact-info>`
`no snmp-server contact`

Parameter	Description
<code><contact-info></code>	The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the system contact information to "support@alliedtelesis.co.nz", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact support@alliedtelesis.co.nz
```

Related Commands [show system](#)
[snmp-server location](#)
[snmp-server group](#)

snmp-server enable trap

Use this command to enable the switch to send the specified notifications (traps).

Note that the Environmental Monitoring traps are enabled by default. So you do not need to issue this command for the Environmental Monitoring traps since these are enabled by default. SNMP environmental monitoring traps defined in AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the sending of the specified notifications.

Syntax

```
snmp-server enable trap {[auth] [bgp] [chassis] [dhcpsnooping] [epsr]
  [lldp] [loopprot] [mstp] [nsm] [ospf] [pim] [power-inline] [rmon]
  [thrash-limit] [vrrp]}

no snmp-server enable trap {[auth] [bgp] [chassis] [dhcpsnooping]
  [epsr] [lldp] [loopprot] [mstp] [nsm] [ospf] [pim] [power-inline]
  [rmon][thrash-limit] [vrrp]}
```

Parameter	Description
auth	Authentication failure.
bgp	BGP traps.
chassis	Chassis traps.
dhcpsnooping	DHCP snooping and ARP security traps. These notifications must also be set using the ip dhcp snooping violation command on page 81.22, and/or the arp security violation command on page 81.3.
epsr	EPSR traps.
lldp	Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the lldp notifications command on page 98.13, and/or the lldp med-notifications command on page 98.8.
loopprot	Loop Protection traps.
mstp	MSTP traps.
nsm	NSM traps.
ospf	OSPF traps.
pim	PIM traps.
power-inline	Power-inline traps (Power Ethernet MIB RFC 3621).
rmon	RMON traps.
thrash-limit	MAC address Thrash Limiting traps.
vrrp	Virtual Router Redundancy (VRRP) traps.

Default By default, no notifications are generated.

Mode Global Configuration

Usage This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the **snmp trap link-status** command.

To specify where notifications are sent, use the **snmp-server host** command.

Note that more than one trap can be configured with one command entry, and also note this command applied to notifications send by SNMP version 3.

Examples To enable the device to send PoE related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
```

To disable PoE traps being sent out by the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable power-inline
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

Related Commands **show snmp-server**
show ip dhcp snooping
snmp trap link-status
snmp-server host

snmp-server engineID local

Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a switch when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the switch until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command. Note that the **snmp-server engineID local reset** command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

Syntax `snmp-server engineID local {<engine-id>|default}`
`no snmp-server engineID local`

Parameter	Description
<code><engine-id></code>	Specify SNMPv3 Engine ID value, a string of up to 27 characters.
<code>default</code>	Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the snmp-server engineID local reset command to force the system to generate a new engine ID.

Mode Global Configuration

Usage All switches must have a unique engine ID which is permanently set unless it is configured by the user.

Example To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

Output The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483
```

Validation Commands `show snmp-server`

Related Commands `snmp-server engineID local reset`
`snmp-server group`

snmp-server engineID local reset

Use this command to force the switch to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the **snmp-server engineID local** command to set SNMPv3 engine ID to a system generated value.

Syntax `snmp-server engineID local reset`

Mode Global Configuration

Example To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

**Validation
Commands** `show snmp-server`

Related Commands `snmp-server engineID local`

snmp-server group

This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

Syntax

```
snmp-server group <groupname> {auth|noauth|priv}
    [read <readname>|write <writename>|notify <notifyname>]
no snmp-server group <groupname> {auth|noauth|priv}
```

Parameter	Description
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
auth	Authentication.
noauth	No authentication and no encryption.
priv	Authentication and encryption.
read	Configure read view.
<readname>	Read view name.
write	Configure write view.
<writename>	Write view name. The view name is a string up to 20 characters long and is case sensitive.
notify	Configure notify view.
<notifyname>	Notify view name. The view name is a string up to 20 characters long and is case sensitive.

Mode Global Configuration

Examples To add SNMP group, for ordinary users, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete SNMP group usergroup, use the following commands

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup noauth
```

Related Commands

- [snmp-server](#)
- [show snmp-server](#)
- [show snmp-server group](#)
- [show snmp-server user](#)

snmp-server host

This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

Syntax

```
snmp-server host <ipv4-address>|<ipv6-address> [traps] [version 1]
    <community-name>]

snmp-server host <ipv4-address>|<ipv6-address> [informs|traps]
    version 2c <community-name>

snmp-server host <ipv4-address>|<ipv6-address> [informs|traps]
    version 3 {auth|noauth|priv} <user-name>

no snmp-server host <ipv4-address>|<ipv6-address> [traps]
    [version 1] <community-name>

no snmp-server host <ipv4-address>|<ipv6-address> [informs|traps]
    version 2c <community-name>

no snmp-server host <ipv4-address>|<ipv6-address> [informs|traps]
    version 3 {auth|noauth|priv} <user-name>
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format A . B . C . D, for example, 192 . 0 . 2 . 2.
<ipv6-address>	IPv6 trap host address in the format x : x : : x : x for example, 2001 : db8 : : 8a2e : 7334.
informs	Send Inform messages to this host.
traps	Send Trap messages to this host (default).
version	SNMP version to use for notification messages. Default: version 1.
1	Use SNMPv1 (default).
2c	Use SNMPv2c.
3	Use SNMPv3.
auth	Authentication.
noauth	No authentication.

Parameter(cont.)	Description(cont.)
<code>priv</code>	Encryption.
<code><community-name></code>	The SNMPv1 or SNMPv2c community name.
<code><user-name></code>	SNMPv3 user name.

Mode Global Configuration

Examples To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name *public*, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name *private*, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c
private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name *public*, use the following command:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

Related Commands [snmp trap link-status](#)
[snmp-server enable trap](#)
[snmp-server view](#)

snmp-server location

This command sets the location of the system. The location is:

- displayed in the output of the **show system** command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

Syntax `snmp-server location <location-name>`
`no snmp-server location`

Parameter	Description
<code><location-name></code>	The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

Related Commands [show snmp-server](#)
[show system](#)
[snmp-server contact](#)

snmp-server source-interface

Use this command to specify the interface that SNMP traps or informs originate from. You cannot specify an interface that does not already have an IP address assigned to the interface.

Use the **no** variant of this command to reset to the default source interface that SNMP traps or informs originate from (the Egress interface as sent from by default).

Syntax `snmp-server source-interface {traps|informs} <interface-name>`
`no snmp-server source-interface {traps|informs}`

Parameter	Description
traps	SNMP traps.
informs	SNMP informs.
<interface-name>	Interface name (with an IP address already assigned).

Default By default the source interface is the Egress interface where traps or informs were sent from.

Mode Global Configuration

Usage An SNMP trap or inform sent from an SNMP server has the notification IP address of the interface where it was sent from. Use this command to monitor notifications from an interface.

Example To set the interface that SNMP informs originate from to port 1.1.2 for inform packets, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs port1.1.2
```

To reset the interface to the default source interface (the Egress interface) that SNMP traps originate from for trap packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

Validation Commands `show running-config`

snmp-server startup-trap-delay

Use this command to set the time in seconds after following completion of the switch startup sequence before the switch sends any SNMP traps (or SNMP notifications).

Use the **no** variant of this command to restore the default startup delay of 30 seconds.

Syntax `snmp-server startup-trap-delay <delay-time>`

`no snmp-server startup-trap-delay`

Parameter	Description
<code><delay-time></code>	Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds.

Default The SNMP server trap delay time is 30 seconds. The **no** variant restores the default.

Mode Global Configuration

Example To delay the switch sending SNMP traps until 60 seconds after switch startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after switch startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

Validation Commands `show snmp-server`

snmp-server user

Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

Syntax

```
snmp-server user <username> <groupname> [encrypted]
    [auth {md5|sha} <auth-password>]
    [priv {des|aes} <privacy-password>]

no snmp-server user <username>
```

Parameter	Description
<username>	User name. The user name is a string up to 20 characters long and is case sensitive.
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
encrypted	Use the encrypted parameter when you want to enter encrypted passwords.
auth	Authentication protocol.
md5	MD5 Message Digest Algorithms.
sha	SHA Secure Hash Algorithm.
<auth-password>	Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.
priv	Privacy protocol.
des	DES Data Encryption Standard.
aes	AES Advanced Encryption Standards.
<privacy-password>	Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.

Mode Global Configuration

Usage Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.
- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the switch. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are

encrypted according to the authentication and privacy protocols selected.

- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

Examples To add SNMP user `authuser` as a member of group `usergroup`, with authentication protocol `md5`, authentication password `Authpass`, privacy protocol `des` and privacy password `Privpass`, use the following commands

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv des Privpass
```

Validate the user is assigned to the group using the following command:

```
awplus#show snmp-server user
Name          Group name      Auth          Privacy
-----
authuser      usergroup       md5           des
```

To enter existing SNMP user `authuser` with existing passwords as a member of group `newusergroup` with authentication protocol `md5` plus the encrypted authentication password `0x1c74b9c22118291b0ce0cd883f8dab6b74`, privacy protocol `des` plus the encrypted privacy password `0x0e0133db5453ebd03822b004eeacb6608f`, use the following commands

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5
0x1c74b9c22118291b0ce0cd883f8dab6b74 priv des
0x0e0133db5453ebd03822b004eeacb6608f
```

Note  Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup-config** commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the following command:

```
awplus#show snmp-server user
Name          Group name      Auth          Privacy
-----
authuser      newusergroup    md5           des
```

To delete SNMP user `authuser`, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

Related Commands `show snmp-server user`
`snmp-server view`

snmp-server view

Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

Note  The object identifier must be specified in a sequence of integers separated by decimal points.

The **no** variant of this command removes the specified view on the device. The view must already exist.

Syntax

```
snmp-server view <view-name> <mib-name> {included|excluded}
no snmp-server view <view-name>
```

Parameter	Description
<view-name>	SNMP server view name. The view name is a string up to 20 characters long and is case sensitive.
<mib-name>	Object identifier of the MIB.
included	Include this OID in the view.
excluded	Exclude this OID in the view.

Mode Global Configuration

Examples The following command creates a view called "loc" that includes system location mib subtree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

Introduction

This chapter describes the Management Information Bases (MIBs) and managed objects supported by the AlliedWare Plus™ Operating System. The following topics are covered:

- **“Allied Telesis Enterprise MIB” on page 96.8** describes the objects implemented in the Allied Telesis Enterprise MIB
- **“Public MIBs” on page 96.74** describes the public MIBs supported by the AlliedWare Plus™ Operating System, and any variations from the standard implementation.

About MIBs

A MIB is a collection of managed objects organized into a tree-like hierarchy of nodes in which the managed objects form the leaves. Within the tree, each node is identified by a non-negative integer identifier that is unique among the node's siblings. The address, or object identifier, of any node within the tree is expressed as a series of dot-delimited node identifiers that trace the path from the root of the tree to the node. For example, the object identifier for the sysDescr object is 1.3.6.1.2.1.1.1.

For more information about MIBs and the structure of management information, see [Chapter 94, SNMP Introduction](#).

Note  This chapter does not indicate which MIB objects are not-accessible (and therefore cannot be queried directly). Please consult the MIB files for that information.

About SNMP

A network management station (NMS) uses a protocol known as Simple Network Management Protocol (SNMP) to query or change the values of objects in the MIB of managed devices.

A managed device uses SNMP to respond to queries from an NMS, and to send unsolicited alerts (traps) to an NMS in response to events.

For more information about the Simple Network Management Protocol (SNMP), see [Chapter 94, SNMP Introduction](#).

For information about configuring SNMP, see [Chapter 95, SNMP Commands](#).

Obtaining MIBs

You can download MIBs from the following locations:

Download this MIB...	From this location...
Allied Telesis Enterprise MIB	The MIB files are available with the software files from the Support area at www.alliedtelesis.com/support/software/restricted
Public MIBs defined in RFCs	www.rfc-editor.org/rfc.html
IANAifType-MIB	www.iana.org/assignments/ianaiftype-mib

Loading MIBs

Individual MIBs define a portion of the total MIB for a device. For example, the MAU-MIB defines objects for managing IEEE 802.3 medium attachment units (MAUs), and forms a sub-tree under mib-2 with the object identifier snmpDot3MauMgt (1.3.6.1.2.1.26).

All the objects within a MIB are assigned object identifiers relative to a parent object. Most MIBs import the object identifier of the parent object, along with other object identifiers, textual conventions, macros and syntax types from the MIBs where they are defined. This creates dependencies between MIBs.

Some network management stations and MIB compilers will generate errors if you load a MIB that depends on another MIB that has not already been loaded. To avoid these errors, we recommend that you load MIBs in the following order:

1. RFC 1212
RFC 1239
RFC 2257
RFC 3410
2. RFC1155-SMI (RFC 1155)
SNMPv2-SMI (RFC 2578)
SNMPv2-PDU (RFC 3416)
3. RFC1213-MIB (RFC 1213)
RFC 1215
SNMPv2-TC (RFC 2579)
SNMPv2-CONF (RFC 2580)
4. IP-MIB (RFC 2011)
TCP-MIB (RFC 2012)
UDP-MIB (RFC 2013)
IP-FORWARD-MIB (RFC 2096)
SNMP-MPD-MIB (RFC 2572)
RMON-MIB (RFC 2819)
HCNUM-TC (RFC 2856)
SNMP-FRAMEWORK-MIB (RFC 3411)
SNMP-MPD-MIB (RFC 3412)
SNMPv2-TM (RFC 3417)
SNMPv2-MIB (RFC 3418)
INET-ADDRESS-MIB (RFC 4001)
IANAifType-MIB
5. IF-MIB (RFC 2863)
SNMP-TARGET-MIB (RFC 3413)
6. SNMP-COMMUNITY-MIB (RFC 2576)
EtherLike-MIB (RFC 3635)
MAU-MIB (RFC 3636)
BRIDGE-MIB (RFC 4188)
DISMAN-PING-MIB (RFC 4560)
SNMP-NOTIFICATION-MIB (RFC 3413)

Allied Telesis Enterprise MIB

The *Allied Telesis Enterprise MIB* defines a portion of the Management Information Base (MIB) for managing Allied Telesis products and features that are not supported by public MIBs. Objects defined in this MIB reside in the private(4) subtree and have the object identifier `alliedTelesis` (`{ enterprises 207 }`).

This document describes only those portions of the Allied Telesis Enterprise MIB supported by the AlliedWare Plus™ Operating System. **Figure 96-1** shows the structure of the Allied Telesis Enterprise MIB. Each component MIB is detailed in the following sections of this chapter.

Figure 96-1: The Allied Telesis Enterprise MIB sub-tree of the Internet-standard Management Information Base (MIB)

AT-SMI-MIB

AT-SMI-MIB defines the high-level structure and root objects of the Allied Telesis Enterprise MIB ([Table 96-1](#)). These objects are imported by other component MIBs of the Allied Telesis Enterprise MIB.

Table 96-1: AT Enterprise MIB - High Level Structure

Object	Object Identifier	Description
alliedTelesis	{ enterprises 207 } 1.3.6.1.4.1.207	Root of the Allied Telesis Enterprise MIB under the private(4) node defined in RFC1155-SMI.
products	{ alliedTelesis 1 } 1.3.6.1.4.1.207.1	Sub-tree of all product OIDs. Described in "AT-PRODUCTS-MIB" on page 96.12.
bridgeRouter	{ products 1 } 1.3.6.1.4.1.207.1.1	Sub-tree of bridge product MIB objects (not applicable for AlliedWare Plus).
routerSwitch	{ products 14 } 1.3.6.1.4.1.207.1.2	Sub-tree for all router and switch product MIB objects.
mibObject	{ alliedTelesis 8 } 1.3.6.1.4.1.207.8	Sub-tree for all managed objects.
brouterMib	{ mibObject 4 } 1.3.6.1.4.1.207.8.4	Sub-tree of objects for managing bridges, routers, and switches.
atRouter	{ brouterMib 4 } 1.3.6.1.4.1.207.8.4.4	Sub-tree of objects for managing multiprotocol routers and switches.
objects	{ atRouter 1 } 1.3.6.1.4.1.207.8.4.4.1	Sub-tree of OIDs for boards, releases, interface types, and chips.
traps	{ atRouter 2 } 1.3.6.1.4.1.207.8.4.4.2	Sub-tree for generic traps (not applicable for AlliedWare Plus).
sysinfo	{ atRouter 3 } 1.3.6.1.4.1.207.8.4.4.3	Sub-tree of objects describing general system information.
modules	{ atRouter 4 } 1.3.6.1.4.1.207.8.4.4.4	Sub-tree of objects for monitoring and managing software features.
arInterfaces	{ atRouter 5 } 1.3.6.1.4.1.207.8.4.4.5	Sub-tree of objects describing boards, slots and physical interfaces.
protocols	{ atRouter 6 } 1.3.6.1.4.1.207.8.4.4.6	Sub-tree of OIDs for protocols.
atAgents	{ atRouter 7 } 1.3.6.1.4.1.207.8.4.4.7	Sub-tree of objects describing variations from standards.

[Table 96-2](#) lists the major modules of the AT-SMI-MIB grouped by their object identifiers. Note that this is also the order in which they are described in this chapter.

Table 96-2: AT-SMI-MIBs Listed by Object Group

MIB Section	OID	Description
AT-SMI-MIB		This section describes the structure of management information for the Allied Telesis Enterprise object, alliedTelesis { 1.3.6.1.4.1.207 }.
AT-PRODUCTS-MIB	1.3.6.1.4.1.207.1	Object identifiers for Allied Telesis products. See “AT-PRODUCTS-MIB” on page 96.12.
AT-BOARDS-MIB	1.3.6.1.4.1.207.8.4.4.1.1	Object identifiers for boards, interface types, and chip sets. See “AT-BOARDS-MIB” on page 96.14.
AT-SYSINFO-MIB	1.3.6.1.4.1.207.8.4.4.3	Objects that describe generic system information and environmental monitoring. See “AT-SYSINFO-MIB” on page 96.18.
AT-ENVMONv2-MIB	1.3.6.1.4.1.207.8.4.4.3.12	Objects and traps for monitoring fans, voltage rails, temperature sensors, and power supply bays. See “AT-ENVMONv2-MIB” on page 96.23.
AT-MIBVERSION-MIB	1.3.6.1.4.1.207.8.4.4.3.15	Object to display the last software release that contained changes to the support AT Enterprise MIB definition files. See “AT-MIBVERSION-MIB” on page 96.29.
AT-USER-MIB	1.3.6.1.4.1.207.8.4.4.3.20	Objects for displaying information of users currently logged into a device, or configured in the Local User Data base of the device. See “AT-USER-MIB” on page 96.30.
AT-RESOURCE-MIB	1.3.6.1.4.1.207.8.4.4.3.21	Objects for displaying system hardware resource information. See “AT-RESOURCE-MIB” on page 96.33.
AT-LICENSE-MIB	1.3.6.1.4.1.207.8.4.4.3.22	Objects for managing software licenses on devices using AlliedWare Plus™ Operating System. See “AT-LICENSE-MIB” on page 96.35.
AT-CHASSIS-MIB	1.3.6.1.4.1.207.8.4.4.3.23	Objects for managing chassis based devices. See “AT-CHASSIS-MIB” on page 96.38.
AT-TRIGGER-MIB	1.3.6.1.4.1.207.8.4.4.4.53	Objects for managing triggers. See “AT-TRIGGER-MIB” on page 96.39.
AT-LOOPPROTECT-MIB	1.3.6.1.4.1.207.8.4.4.4.54	Objects for managing Allied Telesis Loop Protection. See “AT-LOOPPROTECT-MIB” on page 96.41.
AT-SETUP-MIB	1.3.6.1.4.1.207.8.4.4.4.500	Objects for managing software installation and configuration files. See “AT-SETUP-MIB” on page 96.43.
AT-DNS-CLIENT-MIB	1.3.6.1.4.1.207.8.4.4.4.501	Objects for managing Allied Telesis DNS Client Configuration. See “AT-DNS-CLIENT-MIB” on page 96.52.
AT-NTP-MIB	1.3.6.1.4.1.207.8.4.4.4.502	Objects for managing Allied Telesis Network Time Protocol (NTP) configuration. See “AT-NTP-MIB” on page 96.53.
AT-EPSRv2-MIB	1.3.6.1.4.1.207.8.4.4.4.536	Objects for managing Allied Telesis EPSR. See “AT-EPSRv2-MIB” on page 96.56.
AT-DHCP SN-MIB	1.3.6.1.4.1.207.8.4.4.4.537	Objects for managing Allied Telesis DHCP Snooping. See “AT-DHCP SN-MIB” on page 96.59.
AT-FILEv2-MIB	1.3.6.1.4.1.207.8.4.4.4.600	Objects for displaying and managing file content on local and remote sources. See “AT-FILEv2-MIB” on page 96.62.

Table 96-2: AT-SMI-MIBs Listed by Object Group(cont.)

MIB Section	OID	Description
AT-LOG-MIB	1.3.6.1.4.1.207.8.4.4.4.601	Objects for listing log entries from the buffered and permanent logs. See "AT-LOG-MIB" on page 96.68.
AT-IP-MIB	1.3.6.1.4.1.207.8.4.4.4.602	Objects for Allied Telesis specific IP address management. See "AT-IP-MIB" on page 96.70.

AT-PRODUCTS-MIB

AT-PRODUCT-MIB defines object identifiers for Allied Telesis products. Objects in this MIB have the object identifier products ({ alliedTelesis 1 }). **Table 96-3** lists object identifiers for products supported by the AlliedWare Plus™ Operating System.

Table 96-3: Object identifiers for Allied Telesis products supported by the AlliedWare Plus™ Operating System

Object	Object Identifier	Description
products	{ alliedTelesis 1 }	
swhub	{ products 4 }	Subtree beneath which switching hubs are defined.
at_x200_GE52T	{ swhub 181 }	x200-GE52T layer two switch
at_x200_GE28T	{ swhub 182 }	x200-GE28T layer two switch
at_x210_9GT	{ swhub 196 }	x210-9GT, 8xGigabit, 1xSFP/T
at_x210_16GT	{ swhub 197 }	x210-16GT, 14xGigabit, 2xcombo SFP/T
at_x210_24GT	{ swhub 198 }	x210-24GT, 20xGigabit, 4xcombo SFP/T
routerSwitch	{ products 14 }	Subtree beneath which router and switch product MIB object IDs are assigned.
at_SwitchBladex908	{ routerSwitch 69 }	Switchblade x908 8 Slot Layer 3 Switch Chassis
at_x900_12XTS	{ routerSwitch 70 }	AT-x900-12XT/S Advanced Gigabit Layer 3+ Expandable Switch, 12 x combo ports (10/100/1000BASE-T copper or SFP), 1 x 30Gbps expansion bay
at_x900_24XT	{ routerSwitch 75 }	x900-24XT Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays
at_x900_24XS	{ routerSwitch 76 }	x900-24XS Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays
at_x900_24XT_N	{ routerSwitch 77 }	x900-24XT-N Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays, NEBS compliant
at_x600_24Ts	{ routerSwitch 80 }	x600-24Ts Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports
at_x600_24TsXP	{ routerSwitch 81 }	x600-24Ts/XP Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports, 2 x XFP ports
at_x600_48Ts	{ routerSwitch 82 }	x600-48Ts Stackable Managed L2+/L3 Ethernet Switch, 48 x 1000BASE-T copper ports, 4 x SFP ports
at_x600_48TsXP	{ routerSwitch 83 }	x600-48Ts/XP Stackable Managed L2+/L3 Ethernet Switch, 48 x 1000BASE-T copper ports, 4 x SFP ports, 2 x XFP ports
at_x600-24TsPoE	{ routerSwitch 91 }	x600-24Ts-POE Stackable Managed L2+/L3 Ethernet PoE Switch, 24 x 1000BASE-T PoE ports, 4 x SFP (combo) ports
at_x600_24TPoEPlus	{routerSwitch 92}	x600-24Ts-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 24 x 1000BASE-T PoE+ ports, 4 x SFP (combo) ports
x610_48Ts_X_POEPlus	{routerSwitch 93}	x610-48Ts/X-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 48 x 1000BASE-T PoE+ ports, 2 x SFP (combo) ports, 2 x SFP+ ports

Table 96-3: Object identifiers for Allied Telesis products supported by the AlliedWare Plus™ Operating

Object	Object Identifier	Description
x610_48Ts_POEPlus	{routerSwitch 94}	x610-48Ts-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 48 x 1000BASE-T PoE+ ports, 4 x SFP (combo) ports
x610_24Ts_X_POEPlus	{routerSwitch 95}	x610-24Ts/X-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 24 x 1000BASE-T PoE+ ports, 4 x SFP (combo) ports, 2 x SFP+ ports
x610_24Ts_POEPlus	{routerSwitch 96}	x610-24Ts-POE+ Stackable Managed L2+/L3 Ethernet PoE+ Switch, 24 x 1000BASE-T PoE+ ports, 4 x SFP (combo) ports
x610_48Ts_X	{routerSwitch 97}	x610-48Ts/X Stackable Managed L2+/L3 Ethernet Switch, 48 x 1000BASE-T copper ports, 2 x SFP (combo) ports, 2 x SFP+ ports
x610_48Ts	{routerSwitch 98}	x610-48Ts Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports
x610_24Ts_X	{routerSwitch 99}	x610-24Ts/X Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports, 2 x SFP+ ports
x610_24Ts	{routerSwitch 100}	x610-24Ts Stackable Managed L2+/L3 Ethernet Switch, 24 x 1000BASE-T copper ports, 4 x SFP (combo) ports
x610_24SP_X	{routerSwitch 101}	x610-24SP/X Stackable Managed L2+/L3 Ethernet Switch, 24 x SFP (combo) ports, 2 x SFP+ ports
x510_28GTX	{routerSwitch 109}	x510-28GTX Stackable Managed L2+/L3 Ethernet Switch with 24 x 10/100/1000 Base-T ports and 4 x 10 Gb/s SFP+ ports.
x510_28GPX	{routerSwitch 110}	x510-28GPX Stackable Managed L2+/L3 Ethernet Switch with 24 x 10/100/1000 Base-T ports with PoE, 4 x 10 Gb/s SFP+ ports.
x510_28GSX	{routerSwitch 111}	x510-28GSX Stackable Managed L2+/L3 Ethernet Switch with 24 x 100/1000 SFP ports and 4 x 10 Gb/s SFP+ ports.
x510_52GTX	{routerSwitch 112}	x510-52GTX Stackable Managed L2+/L3 Ethernet Switch with 48 x 10/100/1000 Base-T ports and 4 x 10 Gb/s SFP+ ports.
x510_52GPX	{routerSwitch 113}	x510-52GPX Stackable Managed L2+/L3 Ethernet Switch with 48 x 10/100/1000 Base-T ports with PoE, and 4 x 10 Gb/s SFP+ ports.
x510DP_52GTX	{routerSwitch 116}	x510DP-52GTX Stackable Managed L2+/L3 Ethernet Switch with 48 x 10/100/1000 Base-T ports and 4 x 10 Gb/s SFP+ ports.
IX5_28GPX	{routerSwitch 117}	IX5-28GPX Stackable Managed L2+ Ethernet Switch with 24 x 10/100/1000 Base-T ports with PoE, 4 x 10 Gb/s SFP+ ports.
at-SBx8106	{routerSwitch 114}	AT-SBx8106, SwitchBlade x8106 chassis.

AT-BOARDS-MIB

AT-BOARDS-MIB defines object identifiers for components of Allied Telesis products—base CPU and expansion boards, interface types, and chip sets. Objects in this MIB have the object identifier objects ({ atRouter 1 }), and are organized into the following groups:

- Base CPU and expansion boards ([Table 96-4](#)). These object identifiers are for use with the hrDeviceID object in the Host Resources MIB (see [“Public MIBs” on page 96.74](#)).
- Interface types ([Table 96-5](#)).
- Chip sets ([Table 96-6](#)).

Table 96-4: Object identifiers for base CPU and expansion boards

Object	Object Identifier	Description
boards	{ objects 1 }	
pprx90024XT	{ boards 271 }	x900-24XT Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays
pprx90024XS	{ boards 272 }	x900-24XS Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays
pprAtXum10Gi	{ boards 273 }	XEM-1XP Expansion Module, 1 x 10Gbe XFP port
pprAtXum12SFPI	{ boards 274 }	XEM-12S Expansion Module, 12 x SFP Gigabit ports
pprAtXum12Ti	{ boards 275 }	XEM-12T Expansion Module, 12 x 10/100/100BASE-T copper ports (RJ-45 connectors)
pprAtXum12TiN	{ boards 280 }	XEM-12T-N Expansion Module, 12 x 10/100/100BASE-T copper ports (RJ-45 connectors), NEBS compliant
pprx90024XTN	{ boards 281 }	x900-24XT Enhanced Gigabit Layer 3+ Expandable Switch, 24 x 10/100/1000BASE-T copper ports (RJ-45 connectors), 2 x 20 Gigabit expansion bays, NEBS compliant
pprSwitchBladex908	{ boards 282 }	Switchblade x908 8 Slot Layer 3 Switch Chassis
pprx90012XTS	{ boards 288 }	AT-x900-12XT/S Advanced Gigabit Layer 3+ Expandable Switch, 12 x combo ports (10/100/1000BASE-T copper or SFP), 1 x 30Gbps expansion bay
pprAt9524TS	{ boards 290 }	x600-24Ts/XP, 24 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports
pprAt9524TSXP	{ boards 291 }	x600-24Ts/XP, 24 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports, 2 x XFP ports
pprAt9548TS	{ boards 294 }	x600-44Ts, 44 x 1000BASE-T ports, 4 x SFP ports
pprAt9548TSXP	{ boards 295 }	x600-44Ts/XP, 44 x 1000BASE-T ports, 4 x SFP ports, 2 x XFP ports
pprXem2XP	{ boards 306 }	XEM-2XP Expansion Module, 2 x 10Gbe XFP port
pprATStackXG	{ boards 307 }	x600 Expansion Module, Stacking
pprATEMXP	{ boards 308 }	x600 Expansion Module, 2 x 10G XFP ports
pprATLBM	{ boards 309 }	x600 Expansion Module, loopback
pprAtSBx8112	{ boards 316 }	AT-SBx8112, SwitchBlade x8112 chassis
pprAtSBx81CFC400	{ boards 317 }	AT-SBx81CFC, Control Fabric Card for SwitchBlade x8112
pprAtSBx81GP24	{ boards 318 }	AT-SBx81GP24, 24 x 1G PoE line card

Table 96-4: Object identifiers for base CPU and expansion boards(cont.)

Object	Object Identifier	Description
pprAtSBxPWRSYSAC	{ boards 320 }	AT-SBxPWR SYS/AC, system power supply unit for the SwitchBlade x8112 (AC input)
pprAtSBxPWRPOEAC	{ boards 321 }	AT-SBxPWR POE/AC, PoE power supply unit for the SwitchBlade x8112 (AC input)
pprAtSBxFAN12	{ boards 322 }	AT-SBxFAN12, fan tray for the SwitchBlade x8112
pprAtPWR05DC	{ boards 323 }	AT-PWR05, DC power supply unit for SwitchBlade x908
pprXem2XT	{ boards 325 }	XEM-2XT Expansion Module, 2 x 10Gbe copper XEM port
pprx60024TSPOE	{ boards 326 }	x600-24Ts-POE, 24 x 1000BASE-T PoE ports (RJ45 connectors), 4 x SFP (combo) ports
pprx60024TSPOEPLUS	{ boards 327 }	x600-24Ts-POE+, 24 x 1000BASE-T PoE+ ports (RJ45 connectors), 4 x SFP (combo) ports
pprx61048TsXPOEPlus	{ boards 331 }	x610-48Ts/X-POE+, 48 x 1000BASE-T PoE+ ports (RJ45 connectors), 2 x SFP (combo) ports, 2 x SFP+ ports
pprx61048TsPOEPlus	{ boards 332 }	x610-48Ts-POE+, 48 x 1000BASE-T PoE+ ports (RJ45 connectors), 4 x SFP (combo) ports
pprx61024TsXPOEPlus	{ boards 333 }	x610-24Ts/X-POE+, 24 x 1000BASE-T PoE+ ports (RJ45 connectors), 4 x SFP (combo) ports, 2 x SFP+ ports
pprx61024TsPOEPlus	{ boards 334 }	x610-24Ts-POE+, 24 x 1000BASE-T PoE+ ports (RJ45 connectors), 4 x SFP (combo) ports
pprPWR800	{ boards 336 }	AT-PWR800, 800W power supply unit
pprPWR1200	{ boards 337 }	AT-PWR1200, 1200W power supply unit
pprPWR250	{ boards 338 }	AT-PWR250, 250W power supply unit
pprx61048TsX	{ boards 339 }	x610-48Ts/X, 48 x 1000BASE-T ports (RJ45 connectors), 2 x SFP (combo) ports, 2 x SFP+ ports
pprx61048Ts	{ boards 340 }	x610-48Ts, 48 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports
pprx61024TsX	{ boards 341 }	x610-24Ts/X, 24 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports, 2 x SFP+ ports
pprx61024Ts	{ boards 342 }	x610-24Ts, 24 x 1000BASE-T ports (RJ45 connectors), 4 x SFP (combo) ports
pprPWR250DC	{ boards 351 }	AT-PWR250DC, 250W DC power supply unit
pprAtSBx81GT24	{ boards 352 }	AT-SBx81GT24, 24 x 1G copper line card
pprAtSBx81GS24a	{ boards 353 }	AT-SBx81GS24a, 24 x 1G SFP line card
pprAtSBx81XS6	{ boards 354 }	AT-SBx81XS6, 6 x 10G SFP+ line card
pprx2109GT	{ boards 367 }	AT-x210-9GT, 8xGigabit, 1xSFP/T
pprx21016GT	{ boards 368 }	AT-x210-16GT, 14xGigabit, 2xcombo SFP/T
pprx21024GT	{ boards 369 }	AT-x210-24GT, 20xGigabit, 4xcombo SFP/T
pprx51028GTX	{ boards 370 }	AT-x510-28GTX board with 24 10/100/1000 Base-T ports and four 10Gb/s SFP+ ports.
pprx51028GPX	{ boards 371 }	AT-x510-28GPX board with 24 10/100/1000 Base-T ports, four 10 Gb/s SFP+ ports and PSE function available on pins 1/2 and 3/6 (Mode A) of every copper port.
pprx51028GSX	{ boards 372 }	AT-x510-28GSX with 24 100/1000 SFP ports and four 10 Gb/s SFP+ ports.
pprx51052GTX	{ boards 373 }	AT-x510-52GTX board with 48 10/100/1000 Base-T ports and four 10 Gb/s SFP+ ports.

Table 96-4: Object identifiers for base CPU and expansion boards(cont.)

Object	Object Identifier	Description
pprx51052GPX	{ boards 374 }	AT-x510-52GPX board with 48 10/100/1000 Base-T ports, four 10 Gb/s SFP+ ports and PSE function available on pins 1/2 and 3/6 (Mode A) of every copper port.
pprPWR100R	{ boards 384 }	AT-PWR100R, 100W power supply unit
pprPWR250DCR	{ boards 385 }	AT-PWR250R-DC, 250W DC power supply unit
pprx510DP52GTX	{ boards 386 }	AT-x510DP-52GTX board with 48 10/100/1000 Base-T ports and four 10 Gb/s SFP+ ports.
pprxIX528GPX	{ boards 387 }	AT-IX5-28GPX board with 24 10/100/1000 Base-T ports, four 10 Gb/s SFP+ ports and PSE function available on pins 1/2 and 3/6 (Mode A) of every copper port.
pprAtSBx8106	{ boards 375 }	AT-SBx8106, SwitchBlade x8106 chassis
pprAtSBxFAN06	{ boards 376 }	AT-SBxFAN06, fan tray for the SwitchBlade x8106

Table 96-5: Object identifiers for interface types

Object	Object Identifier	Description
iftypes	{ objects 3 }	
ifaceEth	{ iftypes 1 }	Ethernet
ifaceSyn	{ iftypes 2 }	Synchronous
ifaceAsyn	{ iftypes 3 }	Asynchronous
ifaceBri	{ iftypes 4 }	BRI ISDN
ifacePri	{ iftypes 5 }	PRI ISDN
ifacePots	{ iftypes 6 }	POTS (voice)
ifaceGBIC	{ iftypes 7 }	GBIC (Gigabit Interface Converter)

Table 96-6: Object identifiers for chip sets

Object	Object Identifier	Description
chips	{ objects 4 }	
chip68020Cpu	{ chips 1 }	MC68020 CPU
chip68340Cpu	{ chips 2 }	MC68340 CPU
chip68302Cpu	{ chips 3 }	MC68302 CPU
chip68360Cpu	{ chips 4 }	MC68360 CPU
chip860TCpu	{ chips 5 }	MPC860T CPU
chipRtc1	{ chips 21 }	Real Time Clock v1
chipRtc2	{ chips 22 }	Real Time Clock v2
chipRtc3	{ chips 23 }	Real Time Clock v3
chipRtc4	{ chips 24 }	Real Time Clock v4
chipRam1mb	{ chips 31 }	1 MB RAM
chipRam2mb	{ chips 32 }	2 MB RAM
chipRam3mb	{ chips 33 }	3 MB RAM
chipRam4mb	{ chips 34 }	4 MB RAM
chipRam6mb	{ chips 36 }	6 MB RAM

Table 96-6: Object identifiers for chip sets(cont.)

Object	Object Identifier	Description
chipRam8mb	{ chips 38 }	8 MB RAM
chipRam12mb	{ chips 42 }	12 MB RAM
chipRam16mb	{ chips 46 }	16 MB RAM
chipRam20mb	{ chips 50 }	20 MB RAM
chipRam32mb	{ chips 62 }	32 MB RAM
chipFlash1mb	{ chips 71 }	1 MB FLASH memory
chipFlash2mb	{ chips 72 }	2 MB FLASH memory
chipFlash3mb	{ chips 73 }	3 MB FLASH memory
chipFlash4mb	{ chips 74 }	4 MB FLASH memory
chipFlash6mb	{ chips 76 }	6 MB FLASH memory
chipFlash8mb	{ chips 78 }	8 MB FLASH memory
chipPem	{ chips 120 }	Processor Enhancement Module

AT-SYSINFO-MIB

AT-SYSINFO-MIB defines objects that describe generic system information and environmental monitoring. Objects in this group have the object identifier sysinfo ({ atRouter 3 }). [Table 96-7](#) lists the objects supported by the AlliedWare Plus™ sysinfo MIB.

Table 96-7: Objects defined in AT-SYSINFO-MIB

Object	Description
sysinfo { atRouter 1 } (1.3.6.1.4.1.207.8.4.4.3)	Subtree containing generic system information.
fanAndPs {sysinfo 1 }	A collection of objects for monitoring fans and power supplies. For devices running the AlliedWare Plus™ Operating System, these objects are superseded by objects in the AT-ENVMON-MIB (see “AT-ENVMONv2-MIB” on page 96.23).
restartGroup {sysinfo 2 }	A collection of objects and traps for activating and monitoring restarts. This group is not supported by devices running the AlliedWare Plus™ Operating System.
cpu {sysinfo 3 }	A collection of objects containing information about the CPU utilization over different periods of time. All values are expressed as a percentage - integer in range 0 to 100.
cpuUtilisationMax {cpu 1 }	Maximum CPU utilization since the device was last restarted.
cpuUtilisationAvg {cpu 2 }	Average CPU utilization since the device was last restarted.
cpuUtilisationAvgLastMinute {cpu 3 }	Average CPU utilization over the past minute.
cpuUtilisationAvgLast10Seconds {cpu 4 }	Average CPU utilization over the past ten seconds.
cpuUtilisationAvgLastSecond {cpu 5 }	Average CPU utilization over the past second.
cpuUtilisationAvgMaxLast5Minutes {cpu 6 }	Maximum CPU utilization over the last 5 minutes.
cpuUtilisationAvgLast5Minutes {cpu 7 }	Average CPU utilization over the past 5 minutes.
sysTemperature {sysinfo 4 }	A collection of objects and traps for monitoring and managing the temperature status. For devices running the AlliedWare Plus™ Operating System.
atContactDetails {sysinfo 5 }	Contact details for Allied Telesis.
memory {sysinfo 7 }	A collection of objects and traps for monitoring memory usage and status.

Table 96-7: Objects defined in AT-SYSINFO-MIB

Object	Description
atEnvMonv2 {sysinfo 12 }	AT Environment Monitoring v2 MIB for managing and reporting data relating to voltage rails, fan speeds, temperature sensors and power supply units. Objects under this portion of the OID are shown in the "AT-ENVMONv2-MIB" on page 96.23.
atPortInfo {sysinfo 14 }	Objects containing information about the transceiver of an interface. This portion of the object tree is documented separately in: "AT-PORTINFO" on page 96.20.
{sysinfo 17 } to {sysinfo 19 }	These objects are not supported on your switch.
user {sysinfo 20 }	Contains objects for displaying information of users currently logged into a device, or configured in its local database. Objects under this portion of the OID are shown in the "AT-USER-MIB" on page 96.30.
resource {sysinfo 21 }	Contains objects for displaying hardware resource information. Objects under this portion of the OID are shown in the "AT-RESOURCE-MIB" on page 96.33.
license {sysinfo 22 }	This MIB, is used for listing applied software licenses, adding new licenses, and deleting existing licenses. Objects under this portion of the OID are shown in the "AT-LICENSE-MIB" on page 96.35.
chassis {sysinfo 23 }	This MIB is used for accessing trap notifications on chassis based products. Objects under this portion of the OID are shown in the "AT-CHASSIS-MIB" on page 96.38.

AT-PORTINFO

This table defines objects for managing interface port objects such as transceivers. Objects in this group have the object identifier atPortInfo ({ sysinfo 14 }), OID path, 1.3.6.1.4.1.207.8.4.4.3.14.

Table 96-8: Objects defined in AT-ATPORTINFO portion of the MIB

Object / Object Identifier	Description
atPortInfo {sysinfo 14}	This object returns information about interface transceivers.
atPortInfoTransceiverTable {atPortInfo 1}	A table of information about the transceiver of a interface.
atPortInfoTransceiverEntry {atPortInfoTransceiverTable 1}	The description, the transceiver type of a interface.
atPortInfoTransceiverifIndex {atPortInfoTransceiverEntry 1}	The ifIndex for the interface represented by this entry of the interfaces table.
atPortInfoTransceiverType {atPortInfoTransceiverEntry 2}	This object indicates the type of transceiver on a interface. It contains the following value list objects:

Table 96-8: Objects defined in AT-ATPORTINFO portion of the MIB(cont.)

Object / Object Identifier	Description
	<p>The type of transceiver on an interface can be one of the following:</p> <ul style="list-style-type: none"> ■ rj45(1) ■ sfp-px(2) ■ sfp-bx10(3) ■ sfp-fx(4) ■ sfp-100base-lx(5) ■ sfp-t(6) ■ sfp-cx(7) ■ sfp-zx-cwdm(8) ■ sfp-lx(9) ■ sfp-sx(10) ■ sfp-oc3-lr(11) ■ sfp-oc3-ir(12) ■ sfp-oc3-mm(13) ■ xfp-srsw(14) ■ xfp-lrlw(15) ■ xfp-erew(16) ■ xfp-sr(17) ■ xfp-lr(18) ■ xfp-er(19) ■ xfp-lrm(20) ■ xfp-sw(21) ■ xfp-lw(22) ■ xfp-ew(23) ■ unknown(24) ■ empty(25) ■ sfpp-sr(26) ■ sfpp-lr(27) ■ sfpp-er(28) ■ sfpp-lrm(29) ■ inf-1-x-copper-pasv(30) ■ inf-1-x-copper-actv(31) ■ inf-1-x-lx(32) ■ inf-1-x-sx(33) ■ cx4(34)

Table 96-8: Objects defined in AT-ATPORTINFO portion of the MIB(cont.)

Object / Object Identifier	Description
atPortRenumbeEvents {atPortInfo 2}	The number of times that port number values (represented by the dot1dBasePort object in BRIDGE-MIB), have been re-assigned due to stack member leave/join events or XEM hot-swap events, since the system was initialized.

AT-ENVMONv2-MIB

The AT Environment Monitoring v2 MIB (atEnvMonv2-MIB) has the object path 207.8.4.4.3.12. It contains objects for managing and reporting data relating to fans, voltage rails, temperature sensors and power supply units installed in the device (**Table 96-9**). Objects in this group have the object identifier EnvMonv2 ({ sysinfo 12 }).

Table 96-9: Objects defined in AT-ENVMONV2-MIB

Object / Object Identifier	Description
atEnvMonv2Notifications { atEnvMonv2 0 } Or (207.8.4.4.3.12.0)	A collection of traps (notification) objects for monitoring fans, voltage rails, temperature sensors, and power supply bays.
atEnvMonv2FanAlarmSetNotify { atEnvMonv2Notifications 1 }	A notification that is generated when the monitored speed of a fan drops below its lower threshold. It returns the value of: <ol style="list-style-type: none"> atEnvMonv2FanStackMemberId atEnvMonv2FanBoardIndex atEnvMonv2FanIndex atEnvMonv2FanDescription atEnvMonv2FanLowerThreshold atEnvMonv2FanCurrentSpeed
atEnvMonv2FanAlarmClearedNotify { atEnvMonv2Notifications 2 }	Notification generated when the monitored speed of a fan returns to an acceptable value, the fan having previously been in an alarm condition. It returns the value of: <ol style="list-style-type: none"> atEnvMonv2FanStackMemberId atEnvMonv2FanBoardIndex atEnvMonv2FanIndex atEnvMonv2FanDescription atEnvMonv2FanLowerThreshold atEnvMonv2FanCurrentSpeed
atEnvMonv2VoltAlarmSetNotify { atEnvMonv2Notifications 3 }	Notification generated when the voltage of a monitored voltage rail, goes out of tolerance by either dropping below its lower threshold, or exceeding its upper threshold. It returns the value of: <ol style="list-style-type: none"> atEnvMonv2VoltageStackMemberId atEnvMonv2VoltageBoardIndex atEnvMonv2VoltageIndex atEnvMonv2VoltageDescription atEnvMonv2VoltageUpperThreshold atEnvMonv2VoltageLowerThreshold atEnvMonv2VoltageCurrent (i.e. the voltage currently being measured).

Table 96-9: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2VoltAlarmClearedNotify { atEnvMonv2Notifications 4 }	<p>Notification generated when the voltage of a monitored voltage rail returns to an acceptable value, having previously been in an alarm condition. It returns the value of:</p> <ol style="list-style-type: none"> 1. atEnvMonv2VoltageStackMemberId 2. atEnvMonv2VoltageBoardIndex 3. atEnvMonv2VoltageIndex 4. atEnvMonv2VoltageDescription 5. atEnvMonv2VoltageUpperThreshold 6. atEnvMonv2VoltageLowerThreshold 7. atEnvMonv2VoltageCurrent (i.e. the voltage currently being measured).
atEnvMonv2TempAlarmSetNotify { atEnvMonv2Notifications 5 }	<p>Notification generated when a monitored temperature exceeds its upper threshold. It returns the value of:</p> <ol style="list-style-type: none"> 1. atEnvMonv2TemperatureStackMemberId 2. atEnvMonv2TemperatureBoardIndex 3. atEnvMonv2TemperatureIndex 4. atEnvMonv2TemperatureDescription 5. atEnvMonv2TemperatureUpperThreshold 6. atEnvMonv2TemperatureCurrent
atEnvMonv2TempAlarmClearedNotify { atEnvMonv2Notifications 6 }	<p>Notification generated when a monitored temperature returns to an acceptable value, having previously been in an alarm condition. It returns the value of:</p> <ol style="list-style-type: none"> 1. atEnvMonv2TemperatureStackMemberId 2. atEnvMonv2TemperatureBoardIndex 3. atEnvMonv2TemperatureIndex 4. atEnvMonv2TemperatureDescription 5. atEnvMonv2TemperatureUpperThreshold
atEnvMonv2PsbAlarmSetNotify { atEnvMonv2Notifications 7 }	<p>Notification generated when a monitored parameter of a power supply bay device goes out of tolerance. It returns the value of:</p> <ol style="list-style-type: none"> 1. atEnvMonv2PsbSensorStackMemberId 2. atEnvMonv2PsbSensorBoardIndex 3. atEnvMonv2PsbSensorIndex 4. atEnvMonv2PsbSensorType 5. atEnvMonv2PsbSensorDescription
atEnvMonv2PsbAlarmClearedNotify { atEnvMonv2Notifications 8 }	<p>Notification generated when a monitored parameter of a power supply bay device returns to an acceptable value, having previously been in an alarm condition. It returns the value of:</p> <ol style="list-style-type: none"> 1. atEnvMonv2PsbSensorStackMemberId 2. atEnvMonv2PsbSensorBoardIndex 3. atEnvMonv2PsbSensorIndex 4. atEnvMonv2PsbSensorType 5. atEnvMonv2PsbSensorDescription

Table 96-9: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2FanTable { EnvMonv2 1 }	Table of information about fans installed in the device that have their fan speeds monitored by environment monitoring hardware, indexed by: <ol style="list-style-type: none"> atEnvMonv2FanStackMemberId atEnvMonv2FanBoardIndex atEnvMonv2FanIndex
atEnvMonv2FanEntry { atEnvMonv2FanTable 1 }	Description, current speed, lower threshold speed and current status of a single fan.
atEnvMonv2FanStackMemberId { atEnvMonv2FanEntry 1 }	Index of the stack member hosting this fan.
atEnvMonv2FanBoardIndex { atEnvMonv2FanEntry 2 }	Index of the board hosting this fan in the board table.
atEnvMonv2FanIndex { atEnvMonv2FanEntry 3 }	Numeric identifier of this fan on its host board.
atEnvMonv2FanDescription { atEnvMonv2FanEntry 4 }	Description of this fan.
atEnvMonv2FanCurrentSpeed { atEnvMonv2FanEntry 5 }	Current speed of this fan in revolutions per minute.
atEnvMonv2FanLowerThreshold { atEnvMonv2FanEntry 6 }	Minimum acceptable speed of the fan in revolutions per minute.
atEnvMonv2FanStatus { atEnvMonv2FanEntry 7 }	Whether this fan is currently in an alarm condition. The values can be: <ol style="list-style-type: none"> Failed. Means that the current speed is too low. Good. Means that the current speed is acceptable.
atEnvMonv2VoltageTable { atEnvMonv2 2 }	Table of information about voltage rails in the device that are monitored by environment monitoring hardware, indexed by: <ol style="list-style-type: none"> atEnvMonv2VoltageStackMemberId <ul style="list-style-type: none"> atEnvMonv2VoltageBoardIndex atEnvMonv2VoltageIndex
atEnvMonv2VoltageEntry { atEnvMonv2VoltageTable 1 }	Description, current value, upper & lower threshold settings and current status of a single voltage rail.
atEnvMonv2VoltageStackMemberId { atEnvMonv2VoltageEntry 1 }	Index of the stack member hosting this voltage sensor.
atEnvMonv2VoltageBoardIndex { atEnvMonv2VoltageEntry 2 }	Index of the board hosting this voltage sensor in the board table.
atEnvMonv2VoltageIndex { atEnvMonv2VoltageEntry 3 }	Numeric identifier of this voltage rail on its host board.
atEnvMonv2VoltageDescription { atEnvMonv2VoltageEntry 4 }	Description of this voltage rail.
atEnvMonv2VoltageCurrent { atEnvMonv2VoltageEntry 5 }	Current reading of this voltage rail in millivolts.
atEnvMonv2VoltageUpperThreshold { atEnvMonv2VoltageEntry 6 }	Maximum acceptable reading of this voltage rail in millivolts.
atEnvMonv2VoltageLowerThreshold { atEnvMonv2VoltageEntry 7 }	Minimum acceptable reading of this voltage rail in millivolts.

Table 96-9: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2VoltageStatus { atEnvMonv2VoltageEntry 8 }	Whether this voltage rail is currently in an alarm condition. Possible values are: <ol style="list-style-type: none"> outOfRange (1) - means that the current reading is outside the threshold range. inRange (2) - means that the current reading is acceptable.
atEnvMonv2TemperatureTable { atEnvMonv2 3 }	Table of information about temperature sensors in the device that are monitored by environment monitoring hardware, indexed by: <ol style="list-style-type: none"> atEnvMonv2TemperatureStackMemberId atEnvMonv2TemperatureBoardIndex atEnvMonv2TemperatureIndex atEnvMonv2TemperatureDescription atEnvMonv2TemperatureCurrent atEnvMonv2TemperatureUpperThreshold atEnvMonv2TemperatureStatus
atEnvMonv2TemperatureEntry { atEnvMonv2TemperatureTable 1 }	Description, current value, upper threshold setting and current status of a single temperature sensor.
atEnvMonv2TemperatureStackMemberId { atEnvMonv2TemperatureEntry 1 }	Index of the stack member hosting this temperature sensor.
atEnvMonv2TemperatureBoardIndex { atEnvMonv2TemperatureEntry 2 }	Index of the board hosting this temperature sensor in the board table.
atEnvMonv2TemperatureIndex { atEnvMonv2TemperatureEntry 3 }	Numeric identifier of this temperature sensor on its host board.
atEnvMonv2TemperatureDescription { atEnvMonv2TemperatureEntry 4 }	Description of this temperature sensor.
atEnvMonv2TemperatureCurrent { atEnvMonv2TemperatureEntry 5 }	Current reading of this temperature sensor in degrees Celsius.
atEnvMonv2TemperatureUpperThreshold { atEnvMonv2TemperatureEntry 6 }	Maximum acceptable reading for this temperature sensor in degrees Celsius.
atEnvMonv2TemperatureStatus { atEnvMonv2TemperatureEntry 7 }	Whether this temperature sensor is currently in an alarm condition. Can be: <ol style="list-style-type: none"> outOfRange (1) - means that the current reading is outside the threshold range. inRange (2) - means that the current reading is acceptable.
atEnvMonv2PsbObjects { atEnvMonv2 4 }	Collection of objects for monitoring power supply bays in the system and any devices that are installed. It contains the following objects: <ol style="list-style-type: none"> atEnvMonv2PsbTable <ul style="list-style-type: none"> atEnvMonv2PsbSensorTable
atEnvMonv2PsbTable { atEnvMonv2PsbObjects 1 }	Table of information about power supply bays in the system, indexed by: <ol style="list-style-type: none"> atEnvMonv2PsbHostStackMemberId atEnvMonv2PsbHostBoardIndex atEnvMonv2PsbHostSlotIndex atEnvMonv2PsbHeldBoardIndex atEnvMonv2PsbHeldBoardId atEnvMonv2PsbDescription

Table 96-9: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2PsbEntry { atEnvMonv2PsbTable 1 }	Description and current status of a single power supply bay device.
atEnvMonv2PsbHostStackMemberId { atEnvMonv2PsbEntry 1 }	Index of the stack member hosting this power supply bay.
atEnvMonv2PsbHostBoardIndex { atEnvMonv2PsbEntry 2 }	Index of the board hosting this power supply bay in the board table.
atEnvMonv2PsbHostSlotIndex { atEnvMonv2PsbEntry 3 }	Index of this power supply bay slot on its host board. This index is fixed for each slot, on each type of board.
atEnvMonv2PsbHeldBoardIndex { atEnvMonv2PsbEntry 4 }	Index of a board installed in this power supply bay. This value corresponds to atEnvMonv2PsbSensorBoardIndex for each sensor on this board. A value of 0 indicates that a board is either not present or not supported.
atEnvMonv2PsbHeldBoardId { atEnvMonv2PsbEntry 5 }	Type of board installed in this power supply bay. The values of this object are taken from the pprXxx object IDs under the boards sub-tree in the parent MIB. A value of 0 indicates that a board is either not present or not supported.
atEnvMonv2PsbDescription { atEnvMonv2PsbEntry 6 }	Description of this power supply bay.
atEnvMonv2PsbSensorTable { atEnvMonv2PsbObjects 2 }	Table of information about environment monitoring sensors on devices installed in power supply bays, indexed by: <ul style="list-style-type: none"> 1. atEnvMonv2PsbSensorStackMemberId <ul style="list-style-type: none"> ■ atEnvMonv2PsbSensorBoardIndex ■ atEnvMonv2PsbSensorIndex
atEnvMonv2PsbSensorEntry { atEnvMonv2PsbSensorTable 1 }	Description and current status of the sensor on a device installed in a power supply bay.
atEnvMonv2PsbSensorStackMemberId { atEnvMonv2PsbSensorEntry 1 }	Index of the stack member hosting this sensor.
atEnvMonv2PsbSensorBoardIndex { atEnvMonv2PsbSensorEntry 2 }	Index of the board hosting this sensor in the board table.
atEnvMonv2PsbSensorIndex { atEnvMonv2PsbSensorEntry 3 }	Index of this power supply bay environmental sensor on its host board.
atEnvMonv2PsbSensorType { atEnvMonv2PsbSensorEntry 4 }	Type of environmental variable this sensor detects. One of: <ul style="list-style-type: none"> 1. psbSensorTypeInvalid(0) <ul style="list-style-type: none"> ■ fanSpeedDiscrete(1) ■ temperatureDiscrete(2) ■ voltageDiscrete(3)
atEnvMonv2PsbSensorDescription { atEnvMonv2PsbSensorEntry 5 }	Description of this power supply bay environmental sensor.
atEnvMonv2PsbSensorStatus { atEnvMonv2PsbSensorEntry 6 }	Whether this environmental sensor is currently in an alarm condition. One of: <ul style="list-style-type: none"> 1. failed (1) - the device is in a failure condition 2. good (2) - the device is functioning normally. 3. notPowered (3) - a PSU is installed, but not powered up

Table 96-9: Objects defined in AT-ENVMONV2-MIB(cont.)

Object / Object Identifier	Description
atEnvMonv2PsbSensorReading { atEnvMonv2PsbSensorEntry 7 }	An indication of whether this environmental sensor is currently reading a value for the monitored device. A value of 'no' indicates that there is no current reading, 'yes' indicates that the monitored device is supplying a reading. <ol style="list-style-type: none"> no yes
atEnvMonv2Traps { atEnvMonv2 5 } (207.8.4.4.3.12.5)	Note that objects under this portion of the tree have been deprecated, and replaced by objects under the tree portion 207.8.4.4.3.12.0.
atEnvMonv2FaultLedTable { atEnvMonv2 6 }	Table detailing any LED fault indications on the device, indexed by: <ol style="list-style-type: none"> atEnvMonv2FaultLedStackMemberId
atEnvMonv2FaultLedEntry { atEnvMonv2FaultLedTable 1 }	Information pertaining to a given fault LED.
atEnvMonv2FaultLedStackMemberId { atEnvMonv2FaultLedEntry 1 }	Index of the stack member hosting this fault LED.
atEnvMonv2FaultLed1Flash { atEnvMonv2FaultLedEntry 2 }	Indicates whether a fault LED is currently showing a system failure by flashing once. Values can be: <ol style="list-style-type: none"> heatsinkFanFailure (1) - indicates that one or more heatsink fans have failed, or are operating below the recommended speed noFault (2)
atEnvMonv2FaultLed2Flashes { atEnvMonv2FaultLedEntry 3 }	Indicates whether a fault LED is currently showing a system failure by flashing twice. Values can be: <ol style="list-style-type: none"> chassisFanFailure (1) - indicates that one or both of the chassis fans are not installed, or the fans are operating below the recommended speed noFault (2)
atEnvMonv2FaultLed3Flashes { atEnvMonv2FaultLedEntry 4 }	Indicates whether a fault LED is currently showing a system failure by flashing three times. Values can be: <ol style="list-style-type: none"> sensorFailure (1) - indicates that the ability to monitor temperature or fans has failed noFault (2)
atEnvMonv2FaultLed4Flashes { atEnvMonv2FaultLedEntry 5 }	Indicates whether a fault LED is currently showing a system failure by flashing four times. Values can be: <ol style="list-style-type: none"> xemInitialisationFailure (1) - indicates that a XEM failed to initialise or is incompatible noFault (2)
atEnvMonv2FaultLed5Flashes { atEnvMonv2FaultLedEntry 6 }	Indicates whether a fault LED is currently showing a system failure by flashing five times. This flashing sequence is not currently in use. Value is: <ul style="list-style-type: none"> noFault (2)
atEnvMonv2FaultLed6Flashes { atEnvMonv2FaultLedEntry 7 }	Indicates whether a fault LED is currently showing a system failure by flashing six times. Values can be: <ol style="list-style-type: none"> temperatureFailure (1) - indicates that the device's temperature has exceeded the recommended threshold noFault (2)

AT-MIBVERSION-MIB

The AT-MIBVERSION-MIB contains an object to display the last software release that contained changes to the supported AT Enterprise MIB definition files ([Table 96-10](#)). Objects in this group have the object identifier atMibsetVersion ({ sysinfo 15 }).

Table 96-10: Object defined in AT-MIBVERSION-MIB

Object	Object Identifier	Description
atMibsetVersion	{ sysinfo 15 }	This object returns a five digit integer which indicates the last software release that contained changes to the supported AT Enterprise MIB definition files. For example, If the currently loaded software release on the device is 5.3.1-0.3 but the Enterprise MIBs have not changed since 5.3.1-0.1, then the value returned will be 53101.

AT-USER-MIB

The AT-USER-MIB contains objects for displaying information about users currently logged into a device, or configured in the Local User Database of the device ([Table 96-11](#)).

Objects in this group have the object identifier user ({ sysinfo 20 }).

Table 96-11: Objects defined in AT-USER-MIB

Object	Object Identifier	Description
userInfoTable (207.8.4.4.3.20.1)	{ user 1 }	Table containing information about users. Each entry in the table represents a user currently logged into the device. Indexed by: rscBoardType and rscBoardIndex.
userInfoEntry	{ userInfoTable 1 }	Information about a single user logged into the device.
userInfoType	{ userInfoEntry 1 }	The type of connection through which the user logged into the device. Can be: <ol style="list-style-type: none"> 1. console (1) 2. aux (2) 3. telnet (3) 4. script (4) 5. stack (5)
userInfoIndex	{ userInfoEntry 2 }	Index of the line upon which the user logged into the device. Can be a value in range 1 to 16.
userInfoName	{ userInfoEntry 3 }	User name of the user logged into the device.
userInfoPrivilegeLevel	{ userInfoEntry 4 }	The user's privilege level. Can be a value in range 1 to 15.
userInfoIdleTime	{ userInfoEntry 5 }	The amount of time since the user was last active, in the form hh:mm:ss.
userInfoLocation	{ userInfoEntry 6 }	The user location or login method. It can be an IP Address used by the user to telnet into the device, or an asyn port, etc.
userInfoPasswordLifetime	{ userInfoEntry 7 }	The number of days remaining until the user's password expires. Depending on the current user setting it will display one of the following: No Expiry - the password will never expire (default setting) x days - where x is the remaining lifetime of the current password (maximum lifetime value is 1000 days) -x days (expired) - indicating that the current password expired x days ago
userInfoPasswordLastChange	{ userInfoEntry 8 }	The number of days since the password was last altered.

Table 96-11: Objects defined in AT-USER-MIB(cont.)

Object	Object Identifier	Description
userConfigTable	{ user 2 } or (207.8.4.4.3.20.2)	Table containing user configuration information. Each entry in the table relates to a user configured in the Local User Database of the device. Indexed by userConfigIndex.
userConfigEntry	{ userConfigTable 1 }	Information about a single user configured in the Local User Database of the device.
userConfigIndex	{ userConfigEntry 1 }	Unique number used to identify entries in the userConfigTable.
userConfigName	{ userConfigEntry 2 }	The user's name.
userConfigPrivilegeLevel	{ userConfigEntry 3 }	The privilege level granted to the user. Can be a value in range 1 to 15.

Table 96-11: Objects defined in AT-USER-MIB(cont.)

Object	Object Identifier	Description
userSecurityPasswordRules	{ user 3 } or (207.8.4.4.3.20.3)	Information about user password security rules.
userSecurityPasswordHistory	{ userSecurityPasswordRules 1 }	The number of previous passwords that are retained for comparison when a user password is created. A new password must be unique when compared against the previous history. A value of 0 represents no restriction. The maximum number of retained passwords is 15.
userSecurityPasswordLifetime	{ userSecurityPasswordRules 2 }	The maximum number of days that the password may persist before a change is required. A value of 0 represents no expiry. The maximum value is 1000.
userSecurityPasswordWarning	{ userSecurityPasswordRules 3 }	The number of days before the password expires that a warning message is displayed when the user logs in. A value of 0 indicates no warning. The maximum value is 1000 but must always be less than the password lifetime.
userSecurityPasswordMinLength	{ userSecurityPasswordRules 4 }	The minimum allowable password length.
userSecurityPasswordMinCategory	{ userSecurityPasswordRules 5 }	The minimum number of different categories that the password must satisfy to be considered valid. Categories are split into four groups: upper-case letters lower-case letters digits special symbols. ASCII characters not included in the previous three categories.
userSecurityPasswordForced	{ userSecurityPasswordRules 6 }	Whether or not a user with an expired password is forced to change their password at the next login. At login a user with an expired password is prompted to change their password. If the new password meets the current security password rules the user is allowed to log in, otherwise they are rejected.
userSecurityPasswordReject	{ userSecurityPasswordRules 7 }	Whether or not a user login attempt with an expired password is rejected. If the user is not rejected then they can log in.

AT-RESOURCE-MIB

The AT-RESOURCE-MIB contains objects for displaying system hardware resource and host information ([Table 96-12](#)). Objects in this group have the object identifier rsc ({ sysinfo 21 }).

Table 96-12: Objects defined in AT-RESOURCE-MIB

Object and OID	Description
resource { sysinfo 21 }	Contains objects for displaying system hardware resource and host information.
rscBoardTable { resource 1 }	Table containing information about boards installed in a device. Indexed by: <ol style="list-style-type: none"> rscStkId rscResourceId
rscBoardEntry { rscBoardTable 1 }	Information about a single board installed in the device.
rscStkId { rscBoardEntry 1 }	The ID of the stack member. It is a number from 1 to 8, assigned to a stackable unit by the operating system when it is stacked. A default of 1 is given to a stand-alone unit.
rscResourceId { rscBoardEntry 2 }	The resource ID number of the board. It is a number assigned to a hardware resource when the operating system detects its existence. Can be a value in range 1 to 4294967294.
rscBoardType { rscBoardEntry 3 }	The type of board. Can be one of the following: <ol style="list-style-type: none"> Base Expansion Fan module PSU, etc.
rscBoardName { rscBoardEntry 4 }	The name of the board. Can be one of the following: <ol style="list-style-type: none"> SwitchBlade x908 XEM-12S AT-PWR05-AC, etc
rscBoardId { rscBoardEntry 5 }	The ID number of the board. Its value is an Allied Telesis assigned number, such as 274 for the XEM-12S, or 255 for the AT-9924Ts.
rscBoardBay { rscBoardEntry 6 }	The board installation location. Its value can be Bay1, Bay2, PSU1, etc. For a base board, it has a value of a single character space.
rscBoardRevision { rscBoardEntry 7 }	The revision number of the board.
rscBoardSerialNumber { rscBoardEntry 8 }	The serial number of the board.
hostInfoTable { resource 2 }	Table containing general system information. Indexed by rscStkId.
hostInfoEntry { hostInfoTable 1 }	Information about a single system parameter

Table 96-12: Objects defined in AT-RESOURCE-MIB(cont.)

Object and OID	Description
hostInfoDRAM { hostInfoTable 2 }	The host DRAM information.
hostInfoFlash { hostInfoTable 3 }	The host Flash information.
hostInfoUptime { hostInfoTable 4 }	The host up-time.
hostInfoBootloaderVersion { hostInfoTable 5 }	The host boot loader version.

AT-LICENSE-MIB

The AT-LICENSE-MIB contains objects for managing the AlliedWare Plus™ Operating System software licenses: listing applied software licenses, adding new licenses and deleting existing licenses ([Table 96-13](#)). The objects reside in the module license { sysinfo 22 }, organized in the following groups:

- Base Software License Table - a table containing the installed base software licenses on the device
- Installed Software License Table - a list of installed software licenses; used also to remove software license from the device
- Available Software Features Table
- LicenseNew - Objects used to install a new license

Table 96-13: Objects defined in AT-LICENSE-MIB

Object	Object Identifier	Description
license	{ sysinfo 22 }	MIB containing objects for listing applied software licenses, adding new licenses, and deleting existing licenses.
baseLicenseTable	{ license 1 }	Table containing information about base software licenses installed on a device. Indexed by: <ul style="list-style-type: none"> ■ baseLicenseStkld
baseLicenseEntry	{ baseLicenseTable 1 }	Information about a single license installed on the device.
baseLicenseName	{ baseLicenseEntry 2 }	The name of the base license.
baseLicenseQuantity	{ baseLicenseEntry 3 }	The number of licenses issued for this entry.
baseLicenseType	{ baseLicenseEntry 4 }	The type of base license issued.
baseLicenseIssueDate	{ baseLicenseEntry 5 }	The date of issue of the base license.
baseLicenseExpiryDate	{ baseLicenseEntry 6 }	The expiry date of the base license.
baseLicenseFeatures	{ baseLicenseEntry 7 }	The feature set that this license enables, in the format of an octet string. Each bit in the returned octet string represents a particular feature that can be license-enabled. The bit position within the string maps to the feature entry with the same index, in licenseFeatureTable. A binary '1' indicates that the feature is included in the license; a binary '0' indicates that the feature is not included in the license.
licenseTable	{ license 2 }	Table containing information about software licenses installed on the device. Indexed by: <ul style="list-style-type: none"> ■ licenseIndex
licenseEntry	{ licenseTable 1 }	Information about a single installed software license on the device.
licenseIndex	{ licenseEntry 2 }	The index number of the license entry.
licenseName	{ licenseEntry 3 }	The name of the license.
licenseCustomer	{ licenseEntry 4 }	The name of the customer of the license.
licenseQuantity	{ licenseEntry 5 }	The number of licenses issued for this entry.
licenseType	{ licenseEntry 6 }	The type of license issued.
licenseIssueDate	{ licenseEntry 7 }	The date of issue of the license.
licenseExpiryDate	{ licenseEntry 8 }	The expiry date of the license.

Table 96-13: Objects defined in AT-LICENSE-MIB(cont.)

Object	Object Identifier	Description
licenseFeatures	{ licenseEntry 9 }	<p>The feature set that this license enables, in the format of octet string.</p> <p>Each bit in the returned octet string represents a particular feature that can be license-enabled. The bit position within the string maps to the feature entry with the same index, in licenseFeatureTable.</p> <p>A binary '1' indicates that the feature is included in the license; a binary '0' indicates that the feature is not included in the license.</p>
licenseRowStatus	{ licenseEntry 10 }	<p>The current status of the license. The following values may be returned when reading this object:</p> <ol style="list-style-type: none"> active (1) - the license is currently installed and valid notInService (2) - the license has expired or is invalid <p>The following value may be written to this object:</p> <p>destroy (6) - the license will be removed from the device; this may result in some features being disabled.</p>
licenseFeatureTable	{ license 3 }	Table containing all available Software Features. A feature must be license-enabled to be utilized on the device.
licenseFeatureEntry	{ licenseFeatureTable 1 }	Information about a single feature that must be license-enabled in order to be utilized on the device.
licenseFeatureIndex	{ licenseFeatureEntry 1 }	The index number of the feature which must be license-enabled.
licenseFeatureName	{ licenseFeatureEntry 2 }	The name of the feature under licensing control.
licenseNew	{ license 4 }	Group of objects available for updates, used when installing a new software license on the device.

Table 96-13: Objects defined in AT-LICENSE-MIB(cont.)

Object	Object Identifier	Description
licenseNewName	{ licenseNew 2 }	The name of the new license to be installed.
licenseNewKey	{ licenseNew 3 }	The key for the new license to be installed.
licenseNewInstall	{ licenseNew 4 }	<p>Used to install new licenses. Values can be:</p> <ol style="list-style-type: none"> 1. true (1) 2. false (2) <p>To commence installation, a valid license name and key must first have been set via the licenseNewName and licenseNewKey respectively. This object should then be set to the value true (1). If either the license name or key is invalid, the write operation will fail.</p> <p>Once installed, the software modules affected by any newly enabled features will automatically be restarted.</p> <p>When read, the object will always return the value false (2).</p>
licenseNewInstallStatus	{ licenseNew 5 }	<p>The current status of the last license installation request.</p> <p>One of the following values is returned when reading this object:</p> <ul style="list-style-type: none"> ■ idle (1) ■ processing (2) ■ success (3) ■ failed (4)

AT-CHASSIS-MIB

The AT-CHASSIS-MIB defines objects for managing chassis-based devices (**Table 96-14**). Objects in this group have the object identifier chassis ({ sysinfo 23 }).

Table 96-14: Objects defined in AT-CHASSIS-MIB

Object	Object Identifier	Description
chassis	{ sysinfo (23) } or (1.3.6.1.4.1.207.8.4.4.3.23)	Trap notifications for chassis based devices.
chassisNotifications	{ chassis 0 }	List of traps (notifications) generated for the chassis.
chassisCardRoleChangeNotify	{ chassisNotifications 1 }	Notification generated when the Control Fabric Card's role changes.
chassisCardJoinNotify	{ chassisNotifications 2 }	Notification generated when a line card connects to the Control Fabric Card.
chassisCardLeaveNotify	{ chassisNotifications 3 }	Notification generated when a line card detaches from the Control Fabric Card.
slotNumber	{ chassisNotifications 4 }	The slot number of the line card or Control Fabric Card that has changed. Has the numeric range 1-12.
chassisRole	{ chassisNotifications 5 }	The Control Fabric Card's role in the chassis. Can be one of the following: leaving (1) discovering (2) synchronizing (3) standbyMember (4) pendingMaster (5) disabledMaster (6) activeMaster (7)
chassisCardTable	{ chassis 1 }	A list of cards presented on the device.
chassisCardEntry	{ chassis 1.1 }	A table entry containing information about a card.
chassisCardSlot	{ chassis 1.1.1 }	The slot number that the card is installed in.

AT-TRIGGER-MIB

AT-TRIGGER-MIB defines objects for managing triggers ([Table 96-15](#)). Objects in this group have the object identifier trigger ({ modules 53 }). All objects in this group have read only access.

Table 96-15: Objects defined in AT-TRIGGER-MIB

Object Identifier	Description
triggerTraps { trigger 0 }	Sub-tree for all trigger traps.
triggerTrap { triggerTraps 1 }	Notification generated when a trigger is activated. It returns the value of triggerLastTriggerActivated.
triggerLastTriggerActivated { trigger 1 }	Trigger number of the most recent trigger activated on the switch.
triggerConfigInfoTable { trigger 9 }	Table of information about each trigger that has been configured, indexed by triggerNumber.
triggerConfigInfoEntry { triggerConfigInfoTable 1 }	Information about the configuration of a single trigger.
triggerNumber { triggerConfigInfoEntry 1 }	ID number of the trigger. Values are in range 1- 250.
triggerName { triggerConfigInfoEntry 2 }	Name and description of the trigger.
triggerTypeDetail { triggerConfigInfoEntry 3 }	Trigger type and its activation conditions.
triggerActiveDaysOrDate { triggerConfigInfoEntry 4 }	The days of a week or the date on which the trigger can be activated.
triggerActivateAfter { triggerConfigInfoEntry 5 }	Time after which the trigger can be activated.
triggerActivateBefore { triggerConfigInfoEntry 6 }	Time before which the trigger can be activated.
triggerActiveStatus { triggerConfigInfoEntry 7 }	Whether or not the trigger can be activated.
triggerTestMode { triggerConfigInfoEntry 8 }	Whether or not the trigger is operating in diagnostic (test) mode.
triggerSnmpTrap { triggerConfigInfoEntry 9 }	Whether or a not an SNMP trap will be generated when the trigger is activated.
triggerRepeatTimes { triggerConfigInfoEntry 10 }	Whether the trigger can repeat an unlimited number of times (continuous) or a specified number of times. If the trigger can repeat only a specified number of times, then the number of times the trigger has already been activated is displayed in brackets.
triggerLasttimeModified { triggerConfigInfoEntry 11 }	Date and time that the trigger configuration was last modified.
triggerNumberOfActivation { triggerConfigInfoEntry 12 }	Number of times the trigger has been activated since the last restart of the device.
triggerLasttimeActivation { triggerConfigInfoEntry 13 }	Date and time that the trigger was last activated.
triggerNumberOfScripts { triggerConfigInfoEntry 14 }	Number of scripts that this trigger will execute. Values are in range 0-5.
triggerScript1 { triggerConfigInfoEntry 15 }	Name of the first script that this trigger will execute if the trigger is activated.

Table 96-15: Objects defined in AT-TRIGGER-MIB(cont.)

Object Identifier	Description
triggerScript2 { triggerConfigInfoEntry 16 }	Name of the second script that this trigger will execute if the trigger is activated.
triggerScript3 { triggerConfigInfoEntry 17 }	Name of the third script that this trigger will execute if the trigger is activated.
triggerScript4 { triggerConfigInfoEntry 18 }	Name of the fourth script that this trigger will execute if the trigger is activated.
triggerScript5 { triggerConfigInfoEntry 19 }	Name of the fifth script that this trigger will execute if the trigger is activated.
triggerCounters { trigger 10 }	Collection of counters for trigger activations.
triggerNumOfActivation { triggerCounters 1 }	Number of times a trigger has been activated.
triggerNumOfActivationToday { triggerCounters 2 }	Number of times a trigger has been activated today.
triggerNumOfPeriodicActivationToday { triggerCounters 3 }	Number of times a periodic trigger has been activated today.
triggerNumOfInterfaceActivationToday { triggerCounters 4 }	Number of times an interface trigger has been activated today.
triggerNumOfResourceActivationToday { triggerCounters 5 }	Number of times a CPU or memory trigger has been activated today.
triggerNumOfRebootActivationToday { triggerCounters 6 }	Number of times a reboot trigger has been activated today.
triggerNumOfPingPollActivationToday { triggerCounters 7 }	Number of times a ping-poll trigger has been activated today.

AT-LOOPPROTECT-MIB

The atLoopProtect-MIB (**Figure 96-2, Table 96-16**) defines objects for managing Loop Protection objects and triggers. Objects in this group have the object identifier atLoopProtect ({ modules 4 }).

Figure 96-2: The ATLoopProtect MIB Sub-tree

Table 96-16: Objects Defined in the AT-Loop Protect MIB

Object	Object Identifier	Description
{ atLoopProtect }	{ modules 54 }	The root of the Loop Protect object sub tree.
{ atLoopProtectTrap }	{ atLoopProtect0 }	The Loop Protection node state transition trap. List of traps (notifications) generated for Loop Protection.
{ atLoopProtectDetectedLoopBlockedTrap }	{ atLoopProtectTrap1 }	Notification generated when the Loop Protection feature blocks an interface with a loop. The following bindings are associated with this trap: <ol style="list-style-type: none"> 1. atLoopProtectIfIndex 2. atLoopProtectVlanId 3. atLoopProtectAction
{ atLoopProtectRecoverLoopBlockedTrap }	{ atLoopProtectTrap2 }	Notification generated when the Loop Protection feature restores a blocked interface back to normal operation. The following bindings are associated with this trap: <ol style="list-style-type: none"> 1. atLoopProtectIfIndex 2. atLoopProtectVlanId 3. atLoopProtectAction
{ atLoopProtectDetectedByLoopDetectionTrap }	{ atLoopProtectTrap3 }	Notification generated when the Loop Protection feature detects a loop by Loop Detection method. The following bindings are associated with this trap: <ol style="list-style-type: none"> 1. atLoopProtectIfIndex 2. atLoopProtectVlanId 3. atLoopProtectRxLDFIfIndex 4. atLoopProtectRxLDFVlanId
{ atLoopProtectAction }	{ atLoopProtect1 }	The Action for the Loop Protection feature. The following values are defined: <ol style="list-style-type: none"> 1. atLoopProtectAction-LearnDisable (0) 2. atLoopProtectAction-LearnEnable (1) 3. atLoopProtectAction-PortDisable (2) 4. atLoopProtectAction-PortEnable (3) 5. atLoopProtectAction-LinkDown (4) 6. atLoopProtectAction-LinkUp (5) 7. atLoopProtectAction-VlanDisable (6) 8. atLoopProtectAction-VlanEnable (7)
{ atLoopProtectIfIndex }	{ atLoopProtect2 }	The interface on which the loop was detected.
{ atLoopProtectVlanId }	{ atLoopProtect3 }	The VLAN ID on which the loop was detected.
{ atLoopProtectRxLDFIfIndex }	{ atLoopProtect4 }	The interface on which the loop detection frame was received.
{ atLoopProtectRxLDFVlanId }	{ atLoopProtect5 }	The VLAN ID on which the loop detection frame was received.

AT-SETUP-MIB

AT-SETUP-MIB defines objects for managing software installation and configuration files (**Figure 96-3, Table 96-17**). Objects in this group have the object identifier setup ({ modules 500 }). The procedure in **Table 94-6 on page 94.22** shows how to use these MIB objects to upgrade to a new software version and boot configuration file. For objects used for file copying, see **“AT-FILEv2-MIB” on page 96.62**.

Figure 96-3: The AT-SETUP-MIB sub-tree

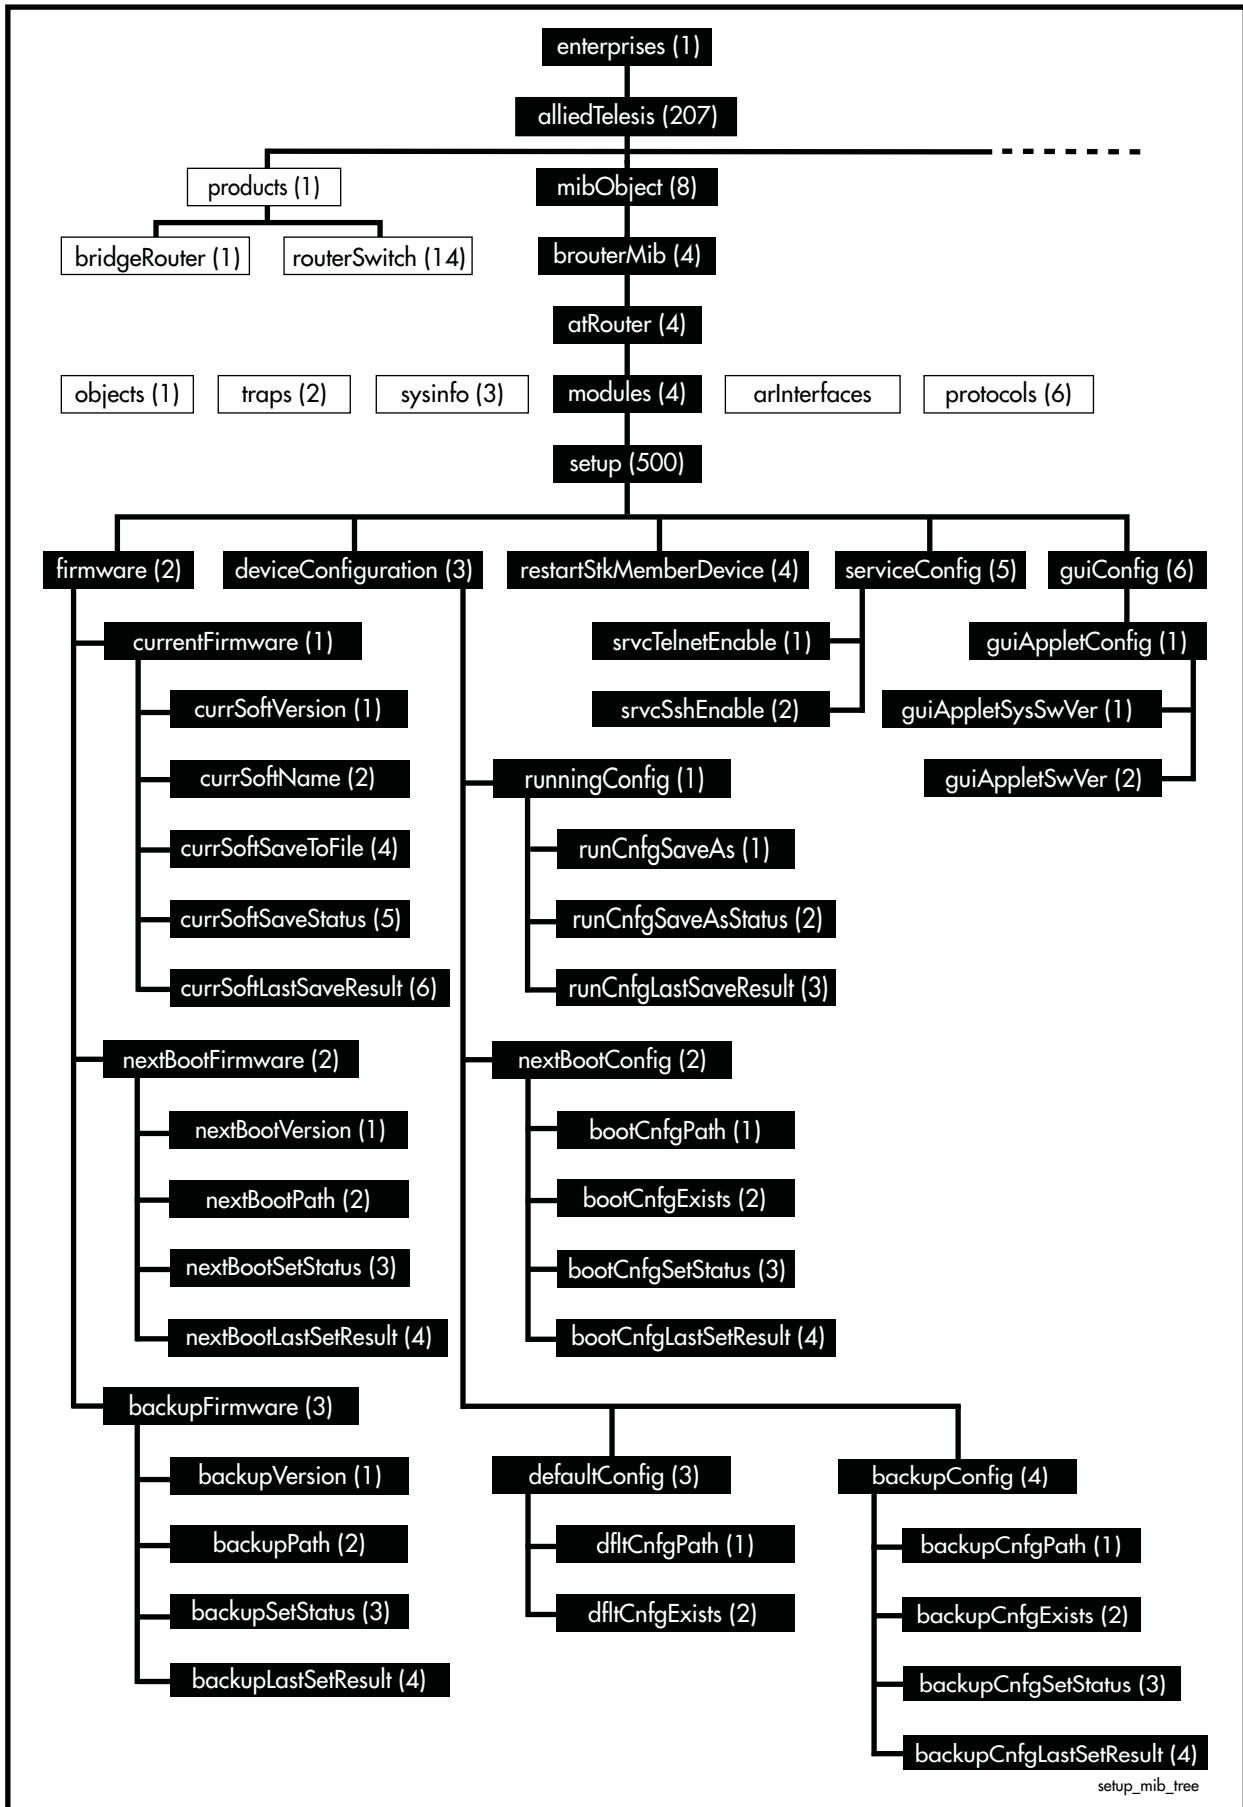

Table 96-17: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
restartDevice	{ setup 1 }	Object for restarting the device. When set to '1', the device will restart immediately. Note: This object has been deprecated. Use instead the restartStkMemberDevice object.
firmware	{ setup 2 }	Objects for managing the software version files that the device will install and run.
currentFirmware	{ firmware 1 }	Information about the current software version installed on the device.
currSoftVersion	{ currentFirmware 1 }	Current software version.
currSoftName	{ currentFirmware 2 }	Current software name.
currSoftSaveAs	{ currentFirmware 3 }	The file name to save the currently running software to the root of the Flash. Only one save operation can be executed at a time across all SNMP users. Note: This object has been deprecated. Use instead the currSoftSaveToFile, currSoftSaveStatus and currSoftLastSaveResult objects.
currSoftSaveToFile	{ currentFirmware 4 }	Set with a URL to save the currently running software to the root of Flash or USB flash drive (e.g. 'flash:/filename.rel' or 'USB:/filename.rel'). The URL must not contain whitespace characters. Only one save operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of currSoftSaveStatus is 'idle'. Immediately upon executing the set action, the actual firmware save operation is started and will continue on the device until it has completed or a failure occurs. When read, this object will return the URL of the last firmware save operation that was attempted.
currSoftSaveStatus	{ currentFirmware 5 }	This object will return the status of any current operation to store the running software to a release file. The following values may be returned: 1. (idle) - there is no release file save operation in progress 2. (success) - the last release file save operation completed successfully 3. (failure) - the last release file save operation failed 4. (saving) - a release file save operation is currently in progress When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading currSoftLastSaveResult.
currSoftLastSaveResult	{ currentFirmware 6 }	Gives an indication of the result of the last completed SNMP operation to save the running firmware to a release file.

Table 96-17: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
nextBootFirmware	{ firmware 2 }	Information about the software version to be installed on the device when booting.
nextBootVersion	{ nextBootFirmware 1 }	Provides information on the software version (major.minor.interim, for example version 5.4.1) that the device will boot from. A zero will be returned if the version cannot be determined.
nextBootPath	{ nextBootFirmware 2 }	<p>The full path to the release file that will be used the next time the device is rebooted. The URL must not contain whitespace characters.</p> <p>Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of nextBootSetStatus is 'idle'.</p> <p>Immediately upon executing the set action, the system will attempt to set the new configuration path, and the process will continue on the device until it has completed or a failure occurs.</p> <p>This object can be set with an empty string in order to clear the current boot firmware. Otherwise, the path should be of the form 'flash:/filename.cfg' or 'card:/filename.cfg'.</p> <p>In order to set this object, the file must meet the following conditions:</p> <ul style="list-style-type: none"> ■ it must exist ■ it must be located in the root of Flash (on the active master in a stacked environment) or USB flash drive ■ it must not be the same as the backup release file ■ it must have a .rel suffix ■ it must pass several internal checks to ensure that it is a genuine release file ■ in a stacked environment, there must be enough disk space available to store the release file on each stack member
nextBootSetStatus	{ nextBootFirmware 3 }	<p>Returns the status of any current operation to set the next boot release file. The following values may be returned:</p> <ul style="list-style-type: none"> ■ 1 (idle) - there is no boot release setting operation in progress ■ 2 (success) - the last boot release setting operation completed successfully ■ 3 (failure) - the last boot release setting operation failed ■ 5 (syncing) - a boot release setting operation is currently in progress and the file is being synchronized across the stack <p>When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading nextBootLastSetResult.</p>
nextBootLastSetResult	{ nextBootFirmware 4 }	Gives an indication of the result of the last completed SNMP operation to set the boot release filename.

Table 96-17: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
backupFirmware	{ firmware 3 }	Information about the backup software version and path.
backupVersion	{ backupFirmware 1 }	Provides information on the backup software version (major.minor.interim, for example version 5.4.1) that the device will boot from. A zero will be returned if the version cannot be determined.
backupPath	{ backupFirmware 2 }	<p>The full path to the backup release file that will be used the next time the device is rebooted. The URL must not contain whitespace characters.</p> <p>Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of backupSetStatus is 'idle'. Immediately upon executing the set action, the system will attempt to set the new configuration path, and the process will continue on the device until it has completed or a failure occurs.</p> <p>This object can be set with an empty string in order to clear the current backup firmware. Otherwise, the path should be of the form 'flash:/filename.cfg' or 'card:/filename.cfg'.</p> <p>In order to set this object, the file must meet the following conditions:</p> <ul style="list-style-type: none"> ■ it must exist ■ it must be located in the root of Flash (on the active master in a stacked environment) or USB flash drive ■ it must not be the same as the configured main release file ■ it must have a .rel suffix ■ it must pass several internal checks to ensure that it is a genuine release file ■ in a stacked environment, there must be enough disk space available to store the release file on each stack member
backupSetStatus	{ backupFirmware 3 }	<p>Returns the status of any current operation to set the backup boot release file. The following values may be returned:</p> <ul style="list-style-type: none"> ■ 1 (idle) - there is no backup boot release setting operation in progress ■ 2 (success) - the last backup boot release setting operation completed successfully ■ 3 (failure) - the last backup boot release setting operation failed ■ 5 (syncing) - a backup boot release setting operation is currently in progress and the file is being synchronized across the stack <p>When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading backupLastSetResult.</p>
backupLastSetResult	{ backupFirmware 4 }	Gives an indication of the result of the last completed SNMP operation to set the backup boot release filename.

Table 96-17: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
deviceConfiguration	{ setup 3 }	Objects for managing device configuration.
runningConfig	{ deviceConfiguration 1 }	
runCnfgSaveAs	{ runningConfig 1 }	<p>Set with a URL to save the currently running software to the root of Flash or USB flash drive (e.g. 'flash:/filename.rel' or 'usb:/filename.rel'). The URL must not contain whitespace characters.</p> <p>Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of runCnfgSaveAsStatus is 'idle'. Immediately upon executing the set action, the system will attempt to save the running configuration and the process will continue on the device until it has completed or a failure occurs.</p> <p>When read, this object will return the URL of the last firmware save operation that was attempted.</p>
runCnfgSaveAsStatus	{ runningConfig 2 }	<p>Returns the status of any current operation to save the running configuration. The following values may be returned:</p> <ol style="list-style-type: none"> 1. (idle) - there is no config file save operation in progress 2. (success) - the last config file save operation completed successfully 3. (failure) - the last config file save operation failed 4. (saving) - a config file save operation is currently in progress <p>When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading runCnfgLastSaveResult.</p>
runCnfgLastSaveResult	{ runningConfig 3 }	Gives an indication of the result of the last completed SNMP operation to save the running configuration.
nextBootConfig	{ deviceConfiguration 2 }	

Table 96-17: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
bootCnfgPath	{ nextBootConfig 1 }	<p>The full path to the configuration file that will be used the next time the device is rebooted. The URL must not contain whitespace characters.</p> <p>Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of bootCnfgSetStatus is 'idle'. Immediately upon executing the set action, the system will attempt to set the new configuration path, and the process will continue on the device until it has completed or a failure occurs.</p> <p>This object can be set with an empty string in order to clear the current boot configuration. Otherwise, the path should be of the form 'flash:/myconfig.cfg' or 'card:/filename.cfg'.</p> <p>In order to set this object, the file must meet the following conditions:</p> <ul style="list-style-type: none"> ■ it must exist ■ it must be located in the root of Flash (on the active master in a stacked environment) or USB flash drive ■ it must have a .cfg suffix ■ in a stacked environment, there must be enough disk space available to store the configuration file on each stack member
bootCnfgExists	{ nextBootConfig 2 }	This object will return the value TRUE if the currently defined boot configuration file exists, or FALSE if it does not.
bootCnfgSetStatus	{ nextBootConfig 3 }	<p>Returns the status of any current operation to set the next boot configuration file. The following values may be returned:</p> <ul style="list-style-type: none"> ■ 1 (idle) - there is no boot configuration setting operation in progress ■ 2 (success) - the last boot configuration setting operation completed successfully ■ 3 (failure) - the last boot configuration setting operation failed ■ 5 (syncing) - a boot configuration setting operation is currently in progress and the file is being synchronized across the stack <p>When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading bootCnfgLastSetResult.</p>
bootCnfgLastSetResult	{ nextBootConfig 4 }	Gives an indication of the result of the last completed SNMP operation to set the boot configuration filename.
defaultConfig	{ deviceConfiguration 3 }	
dfltCnfgPath	{ defaultConfig 1 }	<p>The full path of the configuration file to use as backup when the device is rebooted.</p> <p>This object is not settable. The default configuration file is always 'flash:/default.cfg'.</p>

Table 96-17: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
dfltCnfgExists	{ defaultConfig 2 }	This object will return the value TRUE if the currently defined default configuration file exists, or FALSE if it does not.
backupConfig	{ deviceConfiguration 4 }	
backupCnfgPath	{ backupConfig 1 }	<p>The full path to the backup configuration file that will be used the next time the device is rebooted. The URL must not contain whitespace characters.</p> <p>Only one set operation can be executed at a time across all SNMP users and an operation may not be started unless the current value of backupCnfgSetStatus is 'idle'. Immediately upon executing the set action, the system will attempt to set the new backup configuration path, and the process will continue on the device until it has completed or a failure occurs.</p> <p>This object can be set with an empty string in order to clear the current boot configuration. Otherwise, the path should be of the form 'flash:/myconfig.cfg' or 'card:/filename.cfg'.</p> <p>In order to set this object, the file must meet the following conditions:</p> <ul style="list-style-type: none"> ■ it must exist ■ it must be located in the root of Flash (on the active master in a stacked environment) or USB flash drive ■ it must have a .cfg suffix ■ in a stacked environment, there must be enough disk space available to store the configuration file on each stack member
backupCnfgExists	{ backupConfig 2 }	This object will return the value TRUE if the currently defined backup configuration file exists, or FALSE if it does not.
backupCnfgSetStatus	{ backupConfig 3 }	<p>Returns the status of any current operation to set the next backup boot configuration file. The following values may be returned:</p> <ul style="list-style-type: none"> ■ 1 (idle) - there is no backup boot configuration setting operation in progress ■ 2 (success) - the last backup boot configuration setting operation completed successfully ■ 3 (failure) - the last backup boot configuration setting operation failed ■ 5 (syncing) - a backup boot configuration setting operation is currently in progress and the file is being synchronized across the stack <p>When a read of this object returns a value of 'success' or 'failure', it will immediately be reset to 'idle' and a new operation may be initiated if desired. A detailed description of the last completed operation may be determined by reading backupCnfgLastSetResult.</p>
backupCnfgLastSetResult	{ backupConfig 4 }	Gives an indication of the result of the last completed SNMP operation to set the backup boot configuration filename.

Table 96-17: Objects defined in AT-SETUP-MIB

Object Identifier	Description	Object Identifier
restartStkMemberDevice	{ setup 4 }	This object causes a specified device to restart immediately. The restart is initiated by setting its value to the device's stack member ID. Setting its value to zero will cause all devices in the stack, or a standalone device, to restart. Reading the object will always return zero.
serviceConfig	{ setup 5 }	
srvcTelnetEnable	{ serviceConfig 1 }	This object is used to either read or set the state of the telnet server on a device. Telnet can be enabled by setting the value of this object to 'enable(1)' or can be disabled by setting the value 'disable(2)'.
srvcSshEnable	{ serviceConfig 2 }	This object is used to either read or set the state of the SSH server on a device. SSH can be enabled by setting the value of this object to 'enable(1)' or can be disabled by setting the value 'disable(2)'.
guiConfig	{ setup 6 }	
guiAppletConfig	{ guiConfig 1 }	
guiAppletSysSwVer	{ guiAppletConfig 1 }	<p>This object represents the system software release that the currently selected GUI applet was designed to run on.</p> <p>The system automatically searches for GUI applet files that reside in the root directory of the Flash memory, and selects the latest available file that is applicable to the currently running system software. This is the applet that will be uploaded to a user's web browser when they initiate the GUI.</p>
	{ guiAppletConfig 2 }	<p>This object represents the software version of the currently selected GUI applet.</p> <p>The system automatically searches for GUI applet files residing in the root directory of the Flash memory, and selects the latest available one that is applicable to the currently running system software. This is the applet that will be uploaded to a user's web browser when they initiate the GUI.</p>

AT-DNS-CLIENT-MIB

AT-DNS-CLIENT-MIB contains definitions of managed objects for the Allied Telesis DNS Client Configuration.

Objects in this group have the object identifier atDns (Modules 501). **Table 96-18** lists the objects supported by the AlliedWare Plus™ Operating System.

Table 96-18: Objects defined in AT-DNS-CLIENT-MIB

Object	Object Identifier	Description
atDnsClient	{ atDns 1 }	MIB File for DNS Client Configuration.
atDNSServerIndexNext	{ atDnsClient 1 }	The next available value for the object 'atDNSServerIndex'. The value is used by a management application to create an entry in the 'atDNSServerTable'.
atDNSServerTable	{ atDnsClient 2 }	Table of information about the Domain Name System (DNS) Server configurations in the system, indexed by 'atDNSServerIndex'.
atDNSServerEntry	{ atDNSServerTable 1 }	Information about a single DNS Server Configuration.
atDNSServerIndex	{ atDNSServerEntry 1 }	The index corresponding to the particular DNS Server Configuration. When creating a new entry in the table, the value of this object must be equal to the value in the 'atDNSServerIndexNext'.
atDNSServerAddrType	{ atDNSServerEntry 2 }	The Internet Address Type of the 'atDNSServerAddr' object. Can be one of the following: unknown (0) <ol style="list-style-type: none"> 1. ipv4 (1) - default 2. ipv6 (2) - not supported 3. ipv4z (3) - not supported 4. ipv6z (4) - not supported 5. dns (16) - not supported
atDNSServerAddr	{ atDNSServerEntry 3 }	The IP Address of the DNS Server. When a new entry is created, this object is set to the default of '0.0.0.0' { '00000000'h }. The management application will change this to the desired value using a SET operation.
atDNSServerStatus	{ atDNSServerEntry 4 }	The status of the current entry (row). Can be one of the following: <ol style="list-style-type: none"> 1. active (1) 2. createAndGo (4) 3. destroy (6) <p>To create a new entry the management application must set this object with value 'createAndGo (4)'. To delete an entry, the management application must set this object with value 'destroy (6)'. Once an entry is deleted, all subsequent entries in the table will be renumbered. The default is 1 (active)</p>

AT-NTP-MIB

This MIB contains objects for managing the Allied Telesis Network Time Protocol (NTP) configuration ([Table 96-19](#)). The objects reside in the module atNtp { modules 502 }, organized in the following groups:

- NTP Peer/Server Table - a table containing information on the Network Time Protocol (NTP) peers or server configurations in the system.
- Associations Table - a list of installed software; used also to remove software from the device.
- Status Table - Objects in this group are not supported.

Table 96-19: Objects defined in AT-NTP-MIB

Object	Object Identifier	Description
atNtp	{ modules 502 }	MIB containing objects for configuring NTP.
atNtpPeerIndexNext	{ atNtp 6 }	The next available index number to be used for object 'atNtpPeerIndex'.
atNtpPeerTable	{ atNtp 7 }	Table containing information on the Network Time Protocol (NTP) peers or server configurations in the system. Indexed by: <ul style="list-style-type: none"> ■ atNtpPeerIndex
atNtpPeerEntry	{ atNtpPeerTable 1 }	Information about a single NTP server or peer configuration.
atNtpPeerIndex	{ atNtpPeerEntry 1 }	The index number corresponding to a particular NTP server or peer configuration in the system. To create a new entry, the value of this object should be the same as that of the value of atNtpPeerIndexNext object, otherwise the entry creation will fail.
atNtpPeerNameAddr	{ atNtpPeerEntry 2 }	The host name, or the IP address of the NTP peer. When a new row (entry) is created, this object is set with a default of '0.0.0.0', and the management application should change it to a desired value by using a SET operation.
atNtpPeerMode	{ atNtpPeerEntry 3 }	The mode of the peer. Can be one of the following: <ul style="list-style-type: none"> ■ server (1) ■ peer (2) - default
atNtpPeerPreference	{ atNtpPeerEntry 4 }	The values in this object specifies whether this peer is the preferred one. Valid values are 0 to 2: <ul style="list-style-type: none"> ■ 0 - unknown - default ■ 1 - not preferred ■ 2 - preferred When the value is 'not preferred' (1) NTP chooses the peer with which to synchronize the time on the local system. If the object is set to 'preferred' (2) NTP will choose the corresponding peer to synchronize the time with.

Table 96-19: Objects defined in AT-NTP-MIB(cont.)

Object	Object Identifier	Description
atNtpPeerVersion	{ atNtpPeerEntry 5 }	The NTP version the peer supports. Can be one of the following: <ul style="list-style-type: none"> ■ 0 - unknown - default ■ 1 - version 1 ■ 2 - version 2 ■ 3 - version 3 ■ 4 - version 4
atNtpPeerKeyNumber	{ atNtpPeerEntry 6 }	The authentication key number. Default number is 0.
atNtpPeerRow Status	{ atNtpPeerEntry 7 }	The current status of this peer entry. The following values may be returned when reading this object: <ul style="list-style-type: none"> ■ active (1) - this value is returned on reading of this entry. ■ createAndGo (4) - this value is set by the management application when creating a new entry ■ destroy (6) - value set by the management application when deleting the entry. When an entry is deleted, all subsequent entries in the table will be re-indexed.
atNtpAssociationTable	{ atNtp 10 }	Table containing information on the Network Time Protocol (NTP) associations. Indexed by: <ul style="list-style-type: none"> ■ atNtpAssociationIndex
atNtpAssociationEntry	{ atNtpAssociationTable 1 }	Information about a single NTP server or peer configuration.
atNtpAssociationIndex	{ atNtpAssociationEntry 1 }	The index number corresponding to a particular NTP server or peer configuration in the system. To create a new entry, the value of this object should be the same as that of the value of atNtpPeerIndexNext object, otherwise the entry creation will fail.
atNtpAssociationPeerAddr	{ atNtpAssociationEntry 2 }	The host name, or the IP address of the NTP peer. When a new row (entry) is created, this object is set with a default of '0.0.0.0', and the management application should change it to a desired value by using a SET operation.
atNtpAssociationStatus	{ atNtpAssociationEntry 3 }	The status of this association. Can be one of the following: <ul style="list-style-type: none"> ■ master (synced) ■ master (unsynced) ■ selected ■ candidate ■ configured ■ unknown
atNtpAssociationConfigured	{ atNtpAssociationEntry 4 }	The value in this object specifies whether the association is from configuration or not. Value can be: <ul style="list-style-type: none"> ■ configured ■ dynamic
atNtpAssociationRefClkAddr	{ atNtpAssociationEntry 5 }	The IP Address for the reference clock.

Table 96-19: Objects defined in AT-NTP-MIB(cont.)

Object	Object Identifier	Description
atNtpAssociationStratum	{ atNtpAssociationEntry 6 }	The stratum of the peer clock.
atNtpAssociationPoll	{ atNtpAssociationEntry 7 }	The time between NTP requests from the device to the server, in seconds.
atNtpAssociationReach	{ atNtpAssociationEntry 8 }	An integer that indicates the reachability status of the peer.
atNtpAssociationDelay	{ atNtpAssociationEntry 9 }	The round trip delay between the device and the server.
atNtpAssociationOffset	{ atNtpAssociationEntry 10 }	The difference between the device clock and the server clock.
atNtpAssociationDisp	{ atNtpAssociationEntry 11 }	The lowest measure of error associated with peer offset, based on delay, in seconds.
atNtpStatus	{ atNtp 11 }	Group of objects containing system status information. The objects in this group are not supported.
atNtpSysClockSync	{ atNtpStatus 1 }	Not supported.
atNtpSysStratum	{ atNtpStatus 2 }	Not supported.
atNtpSysReference	{ atNtpStatus 3 }	Not supported.
atNtpSysFrequency	{ atNtpStatus 4 }	Not supported.
atNtpSysPrecision	{ atNtpStatus 5 }	Not supported.
atNtpSysRefTime	{ atNtpStatus 6 }	Not supported.
atNtpSysClkOffset	{ atNtpStatus 7 }	Not supported.
atNtpSysRootDelay	{ atNtpStatus 8 }	Not supported.
atNtpSysRootDisp	{ atNtpStatus 9 }	Not supported.

AT-EPSRv2-MIB

The EPSRv2 Group-MIB defines objects for managing Epsrv2 objects and triggers (Figure 96-4, Table 96-20). Objects in this group have the object identifier Epsrv2 ({ modules 536 }).

Figure 96-4: The AT-EPSRv2 MIB sub-tree

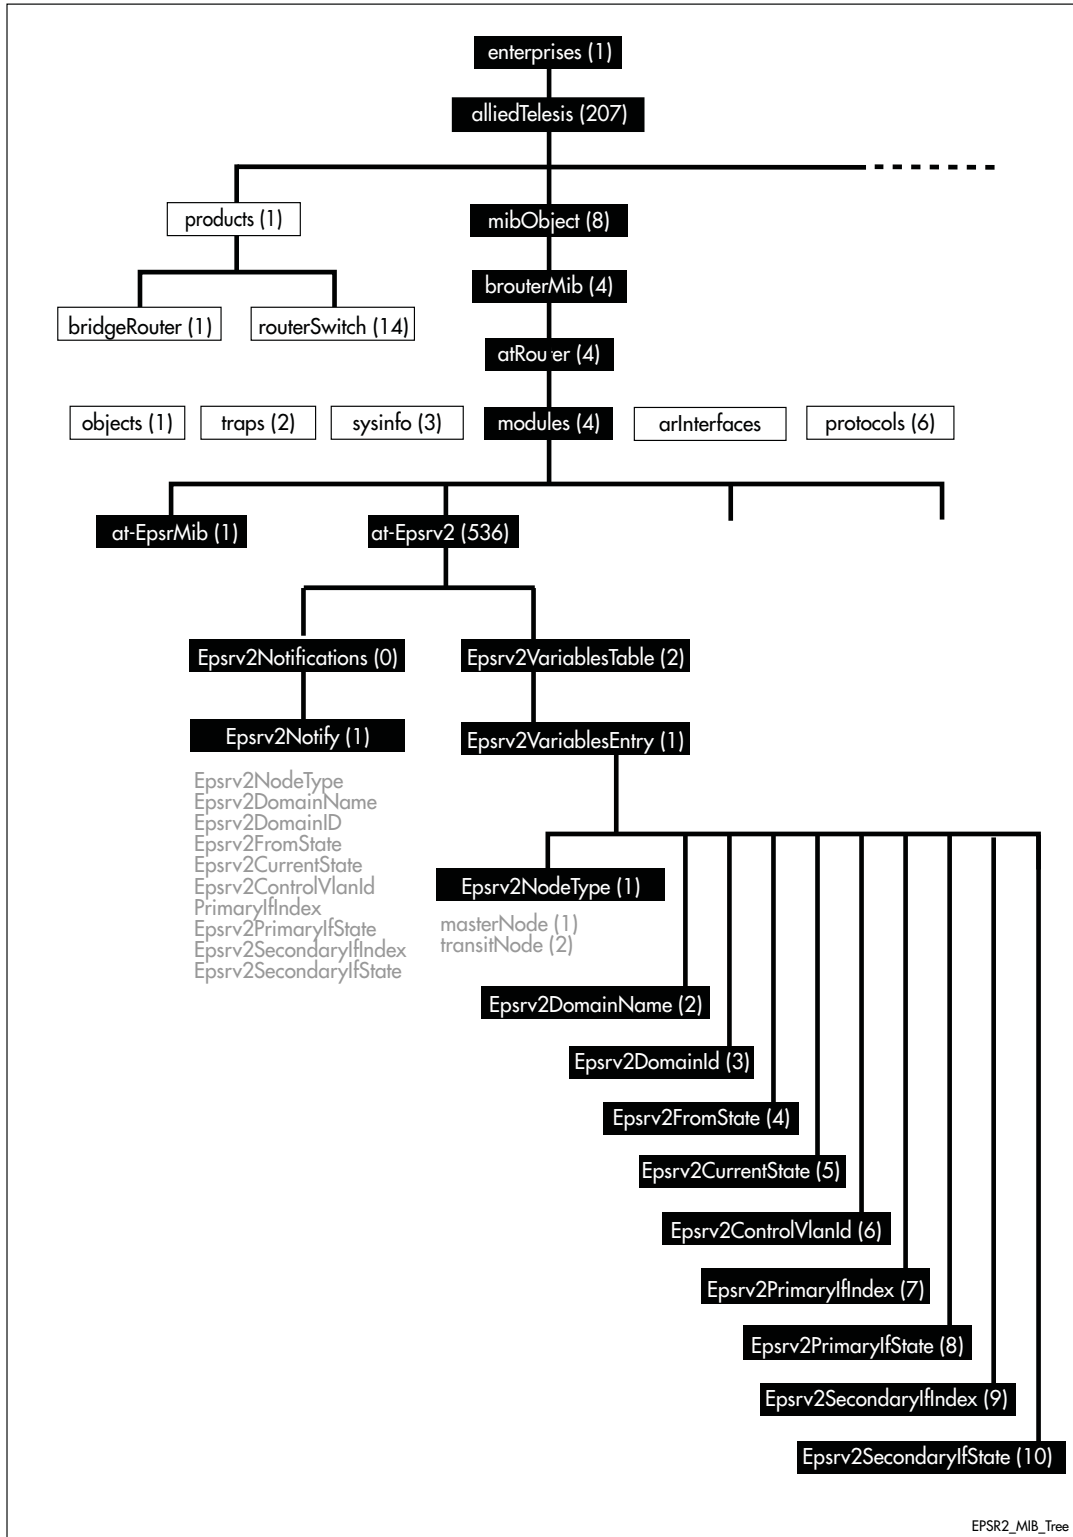

Table 96-20: atEpsrv2Objects Defined in the AT-EPSRV2 MIB

Object	Object Identifier	Description
{ at-Epsrv2 }	{ modules 536 }	The root of the Epsrv2 object sub tree.
{ atEpsrv2Notifications }	{ at-Epsrv2 0 }	
{ atEpsrv2Notify }	{ atEpsrv2Notifications 1 }	EPSR Master/Transit node state transition trap. Note that there is a one to one relationship between nodes and domains.
{ Epsrv2NodeType }	{ atEpsrv2VariablesEntry 1 }	The EPSR node type: either master or transit.
{ atEpsrv2DomainName }	{ atEpsrv2VariablesEntry 2 }	The name of the EPSR domain.
{ atEpsrv2DomainID }	{ atEpsrv2VariablesEntry 3 }	The ID of the EPSR domain.
{ Epsrv2FromState }	{ atEpsrv2VariablesEntry 4 }	The previous state of the EPSR domain
{ Epsrv2Current State }	{ atEpsrv2VariablesEntry 5 }	The current state of the EPSR domain.
{ Epsrv2ControlVlanId }	{ atEpsrv2VariablesEntry 6 }	The VLAN identifier for the control VLAN.
{ Epsrv2PrimaryIfIndex }	{ atEpsrv2VariablesEntry 7 }	The IfIndex of the primary interface.
{ atEpsrv2PrimaryIfState }	{ atEpsrv2VariablesEntry 8 }	The current state of the primary interface.
{ atEpsrv2SecondaryIfIndex }	{ atEpsrv2VariablesEntry 9 }	The IfIndex of the secondary interface.
{ atEpsrv2SecondaryIfState }	{ atEpsrv2VariablesEntry 10 }	The state of the secondary interface.
{ atEpsrv2VariablesTable }	{ at-Epsrv2 2 }	The enterprise Epsrv2VariablesTable.
{ atEpsrv2VariablesEntry }	{ atEpsrv2VariablesTable 1 }	Contains entries within the enterprise atEpsrv2VariablesTable.
{ atEpsrv2NodeType }	{ atEpsrv2VariablesEntry 1 }	The EPSR domain node type: either 1. master (1) 2. transit (2)
{ atEpsrv2DomainName }	{ Epsrv2NodeType 2 }	The name of the EPSR domain.
{ atEpsrv2DomainID }	{ Epsrv2NodeType 3 }	The ID of the EPSR domain.
{ atEpsrv2FromState }	{ Epsrv2NodeType 4 }	The previous state of the EPSR domain
{ atEpsrv2Current State }	{ Epsrv2NodeType 5 }	The current state of the EPSR domain.
{ atEpsrv2ControlVlanId }	{ Epsrv2NodeType 6 }	The VLAN identifier for the control VLAN.
{ Epsrv2PrimaryIfIndex }	{ Epsrv2NodeType 7 }	The IfIndex of the primary interface.
{ atEpsrv2PrimaryIfState }	{ Epsrv2NodeType 8 }	The current state of the primary interface.
{ atEpsrv2SecondaryIfIndex }	{ Epsrv2NodeType 9 }	The IfIndex of the secondary interface.
{ atEpsrv2SecondaryIfState }	{ Epsrv2NodeType 10 }	The state of the secondary interface.
TEXTUAL CONVENTIONS		
{ atEpsrv2NodeState }		The trap states that can be advertised for an EPSR domain node. The following states are defined: 1. idle (1) 2. complete (2) 3. failed (3) 4. linksUp (4) 5. linksDown (5) 6. preForward (6) 7. unknown (7)

Table 96-20: atEpsrv2Objects Defined in the AT-EPSRV2 MIB(cont.)

Object	Object Identifier	Description
{ atEpsrv2InterfaceState }		The trap states that can be advertised for an EPSR interface. The following states are defined: <ol style="list-style-type: none">1. unknown (1)2. down (2)3. blocked (3)4. forward (4)

AT-DHCPSN-MIB

This MIB contains objects for displaying and managing DHCP snooping and ARP security information on the switch. (Table 96-21). The objects reside in the module atDhcpsn { modules 537 }, organized in the following groups:

- The DHCP Snooping Events group (atDhcpsnEvents) contains notifications (traps)
- The DHCP Snooping table (atDhcpsnVariablesTable) contains DHCP snooping information
- The ARP Security table (atArpsecVariablesTable) contains ARP security information

Table 96-21: Objects defined in AT-DHCPSN-MIB

Object	Object Identifier	Description
atDhcpsn	{ modules 537 }	This MIB file contains definitions of managed objects for DHCP Snooping in AlliedWare Plus™.
atDhcpsnEvents	{ atDhcpsn 1 }	DHCP Snooping notifications (traps)
atDhcpsnTrap	{ atDhcpsnEvents 1 }	DHCP Snooping violation notification.
atArpsecTrap	{ atDhcpsnEvents 2 }	DHCP Snooping ARP Security violation notification.
atDhcpsnVariablesTable	{ atDhcpsn 1 }	The DHCP Snooping table. This table contains rows of DHCP Snooping information.
atDhcpsnVariablesEntry	{ atDhcpsnVariablesTable 1 }	A set of parameters that describe the DHCP Snooping features.
atDhcpsnIfIndex	{ atDhcpsnVariablesEntry 1 }	Ifindex of the port that the packet was received on.
atDhcpsnVid	{ atDhcpsnVariablesEntry 2 }	VLAN ID of the port that the packet was received on.
atDhcpsnSmac	{ atDhcpsnVariablesEntry 3 }	Source MAC address of the packet that caused the trap.
atDhcpsnOpcode	{ atDhcpsnVariablesEntry 4 }	Opcode value of the BOOTP packet that caused the trap. Only bootpRequest(1) or bootpReply(2) is valid.
atDhcpsnCiaddr	{ atDhcpsnVariablesEntry 5 }	Ciaddr value of the BOOTP packet that caused the trap.
atDhcpsnYiaddr	{ atDhcpsnVariablesEntry 6 }	Yiaddr value of the BOOTP packet that caused the trap.
atDhcpsnGiaddr	{ atDhcpsnVariablesEntry 7 }	Giaddr value of the BOOTP packet that caused the trap.
atDhcpsnSiaddr	{ atDhcpsnVariablesEntry 8 }	Siaddr value of the BOOTP packet that caused the trap.
atDhcpsnChaddr	{ atDhcpsnVariablesEntry 9 }	Chaddr value of the BOOTP packet that caused the trap.

Table 96-21: Objects defined in AT-DHCPSN-MIB(cont.)

Object	Object Identifier	Description
atDhcpsnVioType	{ atDhcpsnVariablesEntry 10 }	<p>The reason that the trap was generated.</p> <ul style="list-style-type: none"> ■ invalidBootp(1) indicates that the received BOOTP packet was invalid. For example, it is neither BootpRequest nor BootpReply. ■ invalidDhcpAck(2) indicates that the received DHCP ACK was invalid. ■ invalidDhcpRelDec(3) indicates the DHCP Release or Decline was invalid. ■ invalidIp(4) indicates that the received IP packet was invalid. ■ maxBindExceeded(5) indicates that if the entry was added, the maximum bindings configured for the port would be exceeded. ■ opt82InsertErr(6) indicates that the insertion of Option 82 failed. ■ opt82RxInvalid(7) indicates that the received Option 82 information was invalid. ■ opt82RxUntrusted(8) indicates that Option 82 information was received on an untrusted port. ■ opt82TxUntrusted(9) indicates that Option 82 would have been transmitted out an untrusted port. ■ replyRxUntrusted(10) indicates that a BOOTP Reply was received on an untrusted port. ■ srcMacChaddrMismatch(11) indicates that the source MAC address of the packet did not match the BOOTP CHADDR of the packet. ■ staticEntryExisted(12) indicates that the static entry to be added already exists. ■ dbAddErr(13) indicates that adding an entry to the database failed.
atArpsecVariablesTable	{ atDhcpsn 2 }	The ARP Security table. This table contains rows of DHCP Snooping ARP Security information.
atArpsecVariablesEntry	{ atArpsecVariablesTable 1 }	A set of parameters that describe the DHCP Snooping ARP Security features.
atArpsecIfIndex	{ atArpsecVariablesEntry 1 }	Ifindex of the port that the ARP packet was received on.
atArpsecClientIP	{ atArpsecVariablesEntry 2 }	Source IP address of the ARP packet.
atArpsecSrcMac	{ atArpsecVariablesEntry 3 }	Source MAC address of the ARP packet.
atArpsecVid	{ atArpsecVariablesEntry 4 }	VLAN ID of the port that the ARP packet was received on.

Table 96-21: Objects defined in AT-DHCP SN-MIB(cont.)

Object	Object Identifier	Description
atArpsecVioType	{ atArpsecVariablesEntry 5 }	<p>The reason that the trap was generated.</p> <ul style="list-style-type: none"> ■ srclpNotFound(1) indicates that the Sender IP address of the ARP packet was not found in the DHCP Snooping database. ■ badVLAN(2) indicates that the VLAN of the DHCP Snooping binding entry associated with the Sender IP address of the ARP packet does not match the VLAN that the ARP packet was received on. ■ badPort(3) indicates that the port of the DHCP Snooping binding entry associated with the Sender IP address of the ARP packet does not match the port that the ARP packet was received on. ■ srclpNotAllocated(4) indicates that the CHADDR of the DHCP Snooping binding entry associated with the Sender IP address of the ARP packet does not match the Source MAC and/or the ARP source MAC of the ARP packet.

AT-FILEv2-MIB

This MIB contains objects for displaying and managing file content of Flash, USB storage devices and NVS, and copying, moving and deleting files from local and remote sources (**Table 96-22**).

The objects reside in the module atFilev2 { modules 600 }, organized in the following groups:

- The file operation devices - object for various devices supported for file operations
- The File Info Table - information about all files, including pathnames, that are present on the device
- The USB storage device table - information about the USB storage device configured on the device

The procedure in **“Copy a File to or from a TFTP Server” on page 94.20** shows how to use these MIB objects to upgrade to a new software version and boot configuration file.

Table 96-22: Objects defined in AT-FILEv2-MIB

Object	Object Identifier	Description
atFilev2	{ modules 600 }	MIB containing objects for listing and managing files.
atFilev2FileOperation	{ atFilev2 3 }	Collection of file operation objects available for configuration, to enable copying, moving and deleting files.
atFilev2SourceStackID	{ atFilev2Operation 1 }	Specifies the Stack ID of the source file. Set an integer corresponding to the stack ID of the stack member to use as the source. For devices that are not capable of being stacked, set with the value 1. This value is ignored if the source device is set to TFTP.
atFilev2SourceDevice	{ atFilev2Operation 2 }	<p>Specifies the source device for the file to be copied. Valid values are 1 to 5. Set a value that corresponds with the various devices, as below:</p> <ul style="list-style-type: none"> ■ 1 - Flash - default ■ 2 - Card - not supported ■ 3 - NVS ■ 4 - TFTP ■ 5 - USB <p>For copying files, you may use any combination of devices for the source and destination, except for copying from TFTP to TFTP.</p> <p>For moving files you cannot use TFTP as source or destination.</p> <p>For deleting files, the source cannot be TFTP.</p> <p>You must fully configure all required parameters before an operation can commence. Where a TFTP operation is configured, an IP address must also be set via atFilev2TftpIPAddr.</p> <p>To copy a file from TFTP to Flash, use 4 for source and 1 for destination.</p>

Table 96-22: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2SourceFilename	{ atFilev2Operation 3 }	<p>Specifies the filename of the source file to copy, move or delete. Include any path as required, but the storage type is not necessary.</p> <p>For example, to copy the file <code>latest.cfg</code> from the <code>backupconfigs/routers</code> directory on the TFTP server, you would set: <code>backupconfigs/routers/latest.cfg</code></p>
atFilev2DestinationStackID	{ atFilev2Operation 4 }	<p>Specifies the Stack ID for the destination file. For devices that are not capable of being stacked, set with the value 1. This value is ignored if the destination device is set to TFTP, or if a deletion operation is carried out.</p>
atFilev2DestinationDevice	{ atFilev2Operation 5 }	<p>Specifies the destination device for the files to be copied into. Valid values are 1 to 5. Set a value that corresponds with the various devices, as below:</p> <ul style="list-style-type: none"> ■ 1 - Flash - default ■ 2 - Card - not supported ■ 3 - NVS ■ 4 - TFTP ■ 5 - USB <p>For copying files, you may use any combination of devices for the source and destination, except for copying from TFTP to TFTP.</p> <p>For moving files you cannot use TFTP as source or destination.</p> <p>For deleting files, this object is ignored.</p> <p>You must fully configure all required parameters before an operation can commence. Where a TFTP operation is configured, an IP address must also be set via <code>atFilev2TftpIPAddr</code>.</p> <p>To copy a file from TFTP to Flash, use 4 for source and 1 for destination.</p>
atFilev2DestinationFilename	{ atFilev2Operation 6 }	<p>Specifies the destination filename of the file to be copied or moved. Include any path as required, but the storage type is not necessary.</p> <p>The destination filename does not need to be the same as the source filename, and this object is ignored for file deletion operations.</p> <p>For example, to copy a release file from the TFTP server to the backup release directory on Flash, you would set: <code>backuprelease/latest.rel</code></p> <p>Note: If the destination is set to Flash, card or NVS, any file at the destination that shares the destination filename will be overwritten by a move or copy operation.</p>

Table 96-22: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2CopyBegin	{ atFilev2Operation 7 }	<p>Represents the status of the copy file operation, in the form of octet string.</p> <p>A read on this object can return several possible values, depending on the current status of the system and the various file operation objects:</p> <ul style="list-style-type: none"> ■ idle - There is no file operation in progress and all required objects have been set correctly. Setting a '1' to this object will begin the file copy. ■ Error codes: [1-7] - A copy operation cannot be started until these errors are resolved. See below for key. ■ [action]ing x [--> y] - A file operation is currently in progress. You cannot start another operation while the object is returning this value. ■ [action] x [--> y] success - The last copy, move or delete operation was successfully completed. ■ [action] x [--> y] failure: [err] - The last copy, move or delete operation failed, with the error message attached. Common failures include lack of space on the destination file system, incorrect source file names or communication errors with remote services. <p>Upon reading a success or failure message, the message will be cleared and the next read will result in either an 'idle' message or an 'Error codes' message if not all required objects have been correctly set. If the read returned 'idle', a new file operation can now be started.</p> <p>Following are possible values returned as Error codes for file copy:</p> <ul style="list-style-type: none"> ■ 1 - atFilev2SourceDevice has not been set ■ 2 - atFilev2SourceFilename has not been set ■ 3 - atFilev2DestinationDevice has not been set ■ 4 - atFilev2DestinationFilename has not been set ■ 5 - atFilev2SourceDevice and atFilev2DestinationDevice are both set to TFTP ■ 6 - the combination of source device, stackID and filename is the same as the destination device, stackID and filename (i.e. it is not valid to copy a file onto itself. ■ 7 - TFTP IP address has not been set and TFTP has been set for one of the devices <p>Provided all above requirements are met, immediately upon executing the SNMP set, the device will indicate that it was a success. The actual file copy itself will be started and continue on the device until it has completed. For large files, operations can take several minutes to complete.</p> <p>Subsequent reads of the object will return one of messages shown in the first table, to allow for tracking of the progress of the copy operation.</p>

Table 96-22: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2MoveBegin	{ atFilev2Operation 8 }	<p>Represents the status of the move file operation, in the form of octet string.</p> <p>A read on this object can return several possible values, depending on the current status of the system and the various file operation objects:</p> <ul style="list-style-type: none"> ■ idle - There is no file operation in progress and all required objects have been set correctly. Setting a '1' to this object will begin the file move. ■ Error codes: [1-6] - A move operation cannot be started until these errors are resolved. See below for key. ■ [action]ing x [--> y] - A file operation is currently in progress. You cannot start another operation while the object is returning this value. ■ [action] x [--> y] success - The last copy, move or delete operation was successfully completed. ■ [action] x [--> y] failure: [err] - The last copy, move or delete operation failed, with the error message attached. Common failures include lack of space on the destination file system, incorrect source file names or communication errors with remote services. <p>Upon reading a success or failure message, the message will be cleared and the next read will result in either an 'idle' message or an 'Error codes' message if not all required objects have been correctly set. If the read returned 'idle', a new file operation can now be started.</p> <p>Following are possible values returned as Error codes for file move:</p> <ul style="list-style-type: none"> ■ 1 - atFilev2SourceDevice has not been set ■ 2 - atFilev2SourceFilename has not been set ■ 3 - atFilev2DestinationDevice has not been set ■ 4 - atFilev2DestinationFilename has not been set ■ 5 - either atFilev2SourceDevice or atFilev2DestinationDevice are set to TFTP ■ 6 - the combination of source device, stackID and filename is the same as the destination device, stackID and filename (i.e. it is not valid to move a file onto itself). <p>Provided all above requirements are met, immediately upon executing the SNMP set, the device will indicate that it was a success. The actual file move itself will be started and continue on the device until it has completed. For large files, operations can take several minutes to complete.</p> <p>Subsequent reads of the object will return one of messages shown in the first table, to allow for tracking of the progress of the move operation.</p>

Table 96-22: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2DeleteBegin	{ atFilev2Operation 9 }	<p>Represents the status of the delete file operation, in the form of octet string.</p> <p>A read on this object can return several possible values, depending on the current status of the system and the various file operation objects:</p> <ul style="list-style-type: none"> ■ idle - There is no file operation in progress and all required objects have been set correctly. Setting a '1' to this object will begin the file deletion. ■ Error codes: [1-3] - A delete operation cannot be started until these errors are resolved. See below for key. ■ [action]ing x [--> y] - A file operation is currently in progress. You cannot start another operation while the object is returning this value. ■ [action] x [--> y] success - The last copy, move or delete operation was successfully completed. ■ [action] x [--> y] failure: [err] - The last copy, move or delete operation failed, with the error message attached. Common failures include lack of space on the destination file system, incorrect source file names or communication errors with remote services. <p>Upon reading a success or failure message, the message will be cleared and the next read will result in either an 'idle' message or an 'Error codes' message if not all required objects have been correctly set. If the read returned 'idle', a new file operation can be started.</p> <p>File deletion operations ignore the values set in the atFilev2DestinationStackID, atFilev2DestinationDevice and atFilev2DestinationFilename objects.</p> <p>The file deletion operation is equivalent to the CLI 'delete force [file]' command, so it is possible to delete any normally-protected system files, such as the currently configured boot release.</p> <p>Following are possible values returned as Error codes for file move:</p> <ul style="list-style-type: none"> ■ 1 - atFilev2SourceDevice has not been set ■ 2 - atFilev2SourceFilename has not been set ■ 3 - atFilev2SourceDevice has not been set to TFTP <p>Provided all above requirements are met, immediately upon executing the SNMP set, the device will indicate that it was a success. The actual file move itself will be started and continue on the device until it has completed. For large files, operations can take several minutes to complete.</p> <p>Subsequent reads of the object will return one of messages shown in the first table, to allow for tracking of the progress of the move operation.</p>
atFilev2Flash_1	{ atFilev2Operation 10 }	Represents the Flash operation device object
atFilev2Card_2	{ atFilev2Operation 11 }	Represents the Card operation device object
atFilev2Nvs_3	{ atFilev2Operation 12 }	Represents the NVS operation device object
atFilev2Tftp_4	{ atFilev2Operation 13 }	Represents the TFTP operation device object

Table 96-22: Objects defined in AT-FILEv2-MIB(cont.)

Object(cont.)	Object Identifier	Description
atFilev2TftpIPAddr	{ atFilev2Tftp_4 1 }	The IP address of the TFTP server that is to be used for the file copy process. This IP Address needs to be reachable from the device, or the file copy will fail.
atFilev2Usb	{ atFilev2Operation 15 }	Represents the USB storage device operation device object.
atFilev2InfoTable	{ atFilev2 5 }	A list of all files, including pathnames, that are present on the device. Hidden system files are not displayed.
atFilev2InfoEntry	{ atFilev2InfoTable 1 }	An entry in the list of files, containing information about a single file.
atFilev2InfoFilepath	{ atFilev2InfoEntry 1 }	The full path and name of the file. Files are sorted in alphabetical order and any filepath that is longer than 112 characters will not be displayed due to SNMP Object Identifier length limitations.
atFilev2InfoFileSize	{ atFilev2InfoEntry 2 }	The size of the file in bytes.
atFilev2InfoFileCreationTime	{ atFilev2InfoEntry 3 }	File creation time in the form <MMM DD YYYY HH:MM:SS>. For example, Sep 7 2008 06:07:54.
atFilev2InfoFileIsDirectory	{ atFilev2InfoEntry 4 }	This object will return the value TRUE if the entry is a directory, or FALSE if it is not.
atFilev2InfoFileIsReadable	{ atFilev2InfoEntry 5 }	This object will return the value TRUE if the file is readable, or FALSE if it is not.
atFilev2InfoFileIsWritable	{ atFilev2InfoEntry 6 }	This object will return the value TRUE if the file is writable, or FALSE if it is not.
atFilev2InfoFileIsExecutable	{ atFilev2InfoEntry 7 }	This object will return the value TRUE if the file is executable, or FALSE if it is not.
atFilev2USBMediaTable	{ atFilev2 6 }	The USB storage device table, containing information related to USB storage devices.
atFilev2USBMediaEntry	{ atFilev2USBMediaTable 1 }	Data pertaining to a USB storage device instance.
atFilev2USBMediaStackMemberId	{ atFilev2USBMediaEntry 1 }	The index of the stack member hosting this USB media. For devices that are not capable of being stacked, this object will always return the value 1.
atFilev2USBMediaPresence	{ atFilev2USBMediaEntry 2 }	This object indicates whether or not a USB storage device is inserted in a slot. Possible values are: <ul style="list-style-type: none"> ■ notPresent (1) ■ present (2)

AT-LOG-MIB

The AT Log MIB contains objects for listing log entries from the buffered and permanent logs (**Table 96-23**). The objects reside in the module log { modules 601 }, organized in the following groups:

- Log Table - objects containing the information from log messages issued by the system, ordered from oldest to newest entry
- Log Options - contains objects used to set up the log options configuration

Table 96-23: Objects defined in AT-LOG-MIB

Object	Object Identifier	Description
log	{ modules 601 }	MIB containing objects for listing log entries from the buffered and permanent logs.
logTable	{ log 1 }	A list of log entries from the source specified in the 'logSource' object. The list is ordered from oldest entry to newest entry. Indexed by: <ul style="list-style-type: none"> ■ logIndex
logEntry	{ logTable 1 }	Information about a single log entry, from the source specified in the 'logSource' object.
logIndex	{ logEntry 1 }	An index integer. This index is not directly tied to any specific log entry. Over time, the log will grow larger and eventually older entries will be removed from the log.
logDate	{ logEntry 2 }	The date of the log entry. Data resides in the format octet string, in the form YYYY MMM DD, e.g. 2008 Oct 9.
logTime	{ logEntry 3 }	The time of the log entry. Data resides in the format octet string, in the form HH:MM:SS, e.g. 07:15:04.
logFacility	{ logEntry 4 }	The syslog facility that generated the log entry, in the format octet string. See the reference manual for more information.
logSeverity	{ logEntry 5 }	The severity level of the log entry, in the format octet string. Severities are given below: <ul style="list-style-type: none"> ■ emerg Emergency, system is unusable ■ alert Action must be taken immediately ■ crit Critical conditions ■ errr Error conditions ■ warning Warning conditions ■ notice Normal, but significant, conditions ■ info Informational messages ■ debug Debug-level messages
logProgram	{ logEntry 6 }	The program that generated the log entry, in the format octet string. See the reference manual for more information.
logMessage	{ logEntry 7 }	The message of the log entry, in the format octet string.
logOptions	{ log 2 }	Contains objects used to set up the required log options configuration.

Table 96-23: Objects defined in AT-LOG-MIB(cont.)

Object	Object Identifier	Description
logSource	{ logOptions 1 }	<p>An integer indicating the source from which the log entries are retrieved. The valid values are:</p> <ul style="list-style-type: none"> ■ 1 - Buffered log (default) ■ 2 - Permanent log. <p>This information is used when retrieving the logTable objects, and also specifies the log to be cleared when the 'clearLog' object is set.</p>
logAll	{ logOptions 2 }	<p>An integer indicating whether to display all log entries in the logTable objects, or not. The valid values are:</p> <ul style="list-style-type: none"> ■ 0 - to display only the most recent log messages. This is the default ■ 1 - to show all available log entries. <p>Note: Choosing to display all log entries may result in delays of several seconds when accessing the logTable objects.</p>
clearLog	{ logOptions 3 }	<p>An integer indicating whether to clear the log that is specified by the 'logSource' object. Valid values are:</p> <ul style="list-style-type: none"> ■ 0 - do not clear log ■ 1 - clear log

AT-IP-MIB

This MIB contains objects for Allied Telesis specific IP address management ([Table 96-24](#)). The objects reside in the module atIpMib { modules 602 }.

Table 96-24: Objects defined in AT-IP-MIB

Object	Object Identifier	Description
atIpMib	{ modules 602 }	MIB containing objects for IP addressing management.
AtIpAddressAssignmentType	Textual Convention	Object containing conditional coded values for the IP address assignment type being applied to the interface, referred to by objects in this MIB. The possible values and explanation are: <ul style="list-style-type: none"> ■ notSet (0) - indicates that the IP address assignment type has not yet been configured. This value can only ever be read. ■ primary (1) - indicates that the address is a primary IP address; only one primary address is allowed per interface. ■ secondary (2) - indicates that the address is a secondary IP address; any number of secondary IP addresses may be applied
AtIpAddressTable	{ atIpMib 1 }	A table containing mappings between primary or secondary IP addresses, and the interfaces they are assigned to. Indexed by: <ul style="list-style-type: none"> ■ atIpAddressAddrType ■ atIpAddressAddr
AtIpAddressEntry	{ AtIpAddressTable 1 }	Information about the address mapping for a particular interface.
atIpAddressAddrType	{ AtIpAddressEntry 1 }	An indication of the IP version of 'atIpAddressAddr'
atIpAddressAddr	{ AtIpAddressEntry 2 }	The IP address to which this entry's addressing information pertains. The address type of this object is specified in object 'atIpAddressAddrType'.
atIpAddressPrefixLen	{ AtIpAddressEntry 3 }	An integer, specifying the prefix length of the IP address represented by this entry.
atIpAddressLabel	{ AtIpAddressEntry 4 }	The name assigned to the IP address represented by this entry.
atIpAddressIfIndex	{ AtIpAddressEntry 5 }	The index value that uniquely identifies the interface to which this entry is applicable. The interface identified by a particular value of this index corresponds to the interface identified by the same value of the IF-MIB's ifIndex.
atIpAddressAssignmentType	{ AtIpAddressEntry 6 }	The IP address assignment type for this entry (primary or secondary), as described in the Textual Convention 'AtIpAddressAssignmentType'.

Table 96-24: Objects defined in AT-IP-MIB(cont.)

Object	Object Identifier	Description
atIpAddressRowStatus	{ AtIpAddressEntry 7 }	<p>The current status of the IP address entry. The following values may be returned when reading this object:</p> <ul style="list-style-type: none"> ■ active (1) The IP address is currently mapped to an interface and is valid. ■ notReady (3) The IP address is currently partially configured and is not mapped to an interface. <p>The following values may be written to this object:</p> <ul style="list-style-type: none"> ■ active (1) An attempt will be made to map the IP address to the configured interface. ■ createAndWait (5) An attempt will be made to create a new IP address entry. ■ destroy (6) The IP address setting will be removed from the device. <p>An entry cannot be made active until its atIpAddressPrefixLen, atIpAddressIfIndex and atIpAddressAssignmentType objects have been set to valid values.</p>

AT-VLANINFO-MIB

The atVlanStatistics-MIB (**Figure 96-2**, and **Table 96-16**) defines objects for managing VLANs. The MIB contains a sub tree for managing VLAN statistics. Objects in the VLAN Statistics sub-tree have the object identifier ({atVlanInfo 1}).

Figure 96-5: The atVlanStatistics MIB tree

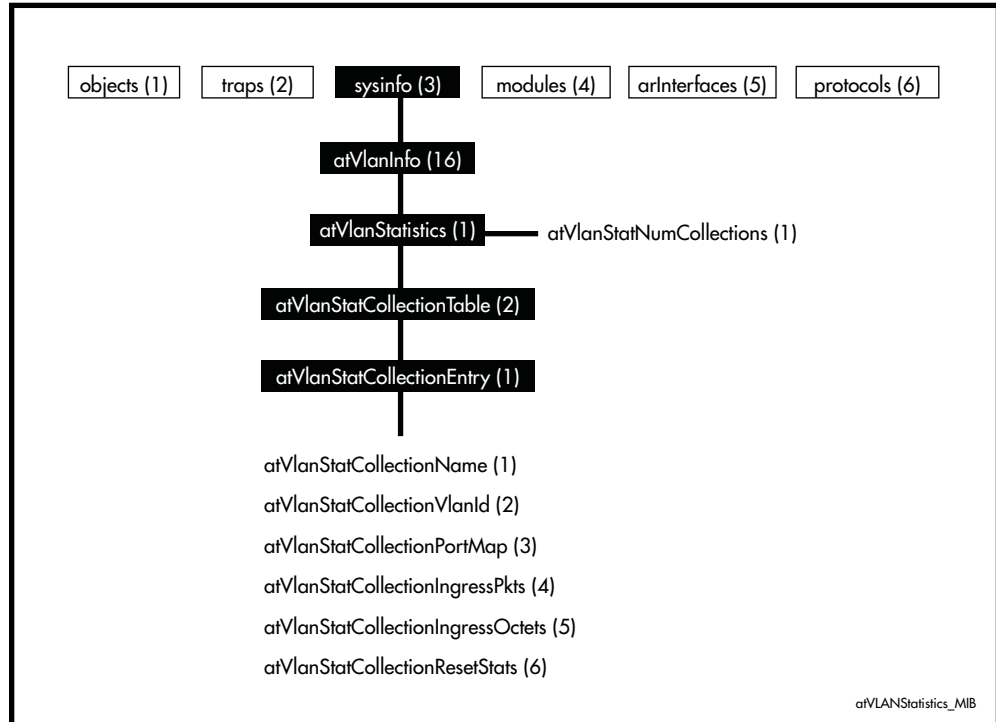

Table 96-25: AT Enterprise MIB - High Level Structure

Object	Description
vlaninfo {sysinfo 16}	Root of the Allied Telesis Enterprise MIB under the private(4) node defined in RFC 1155-SMI.
atVlanStatistics {vlaninfo 1}	The number of unique VLAN statistic gathering instances defined on the device.
atVlanStatNumCollections {atVlanStatistics 1}	The number of unique VLAN statistic gathering instances defined on the device.
atVlanStatCollectionTable {atVlanStatistics 2}	A table of VLAN statistic instances.
atVlanStatCollectionEntry {atVlanStatCollectionTable 1}	Each entry represents a unique VLAN statistic gathering instance defined on the device. Sequences are:
atVlanStatCollectionName {atVlanStatCollectionEntry 1}	The name of a VLAN statistics collection instance.
atVlanStatCollectionVlanId {atVlanStatCollectionEntry 2}	The VLAN ID of ingress packets being monitored by this VLAN statistics collection instance.

Table 96-25: AT Enterprise MIB - High Level Structure(cont.)

Object	Description
atVlanStatCollectionPortMap {atVlanStatCollectionEntry 3}	A bitwise port map indicating the switch ports being monitored by this VLAN statistics collection instance. The bit position within the string, maps to the port with the same index in dot1dBasePortTable in BRIDGE-MIB. A binary '1' indicates that the port is being monitored by this VLAN statistics collection instance, with a '0' indicating that it is not.
atVlanStatCollectionIngressPkts {atVlanStatCollectionEntry 4}	The number of ingress packets received and counted by this VLAN statistics collection instance.
atVlanStatCollectionIngressOctets {atVlanStatCollectionEntry 5}	The number of octets of data received from ingress packets counted by this VLAN statistics collection instance.
atVlanStatCollectionResetStats {atVlanStatCollectionEntry 6}	When read, this object will always return 2 (false). Setting its value to 1 (true) will cause the matching VLAN statistics collection instance's ingress packets and ingress octet values to be reset to zero.

Public MIBs

The following table lists the public MIBs supported by the AlliedWare Plus™ Operating System. In general, all objects are supported except where the relevant protocol or feature is either not supported or not applicable to the device. Any variations from the standard are listed.

Table 96-26: Public MIBs Supported by AlliedWare Plus™

MIB Name	Reference / Implementation
IANAifType-MIB	www.iana.org/assignments/ianaiftype-mib , IANAifType textual convention.
RFC1155-SMI	RFC 1155, <i>Structure and Identification of Management Information for TCP/IP-based Internets</i> .
-	RFC 1212, <i>Concise MIB Definitions</i> .
RFC1213-MIB	See IP-MIB.
-	RFC 1215, <i>A Convention for Defining Traps for use with the SNMP</i> .
-	RFC 1239, <i>Reassignment of Experimental MIBs to Standard MIBs</i> .
IP-MIB	<p>The IP MIB tree encompasses IP-MIB, RFC1213-MIB and IP-FORWARD-MIB definitions. The following documents define the components:</p> <ul style="list-style-type: none"> ■ RFC 1213, <i>Management Information Base for Network Management of TCP/IP-based internets: MIB-II</i> ■ RFC 4292, <i>IP Forwarding Table MIB</i> ■ RFC 4293, <i>Management Information Base for the Internet Protocol (IP)</i> <p>The following objects are supported:</p> <ul style="list-style-type: none"> ■ ipForwarding ■ ipDefaultTTL ■ All ipAddrTable objects except ipAdEntReasmMaxSize ■ All ipNetToPhysicalTable objects except ipNetToPhysicalRowStatus (all read-only) ■ ipCidrRouteNumber ■ All ipCidrRouteTable objects except ipCidrRouteTos <p>All other objects in these MIBs are not supported.</p> <p>Note that an Enterprise version of ipAddressTable objects is provided by atIpAddressTable in AT-IP-MIB. This provides equivalent functionality along with support for primary and secondary IP addresses.</p>

Configuring LLDP	97.11
Configure LLDP	97.12
Configure LLDP-MED	97.14
Configure Authentication for Voice VLAN	97.18

Introduction

This chapter describes the Link Layer Discovery Protocol (LLDP), LLDP for Media Endpoint Devices (LLDP-MED) and Voice VLAN, and general configuration information for these.

LLDP is designed to be managed with the Simple Network Management Protocol (SNMP), and SNMP-based Network Management Systems (NMS). LLDP can be configured, and the information it provides can be accessed, using either the command line interface or SNMP.

- For detailed descriptions of the commands used to configure LLDP and LLDP-MED, see [Chapter 98, LLDP Commands](#).
- For Voice VLAN commands, see [Chapter 17, VLAN Commands](#).
- For information about the LLDP and LLDP-MED MIBs, see [“Public MIBs” on page 96.74](#).

Link Layer Discovery Protocol

Link Layer Discovery Protocol (LLDP) is a Layer 2 protocol defined by the *IEEE Standard 802.1AB-2005*. This switch supports LLDP as specified in this standard, including *Annex F* and *Annex G*.

LLDP enables Ethernet network devices, such as switches and routers, to transmit and/or receive device-related information to or from directly connected devices on the network, and to store such information learned about other devices. The data sent and received by LLDP is useful for many reasons. The switch can discover neighbors—other devices directly connected to it. Devices can use LLDP to advertise some parts of their Layer 2 configuration to their neighbors, enabling some kinds of misconfiguration to be more easily detected and corrected.

LLDP is a link level (“one hop”) protocol; LLDP information can only be sent to and received from devices that are directly connected to each other, or connected via a hub or repeater. Advertised information is not forwarded on to other devices on the network.

The information transmitted in LLDP advertisements flows in one direction only, from one device to its neighbors, and the communication ends there. Transmitted advertisements do not solicit responses, and received advertisements do not solicit acknowledgement.

LLDP operates over physical ports (Layer 2) only. For example, it can be configured on switch ports that belong to static or dynamic aggregated links (channel groups), but not on the aggregated links themselves; and on switch ports that belong to VLANs, but not on the VLANs themselves.

LLDP provides a way for the switch to:

- transmit information about itself to neighbors
- receive device information from neighbors
- store and manage information in an LLDP MIB

Each port can be configured to transmit local information, receive neighbor information, or both.

LLDP defines:

- a set of common advertisements (“[LLDP Advertisements](#)” on page 97.4)
- a protocol for transmitting and receiving advertisements (“[Transmission and Reception](#)” on page 97.8)
- a method for storing the information that is contained within received advertisements (“[Storing LLDP Information](#)” on page 97.10)

Interactions LLDP has the following interactions with other switch features:

- Spanning tree
Ports blocked by a spanning tree protocol can still transmit and receive LLDP advertisements.
- 802.1x
Ports blocked by 802.1x port authorization cannot transmit or receive LLDP advertisements. If LLDP has stored information for a neighbor on the port before it was blocked, this information will eventually time out and be discarded.
- VLAN tagging
LLDP packets are untagged; they do not contain 802.1Q header information with VLAN identifier and priority tagging.
- Mirror ports
LLDP does not operate on mirror analyzer ports.

LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED), is an extension of LLDP used between LAN network connectivity devices, such as this switch, and the media endpoint devices connected to them, such as IP phones. LLDP-MED is specified in *ANSI/TIA-1057-2006*. Of the application types specified in *ANSI/TIA-1057-2006*, the switch supports Application Type 1: Voice.

LLDP-MED uses the LLDP advertisement, transmission and storage mechanisms, but transmits, receives, and stores data specifically related to managing the voice endpoint devices. This includes information about network policy, location, hardware configuration, and, for Power over Ethernet-capable devices, power management.

Voice VLAN

Many IP phones (or other IP voice devices) have two interfaces: one to connect to the network and another that allows a computer or similar device to connect to the network via the IP phone. It is often desirable to treat the voice and data traffic separately so that appropriate Quality of Service (QoS) policies can be applied to each. The Voice VLAN feature uses LLDP-MED to convey configuration information (such as VLAN ID and User Priority tagging, and DiffServ Code Point (DSCP)—“[Differentiated Services Architecture](#)” on page 63.4) for the voice traffic to the IP phone. In response, the IP phone sends voice traffic according to this configuration. The data traffic coming through the IP phone from the PC is sent with the default configuration, typically untagged with normal priority.

LLDP Advertisements

LLDP transmits advertisements as packets called LLDP Data Units (LLDPDUs). An LLDPDU consists of a set of Type-Length-Value elements (TLV), each of which contains a particular type of information about the device or port transmitting it.

Type-Length-Value (TLV)

A single LLDPDU contains multiple TLVs. TLVs are short information elements that communicate complex data, such as variable length strings, in a standardized format. Each TLV advertises a single type of information, such as its device ID, type, or management addresses. The following table describes fields in a TLV.

Table 97-1: Fields in a Type Length Value element

Field	Description
Type	Identifies the kind of information. It consists of a 7-bit Type code.
Length	Identifies the length of the information. It consists of a 9-bit value that specifies the number of bytes of data in the Value field.
Value	Contains the actual value of the advertised information. This is a variable length data field.

LLDP sends mandatory TLVs in each advertisement; it can also be configured to send one or more optional TLVs, from the following groups:

- Mandatory Base TLVs, included in all LLDP advertisements. See IEEE 802.1AB-2005.
- Optional Base TLVs, which may be included in any LLDP advertisements. See IEEE 802.1AB-2005.
- IEEE 802.1 Organizationally Specific TLVs (802.1 TLVs). See IEEE 802.1AB-2005 Annex F.
- IEEE 802.3 Organizationally Specific TLVs (802.3 TLVs). See IEEE 802.1AB-2005 Annex G.
- LLDP-MED Organizationally Specific TLVs (LLDP-MED TLVs), included in LLDP-MED advertisements. See ANSI/TIA-1057- 2006.

Mandatory and optional TLVs for LLDP and LLDP-MED advertisements are shown in [Table 97-2](#).

Table 97-2: TLVs in LLDP advertisements

TLV	Description
Mandatory Base TLVs—IEEE 802.1AB-2005	
Chassis ID	Identifies the device's chassis. On this switch, this is the MAC address of the switch.
Port ID	Identifies the port that transmitted the LLDPDU.
Time To Live (TTL)	Indicates the length of time in seconds for which the information received in the LLDPDU remains valid. If the value is greater than zero, the information is stored in the LLDP remote system MIB. If the value is zero, the information previously received is no longer valid, and is removed from the MIB.
End of LLDPDU	Signals that there are no more TLVs in the LLDPDU.
Optional Base TLVs—IEEE 802.1AB-2005	
Port description	A description of the device's port in alpha-numeric format.

Table 97-2: TLVs in LLDP advertisements(cont.)

TLV	Description
System name	The system's assigned name in alpha-numeric format.
System description	A description of the device in alpha-numeric format. This includes information about the device's hardware and operating system.
System capabilities	The device's router and bridge functions, and whether or not these functions are currently enabled.
Management address	The address of the local LLDP agent. This can be used to obtain information related to the local device.
IEEE 802.1 Organizationally Specific TLVs (802.1 TLVs)—IEEE 802.1AB-2005 Annex F	
Port VLAN	VLAN identifier that the local port associates with untagged or priority tagged frames.
Port & Protocol VLANs	Whether Port & Protocol VLAN is supported and enabled on the port, and the list of Port & Protocol VLAN identifiers.
VLAN Names	List of VLAN names that the port is assigned to.
Protocol IDs	List of protocols that are accessible through the port, for instance: <ul style="list-style-type: none"> ■ 9000 (Loopback) ■ 00 26 42 42 03 00 00 00 (STP) ■ 00 27 42 42 03 00 00 02 (RSTP) ■ 00 69 42 42 03 00 00 03 (MSTP) ■ 888e01 (802.1x) ■ aa aa 03 00 e0 2b 00 bb (EPSR) ■ 88090101 (LACP) ■ 00540000e302 (Loop protection) ■ 0800 (IPv4) ■ 0806 (ARP) ■ 86dd (IPv6)
IEEE 802.3 Organizationally Specific TLVs (802.3 TLVs)—IEEE 802.1AB-2005 Annex G	
MAC/PHY Configuration/Status	The current values of the following for the port: <ul style="list-style-type: none"> ■ Speed and duplex mode auto-negotiation support ■ Auto-negotiation status ■ PMD (physical media dependent) auto-negotiation advertised capability ■ Operational MAU type This TLV is always included in LLDP-MED advertisements.
Power Via MDI	The power-via-MDI capabilities. On devices that are LLDP-MED and PoE-capable, we recommend using the Extended Power-via-MDI TLV instead of this TLV.
Link Aggregation	Whether the link is capable of being aggregated, whether it is currently in an aggregation and if in an aggregation, the port of the aggregation.
Maximum Frame Size	The maximum supported 802.3 frame size that the sending device is capable of receiving—larger frames will be dropped.

Table 97-2: TLVs in LLDP advertisements(cont.)

TLV	Description
LLDP-MED Organizationally Specific TLVs (LLDP-MED TLVs)—ANSI/TIA-1057- 2006	
LLDP-MED Capabilities	Indicates an LLDP-MED capable device, and advertises which LLDP-MED TLVs are supported and enabled, and the device type. For this switch, the device type is Network Connectivity Device. An advertisement containing this TLV is an LLDP-MED advertisement.
Network Policy	Network policy information configured on the port for connected media endpoint devices. The switch supports Application Type 1: Voice, including the following network policy for connected voice devices to use for voice data: <ul style="list-style-type: none"> ■ Voice VLAN ID ■ Voice VLAN User Priority tagging ■ Voice VLAN Diffserv Code Point (DSCP)
Location Identification	Location information configured for the port, in one or more of the following formats: <ul style="list-style-type: none"> ■ Civic address ■ Coordinate-based LCI ■ Emergency Location Identification Number (ELIN) For more information, see “LLDP-MED: Location Identification TLV” on page 97.7.
Extended Power-via-MDI	For PoE-capable devices, this TLV includes: <ul style="list-style-type: none"> ■ Power Type field: Power Sourcing Entity (PSE). ■ Power Source field: current power source, either Primary Power Source or Backup Power Source. ■ Power Priority field: power priority configured on the port. ■ Power Value field: In TLVs transmitted by Power Sourcing Equipment (PSE) such as this switch, this advertises the power that the port can supply over a maximum length cable based on its current configuration (that is, it takes into account power losses over the cable). In TLVs received from Powered Device (PD) neighbors, the power value is the power the neighbor requests. Available on devices that are PoE-capable.
Inventory Management TLV Set	Includes the following TLVs, based on the current hardware platform and the software version, identical on every port on the switch: <ul style="list-style-type: none"> ■ Hardware Revision ■ Firmware Revision ■ Software Revision ■ Serial Number ■ Manufacturer Name ■ Model Name Asset ID

LLDP-MED: Location Identification TLV

Location information can be configured for each port, and advertised to remote devices, which can then transmit this information in calls; the location associated with voice devices is particularly important for emergency call services. All ports may be configured with the location of the switch, or each port may be configured with the location of the remote voice device connected to it.

The location information for a particular port can be configured using one or more of the following three data formats: coordinate-based, Emergency Location Identification Number (ELIN), and civic address. Up to one location of each type can be assigned to a port.

Location configuration information (LCI) in all configured data formats is transmitted in Location Identification TLVs. When LLDP receives a Location Identification TLV, it updates the remote entry in the LLDP-MED MIB with this information.

Co-ordinate LCI Coordinate-based location data format uses geospatial data, that is, latitude, longitude, and altitude (height or floors), including indications of resolution, with reference to a particular datum: WGS 84, NAD83—North American Vertical Datum of 1988 (NAVD88), or NAD83—Mean Lower Low Water (MLLW). For more information, see *RFC 3825, Dynamic Host Configuration Protocol Option for Coordinate-based Location Configuration Information*.

ELIN LCI Emergency Location Identification Number (ELIN) location data format provides a unique number for each location for Emergency Call Services (ECS). In North America, ELINs are typically 10 digits long; ELINs up to 25 digits are supported.

Civic Address LCI The Civic Address location data format uses common street address format, as described in *RFC4776*.

Transmission and Reception

Table 97-3 describes the LLDP transmission and reception processes. Additional LLDP-MED processes are described in “**LLDP-MED Operation**” on page 97.9.

Table 97-3: LLDP transmission and reception processes

When ...	And ...	Then ...
LLDP is enabled	Ports are configured to transmit LLDP advertisements	Regular LLDP advertisements are sent via these ports at intervals determined by the transmit interval. Each advertisement contains local information (from the Local Systems MIB) for all the mandatory TLVs and the optional TLVs that the port is configured to send.
	Ports are configured to receive LLDP advertisements	Information received in advertisements via these ports is stored in the Neighbor table (Remote Systems MIB). This information is retained until it is replaced by a more recent advertisement from the same neighbor or it times out (the TTL elapses).
Local information changes	The transmission delay time has elapsed since the last advertisement was transmitted	New advertisements are sent containing the new set of local information.
Neighbor information changes	Notifications are enabled, and the notification interval has elapsed since the last notification was sent	The SNMP notification (trap) <code>IldpRemTablesChange</code> is sent.
LLDP transmission and reception is disabled on a port.	An LLDP command was used to do this	It transmits a final ‘shutdown’ LLDPDU with a Time-To-Live (TTL) TLV that has a value of “0”. This tells any remote neighboring devices to remove the information associated with this switch from their remote systems MIB. Then it stops transmitting and receiving advertisements. The neighbor information remains in the Remote Systems MIB until it times out.
	A shutdown command was used on the port	It makes a best effort to send a shutdown LLDPDU. Then it stops transmitting and receiving advertisements. The neighbor information remains in the Remote Systems MIB until it times out.
	Something else disabled LLDP	It does not send a shutdown LLDPDU. It stops transmitting and receiving advertisements. The neighbor information remains in the Remote Systems MIB until it times out.
	It is enabled again	LLDP reinitializes and resumes transmitting and receiving advertisements after the reinitialization interval has elapsed.
The Neighbor table has 1600 neighbors		It discards any further neighbors.
LLDP receives a LLDPDU or TLV with a detectable error		It discards the incorrect TLV.
LLDP receives a TLV it does not recognize	It contains no basic format errors	It stores it for possible later retrieval by network management (in the unrecognized TLV information table <code>IldpRemUnknownTLVTable</code> in the LLDP MIB).

LLDP-MED Operation

When LLDP is enabled, LLDP-MED is enabled by default, and uses the same LLDP transmission and reception process described in [Table 97-3](#). When LLDP receives an advertisement indicating a newly connected LLDP-MED-capable device on a port, it transmits one LLDP-MED advertisement per second via this port, a configurable number of times (the *fast start count*). Thereafter, it sends regular advertisements at the LLDP transmit interval. When the last advertisement for an LLDP-MED-capable device connected to the port times out, it stops sending LLDP-MED advertisements via the port.

If LLDP-MED notifications are enabled for a port, and SNMP traps for LLDP are enabled, LLDP-MED generates a *Topology Change Notification (LLDP-MED IldpXMedTopology ChangeDetected)* when a new LLDP-MED compliant IP telephony device is connected to a port or removed from a port. This notification includes the following information:

- IP Phone Chassis ID and Chassis ID sub-type (IP address)
- LLDP Endpoint Device Class
- Switch Chassis ID (MAC address) and Port ID where the device is attached.

Storing LLDP Information

When an LLDP device receives a valid LLDP advertisement from a neighboring network device, it stores the information in an IEEE-defined Simple Network Management Protocol (SNMP) Management Information Base (MIB).

LLDP stores information in the LLDP MIB defined in Section 12 of the *IEEE Standard 802.1AB-2005*, its extensions defined in *Annex F, Annex G*, and *ANSI/TIA-1057- 2006*, about:

LLDP-EXT-MED-MIB ANSI/TIA-1057- 2006, Section 13.3, LLDP-MED MIB Definition

- Local system information. This is the information that LLDP can transmit in advertisements to its neighbors.
- Remote systems information. This is the data that the device receives in advertisements from its neighbors.
- LLDP configuration. This can be used with SNMP to configure LLDP on the device.
- LLDP statistics. This includes information about LLDP operation on the device, including packet and event counters.

This information can be accessed either via SNMP, or directly using the command line interface.

Local system Information about your device is called local system information. The LLDP local system MIB maintains this information, which consists of device details, as well as any user-configured information that you have set up for your switch, for example a port description or a management address.

LLDP on this device can store one management address per port, and transmit this in LLDP advertisements. It can store multiple management addresses received from each neighbor.

Remote systems Information gained from neighboring devices is called remote system information. The LLDP remote systems MIB maintains this information.

The length of time for which neighbor information remains in the LLDP remote systems MIB is determined by the Time-To-Live (TTL) value of received LLDPDUs. When it receives an advertisement from a neighbor, LLDP starts a timer based on the Time To Live (TTL) information in the advertisement. The Time To Live (TTL) information in an advertisement is:

$TTL = \text{transmit interval} \times \text{holdtime multiplier}$. If the TTL elapses, for instance if the neighbor has been removed, LLDP deletes the neighbor's information from the MIB. This ensures that only valid LLDP information is stored.

Whenever a new neighbor is discovered, or an existing neighbor sends an advertisement with new information that differs from the previous advertisement, for example a new or changed TLV, a remote tables change event is activated. If SNMP notifications are enabled, the notification `lldpRemTablesChange` is sent.

To prevent the remote systems MIB from using large amounts of memory and possibly affecting the operation of your switch, it limits the number of neighbors it stores information for to 1600. If it is storing information from 1600 neighbors, and detects any more neighbors, it is considered to have too many neighbors, and discards advertisements from the rest. There is no per-port limit to the number of neighbors.

SNMP utilities An SNMP utility can read the Neighbors table MIB (Remote Systems Data in the LLDP MIB) on a device to find out about the LLDP neighbors it is directly connected to on each port. Then it can read the Neighbors table MIB on each of these neighbors to find out about their neighboring LLDP devices, and so on.

Configuring LLDP

You can configure LLDP on the device using either:

- the command line interface. For detailed descriptions of the commands, see [Chapter 98, LLDP Commands](#), or
- SNMP—see [Chapter 96, SNMP MIBs](#).

This section includes the following command line interface configuration procedures:

- **“Configure LLDP” on page 97.12**— This procedure includes configuration for LLDP between network connectivity devices; it does not include LLDP-MED. If you are configuring LLDP-MED only, use the following procedure instead of this one.
- **“Configure LLDP-MED” on page 97.14**—This procedure includes the LLDP configuration required to support LLDP-MED, as well as specific LLDP-MED and Voice VLAN configuration.
- **“Configure Authentication for Voice VLAN” on page 97.18**—This procedure includes 802.1X port authentication configuration including dynamic VLAN assignment to be used with LLDP-MED. Use the previous procedure before using this one.

Because LLDP is often used together with SNMP, consider configuring SNMP before you configure LLDP. LLDP transmits large amounts of data about the network. For security reasons, we recommend configuring SNMP for SNMP version 3 only (for read and write access). Remove all SNMPv1 and SNMPv2 configuration. See [Chapter 94, SNMP Introduction](#), and [Chapter 95, SNMP Commands](#).

Configure LLDP

Use the procedure in [Table 97-4](#) below to configure LLDP.

Some optional TLVs send information that can be configured by other commands. If LLDP will be configured to send these TLVs, consider whether to configure the corresponding parameters first.

- Port Description. See the [description \(interface\)](#) command on page 12.2.
- System Name. See the [hostname](#) command on page 8.16.

Table 97-4: Configuration procedure for LLDP

Enable LLDP	
1.	<code>awplus#configure terminal</code> Enter Configuration mode.
2.	<code>awplus(config)#lldp run</code> Enable LLDP.
Configure ports for LLDP	
Configure each port to determine whether and which LLDP messages are transmitted and received. If all the ports running LLDP require the same configuration, configure them all together. Otherwise repeat these commands for each port or group of ports that requires a particular configuration.	
3.	<code>awplus(config)# interface <port-list></code> Enter Interface Configuration mode for the switch ports.
4.	<code>awplus(config-if)#lldp tlv-select {[<tlv>]...}</code> <code>awplus(config-if)#lldp tlv-select all</code> By default, the mandatory TLVs are included in LLDP messages. Enable the transmission of one or more optional TLVs through these port as required.
5.	<code>awplus(config-if)#exit</code> Return to Global Configuration mode.
6.	<code>awplus(config)#interface <port-list></code> By default, transmission and reception of LLDP advertisements is enabled on all ports. Enter Interface Configuration mode for any switch ports that should have transmission or reception disabled.
7.	<code>awplus(config-if)#no lldp {[transmit] [receive]}</code> Disable transmission and/or reception as required.
8.	<code>awplus(config-if)#exit</code> Return to Global Configuration mode.
9.	<code>awplus(config)#exit</code> Return to Privileged Exec mode.
Check LLDP configuration	
10.	<code>awplus#show lldp</code> <code>awplus#show lldp interface [<port-list>]</code> <code>awplus#show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]</code> <code>awplus#show running-config lldp</code> Review the LLDP configuration.
Monitor LLDP	
11.	<code>awplus#show lldp neighbors</code> <code>awplus#show lldp neighbors detail</code> <code>awplus#show lldp statistics</code> <code>awplus#show lldp statistics interface [<port-list>]</code> Monitor LLDP operations and display neighbor information as required.

Table 97-4: Configuration procedure for LLDP(cont.)

Advanced LLDP configuration

The configuration procedure above and the defaults for other settings suit most networks. Use the following commands for fine tuning if necessary.

Timer intervals should be long enough not to create unnecessarily high numbers of advertisements when there are topology changes. However, be aware that if the intervals are long, a neighbor's information can continue to be stored after its information has changed, or after it is disconnected.

12.	<code>awplus#configure terminal</code>	Enter Configuration mode.
13.	<code>awplus(config)#interface <port-list></code>	Enter Interface Configuration mode for the switch ports.
14.	<code>awplus(config-if)#lldp management-address <ipaddr></code>	Override the default LLDP management address advertised through this port if required. This must be an IPv4 address that is already configured on the device. To see the management address that will be advertised, use the show lldp local-info command on page 98.39 .
15.	<code>awplus(config-if)#lldp notifications</code>	By default, SNMP notifications are not transmitted. Enable them for these ports if required. (SNMP LLDP traps (notifications) must also be enabled.)
16.	<code>awplus(config-if)#exit</code>	Return to Global Configuration mode.
17.	<code>awplus(config)#lldp timer <5-32768></code>	The transmit interval determines how often regular LLDP transmits advertisements from each port. The transmit interval must be at least four times the transmission delay. Default: 30 seconds
18.	<code>awplus(config)#lldp notification-interval <5-3600></code>	The notification interval determines the minimum interval between sending SNMP notifications (traps). Default: 5 seconds
19.	<code>awplus(config)#lldp tx-delay <1-8192></code>	A series of successive changes over a short period of time can trigger the agent to send a large number of LLDPDUs. To prevent this, there is a transmission delay timer. This establishes a minimum length of time that must elapse between successive LLDP transmissions. The transmission delay cannot be greater than a quarter of the transmit interval. Default: 2 seconds
20.	<code>awplus(config)#lldp reinit <1-10></code>	Reinitialization delay timer determines the minimum time after disabling LLDP on a port before it can reinitialize. Default: 2 seconds
21.	<code>awplus(config)#lldp holdtime-multiplier <2-10></code>	The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors. Default: 4
22.	<code>awplus(config)#exit</code>	Return to Privileged Exec mode.

Clear data

If necessary, you can clear either neighbor information or LLDP statistics for particular ports or all ports.

23.	<code>awplus#clear lldp table [interface <port-list>]</code>	Clear the information from the table of neighbor information.
24.	<code>awplus#clear lldp statistics [interface <port-list>]</code>	Clear LLDP statistics (packet and event counters).

Configure LLDP-MED

Use the procedure in [Table 97-5](#) to configure LLDP-MED and Voice VLAN for voice devices connected to the switch.

Consider whether you also need to configure:

- Simple Network Management Protocol ([Chapter 95, SNMP Commands](#))
- 802.1X port authentication ([Chapter 66, 802.1X Commands](#), [Chapter 68, Authentication Commands](#), [Chapter 70, AAA Commands](#))
- RADIUS server ([Chapter 76, Local RADIUS Server Commands](#), or [Chapter 72, RADIUS Commands](#))
- Quality of Service ([Chapter 64, QoS Commands](#))
- Access Control Lists ([Chapter 59, IPv4 Hardware Access Control List \(ACL\) Commands](#) and [Chapter 60, IPv4 Software Access Control List \(ACL\) Commands](#))
- Power over Ethernet (PoE), if the switch supports PoE ([Chapter 23, Power over Ethernet Commands](#))

In most cases, configuring LLDP-MED using SNMP or using the CLI command line interface (CLI) described in [Chapter 98, LLDP Commands](#) has the same effect. However, the effect of configuring location information using SNMP differs from the CLI. When location information is assigned to a port by SNMP and a matching location is not found on the device, then a new location is automatically created and assigned to the specified port. If the location is unset by SNMP later, then the location is removed to prevent accumulating SNMP-set location information. However, if the location is being used for other ports, the automatically created location is not removed until no ports use it. Once it is modified or assigned to other ports by CLI commands, the location remains even after no ports use the location.

Table 97-5: Configuration procedure for Voice VLAN and LLDP-MED

Configure a Voice VLAN	
Create a VLAN for voice data from voice endpoint devices connected to ports on the switch. Specify the network policy for voice data in this voice VLAN. LLDP-MED sends the network policy to voice devices connected to these ports. The voice devices use this network policy to determine the VLAN, priority and DSCP tagging of voice data it transmits.	
1. <code>awplus# configure terminal</code>	Enter Global Configuration mode.
2. <code>awplus(config)# vlan database</code>	Enter VLAN Database Configuration mode.
3. <code>awplus(config-vlan)# vlan <vid> [name <vlan-name>] [state {enable disable}]</code>	Create a VLAN to be used for the voice data to and from voice devices connected to the switch. By default, the new VLAN is enabled.
4. <code>awplus(config-vlan)# exit</code>	Return to global configuration mode.
5. <code>awplus(config)# interface <port-list></code>	Enter interface configuration mode for the ports to be configured with the same network policy. This may be all the switch ports with voice devices connected to them, or a subset if the network policy will differ between ports.
6. <code>awplus(config-if)# switchport voice vlan [<vid> dot1p dynamic untagged]</code>	Specify the VLAN tagging to be used for voice data on these ports. Use the dynamic option if the VLAN tagging will be allocated dynamically by a RADIUS server. To configure authentication and dynamic VLAN allocation using the local RADIUS server, see the procedure in Table 97-6 on page 97.18 . Default: none .

Table 97-5: Configuration procedure for Voice VLAN and LLDP-MED(cont.)

7.	<code>awplus(config-if)# switchport voice vlan priority <0-7></code>	Specify the priority-tagging that voice endpoint devices should put into their data packets. Default: 5.
8.	<code>awplus(config-if)# switchport voice dscp <0-63></code>	Specify the DSCP value that voice endpoint devices should put into their data packets. Default: 0.
9.	<code>awplus(config-if)# exit</code>	Return to global configuration mode.
Enable LLDP		
10.	<code>awplus(config)# lldp run</code>	Enable LLDP on the switch. Default: LLDP is disabled.
11.	<code>awplus(config)# interface <port-list></code>	Enter interface configuration mode for the switch ports LLDP is NOT to run on.
12.	<code>awplus(config-if)# no lldp {[transmit] [receive]}</code>	Disable transmission or reception on these ports as required. Default: transmit and receive enabled.
13.	<code>awplus(config-if)# exit</code>	Return to global configuration mode.
Configure LLDP-MED location information		
Create civic address, coordinate, and/or ELIN locations, and assign them to switch ports.		
14.	<code>awplus(config)# location civic-location identifier <civic-loc-id></code>	Specify a civic location ID, and enter configuration mode for this identifier.
15.	<code>awplus(config-civic)# country <country></code> <code>awplus(config-civic)# city <city></code> <code>awplus(config-civic)# primary-road-name <primary-road-name></code> <code>awplus(config-civic)# street-suffix <street-suffix></code> <code>awplus(config-civic)# house-number <house-number></code> <code>awplus(config-civic)# <other-civic-location-parameters ...></code>	Specify the civic address location information for the civic address location ID. You must specify a country first, using the upper-case two-letter country code, and then at least one more parameter. For the full set of parameters you can use to specify civic address location, see the location civic-location configuration command on page 98.22.
16.	<code>awplus(config-civic)# exit</code>	Return to global configuration mode.
17.	<code>awplus(config)# location coord-location identifier <coord-loc-id></code>	Specify a coordinate location identifier, and enter configuration mode for this identifier.
18.	<code>awplus(config-coord)# latitude <latitude></code> <code>awplus(config-coord)# lat-resolution <lat-resolution></code> <code>awplus(config-coord)# longitude <longitude></code> <code>awplus(config-coord)# long-resolution <long-resolution></code> <code>awplus(config-coord)# altitude <altitude> {meters floor}</code> <code>awplus(config-coord)# alt-resolution <alt-resolution></code> <code>awplus(config-coord)# datum {wgs84 nad83-navd nad83-mlw}</code>	Specify the coordinate location for the coordinate location identifier.
19.	<code>awplus(config-coord)# exit</code>	Return to global configuration mode.
20.	<code>awplus(config)# location elin-location <elin> identifier <elin-loc-id></code>	Specify an ELIN location identifier, and the ELIN for this identifier.

Table 97-5: Configuration procedure for Voice VLAN and LLDP-MED(cont.)

21.	<code>awplus(config)# interface <port-list></code>	Enter interface configuration mode for one or more switch ports which require the same location information.
22.	<code>awplus(config-if)# location civic-location-id <civic-loc-id></code> <code>awplus(config-if)# location coord-location-id <coord-loc-id></code> <code>awplus(config-if)# location elin-location-id <elin-loc-id></code>	Assign the civic, coordinate, and/or ELIN location identifier to these ports. LLDP-MED will send the location information associated with a port to the voice endpoint device attached to it.
23.	<code>awplus(config-if)# exit</code>	Return to global configuration mode.
24.	<code>awplus(config)# exit</code>	Return to Privileged Exec mode.
Review the LLDP configuration		
25.	<code>awplus# show lldp</code>	Check general LLDP configuration settings.
26.	<code>awplus# show lldp interface [<port-list>]</code>	Check LLDP configuration for ports.
27.	<code>awplus# show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]</code>	Check the information that may be transmitted in LLDP advertisements from ports.
28.	<code>awplus# show location {civic-location coord-location elin-location}</code> <code>awplus# show location {civic-location coord-location elin-location} identifier {<civic-loc-id> <coord-loc-id> <elin-loc-id>}</code> <code>awplus# show location {civic-location coord-location elin-location} interface <port-list></code>	Check the location information.
29.	<code>awplus# show running-config lldp</code>	If you want to display all the LLDP configuration, use this command.
Monitor LLDP-MED		
30.	<code>awplus# show lldp neighbors [interface <port-list>]</code> <code>awplus# show lldp neighbors detail [base] [dot1] [dot3] [med] [interface <port-list>]</code> <code>awplus# show lldp statistics</code> <code>awplus# show lldp statistics interface [<port-list>]</code>	Monitor LLDP operation.
Advanced configuration		
The configuration procedure above and the defaults for other settings suit most networks. Use the following commands for fine tuning if necessary. For information about other advanced configuration for LLDP, including LLDP timers, see Table 97-4 .		
31.	<code>awplus#configure terminal</code>	Enter Global Configuration mode.
32.	<code>awplus(config)# lldp faststart-count <1-10></code>	By default, when LLDP-MED detects an LLDP-MED capable device on a port, it sends 3 advertisements at 1s intervals. Change the fast start count if required. Default: fast start count is 3
33.	<code>awplus(config)# lldp non-strict-med-tlv-order-check</code>	By default non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, and LLDP-MED TLVs in non-standard order are discarded. If you require LLDP-MED advertisements with non-standard TLV order to be received and stored, enable non-strict order checking.

Table 97-5: Configuration procedure for Voice VLAN and LLDP-MED(cont.)

34	<code>awplus(config)# interface <port-list></code>	Enter interface configuration mode for switch ports which will have the same advanced configuration.
35	<code>awplus(config-if)# lldp management-address <ipaddr></code>	Override the default LLDP management address advertised through this port if required. This must be an IPv4 address that is already configured on the device. To see the management address that will be advertised, use the show lldp local-info command on page 98.39.
36	<code>awplus(config-if)# lldp med-notifications</code>	By default, SNMP notifications are not transmitted. Enable LLDP-MED Topology Change Detected notifications for these ports if required. (SNMP LLDP traps (notifications) must also be enabled.) Default: LLDP-MED notifications disabled
37	<code>awplus(config-if)# lldp tlv-select {[<tlv>]...}</code>	Enable the transmission of one or more optional LLDP TLVs in LLDP-MED advertisements through this port as required. The mac-phy-config TLV is transmitted in LLDP-MED advertisements whether or not it is enabled by this command. Default: all mandatory TLVs are enabled.
38	<code>awplus(config-if)# lldp med-tlv-select</code> <code>[[capabilities] [network-policy] [location]</code> <code>[power-management-ext] [inventory-</code> <code>management]]</code> <code>awplus(config-if)# lldp med-tlv-select all</code> <code>awplus(config-if)# no lldp med-tlv-select</code> <code>[[capabilities] [network-policy] [location]</code> <code>[power-management-ext] [inventory-</code> <code>management]]</code> <code>awplus(config-if)# no lldp med-tlv-select all</code>	Enable or disable the transmission of optional LLDP-MED TLVs in LLDP-MED advertisements through these ports as required. Default: capabilities, network-policy, location, power-management are enabled.
39	<code>awplus(config-if)# exit</code>	Return to global configuration mode.
40	<code>awplus(config)# exit</code>	Return to privileged exec mode.
Clear data		
If necessary, you can clear either neighbor information or LLDP statistics for particular ports or all ports.		
41	<code>awplus# clear lldp table [interface <port-list>]</code>	Clear the information from the table of neighbor information.
42	<code>awplus# clear lldp statistics [interface <port-list>]</code>	Clear LLDP statistics (packet and event counters).

Configure Authentication for Voice VLAN

Use the following procedure with LLDP-MED and Voice VLAN to configure 802.1X port authentication and dynamic VLAN assignment using the local RADIUS server on the switch to which the voice endpoint devices are connected.

This procedure assumes that you have already:

- configured Voice VLAN and LLDP-MED using the procedure in [Table 97-5 on page 97.14](#)
- set `switchport voice vlan` to `dynamic` in the above procedure

This procedure configures the local RADIUS server. If your configuration uses one or more remote RADIUS servers instead, set the IP addresses of the remote RADIUS servers using the `radius-server host` command ([Step 3 on page 18](#)), and skip all the steps that configure the local RADIUS server ([Step 3 on page 18](#) to [Step 14 on page 19](#)).

Table 97-6: Configuration procedure for Voice VLAN with RADIUS authentication and dynamic VLAN

Configure the IP address of the RADIUS host.	
1. <code>awplus#configure terminal</code>	Enter Global Configuration mode.
2. <code>awplus(config)#radius-server host 127.0.0.1 key <key-string></code>	Configure the IP address for the RADIUS server to be the local loopback interface address, so that RADIUS requests are sent to the local RADIUS server. Set the key that Network Access Servers (NAS) will need to use to get access to this RADIUS server. RADIUS server hosts configured using this command are included in the default RADIUS server group.
Enable the local RADIUS server.	
3. <code>awplus(config)#radius-server local</code>	Enter RADIUS Server Configuration mode.
4. <code>awplus(config-radsrv)#server enable</code>	Enable the local RADIUS server.
5. <code>awplus(config-radsrv)#nas 127.0.0.1 key <key-string></code>	Set the switch as a client device (Network Access Server), to allow it to send authentication requests to the local RADIUS server. Use the same local loopback interface IP address and key as in the <code>radius-server host</code> command used in Step 2 on page 18 .
Configure a local RADIUS user group for connected PCs.	
6. <code>awplus(config-radsrv)#group <user-group-name></code>	Create a local RADIUS server user group for PCs connected to the switch, and enter RADIUS Server Group Configuration mode.
7. <code>awplus(config-radsrv-group)#vlan {<vid> <vlan-name>}</code>	Set the VLAN ID for the user group. This will assign the untagged VLAN ID to authenticated ports for PCs connected to the switch. To create multiple user groups for PCs with different VLANs, repeat these two steps.
8. <code>awplus(config-radsrv-group)#exit</code>	Return to RADIUS Server Configuration mode.
Configure a local RADIUS user group for connected phones.	
9. <code>awplus(config-radsrv)#group <user-group-name></code>	Create a new local RADIUS server user group for phones connected to the switch, and enter RADIUS Server Group Configuration mode.

Table 97-6: Configuration procedure for Voice VLAN with RADIUS authentication and dynamic VLAN(cont.)

10. <code>awplus(config-radsrv-group)# vlan {<vid> <vlan-name>}</code>	Configure the local RADIUS user group for connected phones to use the same VLAN as the PCs in Step 7 , so that the phones have access to the same untagged VLAN as the PCs.
11. <code>awplus(config-radsrv-group)# egress-vlan-id <vid> tagged</code>	Set the Egress-VLAN ID attribute for the user group, and set it to send tagged frames. This will assign the tagged VLAN ID to authenticated ports for phones connected to the switch. To create multiple user groups for phones with different VLANs, repeat these two steps.
12. <code>awplus(config-radsrv-group)# exit</code>	Return to RADIUS Server Configuration mode.
Add users to the local RADIUS server.	
13. <code>awplus(config-radsrv)# user <radius-user-name> password <user-password> group <user-group></code>	Add RADIUS user names and passwords to the local RADIUS server for authenticating PCs and phones. Assign the corresponding RADIUS server user groups configured in Step 6 and Step 9 . See the user (RADIUS server) command on page 76.37 .
14. <code>awplus(config-radsrv)# exit</code>	Return to Global Configuration mode.
Create VLANs.	
15. <code>awplus(config)# vlan database</code>	Enter VLAN Database Configuration mode.
16. <code>awplus(config-vlan)# vlan <vid-range></code>	Create the VLANs corresponding to the VLAN IDs that will be allocated to the authenticated ports, as configured in Step 7 , Step 10 , and Step 11 .
17. <code>awplus(config-vlan)# exit</code>	Return to Global Configuration mode.
Configure 802.1X port authentication.	
18. <code>awplus(config)# aaa authentication dot1x default group radius</code>	Enable 802.1X port authentication and set it to use the default group of RADIUS servers that contains all RADIUS server hosts configured using the radius-server host command—in this procedure, the default group consists of the local RADIUS server.
19. <code>awplus(config)# interface <port-list></code>	Enter interface configuration mode for the ports that have users (PCs and phones) connected to them.
20. <code>awplus(config-if)# dot1x port-control auto</code>	Enable 802.1X for port authentication on these ports.
21. <code>awplus(config-if)# auth host-mode multi-suplicant</code>	Configure the ports to use multi-suplicant mode for authentication, so that the phone and PC can be dynamically allocated to different VLANs.
22. <code>awplus(config-if)# auth dynamic-vlan-creation</code>	Configure the ports to accept dynamic VLAN allocation. In this procedure, the RADIUS server user groups for both the PCs and the phones use the same VLAN (Step 7 and Step 10), so the default rule (deny) allows them both the access they need to the port VLAN. For other options, see the auth dynamic-vlan-creation command on page 68.6 . Default: deny differently assigned VLAN IDs.
23. <code>awplus(config-if)# exit</code>	Return to Global Configuration mode.
24. <code>awplus(config)# exit</code>	Return to Privileged Exec mode.

Table 97-6: Configuration procedure for Voice VLAN with RADIUS authentication and dynamic VLAN(cont.)**Review the authentication configuration.**

- | | | |
|------------|---|--|
| 25. | <code>awplus# show radius local-server group [<user-group-name>]</code>
<code>awplus# show radius local-server nas [<ip-address>]</code>
<code>awplus# show radius local-server user [<user-name>]</code> | Check the local RADIUS server configuration. |
| 26. | <code>awplus# show vlan {all brief dynamic static auto static-ports<1-4094>}</code> | Check the VLAN configuration. |
| 27. | <code>awplus# show dot1x [all]</code> | Check the 802.1X authentication configuration. |

Introduction

LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (“**Public MIBs**” on page 96.74). The Voice VLAN feature can be configured using commands in **Chapter 17, VLAN Commands**. For more information about LLDP, see **Chapter 97, LLDP Introduction and Configuration**.

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (**Chapter 94, SNMP Introduction, Chapter 95, SNMP Commands**).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

Command List

This chapter contains an alphabetical list of commands used to configure LLDP.

clear lldp statistics

This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

Syntax `clear lldp statistics [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the statistics are to be cleared.

Mode Privileged Exec

Examples To clear the LLDP statistics on ports 1.1.1 and 1.1.7, use the command:

```
awplus# clear lldp statistics interface port1.1.1,port1.1.7
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

Related Commands [show lldp statistics](#)
[show lldp statistics interface](#)

clear lldp table

This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

Syntax `clear lldp table [interface <port-list>]`

Parameter	Description
<code><port-list></code>	The ports for which the neighbor information table is to be cleared.

Mode Privileged Exec

Examples To clear the table of neighbor information received on ports 1.1.1 and 1.1.7, use the command:

```
awplus# clear lldp table interface port1.1.1,port1.1.7
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

Related Commands [show lldp neighbors](#)

debug lldp

This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

Syntax

```
debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
debug lldp operation
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
no debug lldp operation
no debug lldp all
```

Parameter	Description
rx	LLDP receive debug.
rxpkt	Raw LLDPDUs received in hex format.
tx	LLDP transmit debug.
txpkt	Raw Tx LLDPDUs transmitted in hex format.
<port-list>	The ports for which debug is to be configured.
operation	Debug for LLDP internal operation on the switch.
all	Disables all LLDP debugging for all ports.

Default By default no debug is enabled for any ports.

Mode Privileged Exec

Examples To enable debugging of LLDP receive on ports 1.1.1 and 1.1.7, use the command:

```
awplus# debug lldp rx interface port1.1.1,port1.1.7
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on ports 1.1.1 and 1.1.7, use the command:

```
awplus# no debug lldp rx interface port1.1.1,port1.1.7
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

Related Commands

- [show debugging lldp](#)
- [show running-config lldp](#)
- [terminal monitor](#)

lldp faststart-count

Use this command to set the fast start count for LLDP-MED. The fast start count determines how many fast start advertisements LLDP sends from a port when it starts sending LLDP-MED advertisements from the port, for instance, when it detects a new LLDP-MED capable device.

The **no** variant of this command resets the LLDP-MED fast start count to the default (3).

Syntax `lldp faststart-count <1-10>`
`no lldp faststart-count`

Parameter	Description
<1-10>	The number of fast start advertisements to send.

Default The default fast start count is 3.

Mode Global Configuration

Examples To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

Related Commands [show lldp](#)

lldp holdtime-multiplier

This command sets the holdtime multiplier value. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

Syntax `lldp holdtime-multiplier <2-10>`
`no lldp holdtime-multiplier`

Parameter	Description
<2-10>	The multiplier factor.

Default The default holdtime multiplier value is 4.

Mode Global Configuration

Usage The Time-To-Live defines the period for which the information advertised to the neighbor is valid. If the Time-To-Live expires before the neighbor receives another update of the information, then the neighbor discards the information from its database.

Examples To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp holdtime-multiplier 2
```

Related Commands [show lldp](#)

lldp management-address

This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

Syntax `lldp management-address <ipaddr>`
`no lldp management-address`

Parameter	Description
<code><ipaddr></code>	The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device.

Default The local loopback interface primary IPv4 address if set, else the primary IPv4 interface address of the lowest numbered VLAN the port belongs to, else the MAC address of the device's baseboard if no VLAN IP addresses are configured for the port.

Mode Interface Configuration

Usage To see the management address that will be advertised, use the [show lldp interface](#) command or [show lldp local-info](#) command.

Examples To set the management address advertised by ports 1.1.1 and 1.1.7, to be 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by ports 1.1.1 and 1.1.7, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# no lldp management-address
```

Related Commands [show lldp interface](#)
[show lldp local-info](#)

lldp med-notifications

Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

Syntax `lldp med-notifications`
`no lldp med-notifications`

Default The sending of LLDP-MED notifications is disabled by default.

Mode Interface Configuration

Examples To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# no lldp med-notifications
```

Related Commands [lldp notification-interval](#)
[lldp notifications](#)
[snmp-server enable trap](#)
[show lldp interface](#)

lldp med-tlv-select

Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

Syntax

```
lldp med-tlv-select {[capabilities] [network-policy] [location]
                    [power-management-ext] [inventory-management]}

lldp med-tlv-select all

no lldp med-tlv-select {[capabilities] [network-policy] [location]
                       [power-management-ext] [inventory-management]}

no lldp med-tlv-select all
```

Parameter	Description
capabilities	LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the lldp tlv-select command.
network-policy	Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: <ul style="list-style-type: none"> ■ switchport voice dscp ■ switchport voice vlan ■ switchport voice vlan priority
location	Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: <ul style="list-style-type: none"> ■ location elin-location-id ■ location civic-location identifier ■ location civic-location configuration ■ location coord-location identifier ■ location coord-location configuration ■ location elin-location
power-management-ext	Extended Power-via-MDI TLV. This TLV is transmitted if the port is PoE capable, and PoE is enabled (power-inline enable command on page 23.8).
inventory-management	Inventory Management TLV Set, including the following TLVs: <ul style="list-style-type: none"> ■ Hardware Revision ■ Firmware Revision ■ Software Revision ■ Serial Number ■ Manufacturer Name ■ Model Name ■ Asset ID

Parameter(cont.)	Description(cont.)
all	All LLDP-MED Organizationally Specific TLVs.

Default By default LLDP-MED Capabilities, Network Policy, Location Identification and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the **lldp run** command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

Mode Interface Configuration

Usage LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the **show lldp neighbors** command.

Examples To enable inclusion of the Inventory TLV Set in advertisements transmitted via ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via ports 1.1.1 and 1.1.7, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# no lldp med-tlv-select all
```

lldp non-strict-med-tlv-order-check

Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

Syntax `lldp non-strict-med-tlv-order-check`
`no lldp non-strict-med-tlv-order-check`

Default By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

Mode Global Configuration

Usage The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

Examples To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

Related Commands [show running-config lldp](#)

lldp notification-interval

This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

Syntax `lldp notification-interval <5-3600>`
`no lldp notification-interval`

Parameter	Description
<code><5-3600></code>	The interval in seconds.

Default The default notification interval is 5 seconds.

Mode Global Configuration

Examples To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

Related Commands [lldp notifications](#)
[show lldp](#)

lldp notifications

This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

Syntax `lldp notifications`
`no lldp notifications`

Default The sending of LLDP SNMP notifications is disabled by default.

Mode Interface Configuration

Examples To enable sending of LLDP SNMP notifications for ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# no lldp notifications
```

Related Commands [lldp notification-interval](#)
[show lldp interface](#)
[snmp-server enable trap](#)

lldp port-number-type

This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (*IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.*) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

Syntax `lldp port-number-type [number|ifindex]`
`no lldp port-number-type`

Parameter	Description
number	Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.
ifindex	Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries.

Default The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

Mode Global Configuration

Examples To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

Related Commands [show lldp](#)

lldp reinit

This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

Syntax `lldp reinit <1-10>`

`no lldp reinit`

Parameter	Description
<1-10>	The delay in seconds.

Default The default reinitialization delay is 2 seconds.

Mode Global Configuration

Examples To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

Related Commands [show lldp](#)

lldp run

This command enables the operation of LLDP on the device.

The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

Syntax `lldp run`

`no lldp run`

Default LLDP is disabled by default.

Mode Global Configuration

Examples To enable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp run
```

Related Commands [show lldp](#)

lldp timer

This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

Syntax `lldp timer <5-32768>`
`no lldp timer`

Parameter	Description
<5-32768>	The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer (lldp tx-delay command).

Default The default transmit interval is 30 seconds.

Mode Global Configuration

Examples To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

Related Commands **lldp tx-delay**
show lldp

lldp tlv-select

This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

Syntax

```
lldp tlv-select { [<tlv>]... }
lldp tlv-select all
no lldp tlv-select { [<tlv>]... }
no lldp tlv-select all
```

Parameter	Description
<tlv>	<p>The TLV to transmit in LLDP advertisements. One of these keywords:</p> <ul style="list-style-type: none"> ■ port-description (specified by the description (interface) command on page 12.2) ■ system-name (specified by the hostname command on page 8.16) ■ system-description ■ system-capabilities ■ management-address ■ port-vlan ■ port-and-protocol-vlans ■ vlan-names ■ protocol-ids ■ mac-phy-config ■ power-management (Power Via MDI TLV) ■ link-aggregation ■ max-frame-size
all	All TLVs.

Default By default no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV (**mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

Mode Interface Configuration

Examples To include the management-address and system-name TLVs in advertisements transmitted via ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# lldp tlv-select management-address system-name
```

To include all optional TLVs in advertisements transmitted via ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# no lldp tlv-select management-address system-name
```

To exclude all optional TLVs from advertisements transmitted via ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# no lldp tlv-select all
```

Related Commands

lldp transmit receive

This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

Syntax `lldp {[transmit] [receive]}`
`no lldp {[transmit] [receive]}`

Parameter	Description
transmit	Enable or disable transmission of LLDP advertisements via this port or ports.
receive	Enable or disable reception of LLDP advertisements via this port or ports.

Default LLDP advertisement transmission and reception are enabled on all ports by default.

Mode Interface Configuration

Examples To enable transmission of LLDP advertisements on ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# no lldp transmit receive
```

Related Commands [show lldp interface](#)

lldp tx-delay

This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

Syntax `lldp tx-delay <1-8192>`
`no lldp tx-delay`

Parameter	Description
<1-8192>	The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval (lldp timer command).

Default The default transmission delay timer is 2 seconds.

Mode Global Configuration

Examples To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

Related Commands [lldp timer](#)

```

Parameter	Description
<country>	Upper-case two-letter country code, as specified in ISO 3166.
<state>	State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).
<county>	County (CA Type 2): County, parish, gun (JP), district (IN).

Parameter(cont.)	Description(cont.)
<city>	City (CA Type 3): city, township, shi (JP).
<division>	City division (CA Type 4): City division, borough, city district, ward, chou (JP).
<neighborhood>	Neighborhood (CA Type 5): neighborhood, block.
<street-group>	Street group (CA Type 6): group of streets below the neighborhood level.
<leading-street-direction>	Leading street direction (CA Type 16).
<trailing-street-suffix>	Trailing street suffix (CA Type 17).
<street-suffix>	Street suffix (CA Type 18): street suffix or type.
<house-number>	House number (CA Type 19).
<house-number-suffix>	House number suffix (CA Type 20).
<landmark>	Landmark or vanity address (CA Type 21).
<additional-information>	Additional location information (CA Type 22).
<name>	Name (CA Type 23): residence and office occupant.
<postal-code>	Postal/zip code (CA Type 24).
<building>	Building (CA Type 25): structure.
<unit>	Unit (CA Type 26): apartment, suite.
<floor>	Floor (CA Type 27).
<room>	Room (CA Type 28).
<place-type>	Type of place (CA Type 29).
<postal-community-name>	Postal community name (CA Type 30).
<post-office-box>	Post office box (P.O. Box) (CA Type 31).
<additional-code>	Additional code (CA Type 32).
<seat>	Seat (CA Type 33): seat (desk, cubicle, workstation).
<primary-road-name>	Primary road name (CA Type 34).
<road-section>	Road section (CA Type 35).
<branch-road-name>	Branch road name (CA Type 36).
<sub-branch-road-name>	Sub-branch road name (CA Type 37).
<street-name-pre-modifier>	Street name pre-modifier (CA Type 38).
<street-name-post-modifier>	Street name post-modifier (CA Type 39).

Default By default no civic address location information is configured.

Mode Civic Address Location Configuration

Usage The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in *ISO 3166*. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see **“LLDP-MED: Location Identification TLV” on page 97.7**.

To specify the civic address location, use the **location civic-location identifier** command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command. To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command **location civic-location-id** command.

Examples To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

Related Commands **location civic-location-id**
location civic-location identifier
show lldp local-info
show location

location civic-location identifier

Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

Syntax location civic-location identifier <civic-loc-id>
no location civic-location identifier <civic-loc-id>

Parameter	Description
<civic-loc-id>	A unique civic address location ID, in the range 1 to 4095.

Default By default there are no civic address locations.

Mode Global Configuration

Usage To configure the location information for this civic address location identifier, use the **location civic-location configuration** command. To associate this civic location identifier with particular ports, use the **location elin-location-id** command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

Examples To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

Related Commands **location civic-location-id**
location civic-location configuration
show location
show running-config lldp

location civic-location-id

Use this command to assign a civic address location to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax location civic-location-id <civic-loc-id>
no location civic-location-id [<civic-loc-id>]

Parameter	Description
<civic-loc-id>	Civic address location ID, in the range 1 to 4095.

Default By default no civic address location is assigned to ports.

Mode Interface Configuration

Usage The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- **location civic-location identifier** command
- **location civic-location configuration** command

If a civic-address location is deleted using the **no** variant of the **location civic-location identifier** command, it is automatically removed from all ports.

Examples To assign the civic address location 1 to port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no location civic-location-id
```

Related Commands **lldp med-tlv-select**
location civic-location identifier
location civic-location configuration
show location

location coord-location configuration

Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

Syntax

```
latitude <latitude>
lat-resolution <lat-resolution>
longitude <longitude>
long-resolution <long-resolution>
altitude <altitude> {meters|floor}
alt-resolution <alt-resolution>
datum {wgs84|nad83-navd|nad83-mllw}
```

Parameter	Description
<lat-resolution>	Latitude resolution, as a number of valid bits, in the range 0 to 34.
<latitude>	Latitude value in degrees in the range -90.0 to 90.0
<long-resolution>	Longitude resolution, as a number of valid bits, in the range 0 to 34.
<longitude>	Longitude value in degrees, in the range -180.0 to 180.0.
<alt-resolution>	Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value.
<altitude>	Altitude value, in meters or floors.
meters	The altitude value is in meters.
floors	The altitude value is in floors.
datum	The geodetic system (or datum) that the specified coordinate values are based on.
wgs84	World Geodetic System 1984.
nad83-navd	North American Datum 1983 - North American Vertical Datum.
nad83-mllw	North American Datum 1983 - Mean Lower Low Water vertical datum.

Default By default no coordinate location information is configured.

Mode Coordinate Configuration

Usage Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise altitude is stored as a 30-bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be

represented exactly—the stored binary number is converted to a decimal number for display in the output of the **show location** command. For example, a user-entered latitude value of “2.77” degrees is displayed as “2.7699999809265136718750000”.

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the **location coord-location identifier** command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command. To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the **location elin-location-id** command.

Example To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# la-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# lo-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

Related Commands **location coord-location-id**

show location

location coord-location identifier

Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

Syntax location coord-location identifier <coord-loc-id>
no location coord-location identifier <coord-loc-id>

Parameter	Description
<coord-loc-id>	A unique coordinate location identifier, in the range 1 to 4095.

Default By default there are no coordinate locations.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the **location coord-location configuration** command. To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the **location coord-location-id** command.

Examples To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

Related Commands **location coord-location-id**
location coord-location configuration
show lldp local-info
show location

location coord-location-id

Use this command to assign a coordinate location to the ports. The coordinate location must already exist. This replaces any previous assignment of coordinate location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location from the ports.

Syntax `location coord-location-id <coord-loc-id>`
`no location coord-location-id [<coord-loc-id>]`

Parameter	Description
<code><coord-loc-id></code>	Coordinate location ID, in the range 1 to 4095.

Default By default no coordinate location is assigned to ports.

Mode Interface Configuration

Usage The coordinate location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the following commands:

- **location coord-location identifier** command
- **location coord-location configuration** command

If a coordinate location is deleted using the **no** variant of the **location coord-location identifier** command, it is automatically removed from all ports.

Examples To assign coordinate location 1 to port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# location coord-location-id 1
```

To remove a coordinate location from port1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no location coord-location-id
```

show location

location elin-location

Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

Syntax `location elin-location <elin> identifier <elin-loc-id>`
`no location elin-location identifier <elin-loc-id>`

Parameter	Description
<code><elin></code>	Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long.
<code><elin-loc-id></code>	A unique ELIN location identifier, in the range 1 to 4095.

Default By default there are no ELIN location identifiers.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the **location elin-location-id** command.

Examples To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

Related Commands **location elin-location-id**

location elin-location-id

Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax `location elin-location-id <elin-loc-id>`
`no location elin-location-id [<elin-loc-id>]`

Parameter	Description
<code><elin-loc-id></code>	ELIN location identifier, in the range 1 to 4095.

Default By default no ELIN location is assigned to ports.

Mode Interface Configuration

Usage An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the **location elin-location** command.

If an ELIN location is deleted using the **no** variant of one of the **location elin-location** command, it is automatically removed from all ports.

Examples To assign ELIN location 1 to port 1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# location elin-location-id 1
```

To remove an ELIN location from port 1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1
awplus(config-if)# no location elin-location-id
```

Related Commands **lldp med-tlv-select**

show debugging lldp

This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

Syntax `show debugging lldp [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the LLDP debug settings are shown.

Mode User Exec and Privileged Exec

Examples To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

To display LLDP debug settings for ports 1.1.1 to 1.1.9, use the command:

```
awplus# show debugging lldp interface port1.1.1-1.1.9
```

Output **Figure 98-1: Example output from the show debugging lldp command**

```

LLDP Debug settings:
Debugging for LLDP internal operation is on
Port      Rx      RxPkt   Tx      TxPkt
-----
1.1.1     Yes    Yes     No      No
1.1.2     Yes    No      No      No
1.1.3     No     No      No      No
1.1.4     Yes    Yes     Yes     No

1.1.6     No     No      Yes     No
1.1.7     Yes    Yes     Yes     Yes
1.1.8     Yes    No      Yes     Yes
1.1.9     No     No      Yes     Yes

```

Table 98-1: Parameters in the output of the show debugging lldp command

Parameter	Description
Port	Port name.
Rx	Whether debugging of LLDP receive is enabled on the port.
RxPkt	Whether debugging of LLDP receive packet dump is enabled on the port.
Rx	Whether debugging of LLDP transmit is enabled on the port.
RxPkt	Whether debugging of LLDP transmit packet dump is enabled on the port.

Related Commands [debug lldp](#)

show lldp

This command displays LLDP status and global configuration settings.

Syntax show lldp

Mode User Exec and Privileged Exec

Example To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

Output

Figure 98-2: Example output from the show lldp command

```
awplus# show lldp

LLDP Global Configuration:                [Default Values]
LLDP Status ..... Enabled                [Disabled]
Notification Interval ..... 5 secs       [5]
Tx Timer Interval ..... 30 secs          [30]
Hold-time Multiplier ..... 4             [4]
(Computed TTL value ..... 120 secs)
Reinitialization Delay .... 2 secs       [2]
Tx Delay ..... 2 secs                   [2]
Port Number Type..... Ifindex           [Port-Number]

LLDP Global Status:
Total Neighbor Count ..... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

Table 98-2: Parameters in the output of the show lldp command

Parameter	Description
LLDP Status	Whether LLDP is enabled. Default is disabled.
Notification Interval	Minimum interval between LLDP notifications.
Tx Timer Interval	Transmit interval between regular transmissions of LLDP advertisements.
Hold-time Multiplier	The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.
Reinitialization Delay	The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.
Tx Delay	The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information.
Port Number Type	The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.
Fast Start Count	The number of times fast start advertisements are sent for LLDP-MED.

Table 98-2: Parameters in the output of the show lldp command(cont.)

Parameter	Description
Total Neighbor Count	Number of LLDP neighbors discovered on all ports.
Neighbors table last updated	The time since the LLDP neighbor table was last updated.

Related Commands [show lldp interface](#)

show lldp interface

This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

Syntax show lldp interface [*<port-list>*]

Parameter	Description
<i><port-list></i>	The ports for which the LLDP configuration settings are to be shown.

Mode User Exec and Privileged Exec

Examples To display LLDP configuration settings for ports 1.1.1 to 1.1.8, use the command:

```
awplus# show lldp interface port1.1.1-1.1.8
```

To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

Output Figure 98-3: Example output from the show lldp interface command

```

Related Commands [show lldp](#)
[show running-config lldp](#)

show lldp local-info

This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

Syntax `show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]`

Parameter	Description
base	Information for base TLVs.
dot1	Information for 802.1 TLVs.
dot3	Information for 802.3 TLVs.
med	Information for LLDP-MED TLVs.
<port-list>	The ports for which the local information is to be shown.

Mode User Exec and Privileged Exec

Usage Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements (**lldp transmit receive** command)
- which TLVs it is configured to send (**lldp tlv-select** command, **lldp med-tlv-select** command)

Examples To display local information transmitted via port 1.1.1, use the command:

```
awplus# show lldp local-info interface port1.1.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

Output Figure 98-4: Example output from the show lldp local-info command

```

```

Table 98-4: Parameters in the output of the show lldp local-info command

Parameter	Description
Chassis ID Type	Type of the Chassis ID.
Chassis ID	Chassis ID that uniquely identifies the local device.
Port ID Type	Type of the Port ID.
Port ID	Port ID of the local port through which advertisements are sent.
TTL	Number of seconds that the information advertised by the local port remains valid.
Port Description	Port description of the local port, as specified by the description (interface) command on page 12.2.
System Name	System name, as specified by the hostname command on page 8.16.
System Description	System description.
System Capabilities (Supported)	Capabilities that the local port supports.
System Capabilities (Enabled)	Enabled capabilities on the local port.
Management Addresses	Management address associated with the local port. To change this, use the lldp management-address command.
Port VLAN ID (PVID)	VLAN identifier associated with untagged or priority tagged frames received via the local port.
Port & Protocol VLAN (Supported)	Whether Port & Protocol VLANs (PPV) is supported on the local port.
Port & Protocol VLAN (Enabled)	Whether the port is in one or more Port & Protocol VLANs.
Port & Protocol VLAN (VIDs)	List of identifiers for Port & Protocol VLANs that the port is in.
VLAN Names	List of VLAN names for VLANs that the local port is assigned to.
Protocol IDs	List of protocols that are accessible through the local port.
MAC/PHY Auto-negotiation	Auto-negotiation support and current status of the 802.3 LAN on the local port.
Power Via MDI (PoE)	PoE-capability and current status on the local port.
Port Class	Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device)
Pair Control Ability	Whether power pair selection can be controlled
Power Pairs	Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled

Table 98-4: Parameters in the output of the show lldp local-info command(cont.)

Parameter	Description
Power Class	The power class of the PD device on the port (class 0, 1, 2, 3 or 4)
Link Aggregation	Whether the link is capable of being aggregated and it is currently in an aggregation.
Aggregated Port-ID	Aggregated port identifier.
Maximum Frame Size	The maximum frame size capability of the implemented MAC and PHY.
LLDP-MED Device Type	LLDP-MED device type
LLDP-MED Capabilities	Capabilities LLDP-MED capabilities supported on the local port.
Network Policy	List of network policies configured on the local port.
VLAN ID	VLAN identifier for the port for the specified application type
Tagged Flag	Whether the VLAN ID is to be used as tagged or untagged
Layer-2 Priority:	Layer 2 User Priority (in the range 0 to 7)
DSCP Value	Diffserv codepoint (in the range 0 to 63)
Location Identification	Location configured on the local port.
Extended Power Via MDI (PoE)	PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.
Power Source	The power source the switch currently uses; either primary power or backup power.
Power Priority	The power priority configured on the port; either critical, high or low.
Power Value	The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side.
Inventory Management	Inventory information for the device.

[lldp transmit receive](#)

show lldp neighbors

This command displays a summary of information received from neighbors via specified ports. If no port list is supplied, neighbor information for all ports is displayed.

Syntax `show lldp neighbors [interface <port-list>]`

Parameter	Description
<port-list>	The ports for which the neighbor information is to be shown.

Mode User Exec and Privileged Exec

Examples To display neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors
```

To display neighbor information received via ports 1.1.1 and 1.1.7 with LLDP-MED configuration, use the command:

```
awplus# show lldp neighbors interface port1.1.1,port1.1.7
```

Output **Figure 98-5: Example output from the show lldp neighbors command**

```

LLDP Neighbor Information:
Total number of neighbors on these ports .... 4

System Capability Codes:
O = Other      P = Repeater    B = Bridge          W = WLAN Access Point
R = Router    T = Telephone    C = DOCSIS Cable Device  S = Station Only
LLDP-MED Device Type and Power Source Codes:
1 = Class I    3 = Class III    PSE = PoE          Both = PoE&Local    Prim = Primary
2 = Class II   N = Network Con.  Locl = Local       Unkn = Unknown     Back = Backup

Local  Neighbor      Neighbor      Neighbor      System      MED

```

Table 98-5: Parameters in the output of the show lldp neighbors command

Parameter	Description
Local Port	Local port on which the neighbor information was received.
Neighbor Chassis ID	Chassis ID that uniquely identifies the neighbor.
Neighbor Port Name	Port ID of the neighbor.
Neighbor Sys Name	System name of the LLDP neighbor.

Table 98-5: Parameters in the output of the show lldp neighbors command(cont.)

Parameter	Description
Neighbor Capability	Capabilities that are supported and enabled on the neighbor.
System Capability	System Capabilities of the LLDP neighbor.
MED Device Type	LLDP-MED Device class (Class I, II, III or Network Connectivity)
MED Power Source	LLDP-MED Power Source

Related Commands [show lldp neighbors detail](#)

show lldp neighbors detail

This command displays in detail the information received from neighbors via specified ports. If no port list is supplied, detailed neighbor information for all ports is displayed.

Syntax `show lldp neighbors detail [base] [dot1] [dot3] [med] [interface <port-list>]`

Parameter	Description
base	Information for base TLVs.
dot1	Information for 802.1 TLVs.
dot3	Information for 803.1 TLVs.
med	Information for LLDP-MED TLVs.
<port-list>	The ports for which the neighbor information is to be shown.

Mode User Exec and Privileged Exec

Examples To display detailed neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors detail
```

To display detailed neighbor information received via ports 1.1.1, use the command:

```
awplus# show lldp neighbors detail interface port1.1.1
```

Output Figure 98-6: Example output from the show lldp neighbors detail command

Table 98-6: Parameters in the output of the show lldp neighbors detail command

Parameter	Description
Chassis ID Type	Type of the Chassis ID.
Chassis ID	Chassis ID that uniquely identifies the neighbor.
Port ID Type	Type of the Port ID.
Port ID	Port ID of the neighbor.
TTL	Number of seconds that the information advertised by the neighbor remains valid.
Port Description	Port description of the neighbor's port.
System Name	Neighbor's system name.

Table 98-6: Parameters in the output of the show lldp neighbors detail

Parameter	Description
System Description	Neighbor's system description.
System Capabilities (Supported)	Capabilities that the neighbor supports.
System Capabilities (Enabled)	Capabilities that are enabled on the neighbor.
Management Addresses	List of neighbor's management addresses.
Port VLAN ID (PVID)	VLAN identifier associated with untagged or priority tagged frames for the neighbor port.
Port & Protocol VLAN (Supported)	Whether Port & Protocol VLAN is supported on the LLDP neighbor.
Port & Protocol VLAN (Enabled)	Whether Port & Protocol VLAN is enabled on the LLDP neighbor.
Port & Protocol VLAN (VIDs)	List of Port & Protocol VLAN identifiers.
VLAN Names	List of names of VLANs that the neighbor's port belongs to.
Protocol IDs	List of protocols that are accessible through the neighbor's port.
MAC/PHY Auto-negotiation	Auto-negotiation configuration and status
Power Via MDI (PoE)	PoE configuration and status of 802.3 Power-Via-MDI TLV
Link Aggregation	Link aggregation information
Maximum Frame Size	The maximum frame size capability
LLDP-MED Device Type	LLDP-MED Device type
LLDP-MED Capabilities	LLDP-MED capabilities supported
Network Policy	List of network policies
Location Identification	Location information
Extended Power Via MDI (PoE)	PoE-capability and current status
Inventory Management	Inventory information

Related Commands [show lldp neighbors](#)

show lldp statistics

This command displays the global LLDP statistics (packet and event counters).

Syntax `show lldp statistics`

Mode User Exec and Privileged Exec

Example To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

Output

Figure 98-7: Example output from the show lldp statistics command

```
awplus# show lldp statistics
Global LLDP Packet and Event counters:
  Frames:   Out ..... 345
            In ..... 423
            In Errored ..... 0
            In Dropped ..... 0
  TLVs:    Unrecognized ..... 0
            Discarded ..... 0
  Neighbors: New Entries ..... 20
             Deleted Entries ..... 20
             Dropped Entries ..... 0
             Entry Age-outs ..... 20
```

Table 98-7: Parameters in the output of the show lldp statistics command

Parameter	Description
Frames Out	Number of LLDPDU frames transmitted.
Frames In	Number of LLDPDU frames received.
Frames In Errored	Number of invalid LLDPDU frames received.
Frames In Dropped	Number of LLDPDU frames received and discarded for any reason.
TLVs Unrecognized	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
TLVs Discarded	Number of LLDP TLVs discarded for any reason.
Neighbors New Entries	Number of times the information advertised by neighbors has been inserted into the neighbor table.
Neighbors Deleted Entries	Number of times the information advertised by neighbors has been removed from the neighbor table.
Neighbors Dropped Entries	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
Neighbors Entry Age-outs Entries	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

show location

Use this command to display selected location information configured on the switch.

Syntax

```
show location {civic-location|coord-location|elin-location}
show location {civic-location|coord-location|elin-location}
  identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}
show location {civic-location|coord-location|elin-location} interface
  <port-list>
```

Parameter	Description
civic-location	Display civic location information.
coord-location	Display coordinate location information.
elin-location	Display ELIN location information.
<civic-loc-id>	Civic address location identifier, in the range 1 to 4095.
<coord-loc-id>	Coordinate location identifier, in the range 1 to 4095.
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.
<port-list>	Ports to display information about.

Mode User Exec and Privileged Exec

Examples To display a civic address location configured on port1.1.1, use the command:

```
awplus# show location civic-location interface port1.1.1
```

Figure 98-9: Example output from the show location command

```
awplus# show location civic-location interface port1.1.1
Port      ID      Element Type      Element Value
-----
1.1.1     1       Country           NZ
          City           Christchurch
          Street-suffix   Avenue
          House-number    27
          Primary-road-name Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

Figure 98-10: Example output from the show location command

```
awplus# show location coord-location identifier 1
ID  Element Type                Element Value
-----
1   Latitude Resolution          15 bits
    Latitude                    38.8986481130123138427734375 degrees
    Longitude Resolution        15 bits
    Longitude                    130.2323232293128967285156250 degrees
    Altitude Resolution         10 bits
    Altitude                    2.50000000 meters
    Map Datum                   WGS 84
```

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the [location coord-location configuration](#) command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

Figure 98-11: Example output from the show location command

```
awplus# show location elin-location
ID  ELIN
-----
1   1234567890

Command List	99.2
debug mail.....	99.2
delete mail.....	99.3
mail.....	99.4
mail from.....	99.5
mail smtpserver	99.6
show counter mail	99.7
show mail.....	99.8
undebg mail	99.8

Command List

This chapter provides an alphabetical reference for commands used to configure SMTP.

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

debug mail

This command turns on debugging for sending emails.

The **no** variant of this command turns off debugging for sending emails.

Syntax debug mail
no debug mail

Mode Privileged Exec

Examples To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

Related Commands [delete mail](#)

[show mail](#)
[show counter mail](#)
[undebug mail](#)

delete mail

This command deletes mail from the queue.

Syntax `delete mail [mail-id <mail-id>|all]`

Parameter	Description
mail-id	Deletes a single mail from the mail queue.
<mail-id>	An unique mail ID number. Use the show mail command to display this for an item of mail.
all	Delete all the mail in the queue.

Mode Privileged Exec

Examples To delete a unique mail item 20060912142356.1234 from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

Related Commands [debug mail](#)
[mail](#)
[mail from](#)
[mail smtpserver](#)
[show mail](#)

mail

This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the **mail from** command and a mail server using the **mail smtpserver** command.

Syntax `mail [{to <to>|subject <subject>|file <filename>}]`

Parameter	Description
to	The email recipient.
<to>	Email address.
subject	Description of the subject of this email. Use quote marks when the subject text contains spaces.
<subject>	String.
file	File to insert as text into the message body.
<filename>	String.

Mode Privileged Exec

Example To send an email to `rei@nerv.com` with the subject `dummy plug configuration`, and with the message body inserted from the file `plug.conf` use the command:

```
awplus# mail rei@nerv.com subject dummy plug configuration
filename plug.conf
```

Related Commands

- [debug mail](#)
- [delete mail](#)
- [mail from](#)
- [mail smtpserver](#)
- [show mail](#)
- [show counter mail](#)

mail from

This command sets an email address for the “mail from” SMTP command. You must specify a sending email address with this command before you can send any email.

Syntax `mail from <from>`

Parameter	Description
<code><from></code>	The email address that the mail is sent from.

Mode Global Configuration

Example To set the email address you are sending mail from to “kaji@nerv.com, use the command:

```
awplus(config)# mail from kaji@nerv.com
```

Related Commands

- [delete mail](#)
- [mail](#)
- [mail smtpserver](#)
- [show mail](#)

mail smtpserver

This command sets the IP address of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send any email.

Syntax `mail smtpserver <ip-address>`

Parameter	Description
<code><ip-address></code>	Internet Protocol (IP) Address for the mail server specified.

Mode Global Configuration

Example To specify a mail server at 192.168.0.1, use the command:

```
awplus# mail smtpserver 192.168.0.1
```

Related Commands

- [debug mail](#)
- [delete mail](#)
- [mail](#)
- [mail from](#)
- [show mail](#)
- [show counter mail](#)

show counter mail

This command displays the mail counters.

Syntax `show counter mail`

Mode User Exec and Privileged Exec

Output **Figure 99-1: Example output from the show counter mail command**

```
Mail Client (SMTP) counters
Mails Sent           ..... 0
Mails Sent Fails     ..... 1
```

Table 99-1: Parameters in the output of the show counter mail command

Parameter	Description
Mails Sent	The number of emails sent successfully since the last device restart.
Mails Sent Fails	The number of emails the device failed to send since the last device restart.

Example To show the emails in the queue use the command:

```
awplus# show counter mail
```

Related Commands

- [debug mail](#)
- [delete mail](#)
- [mail](#)
- [mail from](#)
- [show mail](#)

show mail

This command displays the emails in the queue.

Syntax `show mail`

Mode Privileged Exec

Example To display the emails in the queue use the command:

```
awplus# show mail
```

Related Commands [delete mail](#)
[mail](#)
[show counter mail](#)

undebbug mail

This command applies the functionality of the [no debug mail](#) command on page 99.2.

Chapter 100: RMON Introduction and Configuration

Introduction	100.2
Overview	100.2
RMON Configuration Example	100.4

Introduction

The chapter describes the Remote Network MONitoring (RMON) service on the switch, and describes a configuration example showing how to set up an RMON alarm.

This RMON alarm configuration example described creates SNMP traps and log messages when the rate of receipt of Broadcast packets on a switch port exceeds a threshold, and creates SNMP traps and log messages when the rate of receipt of Broadcast packets on a switch drops below a lower threshold.

For detailed information about the commands used to configure RMON, see [Chapter 101, RMON Commands](#)

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

Overview

The Remote Network MONitoring (RMON) MIB (RFC2819) was developed by the IETF to support monitoring and protocol analysis of LANs with a focus on Layer 1 and 2 information in networks. RMON is an industry standard that provides the functionality in network analyzers.

An RMON implementation operates in a client/server model. Monitoring devices (or 'probes') contain RMON agents that collect information and analyze packets. The probes are servers and the Network Management applications that communicate with them are clients. While agent configuration and data collection uses SNMP, RMON operates differently than SNMP systems:

- Probes have responsibility for data collection and processing, reducing SNMP traffic and reducing processing load for clients.
- Information is only transmitted to the management application when required, not polled.

RMON is mainly used for 'flow-based' monitoring, while SNMP is mainly used for 'device-based' management. RMON data collected deals mainly with traffic patterns on the network, and SNMP data collected usually deals with the status of individual devices on the network.

One disadvantage of flow based monitoring is that remote devices have much more of the management burden, and require more resources. AlliedWare Plus minimizes the management and resources burden by implementing a subset of the RMON MIB group to provide a minimal RMON agent implementation supporting statistics, history, alarms, and events.

The RMON groups supported in AlliedWare Plus™ are:

- **Statistics** - collects ethernet statistics on a switch port, such as utilization and collisions.
- **History** - collects a history of ethernet statistics on a switch port.
- **Alarms** - monitor a MIB object for a specified interval, trigger an alarm at a specified value (the '**rising threshold**'), and resets the alarm at another value (the '**falling**

threshold'). Alarms are used with events to trigger alarms, which generate logs or SNMP traps.

- **Events** - specify the action to take when an event is triggered by an alarm. The action of an event can generate a log or an SNMP trap.

RMON Configuration Example

This configuration example sets up an RMON alarm to create SNMP traps and log messages. This RMON alarm creates SNMP traps and log messages when the rate of receipt of Broadcast packets on a switch port exceeds a threshold, and creates SNMP traps and log messages when the rate of receipt of Broadcast packets on a switch port drops below a lower threshold.

Step 1: Set up an RMON collection on the switch port that is being monitored.

Use the following commands to configure this functionality:

```
awplus# configure terminal
awplus(config)# interface port1.1.4
awplus(config-if)# rmon collection stats 4
```

This will cause the software to build a table in which it stores statistics relating to the switch port.

Step 2: Define an RMON event that will be called by the Alarm when the thresholds are passed.

Create this as a 'trap and log' event, so that both an SNMP trap and a log message will be generated. The trap will be sent to the SNMP community named 'public'.

Use the following command to configure this functionality:

```
awplus# configure terminal
awplus(config)# rmon event 10 log trap public
```

Step 3: Create the RMON alarm.

Every 5 seconds, the alarm checks the broadcast packet counter in RMON collection stats 4. If the change in the value of that counter over the 5 second interval exceeds 5000 (1000 broadcasts per second), the alarm will trigger the event defined in step 2 above.

Additionally, when the rate broadcast falls below 500 broadcasts per 5 seconds, then the alarm will trigger the event defined in step 2 above again.

Use the below command to configure this functionality:

```
awplus# configure terminal
awplus(config)# rmon alarm 5 etherStatsBroadcastPkts.4
interval 5 delta rising-threshold 5000
event 10 falling-threshold 500 event 10
```

For the variable 'etherStatsBroadcastPkts.4' in this command, note that '.4' refers to the index number of the RMON collection stats 4 as defined on port1.1.4. So, 'etherStatsBroadcastPkts.4' refers to 'Received broadcasts' in RMON collection stats 4. Further counters for RMON are defined in section 5 of RFC 1757.

Step 4: Enable RMON traps.

To ensure that the SNMP trap is sent, you need to enable RMON traps, and you need to define a trap host in SNMP. Use the below commands to configure this functionality:

```
awplus# configure terminal
awplus(config)# snmp-server
awplus(config)# snmp-server enable trap rmon
awplus(config)# snmp-server community public
awplus(config)# snmp-server host 192.168.2.254 version 2c
public
```

Note that the resulting log message will be of the form listed below:

```
RMON [1024]: Alarm Index 5 alarm Rising Threshold 5000 alarm
Value 5117 alarm Rising event Index 10 event description
RMON_SNMP
```

Chapter 101: RMON Commands

Command List	101.2
rmon alarm	101.2
rmon collection history	101.4
rmon collection stats	101.5
rmon event	101.6
show rmon alarm	101.7
show rmon event	101.8
show rmon history	101.10
show rmon statistics	101.12

Command List

This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see [Chapter 100, RMON Introduction and Configuration](#)

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

rmon alarm

Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the [rmon event](#) command.

Use the **no** variant of this command to remove the alarm configuration.

Note Only alarms for switch port interfaces, not for VLAN interfaces, can be configured.

Syntax `rmon alarm <alarm-index> <oid> interval <1-4294967295> {delta|absolute} rising-threshold <1-2147483647> event <rising-event-index> falling-threshold <1-2147483647> event <falling-event-index> [owner <owner>]`

`no rmon alarm <alarm-index>`

Parameter	Description
<code><alarm-index></code>	<code><1-65535></code> Alarm entry index value.
<code><oid></code>	The variable SNMP MIB Object Identifier (OID) name to be monitored, in the format <code>etherStatsEntry.field.<stats-index></code> . For example, <code>etherStatsEntry.5.22</code> is the OID for the <code>etherStatsPkts</code> field in the <code>etherStatsEntry</code> table for the interface defined by the <code><stats-index> 22</code> in the rmon collection stats command.
<code>interval <1-4294967295></code>	Polling interval in seconds.
<code>delta</code>	The RMON MIB <code>alarmSampleType</code> : the change in the monitored MIB object value between the beginning and end of the polling interval.
<code>absolute</code>	The RMON MIB <code>alarmSampleType</code> : the value of the monitored MIB object.

Parameter(cont.)	Description(cont.)
rising-threshold <1-2147483647>	Rising threshold value of the alarm entry in seconds.
<rising-event-index>	<1-65535> The event to be triggered when the monitored object value reaches the rising threshold value. This is an event index of an event specified by the rmon event command.
falling-threshold <1-2147483647>	Falling threshold value of the alarm entry in seconds.
<falling-event-index>	<1-65535> The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the rmon event command.
owner <owner>	Arbitrary owner name to identify the alarm entry.

Default By default, there are no alarms.

Mode Global Configuration

Usage Note that the SNMP MIB Object Identifier (OID) indicated in the command syntax with <oid> must be specified as a dotted decimal value with the form **etherStatsEntry.field.<stats-index>**.

Example To configure an alarm to monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the **rmon collection stats** command), to trigger event 2 (defined by the **rmon event** command) when it reaches the rising threshold 400, and to trigger event 3 when it reaches the falling threshold 200, and identify this alarm as belonging to Maria, use the commands:

```
awplus# configure terminal
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60
delta rising-threshold 400 event 2 falling-
threshold 200 event 3 owner maria
```

Related Commands **rmon collection stats**
rmon event

rmon collection history

Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

Note Only a history for switch port interfaces, not for VLAN interfaces, can be collected.

Syntax `rmon collection history <history-index> [buckets <1-65535>]
[interval <1-3600>] [owner <owner>]`
`no rmon collection history <history-index>`

Parameter	Description
<code><history-index></code>	<code><1-65535></code> A unique RMON history control entry index value.
<code>buckets <1-65535></code>	Number of requested buckets to store snapshots. Default 50 buckets.
<code>interval <1-3600></code>	Polling interval in seconds. Default 1800 second polling interval.
<code>owner <owner></code>	Owner name to identify the entry.

Default The default interval is 1800 seconds and the default buckets is 50 buckets.

Mode Interface Configuration

Example To create a history statistics control group to store 200 snapshots with an interval of 500 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# rmon collection history 200 buckets 500
interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.2
awplus(config-if)# no rmon collection history 200
```

rmon collection stats

Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

Note Only statistics for switch port interfaces, not for VLAN interfaces, can be collected.

Syntax `rmon collection stats <collection-index> [owner <owner>]`
`no rmon collection stats <collection-index>`

Parameter	Description
<code><collection-index></code>	<code><1-65535></code> Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port.
<code>owner <owner></code>	An arbitrary owner name to identify this statistics collection entry.

Default RMON statistics are not enabled by default.

Mode Interface Configuration

Example To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.3
awplus(config-if)# no rmon collection stats 200
```

rmon event

Use this command to create an event definition for a log or a trap or both. The event index for this event can then be referred to by the **rmon alarm** command.

Use the **no** variant of this command to remove the event definition.

Note  Only the events for switch port interfaces, not for VLAN interfaces, can be collected.

Syntax

```
rmon event <event-index> [description <description>|owner <owner>|
  trap <trap>]

rmon event <event-index> [log [description <description>|
  owner <owner>|trap <trap>] ]

rmon event <event-index> [log trap [description <description>|
  owner <owner>] ]

no rmon event <event-index>
```

Parameter	Description
<event-index>	<1-65535> Unique event entry index value.
log	Log event type.
trap	Trap event type.
log trap	Log and trap event type.
description <description>	Event entry description.
owner <owner>	Owner name to identify the entry.

Default No event is configured by default.

Mode Global Configuration

Example To create an event definition for a log with an index of 299, use this command:

```
awplus# configure terminal
awplus(config)# rmon event 299 log description cond3 owner
alfred
```

To to remove the event definition, use the command:

```
awplus# configure terminal
awplus(config)# no rmon event 299
```

Related Commands **rmon alarm**

show rmon alarm

Use this command to display the alarms and threshold configured for the RMON probe.

Note Only the alarms for switch port interfaces, not for VLAN interfaces, can be shown.

Syntax `show rmon alarm`

Mode User Exec and Privileged Exec

Example To display the alarms and threshold, use this command:

```
awplus# show rmon alarm
```

Related Commands [rmon alarm](#)

show rmon event

Use this command to display the events configured for the RMON probe.

Note Only the events for switch port interfaces, not for VLAN interfaces, can be shown.

Syntax show rmon event

Mode User Exec and Privileged Exec

Output **Figure 101-1: Example output from the show rmon event command**

```
awplus#sh rmon event
event Index = 787
  Description TRAP
  Event type log & trap
  Event community name gopher
  Last Time Sent = 0
  Owner RMON_SNMP

event Index = 990
  Description TRAP
  Event type trap
  Event community name teabo
  Last Time Sent = 0
  Owner RMON_SNMP
```

Note The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

Example To display the events configured for the RMON probe, use this command:

```
awplus# show rmon event
```

Related Commands [rmon event](#)

show rmon history

Use this command to display the parameters specified on all the currently defined RMON history collections on the device.

Note Only the history for switch port interfaces, not for VLAN interfaces, can be shown.

Syntax show rmon history

Mode User Exec and Privileged Exec

Output **Figure 101-2: Example output from the show rmon history command**

```
awplus#sh rmon history
  history index = 56
    data source ifindex = 4501
    buckets requested = 34
    buckets granted = 34
    Interval = 2000
    Owner Andrew

  history index = 458
    data source ifindex = 5004
    buckets requested = 400
    buckets granted = 400
    Interval = 1500
    Owner trev
=====
```

Note The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

Example To display the parameters specified on all the currently defined RMON history collections, use the commands:

```
awplus# show rmon history
```

Related Commands [rmon collection history](#)

show rmon statistics

Use this command to display the current values of the statistics for all the RMON statistics collections currently defined on the device.

Note Only statistics for switch port interfaces, not for VLAN interfaces, can be shown.

Syntax `show rmon statistics`

Mode User Exec and Privileged Exec

Example To display the current values of the statistics for all the RMON statistics collections, use the commands:

```
awplus# show rmon statistics
```

Output **Figure 101-3: Example output from the show rmon statistics command**

```
awplus#show rmon statistics
rmon collection index 45
stats->ifindex = 4501
input packets 1279340, bytes 85858960, dropped 00, multicast packets 1272100
output packets 7306090, bytes 268724, multicast packets 7305660 broadcast
packets 290
rmon collection index 679
stats->ifindex = 5013
input packets 00, bytes 00, dropped 00, multicast packets 00
output packets 8554550, bytes 26777324, multicast packets 8546690 broadcast
packets 7720
```

Note The following etherStats counters are not currently available for Layer 3 interfaces:

- etherStatsBroadcastPkts
- etherStatsCRCAAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

Chapter 102: Triggers Introduction

Introduction	102.2
Trigger Facility.....	102.2
Configuring a Trigger	102.2
Troubleshooting Triggers	102.5

Introduction

This chapter provides information about the Trigger facility on this switch. For specific configuration examples, see [Chapter 103, Triggers Configuration](#). For detailed descriptions of the commands used to configure triggers, see [Chapter 104, Trigger Commands](#).

Trigger Facility

The Trigger facility provides a powerful mechanism for automatic and timed management of your device by automating the execution of commands in response to certain events. For example, you can use triggers to deactivate a service during the weekends, or to collect diagnostic information when the CPU usage is high.

A **trigger** is an ordered sequence of scripts that is executed when a certain event occurs. A **script** is a sequence of commands stored as a plaintext file on a file subsystem accessible to the device, such as Flash memory. Each trigger may reference multiple scripts and any script may be used by any trigger. When an event activates a trigger, the trigger executes the scripts associated with it in sequence. One script is executed completely before the next script begins. Various types of triggers are supported, each activated in a different way.

Configuring a Trigger

The following describes the general steps to configure a trigger. For specific configuration examples, see [Chapter 103, Triggers Configuration](#).

Step 1: Create a configuration script

Create a configuration script with the commands you would like executed when the trigger conditions are met. To create the configuration script using the CLI, use the command:

```
awplus# edit [<filename>]
```

Alternatively, you can create a script on a PC then load it onto your device using the [copy \(URL\)](#) command.

Step 2: Enter the trigger configuration mode

You must be in the Global Configuration mode to reach the Trigger Configuration mode. Use the command:

```
awplus# configure terminal
```

To create a trigger, and enter its configuration mode, use the command:

```
awplus(config)# trigger <1-250>
```

Step 3: Set the trigger type

The trigger type determines how the trigger is activated. To set the trigger to activate:

« when CPU usage reaches a certain level, use the command:

```
awplus(config-trigger)# type cpu <1-100> [up|down|any]
```

« when the link status of a particular interface changes, use the command:

```
awplus(config-trigger)# type interface <interface>
                        [up|down|any]
```

« when the RAM usage reaches a certain level, use the command:

```
awplus(config-trigger)# type memory <1-100> [up|down|any]
```

« periodically after a set number of minutes, use the command:

```
awplus(config-trigger)# type periodic <1-1440>
```

« when a ping poll identifies that a target device's status has changed, use the command:

```
awplus(config-trigger)# type ping-poll <1-100> {up|down}
```

« if your device reboots, use the command:

```
awplus(config-trigger)# type reboot
```

« at a specific time of the day, use the command:

```
awplus(config-trigger)# type time <hh:mm>
```

« when a USB storage device is either inserted or removed, use the command:

```
awplus(config-trigger)# type usb {in|out}
```

Note that a combined limit of 10 triggers of the type periodic and type time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

Step 4: Set the time and days that the trigger can activate on

By default triggers can activate at any time of the day, on all days. If you want your trigger to activate only during a specific time of the day, use the command:

```
awplus(config-trigger)# time {[after <hh:mm:ss>]
                             [before <hh:mm:ss>]}
```

If you want your trigger to activate only on a specific date, use the command:

```
awplus(config-trigger)# day <1-31> <month> <2000-2035>
```

If you want the trigger to activate only on specific days of the week, use the command:

```
awplus(config-trigger)# day <weekday>
```

Note that you can set either a specific date, or specific weekdays, but not both.

Step 5: Specify how often the trigger can activate

By default, triggers can activate an unlimited number of times, as long as the trigger conditions are met. To set a limit on the number of times a trigger can activate, use the command:

```
awplus(config-trigger)# repeat {forever|no|once|yes|  
<1-4294967294>}
```

You device maintains two counters that track the number of times a trigger has activated. One counts the total number of times the trigger is activated and is only reset if the device restarts, or when the trigger is destroyed. The other counter tracks the permitted number of repetitions. To reset this counter, use the [repeat command on page 104.6](#).

Step 6: Add the script to the trigger

You can add up to five scripts to the trigger. When a trigger is activated, it executes the scripts in sequence, with the lowest numbered script activated first. The first script runs to completion before the next script begins. To add a script, use the command:

```
awplus(config-trigger)# script <1-5> {<filename>}
```

Step 7: Specify a description for the trigger

Specify a description for the trigger, so that you can easily identify the trigger in show commands and log output. Use the command:

```
awplus(config-trigger)# description <description>
```

Step 8: Verify the trigger's configuration

To check the configuration of the trigger, use the command:

```
awplus(config-trigger)# show trigger [<1-250>|counter|  
full]
```

Troubleshooting Triggers

You can use the trigger diagnostic mode and trigger debugging to test your triggers and troubleshoot any issues.

Diagnostic mode is set per trigger. In this mode the trigger activates if its trigger conditions are met, but does not run any of its scripts. Your device generates a log message to indicate that the trigger was activated. To place a trigger in diagnostic mode, enter the trigger's configuration mode and use the command:

```
awplus(config-trigger)# test
```

To start debugging for triggers, use the command:

```
awplus(config-trigger)# debug trigger
```

This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

Enabling and Disabling

Triggers are enabled by default. This allows the trigger to activate as soon as its trigger conditions are met. If you need to disable a trigger but do not want to delete the trigger, use the command:

```
awplus(config-trigger)# no active
```

To enable the trigger again, use the command:

```
awplus(config-trigger)# active
```

To delete the trigger, use the command:

```
awplus(config-trigger)# no trigger <1-250>
```

Chapter 103: Triggers Configuration

Introduction	103.2
Restrict Internet Access.....	103.2
Capture Unusual CPU and RAM Activity.....	103.4
See Daily Statistics	103.6
Turn Off Power to Port LEDs.....	103.7
Reduce Power Supplied to Ports	103.9
Capture Show Output and Save to a USB Storage Device	103.11
Load a Release File From a USB Storage Device	103.12

Introduction

The chapter describes how to configure triggers to:

- Restrict Internet Access
- **Capture Unusual CPU and RAM Activity**
- **See Daily Statistics**
- **Turn Off Power to Port LEDs**
- **Capture Show Output and Save to a USB Storage Device**

For more information about triggers, see [Chapter 102, Triggers Introduction](#). For detailed descriptions of the commands used to configure triggers, see [Chapter 104, Trigger Commands](#).

Restrict Internet Access

In the following configuration the ACME company wants to restrict its employees from accessing popular video sharing websites as this is causing bandwidth problems during work hours. The ACME company is happy for workers to access the site after work hours.

Employee PCs at ACME are on vlan2. Two triggers with associated scripts are needed:

- Trigger 1 activates at 8.30am and runs a script called **shutdown.scp**. This script adds commands to restrict access to the specified sites
- Trigger 2 activates at 5.30pm and runs the script called **open.scp**. This script removes the configuration specified by shutdown.scp

1. Create the **shutdown.scp** script

Create a configuration script using Access Control List commands to restrict users on vlan2 from accessing the specific sites.

2. Create the **open.scp** script

Create a script to remove the ACL configuration specified in the **shutdown.scp** file.

3. Configure trigger 1

To create trigger 1, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
```

Set the trigger to activate at 8:30am, by using the command:

```
awplus(config-trigger)# type time 08:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **shutdown.scp** to the trigger:

```
awplus(config-trigger)# script 1 shutdown.scp
```

Specify a helpful description, such as **Stops access to video sharing sites**. Use the command:

```
awplus(config-trigger)# description Stops access to video
sharing sites
```

Change to Global Configuration mode:

```
awplus(config-trigger)# exit
```

4. Configure trigger 2

To create trigger 2, use the command:

```
awplus(config)# trigger 2
```

Set the trigger to activate at 5.30pm:

```
awplus(config-trigger)# type time 17:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **open.scp** to the trigger:

```
awplus(config-trigger)# script 1 open.scp
```

Specify a helpful description, such as **Access allowed to video sharing sites**. Use the command:

```
awplus(config-trigger)# description Access allowed to video
sharing sites
```

5. Verify the configuration

To check the configuration of the triggers, use the commands:

```
awplus# show trigger 1
```

```
awplus# show trigger 2
```

Capture Unusual CPU and RAM Activity

The following configuration allows you to troubleshoot high CPU or RAM usage by the device. It uses two triggers to capture show output, and places this output in a file.

- Trigger 3 activates the script `cpu-usage.scp` when CPU usage is over 90% and can activate up to 5 times
- Trigger 4 activates the script `ram-usage.scp` when RAM usage is over 95%, and can activate up to 10 times

1. Create the `cpu-usage.scp` configuration script

Create a script with the appropriate show command:

```
awplus# show cpu | redirect showcpu.txt
```

The output of the **show cpu** command has been redirected into a file. It is not possible to display trigger script output on the terminal. Redirecting the command output to a file means it is available for later inspection.

If the trigger activates on more than one occasion the contents of **showcpu.txt** will be overwritten with the latest output. To keep a full record for all activations of this trigger an ASH shell script can be added to the trigger to manage the output of the configuration script. For example:

```
#!/bin/ash
date >> showcpu_bkup.txt
cat showcpu.txt >> showcpu_bkup.txt
```

This script concatenates that date and time of activation and the contents of **showcpu.txt** onto the end of the backup file **showcpu_bkup.txt** in flash memory. Note that the files may grow large accumulating data and consume available flash memory.

2. Create the `ram-usage.scp` configuration script

Create a script with the appropriate show command:

```
awplus# show memory | redirect showmem.txt
```

The output of the **show memory** command has been redirected into a file. It is not possible to display trigger script output on the terminal. Redirecting the command output to a file means it is available for later inspection.

If the trigger activates on more than one occasion the contents of **showcpu.txt** will be overwritten with the latest output. To keep a full record for all activations of this trigger an ASH shell script can be added to the trigger to manage the output of the configuration script. For example:

```
#!/bin/ash
date >> showmem_bkup.txt
cat showmem.txt >> showmem_bkup.txt
```

This script concatenates that date and time of activation and the contents of **showmem.scp** onto the end of the backup file **showmem_bkup.scp** in flash memory. Note that the files may grow large accumulating data and consume available flash memory.

3. Configure trigger 3

To create trigger 3, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 3
```

Set the trigger to activate when CPU usage exceeds 80%:

```
awplus(config-trigger)# type cpu 90 up
```

Add the script **cpu-usage.scp** to the trigger:

```
awplus(config-trigger)# script 1 cpu-usage.scp
```

Return to Global Configuration mode:

```
awplus(config-trigger)# exit
```

4. Configure trigger 4

To create trigger 4, use the command:

```
awplus(config)# trigger 4
```

Set the trigger to activate when RAM usage exceeds 95%:

```
awplus(config-trigger)# type cpu 95 up
```

Add the script **cpu-usage.scp** to the trigger:

```
awplus(config-trigger)# script 1 ram-usage.scp
```

5. Verify the configuration

To check the configuration of the triggers, use the command:

```
awplus# show trigger 3
awplus# show trigger 4
```

See Daily Statistics

The ACME company has recently set up QoS on its traffic to give traffic different priorities to the ISP. ACME wants to assess how much traffic is dropped with the QoS bandwidths set over the next week. To do this, they want to generate an hourly report on QoS traffic on the first day that this is implemented.

- Trigger 5 activates the script **qos-stats.scp** every 60 minutes. The trigger is set to only activate during work hours.
1. Create the **qos-stats.scp** script
Create a configuration script with the appropriate show commands. You can either create the configuration script using the CLI with the **edit** command or create a script on a PC then load it onto your device using the **copy (URL)** command.

2. Configure trigger 5

To create trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
```

Set the trigger to activate periodically every 60 minutes:

```
awplus(config-trigger)# type periodic 60
```

Set the trigger to activate only during the hours of 8:00am and 6:00pm:

```
awplus(config-trigger)# time after 8:00 before 18:00
```

Add the script **qos-stats.scp** to the trigger:

```
awplus(config-trigger)# script 1 qos-stats.scp
```

3. Verify the configuration

To check the configuration of the trigger, use the command:

```
awplus# show trigger 5
```

Turn Off Power to Port LEDs

The following configuration allows you to conserve power by using the eco-friendly LED (Light Emitting Diode) feature to turn off power to the port LEDs during non-work hours.

See the [ecofriendly led](#) command for a detailed command description and command examples. See the section [“Save Power With the Eco-Friendly Feature” on page 1.33](#).

- Trigger 6 activates at 5:30pm and runs a script called **LEDoff.scp**. This script adds commands to turn off power to all the port LEDs
- Trigger 7 activates at 8:30am and runs the script called **LEDon.scp**. This script removes the configuration specified by **LEDoff.scp**

1. Create the **LEDoff.scp** script

Create a configuration script with the commands that are executed when the trigger conditions are met. You can either create the configuration script using the CLI with the [edit](#) command or create a script on a PC then load it onto your device using the [copy \(URL\)](#) command. The configuration script for this example is:

```
!
enable
configure terminal
ecofriendly led
exit
exit
!
```

2. Create the **LEDon.scp** script

Create a script to remove the configuration specified in the **LEDoff.scp** file. The configuration script for this example is:

```
!
enable
configure terminal
no ecofriendly led
exit
exit
!
```

3. Configure trigger 6

To create trigger 6, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
```

Set the trigger to activate at 5:30pm, by using the command:

```
awplus(config-trigger)# type time 17:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **LEDOff.scp** to the trigger:

```
awplus(config-trigger)# script 1 LEDOff.scp
```

Specify a helpful description, such as **Shutdown power to LEDs**. Use the command:

```
awplus(config-trigger)# description Shutdown power to LEDs
```

Change to Global Configuration mode:

```
awplus(config-trigger)# exit
```

4. Configure trigger 7

To create trigger 7, use the command:

```
awplus(config)# trigger 9
```

Set the trigger to activate at 8.30am:

```
awplus(config-trigger)# type time 08:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **LEDon.scp** to the trigger:

```
awplus(config-trigger)# script 1 LEDon.scp
```

Specify a helpful description, such as **Turn on power to LEDs**. Use the command:

```
awplus(config-trigger)# description Turn on power to LEDs
```

5. Verify the configuration

To check the configuration of the triggers, use the commands:

```
awplus# show trigger 6
```

```
awplus# show trigger 7
```

Reduce Power Supplied to Ports

The following configuration allows you to conserve power by using the eco-friendly LPI (Low Power Idle) feature to reduce power supplied to the ports during non-work hours.

See the [ecofriendly lpi](#) command for a detailed command description and command examples. See the section [“Save Power With the Eco-Friendly Feature” on page 1.33](#).

- Trigger 6 activates at 5:30pm and runs a script called **LPIon.scp**. This script adds commands to reduce power to all the ports.
- Trigger 7 activates at 8:30am and runs the script called **LPIoff.scp**. This script removes the configuration specified by **LPIon.scp**.

1. Create the **LPIon.scp** script

Create a configuration script with the commands that are executed when the trigger conditions are met. You can either create the configuration script using the CLI with the [edit](#) command or create a script on a PC then load it onto your device using the [copy \(URL\)](#) command. The configuration script for this example is:

```
!  
enable  
configure terminal  
ecofriendly lpi  
exit  
exit  
!
```

2. Create the **LPIoff.scp** script

Create a script to remove the configuration specified in the **LPIon.scp** file. The configuration script for this example is:

```
!  
enable  
configure terminal  
no ecofriendly lpi  
exit  
exit  
!
```

3. Configure trigger 6

To create trigger 6, use the commands:

```
awplus# configure terminal  
awplus(config)# trigger 6
```

Set the trigger to activate at 5:30pm, by using the command:

```
awplus(config-trigger)# type time 17:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **LPIon.scp** to the trigger:

```
awplus(config-trigger)# script 1 LPIon.scp
```

Specify a helpful description, such as **Turn on LPI**. Use the command:

```
awplus(config-trigger)# description Turn on LPI
```

Change to Global Configuration mode:

```
awplus(config-trigger)# exit
```

4. Configure trigger 7

To create trigger 7, use the command:

```
awplus(config)# trigger 9
```

Set the trigger to activate at 8.30am:

```
awplus(config-trigger)# type time 08:30
```

Set the trigger to activate on Monday, Tuesday, Wednesday, Thursday and Friday:

```
awplus(config-trigger)# day mon tue wed thur fri
```

Add the script **LPIoff.scp** to the trigger:

```
awplus(config-trigger)# script 1 LPIoff.scp
```

Specify a helpful description, such as **Turn off LPI**. Use the command:

```
awplus(config-trigger)# description Turn off LPI
```

5. Verify the configuration

To check the configuration of the triggers, use the commands:

```
awplus# show trigger 6
```

```
awplus# show trigger 7
```

Capture Show Output and Save to a USB Storage Device

The following configuration allows you to automatically capture output from the `show tech-support` command when a USB storage device is inserted into the switch. It uses a script called by the USB storage device trigger to capture the `show tech-support` output and places this output in a file on the USB storage device.

- Trigger 9 activates the script `shtech-sup.scp` when a USB storage device is inserted in the switch

1. Create the `shtech-sup.scp` script

Create a configuration script with the commands that are executed when the trigger conditions are met. You can either create the configuration script using the CLI with the `edit` command or create a script on a PC then load it onto your device using the `copy (URL)` command. The configuration script for this example is:

```
!  
enable  
show tech-support outfile usb:support.txt.gz  
exit  
end  
!
```

2. Configure trigger 9

To create trigger 9, use the commands:

```
awplus# configure terminal  
awplus(config)# trigger 9
```

Set the trigger to activate on the insertion of a USB storage device:

```
awplus(config-trigger)# type usb in
```

Add the script `shtech-sup.scp` to the trigger:

```
awplus(config-trigger)# script 1 shtech-sup.scp
```

3. Verify the configuration

To check the configuration of the triggers, use the command:

```
awplus# show trigger 9
```

Load a Release File From a USB Storage Device

The following configuration allows you to automatically load a release file from a USB storage device into Flash memory when a USB storage device is inserted into the switch. It uses a script called by the USB trigger to load the release file from the USB storage device.

Note that you can only specify that the release file is on a USB storage device if there is a backup release file already specified in Flash. See the [boot system](#) command for further information.

Caution  Anyone with physical access to the switch and who knows the name of the release file loaded by the trigger could insert a USB storage device and overwrite the boot configuration in Flash memory.

- Trigger 11 activates the script `copy.scp` when a USB storage device is inserted in the switch

1. Create the `copy.scp` script

Create a configuration script with the commands that are executed when the trigger conditions are met. You can either create the configuration script using the CLI with the `edit` command or create a script on a PC then load it onto your device using the `copy (URL)` command. The configuration script for this example is:

```
!
enable
copy usb flash SBx8100CFC400-5.4.3-3.7.rel
wait 5
configure terminal
boot system SBx8100CFC400-5.4.3-3.7.rel
exit
end
!
```

2. Configure trigger 11

To create trigger 11, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 11
```

Set the trigger to activate on the insertion of a USB storage device:

```
awplus(config-trigger)# type usb in
```

Add the script `copy.scp` to the trigger:

```
awplus(config-trigger)# script 1 copy.scp
```

Specify a helpful description, such as **Load a release file**. Use the command:

```
awplus(config-trigger)# description Load a release file
```

After a USB storage device has been inserted in the switch, use the following two steps to check the trigger and current boot configuration details.

1. Verify the trigger configuration

To check the configuration of the trigger, use the command:

```
awplus# show trigger 11
```

Example output from this command is shown below:

```
awplus#show trigger 11
Trigger Configuration Details
-----
Trigger ..... 11
Description ..... Load a release file
Type and details ..... USB (in)
Days ..... smtwtfS
After ..... 00:00:00
Before ..... 23:59:59
Active ..... Yes
Test ..... No
Trap ..... Yes
Repeat ..... Continuous
Modified ..... Wed Sep 15 16:25:33 2010
Number of activations ..... 1
Last activation ..... Wed Sep 15 16:26:49 2010
Number of scripts ..... 1
    1. copy.scp
    2. <not configured>
    3. <not configured>
    4. <not configured>
    5. <not configured>
-----
```

2. Display the current boot configuration

To display the current boot configuration, use the command:

```
awplus# show boot
```

Example output from this command is shown below:

```
awplus#show boot
Boot configuration
-----
Current software   : SBx8100CFC400-5.4.3-3.7.rel
Current boot image : flash:/SBx8100CFC400-5.4.3-3.7.rel
Backup boot image  : flash:/SBx8100CFC400-5.4.3-3.7.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/atplab.cfg (file exists)
Backup boot config : flash:/default.cfg (file exists)
```

Command List

This chapter provides an alphabetical reference for commands used to configure Triggers. For more information, see [Chapter 102, Triggers Introduction](#) and [Chapter 103, Triggers Configuration](#).

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

active (trigger)

This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

Syntax active

no active

Mode Trigger Configuration

Usage Configure a trigger first before you use this command to activate it. See the [Configuring a Trigger](#) section in [Chapter 102, Triggers Introduction](#) for trigger configuration steps.

Examples To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

Related Commands [show trigger trigger](#)

day

This command specifies the days or date that the can trigger activate on. You can specify either:

- A specific date
- A specific day of the week
- A list of days of the week
- every day

By default, the trigger can activate on any day.

Syntax `day every-day`
`day <1-31> <month> <2000-2035>`
`day <weekday>`

Parameter	Description
<code>every-day</code>	Sets the trigger so that it can activate on any day.
<code><1-31></code>	Day of the month the trigger is permitted to activate on.
<code><month></code>	Sets the month that the trigger is permitted to activate on. Valid keywords are: january, february, march, april, may, june, july, august, september, october, november, and december.
<code><2000-2035></code>	Sets the year that the trigger is permitted to activate in.
<code><weekday></code>	Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: monday, tuesday, wednesday, thursday, friday, saturday, and sunday.

Mode Trigger Configuration

Usage For example trigger configurations that use the **day** command, see [“Restrict Internet Access” on page 103.2](#) and [“Turn Off Power to Port LEDs” on page 103.7](#).

Examples To permit trigger 55 to activate on the 1 Jun 2010, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 Jun 2010
```

To permit trigger 12 to activate on a Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

Related Commands [show trigger](#)
[trigger](#)

debug trigger

This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

Syntax `debug trigger`
`no debug trigger`

Mode Privilege Exec

Examples To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

Related Commands [show debugging trigger](#)
[show trigger](#)
[test](#)
[trigger](#)
[undebug trigger](#)

description (trigger)

This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

Syntax `description <description>`
`no description`

Parameter	Description
<code><description></code>	A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters.

Mode Trigger Configuration

Examples To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

Related Commands [show trigger](#)
[test](#)
[trigger](#)

repeat

This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

Syntax `repeat { forever | no | once | yes | <1-4294967294> }`

Parameter	Description
<code>yes forever</code>	The trigger repeats indefinitely, or until disabled.
<code>no once</code>	The trigger activates only once.
<code><1-4292967294></code>	The trigger repeats the set number of times.

Mode Trigger Configuration

Examples To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

Related Commands [show trigger trigger](#)

script

This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus™ scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus™ scripts only need to be readable.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

Syntax

```
script <1-5> {<filename>}
no script {<1-5>|<filename>|all}
```

Parameter	Description
<1-5>	The position of the script in execution sequence. The trigger runs the lowest numbered script first.
<filename>	The path to the script file.

Mode Trigger Configuration

Examples To configure trigger 71 to run the script `flash:/cpu_trig.sh` in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts `flash:reconfig.scp`, `flash:cpu_trig.sh` and `flash:email.scp` in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3 flash:/
cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

Related Commands [show trigger](#)
[trigger](#)

show debugging trigger

This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the **debug trigger** command.

Syntax show debugging trigger

Mode User Exec and Privileged Exec

Example To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

Output **Figure 104-1: Example output from the show debugging trigger command**

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

Related Commands **debug trigger**

show running-config trigger

This command displays the current running configuration of the trigger utility.

Syntax show running-config trigger

Mode Privileged Exec

Example To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

Output **Figure 104-2: Example output from the show running-config trigger command**

```
trigger 1
  type usb in
trigger 2
  type usb out
!
```

Related Commands **show trigger**

show trigger

This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

Syntax `show trigger [<1-250>|counter|full]`

Parameter	Description
<1-250>	Displays detailed information about a specific trigger, identified by its trigger ID.
counter	Displays statistical information about all triggers.
full	Displays detailed information about all triggers.

Mode Privileged Exec

Example To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Figure 104-3: Example output from the show trigger command

```
awplus#show trigger
TR# Type & Details      Name                Ac Te Tr Repeat      #Scr Days/Date
-----
001 USB (in)           Y N Y Continuous    0  smtwtfS
002 USB (out)          Y N Y Continuous    0  smtwtfS
003 CPU (80% any)     Busy CPU            Y N Y 5             1  smtwtfS

019 Ping-poll (5 up)  Connection to svrl  Y N Y Continuous    1  smtwtfS
-----
```

Table 104-1: Parameters in the output of the show trigger command

Parameter	Description
TR#	Trigger identifier (ID).
Type & Details	The trigger type, followed by the trigger details in brackets.
Name	Descriptive name of the trigger configured with the description (trigger) command.
Ac	Whether the trigger is active (Y), or inactive (N).
Te	Whether the trigger is in test mode (Y) or not (N).
Tr	Whether or not the trigger is enabled to send SNMP traps. See the trap command.
Repeat	Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the show trigger <1-250> command.

Table 104-1: Parameters in the output of the show trigger command(cont.)

Parameter	Description
#Scr	Number of scripts associated with the trigger.
Days/Date	Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated.

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

Figure 104-4: Example output from the show trigger command for a specific trigger

```
awplus#show trigger 3

Table 104-2: Parameters in the output of the show trigger full and show trigger commands for a specific trigger

Parameter	Description
Trigger	The ID of the trigger.
Description	Descriptive name of the trigger.
Type and details	The trigger type and its activation conditions.
Days	The days on which the trigger is permitted to activate.
Date	The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".
Active	Whether or not the trigger is permitted to activate.
Test	Whether or not the trigger is operating in diagnostic mode.
Trap	Whether or not the trigger is enabled to send SNMP traps.
Repeat	Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets.
Modified	The date and time of the last time that the trigger was modified.
Number of activations	Number of times the trigger has been activated since the last restart of the device.
Last activation	The date and time of the last time that the trigger was activated.
Number of scripts	How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

Figure 104-6: Example output from the show trigger counter command

```
awplus#show trigger counter
Trigger Module Counters
-----
Trigger activations ..... 0
Time triggers activated today ..... 0
Periodic triggers activated today ..... 0
Interface triggers activated today ..... 0
Resource triggers activated today ..... 0
Reboot triggers activated today ..... 0
Ping-poll triggers activated today ..... 0
-----
```

Table 104-3: Parameters in the output of the show trigger counter command

Parameter	Description
Trigger activations	Number of times a trigger has been activated.
Time triggers activated today	Number of times a time trigger has been activated today.
Periodic triggers activated today	Number of times a periodic trigger has been activated today.
Interface triggers activated today	Number of times an interface trigger has been activated today.
Resource triggers activated today	Number of times a CPU or memory resource trigger has been activated today.
Ping-poll triggers activated today	Number of times a ping-poll trigger has been activated today.

Related Commands [trigger](#)

test

This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates the scripts associated with the trigger will be run, as normal.

Syntax test
no test

Mode Trigger Configuration

Usage Configure a trigger first before you use this command to diagnose it. See the **Configuring a Trigger** section in **Chapter 102, Triggers Introduction** for trigger configuration steps.

Examples To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

Related Commands [show trigger trigger](#)

time (trigger)

This command specifies the time of day when the trigger is permitted to activate. The **after** parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from "after" to "before" is defined, during which the trigger may activate. This command is not applicable to time triggers (**type time**).

The following figure illustrates how the **before** and **after** parameters operate.

Syntax `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

Parameter	Description
<code>after <hh:mm:ss></code>	The earliest time of day when the trigger may be activated.
<code>before <hh:mm:ss></code>	The latest time of day when the trigger may be activated.

Mode Trigger Configuration

Usage For example trigger configurations that use the **time (trigger)** command, see [“Restrict Internet Access” on page 103.2](#) and [“Turn Off Power to Port LEDs” on page 103.7](#).

Examples To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

Related Commands [show trigger](#)
[trigger](#)

trap

This command enables the specified trigger to send SNMP traps.

Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

Syntax trap
no trap

Default SNMP traps are enabled by default for all defined triggers.

Mode Trigger Configuration

Usage You must configure SNMP before using traps with triggers. See the following SNMP chapters:

[Chapter 94, SNMP Introduction](#)

[Chapter 95, SNMP Commands](#)

[Chapter 96, SNMP MIBs](#)

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to [AT-TRIGGER-MIB](#) for further information about the relevant SNMP MIB.

Examples To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

Related Commands [trigger](#)
[show trigger](#)

trigger

This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

Syntax `trigger <1-250>`
`no trigger <1-250>`

Parameter	Description
<code><1-250></code>	A trigger ID.

Mode Global Configuration

Examples To enter trigger configuration mode for trigger 12 use the command:

```
awplus# trigger 12
```

To completely remove all configuration associated with trigger 12, use the command:

```
awplus# no trigger 12
```

Related Commands [show trigger](#)
[trigger activate](#)

trigger activate

This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

Syntax `trigger activate <1-250>`

Parameter	Description
<1-250>	A trigger ID.

Mode Privileged Exec

Usage This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it is configured as inactive. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

Example To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

Related Commands [show trigger](#)
[trigger](#)

type chassis card

Use this command to activate a configured trigger when an SBx8112 card is inserted in, or removed from, an SBx8112 chassis, depending on which parameters you configure with it.

The SBx8112 card can be an LIF (Line Interface) card or a CFC (Control Fabric) card.

Syntax `type chassis card {join|leave}`

Parameter	Description
join	Activates a configured trigger on insertion of an SBx8112 LIF or CFC card in an SBx8112 chassis.
leave	Activates a configured trigger on removal of an SBx8112 LIF or CFC card in an SBx8112 chassis.

Mode Trigger Configuration

Usage Configure a trigger first before you use this command to activate it. See the [Configuring a Trigger](#) section in [Chapter 102, Triggers Introduction](#) for trigger configuration steps.

Use this command instead of the deprecated [type chassis master-fail \(Deprecated\)](#) and [type chassis member \(Deprecated\)](#) commands.

Examples To activate the configured `trigger 86` when an SBx8112 LIF or CFC card is inserted in an SBx8112 chassis, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type chassis card join
```

To activate the configured `trigger 86` when an SBx8112 LIF or CFC card is removed from an SBx8112 chassis, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type chassis card leave
```

Related Commands [trigger](#)
[type chassis master-fail \(Deprecated\)](#)
[type chassis member \(Deprecated\)](#)
[show running-config trigger](#)
[show trigger](#)

type chassis master-fail (Deprecated)

This command initiates the action of a pre-configured trigger to occur when the Control Fabric Card enters the fail-over state.

This command is deprecated. Use the **type chassis card** command instead of this command.

Syntax type chassis master-fail

Mode Trigger Configuration

Example To configure trigger 86 to activate when a Control Fabric Card fail-over event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type chassis master-fail
```

Related Commands [trigger](#)
[type chassis card](#)
[type chassis member \(Deprecated\)](#)

type chassis member (Deprecated)

This command (configured to the chassis) initiates the action of a pre-configured trigger to occur when a new line card or Control Fabric card either joins or leaves the chassis.

This command is deprecated. Use the **type chassis card** command instead of this command.

Syntax type chassis member {join|leave}

Parameter	Description
join	Join event.
leave	Leave event.

Mode Trigger Configuration

Example To configure a pre-configured trigger number 86 to activate when a new line card or Control Fabric Card joins the chassis, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type chassis member join
```

To configure a pre-configured trigger number 86 to activate when a new line card or Control Fabric Card leaves the chassis, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type chassis member leave
```

Related Commands [trigger](#)
[type chassis card](#)
[type chassis master-fail \(Deprecated\)](#)

type cpu

This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax type cpu <1-100> [up|down|any]

Parameter	Description
<1-100>	The percentage of CPU usage at which to trigger.
up	Activate when CPU usage exceeds the specified level.
down	Activate when CPU usage drops below the specified level
any	Activate when CPU usage passes the specified level in either direction

Mode Trigger Configuration

Usage For an example trigger configuration that uses the **type cpu** command, see [“Capture Unusual CPU and RAM Activity” on page 103.4](#).

Examples To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

Related Commands [show trigger trigger](#)

type interface

This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

Syntax `type interface <interface> [up|down|any]`

Parameter	Description
<code><interface></code>	Interface name. This can be the name of a switch port, an eth-management port, or a VLAN.
<code>up</code>	Activate when interface becomes operational.
<code>down</code>	Activate when the interface closes.
<code>any</code>	Activate when any interface link status event occurs.

Mode Trigger Configuration

Example To configure trigger 19 to be an interface trigger that activates when port1.1.2 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.1.2 up
```

Related Commands [show trigger trigger](#)

type memory

This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax type memory <1-100> [up|down|any]

Parameter	Description
<1-100>	The percentage of memory usage at which to trigger.
up	Activate when memory usage exceeds the specified level.
down	Activate when memory usage drops below the specified level.
any	Activate when memory usage passes the specified level in either direction.

Mode Trigger Configuration

Examples To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

Related Commands [show trigger](#)
[trigger](#)

type periodic

This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

Syntax type periodic <1-1440>

Parameter	Description
<1-1440>	The number of minutes between activations.

Mode Trigger Configuration

Usage A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

For an example trigger configuration that uses the **type periodic** command, see [“See Daily Statistics” on page 103.6](#).

Example To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

Related Commands [show trigger trigger](#)

type ping-poll

This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

Syntax `type ping-poll <1-100> {up|down}`

Parameter	Description
<1-100>	The ping poll ID.
up	The trigger activates when ping polling detects that the target is reachable.
down	The trigger activates when ping polling detects that the target is unreachable.

Mode Trigger Configuration

Example To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

Related Commands [show trigger trigger](#)

type reboot

This command configures a trigger that activates when your device is rebooted.

Syntax `type reboot`

Mode Trigger Configuration

Example To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

Related Commands [show trigger trigger](#)

type time

This command configures a trigger that activates at a specified time of day.

Syntax type time <hh:mm>

Parameter	Description
<hh:mm>	The time to activate the trigger.

Mode Trigger Configuration

Usage A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

Example To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

Related Commands [show trigger](#)
[trigger](#)

type usb

Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

Syntax type usb {in|out}

Parameter	Description
in	Trigger activates on insertion of a USB storage device.
out	Trigger activates on removal of a USB storage device.

Mode Trigger Configuration

Usage USB triggers cannot execute script files from a USB storage device.

For example trigger configurations that use the **type usb** command, see [“Capture Show Output and Save to a USB Storage Device” on page 103.11](#).

Examples To configure `trigger 1` to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

Related Commands [trigger](#)

This command applies the functionality of the [no debug trigger](#) command.

Chapter 105: Ping Polling Introduction and Configuration

Introduction	105.2
How Ping Polling Works	105.2
Configuring Ping Polling	105.4
Creating a Polling Instance.....	105.4
Customizing a Polling Instance	105.5
Troubleshooting Ping Polling	105.6
Interaction with Other Protocols.....	105.7

Introduction

Ping polling lets your device regularly check whether it can reach other hosts on a network. It works by sending ICMP Echo Requests to a host and waiting for replies sent back. If ping polling indicates that a host's status has changed, then your device can respond to the new status. When a host is unreachable, ping polling continues monitoring the host's reachability.

You can configure triggers to activate when ping polling determines that the host's status has changed. For example, you could configure a trigger to run a script that opens and configures an alternative link if the host at the other end of a preferred link becomes unavailable. You could then configure a second trigger to run a script that automatically returns traffic to the preferred link as soon as it is available again.

How Ping Polling Works

To determine a host's reachability, your device regularly sends ICMP Echo Request packets ("pings") to the host. As long as your device receives ping responses from the host, it considers the host to be reachable. If your device does not receive a reply to a set number of ICMP Echo Requests, it considers that the host is unreachable. It continues to try to ping the device, at an increased rate. After it receives a set number of responses, it considers the device to be reachable again.

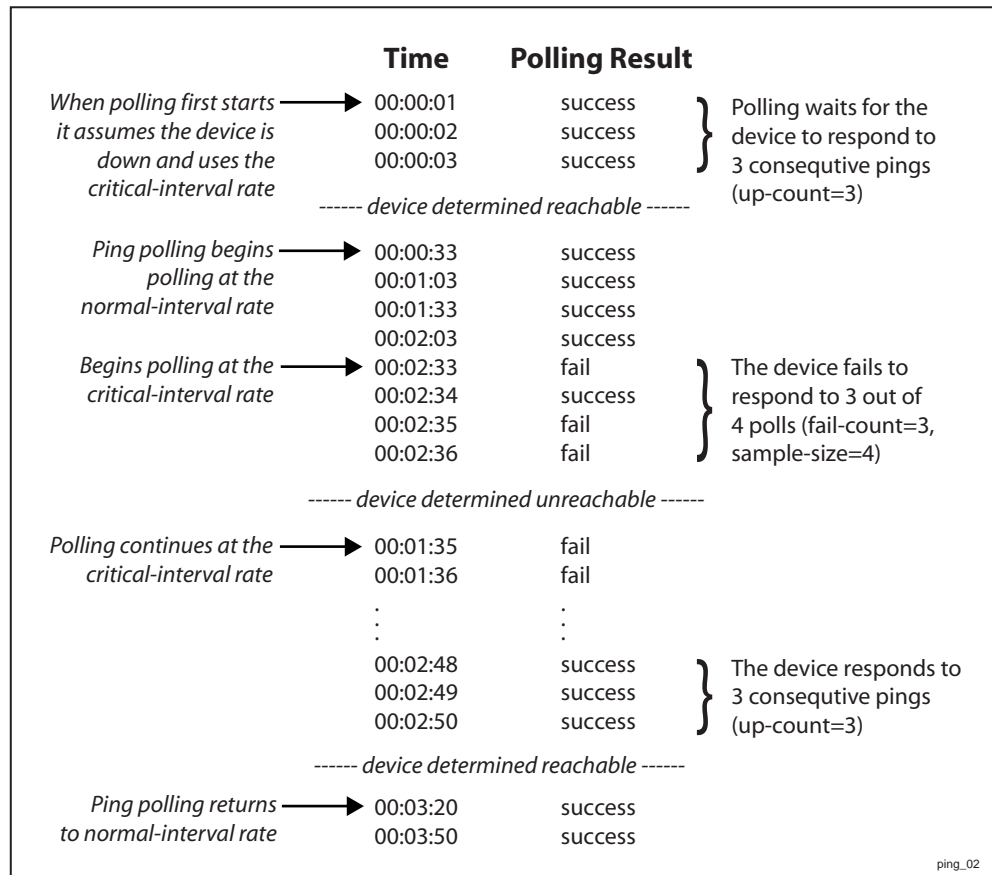

By default, a polling instance sends a ping every 30 seconds as long as it is receiving replies. The frequency of this polling is controlled by the `normal-interval` command. When a reply is not received, the polling instance increases the frequency at which it polls the device. This frequency is controlled by the `critical-interval` command, and by default, is set to send a packet every one second. It maintains this higher rate of polling until it has received sufficient consecutive replies.

The polling instance determines whether a device is reachable or unreachable based on the settings of the `fail-count`, `sample-size`, and `up-count` commands. To determine whether a device is reachable, the polling instance counts the number of failed pings within a set sample size. The sample size is set by the `sample-size` command, and by default is 5 ping responses. Within the sample size, the number of failed pings that means that the device is down is set by the `fail-count` command. By default this is set to 5. Once a polling instance has determined that a device is unreachable, it must receive a set number of consecutive replies before it changes the device's status back to reachable. This number is configured with the `up-count` command.

The following figure illustrates a polling instance where the device becomes unreachable, then reachable. It uses this configuration:

```
awplus(config-ping-poll)# fail-count 4
awplus(config-ping-poll)# sample-size 5
awplus(config-ping-poll)# up-count 3
awplus(config-ping-poll)# critical-interval 1
awplus(config-ping-poll)# normal-interval 30
```

Figure 105-1: Interaction between states and parameters for ping polling

On some operating systems, some servers may respond to a ping even if no other functionality is available, and therefore remain in an Up state while malfunctioning.

Responding to status changes

To configuring your device to determine and respond to changes in a device’s reachability, you will need to:

- create a polling instance to periodically ping the device
- create scripts to run when the device becomes unreachable and when it becomes reachable again
- configure triggers to run these scripts

To set a trigger to activate when a device’s status changes, its trigger type must be **ping-poll**. This is with the following command in the trigger’s configuration mode:

```
awplus(config-trigger)# type ping-poll <1-100> {up|down}
```

where **up** activates the trigger when the device is reachable, and **down** activates the trigger when the device is unreachable.

If you use triggers to open a backup link to a remote device in the event of the primary link failing (rather than the remote device failing), the backup link and primary link must point to different IP addresses on the remote device. Otherwise, when the backup link points to the IP address that your device is polling, your device receives ping replies through the backup link, considers the device to be reachable again, and attempts to reopen the primary link instead of using the backup link. See **Chapter 102, Triggers Introduction** for more information about configuring Triggers with Ping Polling.

Configuring Ping Polling

This section contains:

- **Creating a Polling Instance**
This explains how to quickly create a polling instance using the ping polling defaults.
- **Customizing a Polling Instance**
This explains how to customize a ping poll and explains the other ping poll commands.
- **Troubleshooting Ping Polling**
This explains how to use the debugging and monitoring commands for ping polling.

Creating a Polling Instance

The Ping Polling feature in the AlliedWare Plus™ OS allows you to easily configure polling instances with a minimum of commands. To configure a ping poll suitable for most network situations:

1. Create a polling instance by using the command:

```
awplus(config)# ping-poll <1-100>
```

The range <1-100> identifies the polling instance in the trigger commands and in other ping poll commands. Your device can poll up to 100 IP addresses at once.

2. Set the IP address of the device you are polling by using the command:

```
awplus(config-ping-poll)# ip {<ip-address>|<ipv6-address>}
```

3. Enable the polling instance by using the command:

```
awplus(config-ping-poll)# active
```

4. If desired, set an optional description to identify the polling instance, by using the command:

```
awplus(config-ping-poll)# description <description>
```

You do not need to configure any other commands for most networks, because convenient defaults exist for all other ping poll settings. The following table summarizes the default configuration created.

Command	Default
Critical-interval	1 second
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5

Command(cont.)	Default(cont.)
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

Customizing a Polling Instance

Once you've created a polling instance using the `ping-poll` and `ip (ping-polling)` command, you may wish to customize the polling instance for your network.

Packet size If you find that larger packet types in your network are not reaching the polled device while smaller ones such as ping do, you can increase the data bytes included in the ping packets sent by the polling instance. This encourages the polling instance to change the device's status to unreachable when packet of the size you are interested in are being dropped. To change the number of bytes sent in the data portion of the ping packets, use the command:

```
awplus(config-ping-poll)# length <4-1500>
```

Response timeout The polling instance determines that a device hasn't responded to a ping if one second elapses without a response to the ping. In networks where ping packets have a low priority, you may need to set the allowed response time to a longer time period. To change this, use the command:

```
awplus(config-ping-poll)# timeout <1-30>
```

Polling frequency By default, a polling instance polls a reachable device every 30 seconds. You can change this by using the command:

```
awplus(config-ping-poll)# normal-interval <1-65536>
```

Once the polling instance has determined that a ping has failed, it starts polling the device at the frequency set as the critical interval—by default, one second. To change the frequency set by the critical interval, use the command:

```
awplus(config-ping-poll)# critical-interval <1-65536>
```

The critical interval enables the polling instance to quickly observe changes in the state of the device, and should be set to a much lower value than the normal interval.

Configuring when the device's status changes The number of pings that the polling instance examines to consider a change in state is controlled by the interaction of the `sample-size`, `fail-count`, and `up-count` commands. See [“How Ping Polling Works” on page 105.2](#) for an example showing this interaction.

To determine whether a device is reachable, the polling instance counts the number of failed pings within a sample of a set size. The sample size is 5 pings by default. To change the sample size, use the command:

```
awplus(config-ping-poll)# sample-size <1-100>
```

To change the number of failed pings that the sample must have, use the command:

```
awplus(config-ping-poll)# fail-count <1-100>
```

If the sample size and fail count are the same, the unanswered pings must be consecutive. If the sample size is greater than the fail count, a device that does not always reply to pings may be declared unreachable.

The upcount is the number of consecutive pings that must be answered for the polling instance to consider the device reachable again. To change this from the default of 30, use the command:

```
awplus(config-ping-poll)# up-count <1-100>
```

Checking the configuration

To check the settings and status of the polling instance, use the command:

```
awplus(config-ping-poll)# show ping-poll [<1-100>|state {up|down}] [brief]
```

Troubleshooting Ping Polling

To disable a polling instance, use the command:

```
awplus(config-ping-poll)# no active
```

The polling instance no longer sends ICMP echo requests to the polled device and the counters for this polling instance are reset.

To clear the counters and change the status of a device to unreachable, enter the Privileged Exec mode and use the command:

```
awplus# clear ping-poll {<1-100>|all}
```

The polling instance changes to the polling frequency specified with the `critical-interval` command. The device status changes to reachable once the device responses have reached the `up-count`.

To start debugging for ping polling, use the command:

```
awplus# debug ping-poll <1-100>
```

Interaction with Other Protocols

Ping polling does not work if the polled host, your device, or any intermediate routers or switches are configured to drop ICMP Echo Requests and Replies.

Ping and Traceroute

Ping and Traceroute are not affected by ping polling. You can enter ping and trace commands at any time and independent of the polling.

Chapter 106: Ping-Polling Commands

Command List

This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see [Chapter 105, Ping Polling Introduction and Configuration](#).

For information about modifying or redirecting the output from **show** commands to a file, see [“Controlling “show” Command Output” on page 1.35](#).

Table 106-1: The following table lists the default values when configuring a ping poll.

Default	Value
Critical-interval	1 second
Description	No description
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

active (ping-polling)

This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the **ip (ping-polling)** command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

Syntax active
no active

Mode Ping-Polling Configuration

Examples To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

Related Commands **debug ping-poll**
ip (ping-polling)
ping-poll
show ping-poll

clear ping-poll

This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the **critical-interval** command. The device status changes to reachable once the device responses have reached the **up-count**.

Syntax `clear ping-poll {<1-100>|all}`

Parameter	Description
<1-100>	A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable.
all	Clears the counters and changes the device status of all polling instances.

Mode Privileged Exec

Examples To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

Related Commands [active \(ping-polling\)](#)
[ping-poll](#)
[show ping-poll](#)

critical-interval

This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the **normal-interval** command.

The **no** variant of this command sets the critical interval to the default of one second.

Syntax `critical-interval <1-65536>`
`no critical-interval`

Parameter	Description
<code><1-65536></code>	Time in seconds between pings, when the device has failed to a ping, or the device is unreachable.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

Related Commands **fail-count**
normal-interval
sample-size
show ping-poll
timeout (ping polling)
up-count

debug ping-poll

This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

Syntax `debug ping-poll <1-100>`
`no debug ping-poll {<1-100>|all}`

Parameter	Description
<1-100>	A unique ping poll ID number.
all	Turn off all ping-poll debugging.

Mode Privileged Exec

Examples To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

Related Commands [active \(ping-polling\)](#)
[clear ping-poll](#)
[ping-poll](#)
[show ping-poll](#)
[undebug ping-poll](#)

description (ping-polling)

This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

Syntax `description <description>`
`no description`

Parameter	Description
<code><description></code>	The description of the target. Valid characters are any printable character and spaces. There is no maximum character length.

Mode Ping-Polling Configuration

Examples To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

Related Commands [ping-poll](#)
[show ping-poll](#)

fail-count

This command specifies the number of pings that must be unanswered, within the total number of pings specified by the **sample-size** command, for the ping-polling instance to consider the device unreachable.

If the number set by the **sample-size** command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the **sample-size** command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

Syntax `fail-count <1-100>`

`no fail-count`

Parameter	Description
<code><1-100></code>	The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

Related Commands

ip (ping-polling)

This command specifies the IPv4 address of the device you are polling.

Syntax `ip {<ip-address>|<ipv6-address>}`

Parameter	Description
<code><ip-address></code>	An IPv4 address in dotted decimal notation A . B . C . D
<code><ipv6-address></code>	An IPv6 address in hexadecimal notation X : X : : X : X

Mode Ping-Polling Configuration

Examples To set ping-poll instance 5 to poll the device with the IP address 192 . 168 . 0 . 1, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address 2001 : db8 : :, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

Related Commands

- [ping-poll](#)
- [source-ip](#)
- [show ping-poll](#)

length (ping-poll data)

This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

Syntax length <4-1500>
no length

Parameter	Description
<4-1500>	The number of data bytes to include in the data portion of the ping packet.

Default The default is 32.

Mode Ping-Polling Configuration

Examples To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

Related Commands ping-poll
show ping-poll

normal-interval

This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

Syntax `normal-interval <1-65536>`

`no normal-interval`

Parameter	Description
<code><1-65536></code>	Time in seconds between pings when the target is reachable.

Default The default is 30 seconds.

Mode Ping-Polling Configuration

Examples To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

ping-poll

This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no ping poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the **ip (ping-polling)** command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

Syntax `ping-poll <1-100>`
`no ping-poll <1-100>`

Parameter	Description
<code><1-100></code>	A unique ping poll ID number.

Mode Global Configuration

Examples To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

Related Commands **active (ping-polling)**
clear ping-poll

description (ping-polling)
ip (ping-polling)
length (ping-poll data)
show ping-poll
source-ip

sample-size

This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

Syntax `sample-size <1-100>`
`no sample size`

Parameter	Description
<code><1-100></code>	Number of pings that determines critical and up counts.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

show counter ping-poll

This command displays the counters for ping polling.

Syntax show counter ping-poll [<1-100>]

Parameter	Description
<1-100>	A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls.

Mode User Exec and Privileged Exec

Output **Figure 106-1: Example output from the show counter ping-poll command**

```

Ping-polling counters
Ping-poll: 1
PingsSent                ..... 15
PingsFailedUpState      ..... 0
PingsFailedDownState    ..... 0
ErrorSendingPing        ..... 2
CurrentUpCount          ..... 13
CurrentFailCount        ..... 0
UpStateEntered          ..... 0
DownStateEntered        ..... 0

Ping-poll: 2
PingsSent                ..... 15
PingsFailedUpState      ..... 0
PingsFailedDownState    ..... 0
ErrorSendingPing        ..... 2
CurrentUpCount          ..... 13
CurrentFailCount        ..... 0
UpStateEntered          ..... 0

CurrentFailCount        ..... 0
UpStateEntered          ..... 0
DownStateEntered        ..... 0

```

Table 106-2: Parameters in output of the show counter ping-poll command

Parameter	Description
Ping-poll	The ID number of the polling instance.
PingsSent	The total number of pings generated by the polling instance.
PingsFailedUpState	The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.
PingsFailedDownState	Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.

Table 106-2: Parameters in output of the show counter ping-poll command(cont.)

Parameter	Description
ErrorSendingPing	The number of pings that were not successfully sent to the target device. This error can occur when your device does not have a route to the destination.
CurrentUpCount	The current number of sequential ping replies.
CurrentFailCount	The number of ping requests that have not received a ping reply in the current sample-size window.
UpStateEntered	Number of times the target device has entered the Up state.
DownStateEntered	Number of times the target device has entered the Down state.

Example To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

Related Commands

- debug ping-poll**
- ping-poll**
- show ping-poll**

show ping-poll

This command displays the settings and status of ping polls.

Syntax `show ping-poll [<1-100>|state {up|down}] [brief]`

Parameter	Description
<1-100>	Displays settings and status for the specified polling instance.
state	Displays polling instances based on whether the device they are polling is currently reachable or unreachable.
up	Displays polling instance where the device state is reachable.
down	Displays polling instances where the device state is unreachable.
brief	Displays a summary of the state of ping polls, and the devices they are polling.

Mode User Exec and Privileged Exec

Output **Figure 106-2: Example output from the show ping-poll brief command**

```

Ping Poll Configuration
-----
Id Enabled State Destination
-----
1 Yes Down 192.168.0.1
2 Yes Up 192.168.0.100

```

Table 106-3: Parameters in output of the show ping-poll brief command

Parameter	Meaning
Id	The ID number of the polling instance, set when creating the polling instance with the ping-poll command.
Enabled	Whether the polling instance is enabled or disabled.
State	The current status of the device being polled:
Up	The device is reachable.
Down	The device is unreachable.
Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.

Table 106-3: Parameters in output of the show ping-poll brief command(cont.)

Parameter	Meaning
Destination	The IP address of the polled device, set with the ip (ping-polling) command.

Figure 106-3: Example output from the show ping-poll command

```

Ping Poll Configuration
-----

Poll 1:
Description                : Primary Gateway
Destination IP address     : 192.168.0.1
Status                     : Down
Enabled                    : Yes
Source IP address         : 192.168.0.10
Critical interval         : 1
Normal interval           : 30
Fail count                 : 10
Up count                   : 5
Sample size                : 50
Length                    : 32
Timeout                   : 1
Debugging                  : Enabled

Poll 2:
Description                : Secondary Gateway
Destination IP address     : 192.168.0.100
Status                     : Up
Enabled                    : Yes
Source IP address         : Default
Critical interval         : 5
Normal interval           : 60
Fail count                 : 20
Up count                   : 30
Sample size                : 100
Length                    : 56
Timeout                   : 2
Debugging                  : Enabled
    
```

Table 106-4: Parameters in output of the show ping-poll command

Parameter	Description
Description	Optional description set for the polling instance with the description (ping-polling) command.
Destination IP address	The IP address of the polled device, set with the ip (ping-polling) command.

Table 106-4: Parameters in output of the show ping-poll command(cont.)

Parameter	Description								
Status	The current status of the device being polled: <table border="1" data-bbox="678 369 1426 705"> <tr> <td>Up</td> <td>The device is reachable.</td> </tr> <tr> <td>Down</td> <td>The device is unreachable.</td> </tr> <tr> <td>Critical Up</td> <td>The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.</td> </tr> <tr> <td>Critical Down</td> <td>The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.</td> </tr> </table>	Up	The device is reachable.	Down	The device is unreachable.	Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.	Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Up	The device is reachable.								
Down	The device is unreachable.								
Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.								
Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.								
Enabled	Whether the polling instance is enabled or disabled. The active (ping-polling) and no active commands enable and disable a polling instance.								
Source IP address	The source IP address sent in the ping packets. This is set using the source-ip command.								
Critical interval	The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the critical-interval command.								
Normal interval	The time period between pings when the device is reachable. This is set with the normal-interval command.								
Fail count	The number of pings that must be unanswered, within the total number of pings specified by the sample-size command, for the polling instance to consider the device unreachable. This is set using the fail-count command.								
Up count	The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the up-count command.								
Sample size	The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the sample-size command.								
Length	The number of data bytes to include in the data portion of the ping packet. This is set using the length (ping-poll data) command.								
Timeout	The time in seconds that the polling instance waits for a response to a ping packet. This is set using the timeout (ping polling) command.								
Debugging	Indicates whether ping polling debugging is Enabled or Disabled . This is set using the debug ping-poll command.								

Examples To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll 6 state down brief
```

Related Commands [debug ping-poll](#)
[ping-poll](#)

source-ip

This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

Syntax `source-ip {<ip-address>|<ipv6-address>}`

`no source-ip`

Parameter	Description
<code><ip-address></code>	An IPv4 address in dotted decimal notation A.B.C.D
<code><ipv6-address></code>	An IPv6 address in hexadecimal notation X:X::X:X

Mode Ping-Polling Configuration

Examples To configure the ping-polling instance 43 to use the source IP address 192.168.0.1 in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address 2001:db8:: in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

Related Commands

timeout (ping polling)

This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

Syntax `timeout <1-30>`
`no timeout`

Parameter	Description
<1-30>	Length of time, in seconds, that the polling instance waits for a response from the polled device.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

Related Commands

- up-count**

up-count

This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

Syntax `up-count <1-100>`
`no up-count`

Parameter	Description
<code><1-100></code>	Number of replied pings before an unreachable device is classified as reachable.

Default The default is 30.

Mode Ping-Polling Configuration

Examples To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

undebg ping-poll

This command applies the functionality of the **no debug ping-poll** command on page 106.6.

Chapter 107: sFlow Introduction and Configuration

sFlow Introduction.....	107.2
The sFlow Agent.....	107.3
Sampling Methods.....	107.3
The sFlow Collector.....	107.5
Configuring sFlow on your Switch.....	107.6
Configuration Procedure.....	107.7
sFlow Datagrams.....	107.8
The sFlow MIB.....	107.9

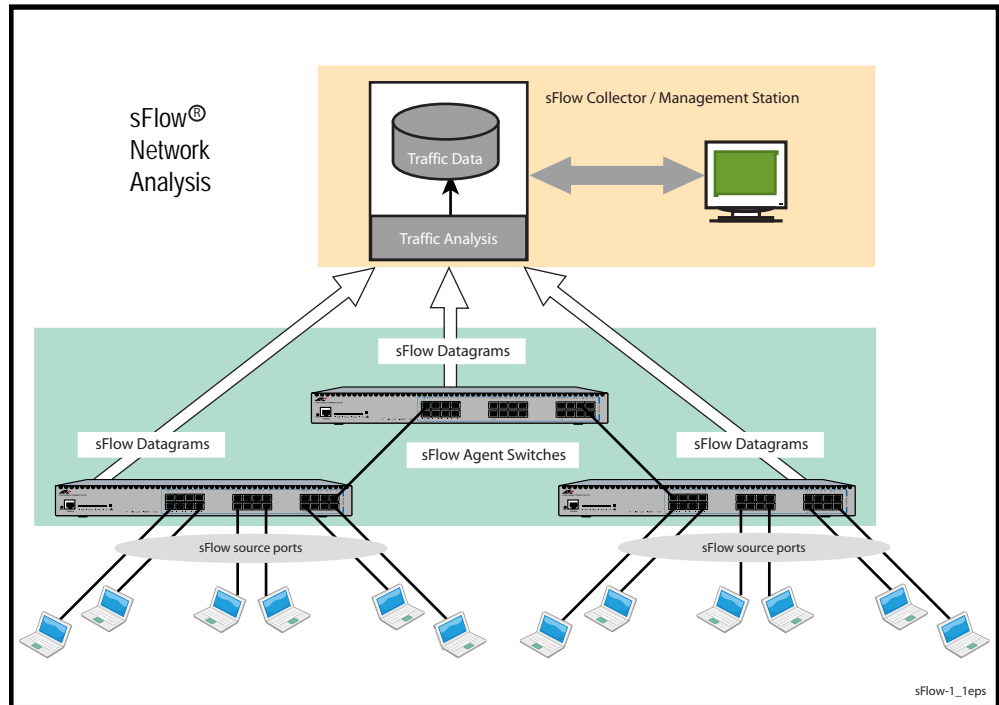

sFlow Introduction

sFlow^{®1} provides the ability to monitor traffic in data networks containing switches and routers. A network employing sFlow typically comprises a number of network (sFlow) agents that accumulate sampled data and traffic counter information. The agents then forward this data to a collector. The collector then analyses the information supplied by its agents in order to compile and display statistical profiles of the network and its traffic. The sFlow feature on your switch provides the sFlow Agent capability.

1. sFlow[®] is a registered trademark belonging to InMon Corp, San Francisco, CA.

Figure 107-1 on page 107.2 shows a basic sFlow network structure. The three network switches also function as sFlow agents. Each agent switch captures samples of the traffic passing through its monitored ports, and sends these samples together with counter information back to the sFlow collector. The agents sample data from a number of switch ports, each acting as an sFlow data source.

Figure 107-1: Basic sFlow Network

The sFlow Agent

Your switch can act as an sFlow agent. The key capabilities of the agent are to:

- sample frames as they pass through selected ports on the switch, and provide sampled extracts of the network traffic.
- periodically capture interface counter data.
- package together the sampled frame and counter information that can be sent to the collector for analysis and display.
- be configurable via SNMP MIB objects.
- communicate to heterogeneous collector devices by means of standard protocols.

Agent components and functionality

sFlow functionality on your switch is based on the requirements defined in of RFC 3176 and its updates defined in the sFlow version 5 memo dated July 2004. This memo can be found at the web site, www.sflow.org/sflow_version_5.txt.

The terms defined in **Table 107-1** are used to describe the agent and its functionality on your switch:

Table 107-1: sFlow Terminology

sFlow® Component	Definition
Network Device	Typically either a network switch or router that has the ability to forward frames across an Ethernet network; or between Ethernet networks, in the case of a router.
Data Source (sFlow Source Port)	The location of a sampling point within the switch. This is typically a switch port.
Packet Flow	The path taken by the data (frames) as they traverse a network device.
Sampling Rate	The ratio of frames passing through the data source, to those captured and forwarded as sFlow data. See sflow sampling-rate command on page 108.13 .
Counter Sampling	The periodic polling of counters taken at the data source.
sFlow Datagram	A UDP datagram that contains details of sFlow captured data, and counters sent by the sFlow Agent to its Collector.

The sFlow agent (switch) uses sampling technology to derive traffic statistics from its monitored ports. Samples are taken at the sFlow source ports. After collecting its information, the switch then packetizes its samples and statistical data, and sends both to a remote sFlow collector.

Sampling Methods

Two sampling methods are employed within the sFlow agent, frame sampling, and counter sampling. Both sample types are combined within the datagrams sent to the collector. The frame sample data will result in a relatively constant traffic stream, but the counter information is sent where it can fill available space within each datagram. Datagrams are normally sent to the collector at the rate of one each second. However, several datagrams can be sent in rapid succession, where more information exists than can be sent in a single datagram.

Frame Sampling

As frames enter or leave an sFlow source port, they are sampled at a rate determined by the **sflow sampling-rate** command on page 108.13 for that particular port.

Sampling occurs every N frames (on average), where N is the rate value set via **sflow sampling-rate** command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000, will sample one frame in every 1000 frames received, one in every 1000 frames sent from the specified port.

Caution

Setting the sFlow sampling rate to a very low value (frequent sampling) can place a heavy load on the switch's CPU. The severity of this loading will increase with the number of ports configured for sampling, the port speeds, and their data sampling rates.

Data Confidentiality

Sampling operates by capturing the initial portion of frames (statistically) selected. The portion sampled is set by the **sflow max-header-size** command on page 108.10, or SNMP. If the **maximum header size** is greater than the actual headers in the sampled frames, then portions of the user data (payload) will also be captured and encapsulated in the datagrams sent to the collector. The amount of user data captured can be minimized by careful selection of the maximum header size.

Counter Polling

The function of counter polling is to provide snapshots of various system counters. This produces a series of data counter sets for each port, which can be independently polled at user defined rates, and sent (once a second or less) to the collector. Allied Telesis switches running AlliedWare Plus software support generic interface counters only. For more information on the data types included in the sampling count, see **"sFlow Datagrams"** on page 107.8.

The sFlow Collector

The sFlow collector receives traffic samples and counter information from a number of sFlow agents. These samples are received as a series of UDP datagrams. From the data contained within these datagrams, the collector is able to provide statistical and or graphical information of network traffic.

The sFlow agent application on your switch supports only a single collector configuration.

sFlow collectors are proprietary third party products. Your switch, running as an sFlow agent has been designed for interoperability with any sFlow collector that supports the sFlow Version 5 specification, including the inMon sFlow collector.

The sFlow Collector may also contain an SNMP Manager that is able to configure sFlow on its agent switches.

Configuring sFlow on your Switch

This section provides some guidelines for setting up the sFlow® agent on your switch. sFlow can be configured directly on your switch - using the CLI, or it can be configured via an SNMP manager. The SNMP management function can be carried out either by a the sFlow collector, or a separate SNMP manager. The configuration examples in this section are shown using the CLI.

Caution

The sFlow configurations set either by the switch's CLI, or the sFlow collector. Sometimes the collector will override the sFlow settings that were initially configured by the CLI, in order to apply "its" own default settings.

If you want to apply the sFlow settings set by the CLI, or by an external network management system, then turn off network management at the collector.

We also advise that as part of your sFlow commissioning process, you review your security access procedures relating to sFlow access and its data traffic management.

sFlow configuration can vary greatly with your overall configuration, data profile, and monitoring intensity. Also, many interdependencies existing between parameter settings. For this reason, few firm configuration settings are recommended in this software reference, but instead these parameter relationships are explained and some typical configuration examples are shown.

The default settings on your switch have sFlow turned off for all ports. The following commands are used to setup and configure sFlow on your switch. These are introduced in the order in which you would logically need to use them.

sFlow Command	Functionality
sflow enable	enables sFlow on your switch (or stack).
sflow max-header-size	sets the maximum sFlow data capture size.
sflow collector max-datagram-size	sets the maximum size for the agent to collector datagrams.
sflow agent (address)	sets the sFlow agent IP address on the switch.
sflow polling-interval	sets the counter polling interval for specified ports.
sflow sampling-rate	sets the mean sampling rate for specified ports.
sflow collector (address)	the sFlow agent's collector IP address and/or UDP port.

Configuration Procedure

The following process sets out a systematic procedure to configure sFlow on your switch:

Information Gathering

sFlow configuration is dependant on your network structure and its data. Start by gathering together the following information.

- Obtain (or determine) the sFlow collector IP address.
- Select an appropriate UDP port for your sFlow datagrams. The recommended value is 6343, and is the default value preconfigured on your switch.
- Select an appropriate IP address for your sFlow agent. We recommend that you use the local IP address of your switch. For more information on local addresses and how to set them up, see the [interface \(to configure\) command on page 12.3](#).
- Assess the sensitivity of the data that your sFlow agent will be sampling.
- Obtain details of the protocols that your sFlow agent will be sampling. If you intend sampling unusual or proprietary protocols, obtain details of their header lengths.
- Calculate the most appropriate max-header-size for your sFlow sampling.
- Select the ports that you want to sample, and their sample rate. These two factors vary (not quite) proportionally; so if you double the number of ports and double your sampling rate (i.e. sample half as many frames) then you will “almost” return to your earlier situation. Also note the speeds of the ports you have selected, because - for the same port utilization - the faster the port speed, the greater the load on the CPU.
- Review the speed of the port used to transport the sFlow datagrams to the collector. Unless configured to a specific port, the collector traffic will share the same network port with other traffic.

The capacity of the collector port should be sufficient to carry the volume of sFlow traffic. This topic is expanded on in the later in this chapter.

Managing the sFlow processing overhead

The sFlow data sampled on the ports converges into the CPU for processing and UDP packetizing. Therefore one of the major factors when configuring sFlow is to prevent the sFlow data volumes from placing a significant overhead on the CPU processing. The two most significant factors here are, the **number of ports sampled**, and the **sampling rate**. The other (and lessor) factors in this equation are the **frame size distribution** and the **maximum header size**. The shorter the frames are on the network, the heavier the sFlow processing load will be (for the same number of frames per second). Conversely the shorter the maximum header size selected, the lighter the sFlow processing load will be (because less data per frame is sent to the CPU).

sFlow Datagrams

After data sampling and counter information has been gathered, each sFlow agent packetizes the data and sends it to an sFlow collector where it can be analyzed and displayed in charts and tables etc.

This packetized data is sent to the collector in UDP datagrams. These datagrams bear the IP address of the collector and the port number 6343. Using a standardized port helps to avoid configuration problems between the sFlow agents and collectors.

Although an analysis of the sFlow datagrams is outside the scope of this document, some basic information is provided here for those interested in knowing the basic components of the sFlow datagrams. The full specification of the sFlow protocol can be found at www.sflow.org/sflow_version_5.txt.

sFlow datagrams comprise three basic components:

- Datagram header information
- Flow sample information - may contain several samples
- Counter statistical information - fitted in where space permits

Figure 107-2: sFlow Datagram Encapsulation

The content of these datagram components is listed below:

sFlow Header Fields

- Version (The sFlow version being used)
- IP Address Type (Can be either an IPv4 or IPv6 address type)
- Source IP Address (The IP address of the sFlow agent)
- Sequence Number (The datagram sequence number)
- System Up-time
- Sample Count (The number of samples in the datagram)
- Sample Dataset

sFlow Flow Sample Fields

- Flow Sample 1 (The first sample)
- Sample Type (Flow Sample, 0x0001)
- Sample Sequence Number (of flow samples)
- Sampler ID
- Sampling Rate (as set by the **“sflow sampling-rate”** on page 108.13 or SNMP)
- Sample Pool (the total number of packets that could have been sampled)
- Packets Dropped (the number of packets dropped, due to a lack of resources)
- Input (the interface that the packet was received on - not supported)
- Output (the index number of the interface that the packet was sent from)
(Note that your collector should have the ability via SNMP to resolve index numbers to physical port numbers)
- Packet Type
- Header Protocol - Ethernet ISO 88023(1)
- Packet Size (Frame Length including the FCS)
- Header Length - The sampled portion of the frame as set by the **“sflow max-header-size”** on page 108.10. May be shorter for small frames.
- Header Bytes

- Extended Elements Number
- Extended Elements

Note that in practice the Ethernet header is usually followed by components for the IP, TCP, and user data.

sFlow Flow Sample Fields

- Counter Sample
- Sample Type (Counter Sample, 0x0002)
- 'Sample Sequence Number
- Sample ID (source ID index value)
- Sample Interval (as set by the **"sflow polling-interval"** on page 108.12)
- Counter Type (1=generic, 2=Ethernet)

Generic Interface Counters

- ifIndex
- ifType
- ifSpeed
- ifDirection (0=unknown, 1=full-duplex, 2=half-duplex, 3=in, 4=out)
- ifStatus
- InOctets
- InUcastpackets
- InMulticast packets
- InBroadcast packets
- InDiscarded packets (= 0)
- InPackets containing errors
- InPackets containing unknown protocols (= 0)
- OutOctets
- OutUcast packets
- OutMulticast packets
- OutBroadcast packets
- OutDiscarded packets
- OutPackets containing errors
- ifPromiscuous Mode

Ethernet Interface Counters

- dot3Stats Alignment Errors (= 0)
- dot3Stats FCS Errors
- dot3Stats Single Collision Frames (= 0)
- dot3Stats Multiple Collision Frames
- dot3Stats SQE Test Errors
- dot3Stats Deferred Transmissions (= 0)
- dot3Stats Late Collisions
- dot3Stats Excessive Collisions
- dot3Stats Internal Mac Transmit Errors
- dot3Stats Carrier Sense Errors (= 0)
- dot3Stats Frame Too Longs
- dot3Stats Internal Mac Receive Errors
- dot3Stats Symbol Errors (= 0)

The sFlow MIB

Your switch fully supports inMon's sFlow MIB. For more information, see **"Private MIBs"** on page 96.79, and the website www.sflow.org/SFLOW-MIB5.txt.

Command List

This chapter provides an alphabetical reference for sFlow commands.

debug sflow

This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

Syntax `debug sflow [interface <port-list>] [sampling][polling]`
`no debug sflow [interface <port-list>] [sampling][polling]`

Parameter	Description
interface	Interface information.
<port-list>	The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: <ul style="list-style-type: none"> ■ a switch port (e.g. port1.1.12) ■ a continuous range of ports separated by a hyphen, e.g. port1.1.1-1.1.24 ■ a comma-separated list of ports and port ranges, e.g. port1.1.1,port1.1.4-1.2.24.
sampling	Debug sFlow sampling for the specified port(s).
polling	Debug sFlow polling for the specified port(s).

Default The sFlow sampling and or polling debug is disabled.

Mode Privileged Exec

Examples To enable sFlow debug message logging for polling and sampling on port1.1.1 and port1.1.7, use the commands:

```
awplus# debug sflow interface port1.1.1,port1.1.7 sampling
polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

Related Commands [show debugging sflow](#)
[no debug all](#)

debug sflow agent

This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

Syntax `debug sflow agent`

`no debug sflow agent`

Default The sFlow agent debug message logging (that is not port specific) is disabled.

Mode Privileged Exec

Example To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

Related Commands [show debugging sflow](#)
[debug sflow](#)

sflow agent (address)

This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then use this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommended that you set the sFlow® agent IP address to be the **local address**¹ that is configured on the switch. This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of VLAN interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

Syntax `sflow agent {ip <ip-address>|ipv6 <ipv6-address>}`
`no sflow agent {ip|ipv6}`

Parameter	Description
<code><ip-address></code>	The IPv4 address of the switch that is acting as the sFlow agent.
<code><ipv6-address></code>	The IPv6 address of the switch that is acting as the sFlow agent. The IPv6 address uses the format X:X::X:X.

Default The sFlow agent address is unset.

Mode Global Configuration

Examples To set the sFlow agent (IPv4) address to 192.0.2.23, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to 2001:0db8::1, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

1. For information on local addresses and how to set them up, see the [interface \(to configure\) command on page 12.3](#).

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

Related Commands [show running-config sflow](#)
 [show sflow](#)

sflow collector (address)

This command sets the sFlow® agent's collector IP address and/or UDP port. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address. Note that sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 (for IPv4) or :: (for IPv6).

The **no** variant of this command returns the IP address and UDP port values to their defaults, which will result in sFlow being deactivated.

Syntax `sflow collector {[ip <ip-address>|ipv6 <ipv6-address>]|
[port <1-65535>]}`
`no sflow collector {[ip|ipv6]|[port]}`

Parameter	Description
<ip-address>	IPv4 address of the remote sFlow collector.
<ipv6-address>	IPv6 address of remote sFlow collector. The IPv6 address uses the format X:X::X:X.
port	Destination UDP port for sFlow datagrams sent to the collector.
<1-65535>	UDP port number (default: 6343).

Default The collector address is 0.0.0.0 (which renders sFlow inactive), and the UDP port is 6343.

Mode Global Configuration

Examples To set the sFlow collector address to 192.0.2.25 and UDP port to 9000, use the command:

```
awplus# configure terminal
awplus(config)# sflow collector ip 192.0.2.25 port 9000
```

To remove the sFlow collector IPv4 address and leave the UDP port unchanged, use the command:

```
awplus# configure terminal
awplus(config)# no sflow collector ip
```

To remove the sFlow collector IPv4 address and to remove the UDP port, use the command:

```
awplus# configure terminal
awplus(config)# no sflow collector ip port
```

To set the sFlow collector address to 2001:0db8::1 and leave the UDP port unchanged, use the command:

```
awplus# configure terminal
awplus(config)# sflow collector ipv6 2001:0db8::1
```

To remove the sFlow collector IPv6 address and leave the UDP port unchanged, use the command:

```
awplus# configure terminal
awplus(config)# no sflow collector ipv6
```

To remove the sFlow collector IPv6 address and to remove the UDP port, use the command:

```
awplus# configure terminal
awplus(config)# no sflow collector ipv6 port
```

Related Commands [show running-config sflow](#)
[show sflow](#)

sflow collector max-datagram-size

This command sets the maximum size of the sFlow® datagrams sent to the collector.

The **no** variant of this command resets the maximum-datagram-size to the default.

Syntax `sflow collector max-datagram-size <200-1500>`

`no sflow collector max-datagram-size`

Parameter	Description
<code><200-1500></code>	The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector.

Default 1400 bytes

Mode Global Configuration

Example To set the maximum datagram size to 1200, use the command:

```
awplus# configure terminal
awplus(config)# sflow collector max-datagram-size 1200
```

Related Commands [show running-config sflow](#)
[show sflow](#)

sflow enable

This command enables sFlow® globally on the switch.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

Syntax sflow enable

no sflow enable

Default sFlow is disabled globally on the switch.

Mode Global Configuration

Example To enable sFlow operation, use the command:

```
awplus# configure terminal
awplus(config)# sflow enable
```

Related Commands [show running-config sflow](#)
[show sflow](#)

sflow max-header-size

This command sets the maximum header size of the ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the ethernet destination address and excludes the ethernet FCS fields.

If a sampled ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

Syntax `sflow max-header-size <14-200>`

`no sflow max-header-size`

Parameter	Description
<code><14-200></code>	The maximum number of header bytes to be sampled.

Default The max-header-size is 128 bytes.

Mode Interface Configuration

Usage The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv4 header = 24 bytes

TCP header = 24 bytes

Total = 66 bytes

A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv6 header = 40 bytes

TCP header = 24 bytes

Total = 82 bytes

Caution In the above network scenarios:

- For IPv4 - any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to $128-66=62$ bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.
- For IPv6 - any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to $128-82=46$ bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

Example To set the maximum header size to 160 bytes for ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# sflow max-header-size 160
```

Related Commands [show running-config sflow](#)
[show sflow interface](#)
[sflow max-header-size](#)

sflow polling-interval

This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

Syntax `sflow polling-interval {0|<1-16777215>}`
`no sflow polling-interval`

Parameter	Description
0	Disable polling (the default).
<1-16777215>	The polling interval in seconds.

Default The polling-interval is 0 (polling disabled).

Mode Interface Configuration

Example To set the polling interval to 60 seconds for ports 1.1.1 and 1.1.7, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# sflow polling-interval 60
```

Related Commands [show running-config sflow](#)
[show sflow interface](#)

sflow sampling-rate

This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received. One in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified ports.

The **no** variant of this command applies the default.

Parameter	Description
0	Sets the default.

Default The sampling-rate is 0 (sampling disabled).

Mode Interface Configuration

Example To set the sampling rate to 500 for ports 1.1.1 and 1.1.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.1.1,port1.1.7
awplus(config-if)# sflow sampling-rate 500
```

Related Commands [show running-config sflow](#)
[show sflow interface](#)

show debugging sflow

This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

Syntax `show debugging sflow [interface <port-list>]`

Parameter	Description
interface	The interface information.
<port-list>	The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: <ul style="list-style-type: none"> ■ a switch port (e.g. port1.1.12) ■ a continuous range of ports separated by a hyphen, e.g. port1.1.1-1.1.24 ■ a comma-separated list of ports and port ranges, e.g. port1.1.1, port1.1.5-1.1.24.

Mode User Exec and Privileged Exec

Example To display sFlow debug settings on the agent, and for sampling and polling on ports 1.1.1 to 1.1.9, use the command:

```
awplus# show debugging sflow interface port1.1.1-1.1.9
```

Output **Figure 108-1: Sample obtained for an sFlow agent**

```
awplus# show debugging sflow interface port1.1.1-1.1.9
```

sFlow Agent Debug: Enabled		
Port	Sampling Debug	Polling Debug
1.1.1	Enabled	Enabled
1.1.2	Enabled	-
1.1.3	-	-
1.1.4	-	-
1.1.5	-	-
1.1.6	-	Enabled
1.1.7	-	-
1.1.8	-	Enabled
1.1.9	-	Enabled

To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

Related Commands [show running-config sflow](#)
[show sflow interface](#)

show running-config sflow

This command displays the running system information specific to the sFlow feature.

Syntax show running-config sflow

Mode Privileged Exec and Global Configuration

Example To display the sFlow running configuration information, use the command:

```
awplus# show running-config sflow
```

Output **Figure 108-2: Example output from the show running-config sflow command**

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.1.11-port1.1.22
  sflow sampling-rate 512
```

Related Commands [show running-config](#)

show sflow

This command displays non-port-specific sFlow agent configuration and operational status.

Syntax show sflow

Mode Privileged Exec

Example To display sFlow configuration and operational status, use the command:

```
awplus# show sflow
```

Output

Figure 108-3: Example output from the show sflow command

```
sFlow Agent Configuration:                               Default Values
sFlow Admin Status ..... Disabled                    [Disabled]
sFlow Agent Address ..... [not set]                  [not set]
Collector Address ..... 0.0.0.0                      [0.0.0.0]
Collector UDP Port ..... 6343                       [6343]
Tx Max Datagram Size ..... 1200                     [1400]

sFlow Agent Status:
Polling/sampling/Tx ..... Inactive because:
- sFlow is disabled
- Agent Addr is not set
- Collector Addr is 0.0.0.0
- Polling & sampling disabled
  on all ports
```

Table 108-1: Parameters in the output of the show sflow command

Output Parameter	Description
sFlow Admin Status	Whether sFlow agent operation is administratively enabled.
sFlow Agent Address	The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.
Collector Address	The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0::0.0.
Collector UDP Port	The UDP port on the collector to which sFlow datagrams are sent.
Tx Max Datagram Size	The maximum size of the sFlow datagrams sent to the collector.
Polling/sampling/Tx	Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed.

Related Commands [show running-config sflow](#)
[show sflow interface](#)

show sflow interface

This command displays sFlow agent sampling and polling configuration for specified ports.

Syntax `show sflow interface <ifrang>`

Parameter	Description
<ifrang>	The interface range.

Mode Privileged Exec

undebug sflow

This command applies the functionality of the **no debug sflow** command.

Appendix B: Changes in Versions 5.4.3-3.x

This appendix lists the changes made in Versions 5.4.3-3.x.

- **New or Changed Features:** (Table B-1 on page B.1)
- **New or Changed Commands:** (Table B-2 on page B.1)

Clicking on a topic in the Feature column will take you to the appropriate section of the manual.

Table B-1: New or Changed Features

Feature	Status	Chapter / Section	Description
USB support	New	Creating and Managing Files	Support for secure USB storage devices has been added.
BGP and BGP4+ Overview	New	BGP and BGP4+ Introduction	BGP4+ for IPv6 (RFC 2283 Multiprotocol Extensions for BGP-4) is supported with BGP4 for IPv4 (RFC 1654) as an exterior gateway protocol (EGP) in this release of AlliedWare Plus. See related chapters for sample configurations and command descriptions.
Web-authentication user name and password length extension	Modified	Authentication Introduction and Configuration	The maximum length of the user name and password is 64 characters. The local RADIUS server has a password length limit of 31 characters. 8
Introduction	New	AMF Introduction and Configuration	The Allied Telesis Management Framework (AMF) is a suite of features that combine to simplify network management across all supported network switches from the core to the edge.

Table B-2: New or Changed Commands

Command Name	Status	Chapter / Section	Description
dir	Modified	File Management Commands	This command has been modified with the addition of the sort and card parameters.
address-family (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now enters the IPv6 Address Family Configuration command mode with the new ipv6 parameter, in addition to the IPv4 Address Family Configuration mode with the existing ipv4 parameter. In this mode you can configure address-family specific parameters.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
aggregate-address (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command has been modified for BGP4+ to optionally use an IPv6 prefix and length to add an aggregate route that can be advertised to BGP4+ neighbors. This command creates an aggregate entry in the BGP4+ routing table if the switch learns, by any means, any routes that are within the range configured by the aggregate address/mask.
bgp router-id (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configure the router identifier for BGP and BGP4+. Note you must specify an IPv4 address with this when used for BG4+.
clear bgp (IPv4 or IPv6 address) (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	You can now use this command to reset the BGP4+ and BGP connection for specified peers with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
clear ip bgp (IPv4) (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the clear ip bgp command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
clear ip bgp dampening (BGP)	New	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.
clear ip bgp flap-statistics (BGP)	New	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.
clear bgp (ASN) (BGP and BGP4+)	New	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.
clear bgp external (BGP and BGP4+)	New	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.
clear ip bgp peer-group (BGP)	New	BGP and BGP4+ Commands	The unicast and multicast parameter options have been removed in this release.
clear bgp ipv6 (ipv6 address) (BGP4+)	New	BGP and BGP4+ Commands	Use this command to reset the BGP4+ connection to the peer specified by the IP address.
clear bgp ipv6 dampening (BGP4+)	New	BGP and BGP4+ Commands	Use this command to clear route dampening information and unsuppress routes that have been suppressed routes.
clear bgp ipv6 flap-statistics (BGP4+)	New	BGP and BGP4+ Commands	Use this command to clear the flap count and history duration for the specified prefixes.
clear bgp ipv6 (ASN) (BGP4+)	New	BGP and BGP4+ Commands	Use this command to reset the BGP4+ connections to all peers in a specified Autonomous System Number (ASN).
clear bgp ipv6 external (BGP4+)	New	BGP and BGP4+ Commands	Use this command to reset the BGP4+ connections to all external peers.
clear bgp ipv6 peer-group (BGP4+)	New	BGP and BGP4+ Commands	Use this command to reset the BGP4+ connections to all members of a peer group.
exit-address-family (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now exits either the IPv6 or the IPv4 Address Family Configuration command mode.
neighbor activate (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now enables the exchange of BGP IPv4 and BGP4+ IPv6 routes with a BGP or BGP4+ neighboring router, and also within an IPv4 or an IPv6 specific address-family.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
neighbor advertisement-interval (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now sets up the minimum interval between sending the BGP or BGP4+ routing updates.
neighbor allow-as-in (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now accepts an AS-path with the specified Autonomous System (AS) number from inbound updates for both BGP and BGP4+ routes.
neighbor as-origination-interval (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now enables the sending of AS (Autonomous System) origination routing updates to the specified BGP or BGP4+ neighbor.
neighbor attribute-unchanged (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now advertises unchanged BGP or BGP4+ attributes to the specified BGP or BGP4+ neighbor.
neighbor capability graceful-restart (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now configures the device to advertise the Graceful Restart Capability to BGP and BGP4+ neighbors.
neighbor capability orf prefix-list (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now advertises the OSF (Outbound Route Filters) capability to BGP and BGP4+ neighbors.
neighbor capability route-refresh (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now advertises the route-refresh capability to the specified BGP and BGP4+ neighbors.
neighbor collide-established (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command specifies a BGP or BGP4+ neighbor, which is already in an 'established' state, for conflict resolution when a TCP connection collision is detected.
neighbor default-originate (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now allows a BGP or BGP4+ local router to send the default route, 0.0.0.0, to a neighbor.
neighbor description (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now associates a description with a BGP or a BGP4+ neighbor.
neighbor disallow-infinite-holdtime (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now disallows the configuration of infinite holdtime for BGP and BGP4+.
neighbor distribute-list (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now filters route updates from a particular BGP or BGP4+ neighbor using an Access Control List (ACL).
neighbor dont-capability-negotiate (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now disables capability negotiation for BGP and BGP4+.
neighbor ebgp-multihop (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now accepts and attempts BGP and BGP4+ connections to external peers on indirectly connected networks.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
neighbor enforce-multihop (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now enforces the requirement that BGP and BGP4+ neighbors form multihop connections.
neighbor filter-list (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now creates a BGP or a BGP4+ filter using an AS (Autonomous System) path list.
neighbor interface (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now configures the interface name of a BGP and a BGP4+ speaking neighbor.
neighbor local-as (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures a local AS number for the specified BGP or BGP4+ neighbor.
neighbor maximum-prefix (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now controls the number of prefixes that can be received from a BGP or a BGP4+ neighbor.
neighbor default-originate (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now allows a BGP or BGP4+ local router to send the default route, 0.0.0.0, to a neighbor.
neighbor description (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now associates a description with a BGP or a BGP4+ neighbor.
neighbor disallow-infinite-holdtime (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now disallows the configuration of infinite holdtime for BGP and BGP4+.
neighbor distribute-list (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now filters route updates from a particular BGP or BGP4+ neighbor using an Access Control List (ACL).
neighbor dont-capability-negotiate (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now disables capability negotiation for BGP and BGP4+.
neighbor ebgp-multihop (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now accepts and attempts BGP and BGP4+ connections to external peers on indirectly connected networks.
neighbor enforce-multihop (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now enforces the requirement that BGP and BGP4+ neighbors form multihop connections.
neighbor filter-list (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now creates a BGP or a BGP4+ filter using an AS (Autonomous System) path list.
neighbor interface (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now configures the interface name of a BGP and a BGP4+ speaking neighbor.
neighbor local-as (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures a local AS number for the specified BGP or BGP4+ neighbor.
neighbor maximum-prefix (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now controls the number of prefixes that can be received from a BGP or a BGP4+ neighbor.
neighbor default-originate (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now allows a BGP or BGP4+ local router to send the default route, 0.0.0.0, to a neighbor.
neighbor description (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now associates a description with a BGP or a BGP4+ neighbor.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
neighbor disallow-infinite-holdtime (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now disallows the configuration of infinite holdtime for BGP and BGP4+.
neighbor distribute-list (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now filters route updates from a particular BGP or BGP4+ neighbor using an Access Control List (ACL).
neighbor dont-capability-negotiate (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now disables capability negotiation for BGP and BGP4+.
neighbor ebgp-multihop (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now accepts and attempts BGP and BGP4+ connections to external peers on indirectly connected networks.
neighbor enforce-multihop (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now enforces the requirement that BGP and BGP4+ neighbors form multihop connections.
neighbor filter-list (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now creates a BGP or a BGP4+ filter using an AS (Autonomous System) path list.
neighbor interface (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now configures the interface name of a BGP and a BGP4+ speaking neighbor.
neighbor local-as (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures a local AS number for the specified BGP or BGP4+ neighbor.
neighbor maximum-prefix (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now controls the number of prefixes that can be received from a BGP or a BGP4+ neighbor.
neighbor default-originate (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now allows a BGP or BGP4+ local router to send the default route, 0.0.0.0, to a neighbor.
neighbor description (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now associates a description with a BGP or a BGP4+ neighbor.
neighbor disallow-infinite-holdtime (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now disallows the configuration of infinite holdtime for BGP and BGP4+.
neighbor distribute-list (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now filters route updates from a particular BGP or BGP4+ neighbor using an Access Control List (ACL).
neighbor dont-capability-negotiate (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now disables capability negotiation for BGP and BGP4+.
neighbor ebgp-multihop (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now accepts and attempts BGP and BGP4+ connections to external peers on indirectly connected networks.
neighbor enforce-multihop (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now enforces the requirement that BGP and BGP4+ neighbors form multihop connections.
neighbor filter-list (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now creates a BGP or a BGP4+ filter using an AS (Autonomous System) path list.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
neighbor interface (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now configures the interface name of a BGP and a BGP4+ speaking neighbor.
neighbor local-as (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures a local AS number for the specified BGP or BGP4+ neighbor.
neighbor maximum-prefix (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now controls the number of prefixes that can be received from a BGP or a BGP4+ neighbor.
neighbor next-hop-self (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now configures the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.
neighbor override-capability (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now overrides a capability negotiation result for BGP and BGP4+.
neighbor passive (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures the local BGP or BGP4+ router to be passive to the specified BGP or BGP4+ neighbor.
neighbor password (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now enables MD5 authentication on a TCP connection between BGP and BGP4+ neighbors.
neighbor peer-group (add a neighbor) (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now adds a BGP or a BGP4+ neighbor to an existing peer-group.
neighbor peer-group (create a peer-group) (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now creates a peer-group for BGP and BGP4+.
neighbor port (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now specifies the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor.
neighbor prefix-list (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now distributes BGP and BGP4+ neighbor information as specified in a prefix list.
neighbor remote-as (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.
neighbor restart-time (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures a different restart-time from the global restart-time configured using the bgp graceful-restart command for BGP and BGP4+.
neighbor route-map (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now applies a route map to incoming or outgoing routes for BGP and BGP4+.
neighbor next-hop-self (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now configures the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.
neighbor override-capability (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now overrides a capability negotiation result for BGP and BGP4+.
neighbor passive (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures the local BGP or BGP4+ router to be passive to the specified BGP or BGP4+ neighbor.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
neighbor password (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now enables MD5 authentication on a TCP connection between BGP and BGP4+ neighbors.
neighbor peer-group (add a neighbor) (BGP and BGP+)	Modified	BGP and BGP4+ Commands	This command now adds a BGP or a BGP4+ neighbor to an existing peer-group.
neighbor peer-group (create a peer-group) (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now creates a peer-group for BGP and BGP4+.
neighbor port (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now specifies the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor.
neighbor prefix-list (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now distributes BGP and BGP4+ neighbor information as specified in a prefix list.
neighbor remote-as (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.
neighbor restart-time (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures a different restart-time from the global restart-time configured using the bgp graceful-restart command for BGP and BGP4+.
neighbor route-map (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now applies a route map to incoming or outgoing routes for BGP and BGP4+.
neighbor next-hop-self (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now configures the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.
neighbor override-capability (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now overrides a capability negotiation result for BGP and BGP4+.
neighbor send-community (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now specifies that a community attribute should be sent to a BGP or BGP4+ neighbor.
neighbor shutdown (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now disables a peering relationship with a BGP or BGP4+ neighbor.
neighbor soft-reconfiguration inbound (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now configures the switch to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor.
neighbor timers (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now sets the keepalive, holdtime, and connect timers for a specific BGP or BGP4+ neighbor.
neighbor transparent-as (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now specifies not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.
neighbor transparent-nexthop (BGP and BGP4+)	Modified	BGP and BGP4+ Commands	This command now specifies to keep the nexthop value of the route if the BGP or BGP4+ peer is an eBGP peer.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
neighbor unsuppress-map (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now selectively leaks more specific routes to a particular BGP or BGP4+ neighbor.
neighbor update- source (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now specifies the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface.
neighbor weight (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now sets default weights for routes from this BGP or BGP4+ neighbor.
network (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now specifies particular routes to be redistributed into the BGP or BGP4+ routing process.
network synchronization (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command now ensures the exact same static network prefix, specified through any of the network commands, is local or has IGP reachability before introduction to BGP or BGP4+.
show bgp ipv6 (BGP4+)	New	BGP and BGP4+ Commands	This command displays BGP4+ network information for a specified IPv6 address.
show ip bgp attribute-info (BGP)	New	BGP and BGP4+ Commands	This command displays routes that match specified communities within an IPv6 environment.
show ip bgp community-info (BGP)	New	BGP and BGP4+ Commands	This command display routes that match the given community-list within an IPv6 environment.
show bgp ipv6 dampening (BGP4+)	New	BGP and BGP4+ Commands	This command shows dampened routes from a BGP4+ instance.
show bgp ipv6 filter-list (BGP4+)	New	BGP and BGP4+ Commands	This command displays routes conforming to the filter-list within an IPv6 environment.
show bgp ipv6 inconsistent-as (BGP4+)	New	BGP and BGP4+ Commands	This command displays routes with inconsistent AS Paths within an IPv6 environment.
show bgp ipv6 longer-prefixes (BGP4+)	New	BGP and BGP4+ Commands	This command displays the route of the local BGP4+ routing table for a specified prefix with a specific mask, or for any prefix having a longer mask than the one specified.
show bgp ipv6 neighbors (BGP4+)	New	BGP and BGP4+ Commands	This command displays detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.
show bgp ipv6 paths (BGP4+)	New	BGP and BGP4+ Commands	This command displays BGP4+ path information within an IPv6 environment.
show bgp ipv6 prefix-list (BGP4+)	New	BGP and BGP4+ Commands	This command displays routes matching the prefix-list within an IPv6 environment.
show bgp ipv6 quote-regexp (BGP4+)	New	BGP and BGP4+ Commands	This command displays routes matching the AS path regular expression stated in quotes within an IPv6 environment.
show bgp ipv6 regexp (BGP4+)	New	BGP and BGP4+ Commands	This command displays routes matching the AS path regular expression without using quotes within an IPv6 environment.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
show bgp ipv6 route-map (BGP4+)	New	BGP and BGP4+ Commands	This command to display BGP4+ routes that match the specified route-map within an IPv6 environment.
show bgp ipv6 summary (BGP4+)	New	BGP and BGP4+ Commands	This command displays a summary of BGP4+ neighbor status within an IPv6 environment.
show ip bgp neighbors (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors connection-retrytime (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors connection-retrytime command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors hold-time (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors hold-time command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors keepalive (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors keepalive command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors keepalive-interval (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors keepalive-interval command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors notification (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors notification command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors open (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors open command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors rcvd-msgs (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors rcvd-msgs command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors sent-msgs (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors sent-msgs command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
show ip bgp neighbors update (BGP)	Modified	BGP and BGP4+ Commands	IPv6 address and IPv4 address parameters are available with the show ip bgp neighbors update command with BGP4+ feature licensing for IPv6 available since AlliedWare Plus 5.4.3-2.5 release.
synchronization (BGP and BGP4+)	New	BGP and BGP4+ Commands	This command enables IGP (Internal Gateway Protocol) synchronization of Internal BGP4+ (iBGP) learned routes with the IGP system in the Router Configuration mode or in the IPv6 Address Family Configuration mode.

Table B-2: New or Changed Commands (cont.)

Command Name	Status	Chapter / Section	Description
show dot1x	Modified	802.1X Commands	This command displays authentication information for 802.1X port authentication. It now includes output for the new command auth connect-timeout period ..
show dot1x interface	Modified	802.1X Commands	This command displays authentication information for 802.1X port authentication. It now includes output for the new command auth connect-timeout period ..
auth timeout connect-timeout	New	Authentication Commands	This command sets the connect-timeout period for the interface. 21
show counter dhcp-server	Modified	Dynamic Host Configuration Protocol (DHCP) Commands	This command shows counters for the DHCP server on your device and is now available from both the User Exec and the Privileged Exec mode. Also note that counters for DHCP Lease Query messages from the DHCP Server to DHCP Relay Agents are no longer shown.

Introduction

This appendix describes how to install, configure and use the Graphical User Interface (GUI) on switches running the AlliedWare Plus™ OS. The GUI provides extensive monitoring and essential configuration functionality for Allied Telesis switches via a web browser. This document explains how to install the GUI using either a USB storage device or via a TFTP server.

The GUI functionality is provided via a Java applet file. Before you can use the GUI to manage your switches, you must download the Java applet file, and install it to your switch's Flash file system.

Once the Java applet file is present in your switch's Flash, no specific commands are required to enable the GUI, or to inform the switch which Java applet file to use. Instead, when an incoming browser connection is established with the switch, the switch will automatically send the most recent compatible Java applet file that is present in its Flash file system.

Different versions of the Java applet file will be compatible with different versions of the AlliedWare Plus™ OS. The AlliedWare Plus™ OS automatically determines if a Java applet file is compatible, so the Java applet file that is delivered to your browser will always be compatible with the AlliedWare Plus™ OS version running on the switch to which you have connected.

Note which products and software version the GUI works with, along with PC and browser specifications listed. You may need to install and run the latest Java Runtime Environment that you can download from the Sun site so your browser can fully support the GUI Java applet.

Installing the GUI and setting the switch

This section shows you how to install and setup the AlliedWare Plus™ GUI on your switch.

System Requirements

To install and run the AlliedWare Plus™ GUI you will require the following system products and setup:

- PC Platform:
Windows XP SP2 and up / Windows Vista SP1 and up
- Browser: (must support Java Runtime Environment (JRE) version 6)
Microsoft Internet Explorer 7.0 and up / Mozilla Firefox 2.0 and up

Installing the GUI to your switch using a USB storage device

Step 1: Download a GUI Java applet

AlliedWare Plus™ Operating System software from the Software Download area of the Allied Telesis Website: <http://www.alliedtelesis.com/support/software/restricted>. Login using your assigned Email Address and Password.

Download the Java applet file. This file will have a .zip file name extension. You need to extract the Java .jar file from the compressed .zip file. The version number of the software applet file (.jar) gives the earliest version of the software file (.rel) that the GUI can operate with.

Step 2: Copy the GUI Java applet .jar file on a USB storage device to flash memory

Insert the USB storage device into the switch. Connect to the management port, then login to the switch.

Copy the GUI Java applet to your switch, using the below commands:

```
awplus# copy usb:<filename.jar> flash:/
```

Where <filename.jar> is the GUI Java applet file you downloaded in Step 1.

Note Where the GUI file is not in the root directory of the USB flash drive, you must enter the full path to the GUI file. For example, where the GUI file resided in the folder gui_files, you would enter the command:
copy usb:/gui_files/filename.jar flash:/

Installing the GUI to your switch via TFTP server

Step 1: Download a GUI Java applet file from the support site:

The GUI Java applet file is available in a compressed (.zip) file with the AlliedWare Plus™ Operating System software from the Support area of the Allied Telesis Website: <http://www.alliedtelesis.com>. Download the Java applet file. This file will have a .zip file name extension. You need to extract the Java .jar file from the compressed .zip file. The version number of the software applet file (.jar) gives the earliest version of the software file (.rel) that the GUI can operate with.

Step 2: Copy the GUI applet

Copy the GUI applet .jar file onto a TFTP server. Ensure this TFTP server is enabled and ready for the switch. Connect to the management port of the switch, then login to the switch. Do not connect to the management port of the TFTP server

Step 3: Copy the GUI Java applet to your switch

Use the following commands to copy the GUI Java applet to your switch:

```
awplus# copy tftp://<server-address>/  
          <filename.jar> flash:/
```

Where *<server-address>* is the IP address for the TFTP server, and where *<filename.jar>* is the GUI Java applet file you downloaded in Step 1.

Setting up your switch and logging into the GUI

Step 1: Assign the IP addresses:

Use the following commands to configure your switch with an appropriate IP address:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address <address>/<prefix-length>
```

Step 2: Where *<address>* is the IP address that you will subsequently browse to when you connect to the GUI Java applet. For example, to give the switch an IP address of 192.168.2.6, and a subnet mask of 255.255.255.0, use the following command:

```
awplus(config-if)# ip address 192.168.2.6/24
```

Configure the Default Gateway

If necessary, use the following commands to configure the default gateway.

```
awplus(config-if)# exit
awplus(config)# ip route 0.0.0.0/0 <gateway address>
```

Where *<gateway-address>* is the IP address for your gateway device. Note that you do not need to define a default gateway if you browse to the switch from within its own subnet.

Step 3: Create a user account

In order to log into the GUI, you must first create a user account. Use the following commands to setup a user account

```
awplus(config)# username <username> privilege 15
password <password>
```

Note that you can create multiple users to log into the GUI. See the AlliedWare Plus Software Reference for information about the **username** command. The switch must be configured with a local database user, or the switch must be configured to remotely authenticate users with either TACACS+ or RADIUS.

Step 4: Ensure HTTP service is enabled

The HTTP service needs to be enabled on the switch before it accepts connections from a web browser. The HTTP service is enabled by default. However, if the HTTP service has been disabled then you must enable the HTTP service again. If the HTTP service is disabled then use the following command to enable the HTTP service:

```
awplus(config)# service http
```

See the AlliedWare Plus™ Software Reference for information about the **service http** command.

Step 5: Logging into the GUI

Start a browser then enter the IP address you configured in Step 3 as the URL. You will then be presented with a login screen after the GUI Java applet has started. You can then Log in with the username and password that you defined previously in Step 6.

Step 6: Security Check

You may also be presented with a security check password prompt. This will occur when you have logged into the GUI with a user that is configured on the switch and has a privilege level of less than 15, or if the switch has been configured to authenticate enable passwords via TACACS+ using the **aaa authentication enable default group tacacs+** command.

You must enter the privilege level 15 enable password configured on the switch to access GUI configuration dialogs. If you enter an incorrect enable password, or no privilege level 15 enable password has been configured, then a message is shown stating you can use the GUI to monitor the switch, but not to configure the switch.

Using the GUI

This section explains how to use the AlliedWare Plus™ GUI. It assumes that you have installed the GUI on your switches and have the setup the browser on your PC. This procedure is covered in “[Installing the GUI and setting the switch](#)” on page C.4.

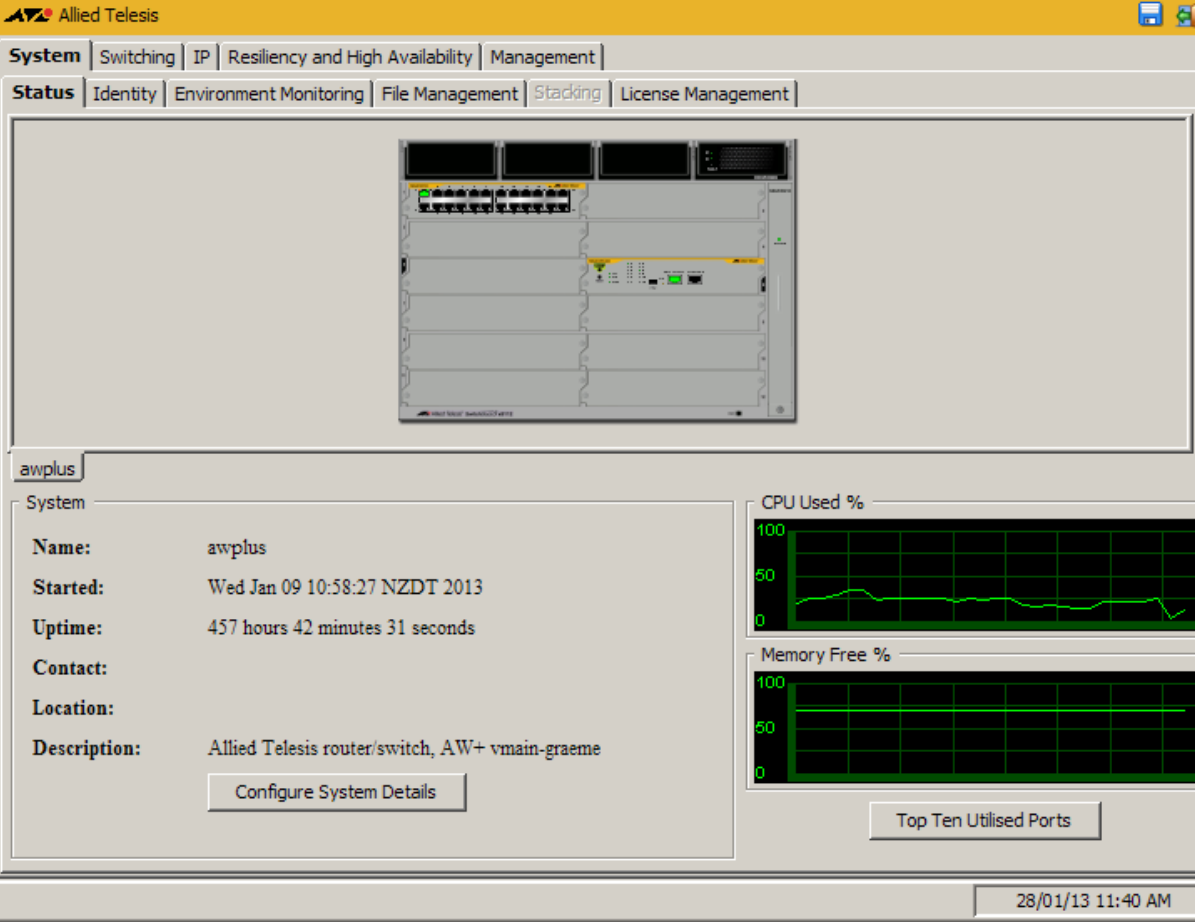

In this section each screen is presented by its tab name and explains the content of the screen components.

System > Status

The **System > Status** menu tab enables you to display and configure basic system information.

The **CPU Used %** and **Memory Free %** graphs provide a brief history of CPU and memory usage.

Menu Tab Example showing the **System > Status** menu tab:

The screenshot shows the AlliedWare Plus GUI interface. At the top, there is a yellow header with the Allied Telesis logo and the text "Allied Telesis". Below the header is a navigation menu with tabs for "System", "Switching", "IP", "Resiliency and High Availability", and "Management". Under the "System" tab, there are sub-tabs for "Status", "Identity", "Environment Monitoring", "File Management", "Stacking", and "License Management". The "Status" sub-tab is selected. The main content area displays a rack of switches. Below this, there is a system information section for "awplus" with the following details:

- Name:** awplus
- Started:** Wed Jan 09 10:58:27 NZDT 2013
- Uptime:** 457 hours 42 minutes 31 seconds
- Contact:**
- Location:**
- Description:** Allied Telesis router/switch, AW+ vmain-graeme

To the right of the system information, there are two line graphs: "CPU Used %" and "Memory Free %". Below the graphs, there is a button labeled "Top Ten Utilised Ports". At the bottom right corner, the date and time are displayed as "28/01/13 11:40 AM".

Description

Display Label / Field	Description
Chassis View Pop-out (icon)	Displays an enlarged view of the chassis.
View Rear Panel (icon)	Displays an enlarged view of the rear panel of the chassis.
View Front Panel (icon)	Displays an enlarged view of the front panel of the chassis.

Description

Display Label / Field	Description
View Rear Panel (icon)	Displays view of the rear panel of the chassis.
View Front Panel (icon)	Displays view of the front panel of the chassis.

Description

Display Label / Field	Description
System / Name	Specifies the network name of the system, as set with the 'hostname' command in the CLI.
System / Started	Date and time the switch was last booted.
System / Uptime	Elapsed time since the last boot.
System / Contact	Contact details for system maintenance.
System / Location	Location of the switch
System / Description	Description of the switch, including manufacturer, model, and software version.
Top Ten Utilised Ports	Displays a sorted list of the ten most used ports listed by port and its utilization. You can rearrange and resort the list by port or utilization.

Description

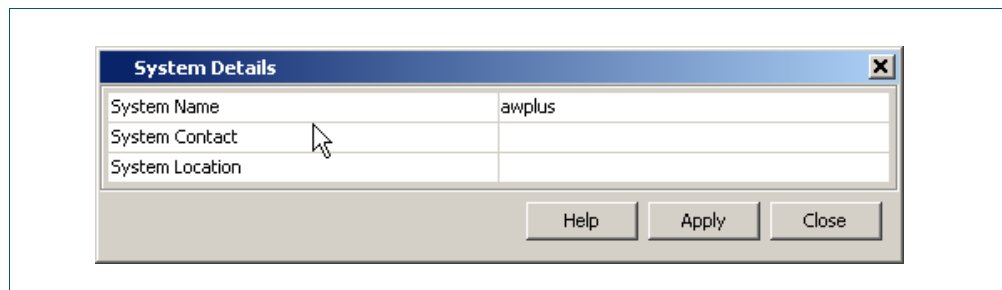

Configuration Button / Field	Description
System Time & Date (icon)	Add or modify System Date, System Time, UTC Time Zone Offset.
Configure System Details	Add or modify System Name, System Contact, System Location.
Configure System Details / System Name	Configures the network name of the system.
Configure System Details / System Contact	Configures the contact information for the system, from 0 to 255 characters long. Valid characters are any printable characters and spaces.
Configure System Details / System Location	Configures the location of the system, from 0 to 255 characters long. Valid characters are any printable characters and spaces.

System > Status > System Details

The **System > Status > System Details** dialog allows you to configure basic system information.

Configuration Dialog

Example showing **System > Status > System Details** dialog:

**Description**

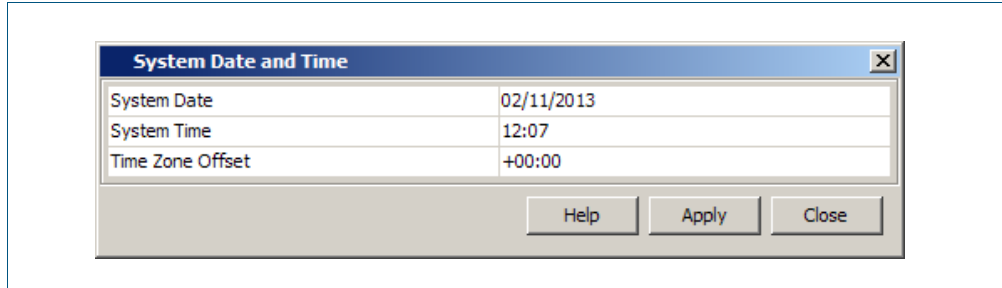

Label / Field / Button	Description
System Name	Enter the network name of the system.
System Contact	Enter the contact information for the system, from 0 to 255 characters long. Valid characters are any printable characters and spaces.
System Location	Enter the location of the system, from 0 to 255 characters long. Valid characters are any printable characters and spaces.

System > Status > System Date and Time

The **System > Status > System Date and Time** dialog allows you to configure the date and time for the switch.

Configuration Dialog

Example showing **System > Status > System Date and Time** dialog:

Description

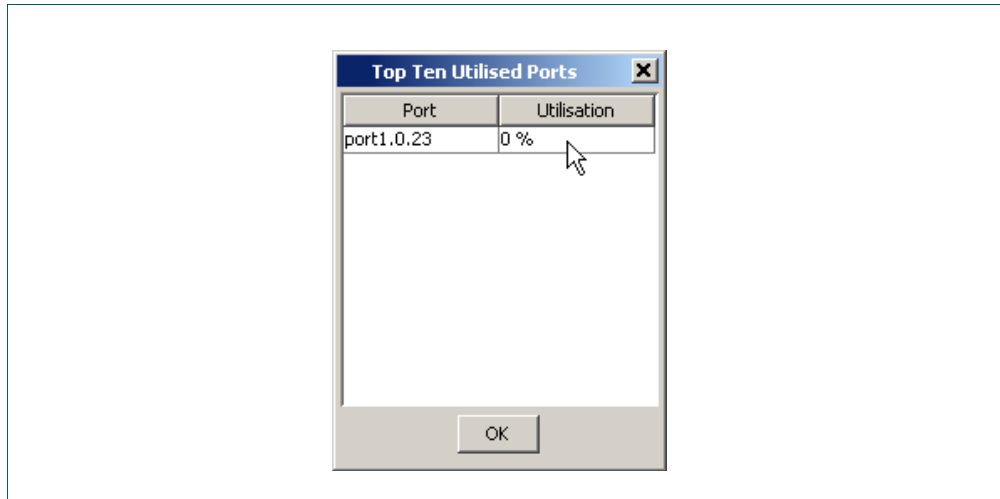

Label / Field / Button	Description
System Date	Enter the current system date in month, day, and year format.
System Time	Enter the local time for the system clock in hours and minutes.
Time Zone Offset	Enter the offset to the UTC (Coordinated Universal Timezone) for a local timezone in hours and minutes.

System > Status > Top Ten Utilised Ports

The **System > Status > Top Ten Utilised Port** dialog allows you to monitor port utilisation on the switch.

Configuration Dialog

Example showing **System > Status > Top Ten Utilised Ports** dialog:

Description

Label / Field / Button	Description
Port	Displays up to ten ports that are used the most on the switch. You can sort by ascending or descending port order.
Utilisation	Displays the utilisation percentage for the port. You can sort by ascending or descending utilisation percentage.

System > Identity

The **System > Identity** menu tab displays physical properties, software version and configuration file name.

Menu Tab Example showing the **System > Identity** menu tab:

The screenshot displays the Allied Telesis GUI for the 'System > Identity' menu tab. The interface features a top navigation bar with tabs for 'System', 'Switching', 'IP', 'Resiliency and High Availability', and 'Management'. Below this, a secondary set of tabs includes 'Status', 'Identity', 'Environment Monitoring', 'File Management', 'Stacking', and 'License Management'. The main content area is divided into several sections:

- Hardware:** A table listing various components of the switch.
- MAC Address:** Displays the MAC address as `eccd.6d03.1117`.
- Software:** Shows software details including 'Current Software', 'Software Version', 'Boot Loader Version', and 'Current Configuration'.
- Memory:** Displays memory usage: RAM: 501.3 MB, Flash: 126.0MB Available: 85.4MB.

The bottom status bar indicates the date and time: 28/01/13 12:28 PM.

Board	ID	Bay	Model	Revision	Serial #
Controller	316	Bay6	AT-SBx8...	F-0	A042854...
Chassis	315		AT-SBx8...	D-0	A042764...
Blade	351	Bay1	AT-SBx8...	B-1	A044024...
PSU	319	PSUD	AT-SBxP...	A-0	A043344...
Fan module	321	FAN1	AT-SBxF...	E-0	A042844...

Description

Display Label / Field	Description
Chassis View Pop-out (icon)	Displays an enlarged view of the chassis.
View Rear Panel (icon)	Displays an enlarged view of the rear panel of the chassis.
View Front Panel (icon)	Displays an enlarged view of the front panel of the chassis.

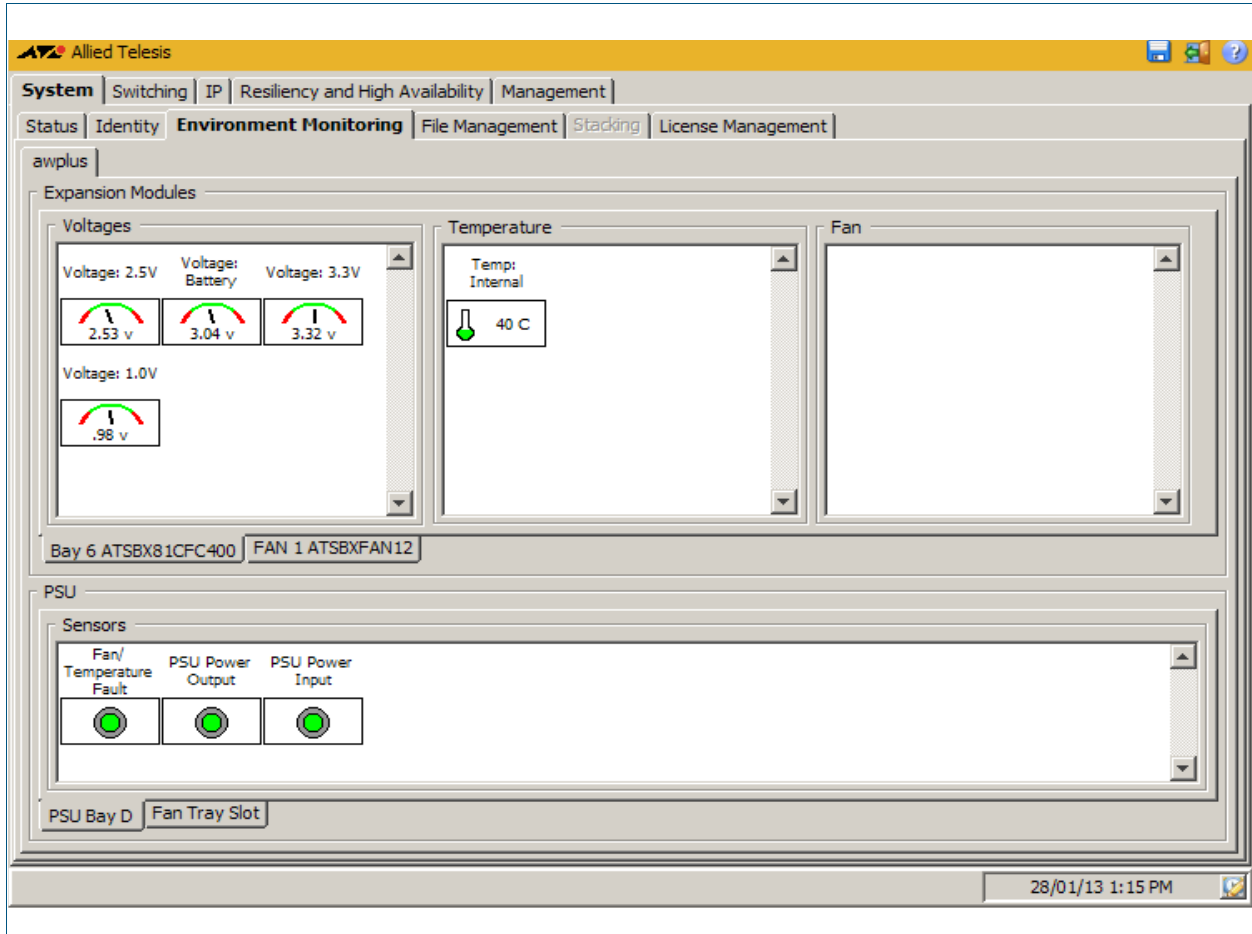

Description

Label / Field / Button	Description
HARDWARE	Displays the board, ID, bay, model, revision and serial number of the switch main board.
MAC Address	Displays the MAC Address of the switch in hexadecimal in the format HHHH . HHHH . HHHH.
SOFTWARE	Displays the software release file name, software version, boot loader version, and configuration file name loaded on the switch.
MEMORY	Displays the amount of installed RAM and Flash, plus the remaining Flash available on the switch.

System > Environment Monitoring

The **System > Environment Monitoring** menu tab allows you to display the status of the environmental properties, such as all voltages and temperatures, which the system monitors.

Menu Tab Example showing the **System > Environment Monitoring** menu tab:

Description

Label / Field / Button	Description
Expansion Modules	Displays the operational status of voltages, temperatures, and fans for any installed line interface cards.
Fan	Displays the operational status of the switch fans.
PSU	Displays the operational status of temperatures and fans for any installed pluggable PSUs.

System > File Management

The **System > File Management** menu tab allows you to create, copy, delete, upload or download boot and backup release and configuration files to and from the switch. From 5.4.2 release onwards, you can specify fallback or backup release and configuration files in case the boot release or configuration files become corrupted, and you can also specify the boot release and configuration files to boot directly from USB storage device or to boot from flash.

Menu Tab Example showing the **System > File Management** menu tab:

Description:
File System

Label / Field / Button	Description
File System	<p>Displays file names, file dates, and file sizes of files in Flash, NVS or USB storage device. Also, only files that have a total URL length of 112 characters or less are displayed. The URL is the path to the file and is of the form <hostname>/<filesystem>:/<pathname>, for example, awplus-1/flash:/test.cfg.</p> <p>The GUI will immediately show all file changes to the NVS and Flash filesystems, regardless of how they have been made, either via the GUI or CLI. However, the USB storage device filesystem is treated differently as it is not permanently mounted. The GUI will only update USB storage device files when the device is inserted/deleted, or when the changes are made via the GUI. They are not updated if modified via the CLI.</p> <p>The buttons shown below the File System label also allow you upload, download, move, copy, and delete files respectively.</p>
File System / Add Folder	Select the folder you want to create a new sub-folder in then click on the Add Folder button located directly below the File System label.
File System / Rename File	Select the file you want to rename then click on the Rename File or Folder button located directly below the File System label.
File System / Copy File	Select the file you want to copy then click on the Copy File button located directly below the File System label. Choose the Destination Folder from the drop down list in the Copy File dialog then select OK to copy the file to the chosen destination.
File System / Move File	Select the file you want to move then click on the Move File button located directly below the File System label. Choose the Destination Folder from the drop down list in the Move File dialog then select OK to move the file to the chosen destination.
File System / Download File	Select the file you want to download then click on the Download File button located directly below the File System label.
File System / Upload File	Click on the Upload File button located directly below the File System label then select the file you want to upload.
File System / Delete File	Select the file or folder you want to delete then click on the Delete File button located directly below the File System label.

Description: System Configuration

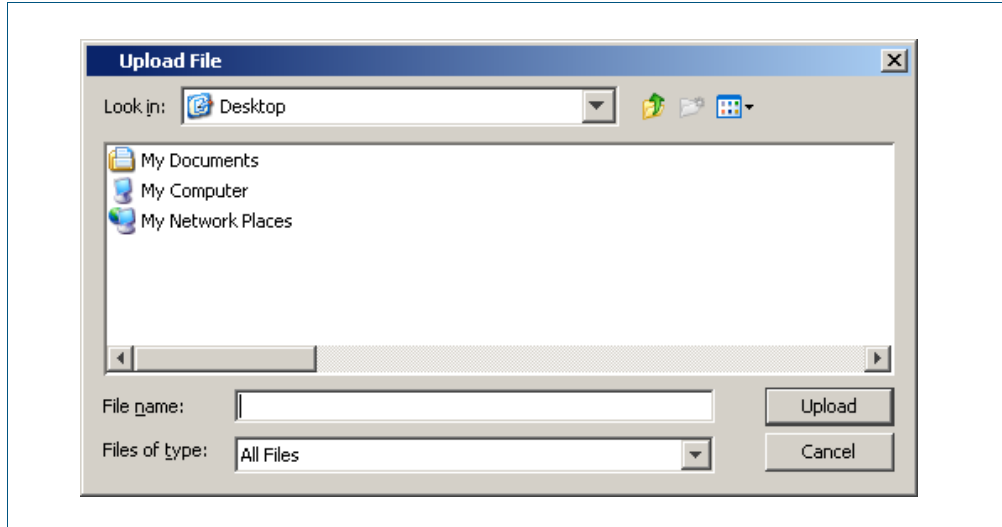

Label / Field / Button	Description
System Configuration	Configures running and backup software, GUI software, and configuration files in Flash or card (or storage device) memory available on the switch.
System Configuration / Next Boot Firmware	Choose the Next Boot Firmware .rel file and path from the drop down list then click Set to make this file the firmware that starts after reboot. From 5.4.2 release onwards, you can set a Next Boot Firmware .rel file to boot directly from a USB storage device.
System Configuration / Backup Boot Firmware	Choose the Backup Boot Firmware .rel file and path from the drop down list then click Set to boot from this file at reboot. A Backup Boot Firmware .rel file is used instead of the Next Boot Firmware .rel file if the Next Boot Firmware .rel file is corrupted.
System Configuration / GUI Files	Displays the GUI file name and file location on the switch and indicates the currently running GUI file with a prefixed asterisk (e.g. * SBx81CFC400_GUI_543_11.jar). Note that you cannot set the GUI version from within the GUI itself. See the GUI installation instructions in <i>Appendix C: GUI Reference</i> of the current <i>AlliedWare Plus Software Reference</i> to install GUI files. The latest version of the GUI .jar file loaded is run by the switch automatically.
System Configuration / Next Boot Config	Choose the Next Boot Config .cfg file and path from the drop down list then click Set to make this file the Config .cfg file that the switch uses at reboot. From 5.4.2 release onwards, you can set a Next Boot Config .cfg file to load directly from a USB storage device.
System Configuration / Backup Boot Config	Choose the Backup Boot Config Files .cfg file and path from the drop down list then click Set to make boot from this file at reboot. A Backup Boot Config .cfg file is used instead of the Next Boot config .cfg file if the Next Boot Config .cfg file is corrupted.

System > File Management > Upload File

The **System > File Management > Upload File** dialog allows you to upload files (e.g. release and configuration files) from a client device to the switch. Select the Upload File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System > File Management > Upload File** dialog:

Description

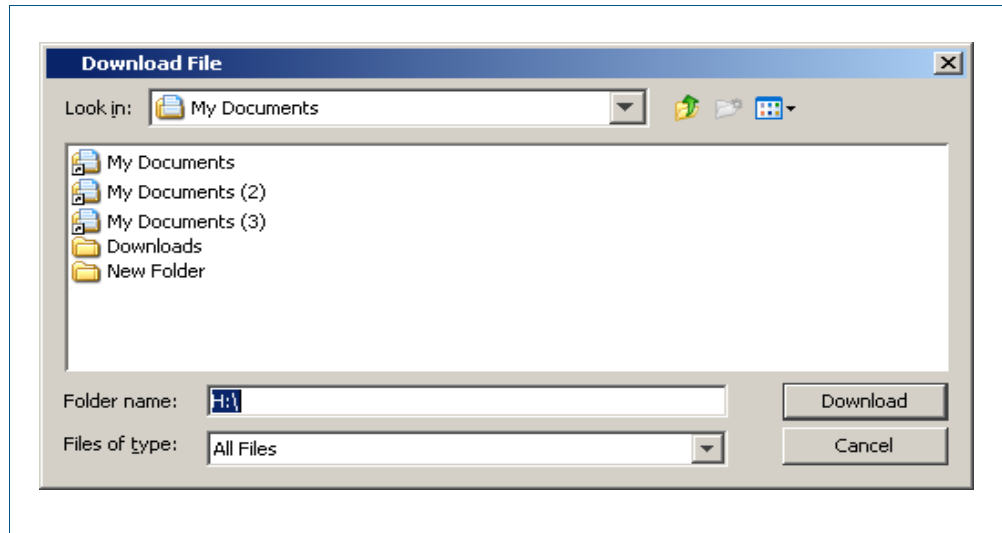

Label / Field / Button	Description
Destination Folder	Select the destination folder to upload the selected file from. An uploading progress bar displays after clicking the Upload button.

System > File Management > Download File

The **System > File Management > Download File** dialog allows you to download files (e.g. release and configuration files) from the switch to a client device. Select the Download File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System > File Management > Download File** dialog:

Description

Label / Field / Button	Description
Destination Folder	Select the destination folder to download the selected file to. A downloading progress bar displays after clicking the Download button.

System > File Management > Copy File

The **System > File Management > Copy File** dialog allows you to copy files (e.g. release and configuration files). Select the Copy File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System > File Management > Copy File** dialog:

Description

Label / Field / Button	Description
Destination Folder	Select the destination folder to copy the selected file to. A copying progress bar displays after clicking the OK button.

System > File Management > Move File

The **System > File Management > Move File** dialog allows you to move files (e.g. release and configuration files). Select the Move File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System > File Management > Move File** dialog:

Description

Label / Field / Button	Description
Destination Folder	Select the destination folder to move the selected file to. A moving progress bar displays after clicking the OK button.

System > File Management > Delete File

The **System > File Management > Delete File** dialog allows you to delete files (e.g. release and configuration files). Select the Delete File button below the File System label to access this dialog.

Configuration Dialog

Example showing **System > File Management > Delete File** dialog:

Description

Label / Field / Button	Description
Yes	Confirm selected file deletion operation.
No	Cancel selected file deletion operation.

System > File Management > Delete Folder

The **System > File Management > Delete Folder** dialog allows you to delete folders in the flash or USB storage device file system containing files (e.g. release and configuration files). Select the Delete Folder button below the File System label to access this dialog.

Configuration Dialog

Example showing **System > File Management > Delete Folder** dialog:

Description

Label / Field / Button	Description
Yes	Confirm selected folder deletion operation.
No	Cancel selected folder deletion operation.

System > License Management

The **System > License Management** menu tab allows you to view, add and delete feature licenses.

- Selecting the + icon allows you to add a feature license.
- Selecting the x icon allows you to delete a feature license.

Menu Tab Example showing the **System > License Management** menu tab:

Description

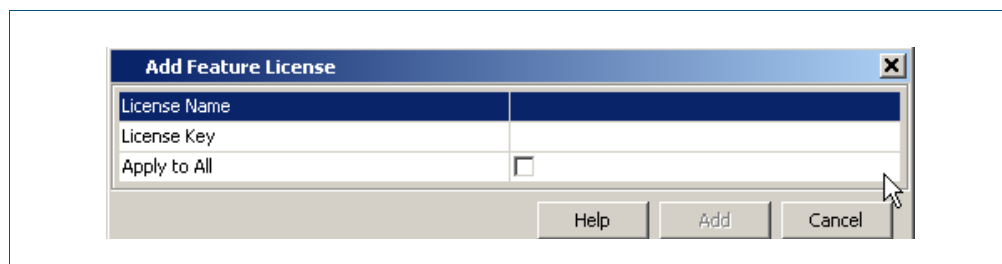

Label / Field / Button	Description
License List / License Name	Name of the license bundle.
License List / Type	The type of license activated on the switch: full or temporary.
License Details / Index	Index identifying entry.
License Details / Name	Name of the license bundle.
License Details / Customer	Customer name.
License Details / Quantity	Quantity of licenses included in the feature key.
License Details / Type	Full or temporary license types.
License Details / Issued	Date the key was generated.
License Details / Expiration	Expiry date for a temporary license.
License Details / Features	List of features enabled by the license.

System > License Management > Add Feature License

The **System > License Management > Add Feature License** dialog allows you add feature licenses by specifying the license name and the license key.

Configuration Dialog

Example showing **System > License Management > Add Feature License** dialog:

**Description**

Label / Field / Button	Description
License Name	Enter the license name of the software feature.
License Key	Enter the encrypted license key to enable this software feature.
Apply to All	Select the checkbox to apply the license.

System > License Management > Delete Feature License

The **System > License Management > Delete Feature License** dialog allows you delete feature licenses by specifying the license name and the license key.

Configuration Dialog

Example showing **System > License Management > Delete Feature License** dialog:

Description

Label / Field / Button	Description
Delete	Select the checkbox to delete the license.

Switching > Ports

The **Switching > Ports** menu tab allows you to view, and configure Layer 1 properties:

- Click on the Chassis View Pop-out icon to enlarge the chassis view.
- Right-clicking a port allows you to select monitoring or configuration dialogs for the selected port.
- The monitoring dialog displays port status, statistics and a brief utilization history.
- The configuration dialog allows you to configure Administrative State, Auto Negotiation, Speed and Duplex settings for the port.

Note Speed and Duplex settings can only be changed if Auto Negotiation is disabled.

Menu Tab Example showing the **Switching > Ports** menu tab:

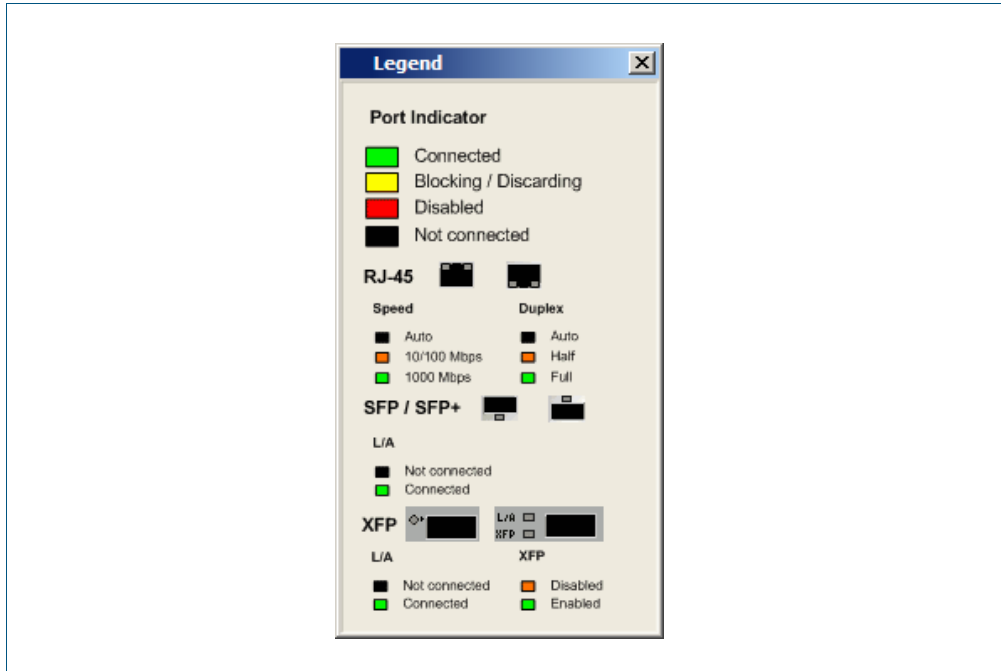

Interface	Description	Link State	Admin State	Duplex	Speed	Uptime
eth0	eth0	up	up	full	100 Mbps	0 millisecond
port1.1.1	port1.1.1	up	up	full	100 Mbps	4 hrs 30 mins 57 sec
port1.1.2	port1.1.2	down	up	auto	auto	0 millisecond
port1.1.3	port1.1.3	down	up	auto	auto	0 millisecond
port1.1.4	port1.1.4	down	up	auto	auto	0 millisecond
port1.1.5	port1.1.5	down	up	auto	auto	0 millisecond
port1.1.6	port1.1.6	down	up	auto	auto	0 millisecond
port1.1.7	port1.1.7	down	up	auto	auto	0 millisecond
port1.1.8	port1.1.8	down	up	auto	auto	0 millisecond
port1.1.9	port1.1.9	down	up	auto	auto	0 millisecond
port1.1.10	port1.1.10	down	up	auto	auto	0 millisecond

11/02/13 4:04 PM

Description

Label / Field / Button	Description
Ports	Displays port number, description of the port, link and administrative status, duplex mode, speed and uptime (in milliseconds) for the selected port.

Legend Example showing **Switching > Ports > Legend:**

Switching > Ports > Monitor Port

The **Switching > Ports > Monitor Port** dialog allows you monitor port counters.

Configuration Dialog

Example showing the **Switching > Ports > Monitor Port** dialog:

Description

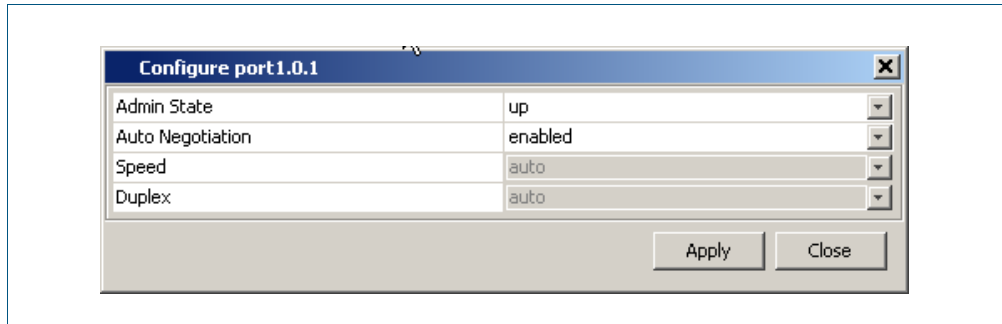

Label / Field / Button	Description
Port Details	Monitors the bay, port, duplex, speed, administrative state and link states for the selected port.
Counters	Monitors the counters for bytes received/transmitted, unicast packets received/transmitted, multicast packets received/transmitted, broadcast packets received/transmitted, dropped packets received/transmitted, and errors received/transmitted for the selected port.
Port Utilisation%	Monitors and graphs the usage percentage for the selected port.

Switching > Ports > Configure Port

The **Switching > Ports > Configure Port** dialog allows you configure Administrative State, Auto Negotiation, Speed and Duplex settings for the selected port.

Configuration Dialog

Example showing the **Switching > Ports > Configure Port** dialog:

Description

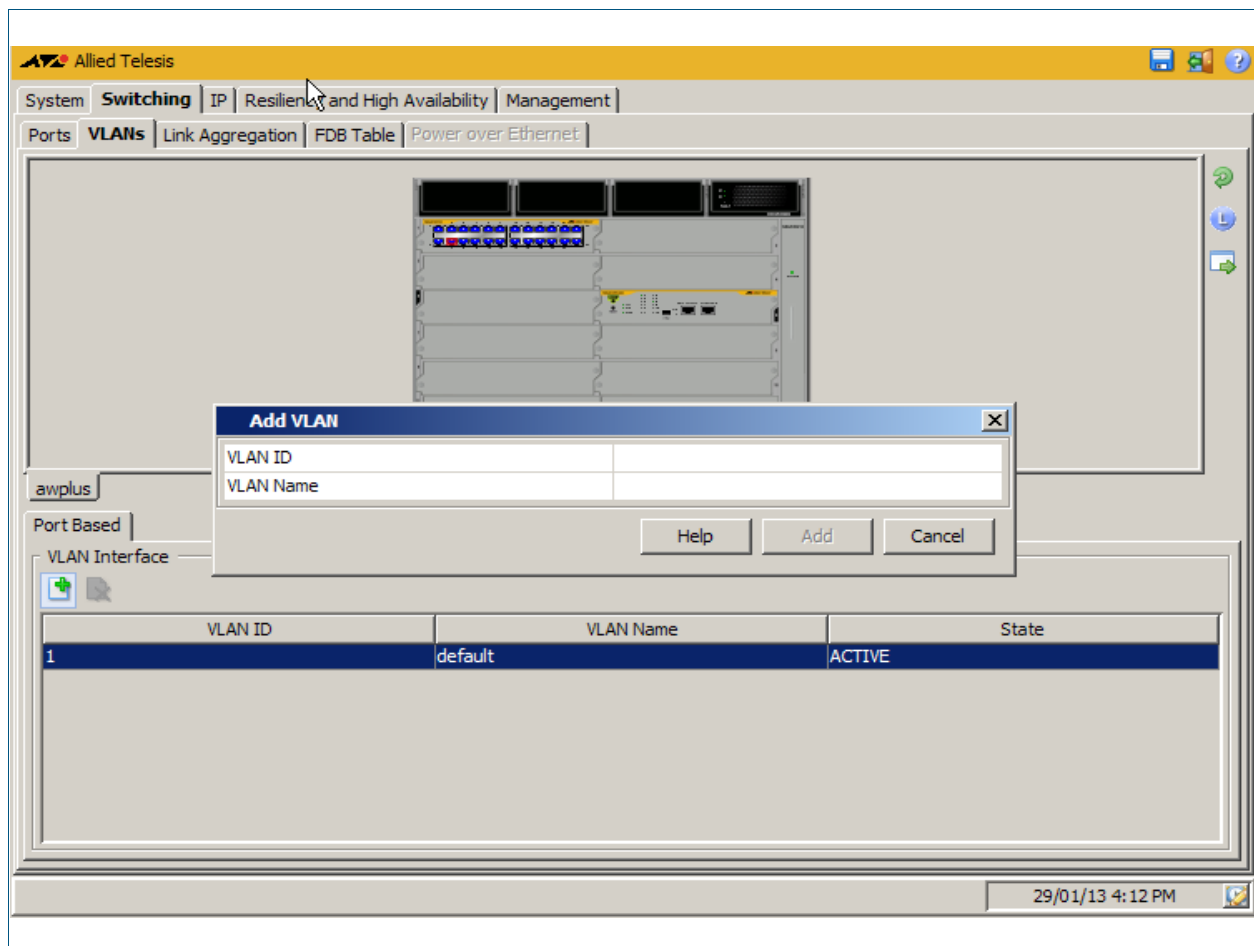

Label / Field / Button	Description
Admin State	Select <code>up</code> or <code>down</code> from the drop down list in this dialog to specify the administrative state for the selected port.
Auto Negotiation	Select <code>disabled</code> or <code>enabled</code> from the drop down list in this dialog to specify auto negotiation for the selected port. Note that selecting <code>enabled</code> to enable Auto Negotiation will disable Speed and Duplex options, indicated by greyed out options.
Speed	Select <code>10 Mbps</code> , <code>100 Mbps</code> , <code>1000 Mbps</code> , <code>10 Gbps</code> , or <code>auto</code> from the drop down list in this dialog to specify the speed setting for the selected port. Note that the options for speed settings are only available if Auto Negotiation has been disabled for the selected port.
Duplex	Select <code>full</code> , <code>half</code> , or <code>auto</code> from the drop down list in this dialog to specify the duplex setting for the selected port. Note that the options for duplex settings are only available if Auto Negotiation has been disabled for the selected port.

Switching > VLANs

The **Switching > VLANs** menu tab allows you to view, and configure Layer 2 properties:

- Click on the Chassis View Pop-out icon to enlarge the chassis view.
- Right-clicking a port allows you to select a VLAN to be tagged or untagged for the port, or to remove a port from the VLAN.
- Define VLANs before assigning VLANs to ports on the front panel of the switch.
- Selecting the + icon (under the VLAN Interface label on the VLAN tab below the front panel illustration) allows you to add a VLAN by specifying the VLAN ID and VLAN Name.
- Selecting the x icon (under the VLAN Interface label below the front panel illustration) allows you to delete a VLAN (except for the default VLAN 1 that is assigned to all ports).

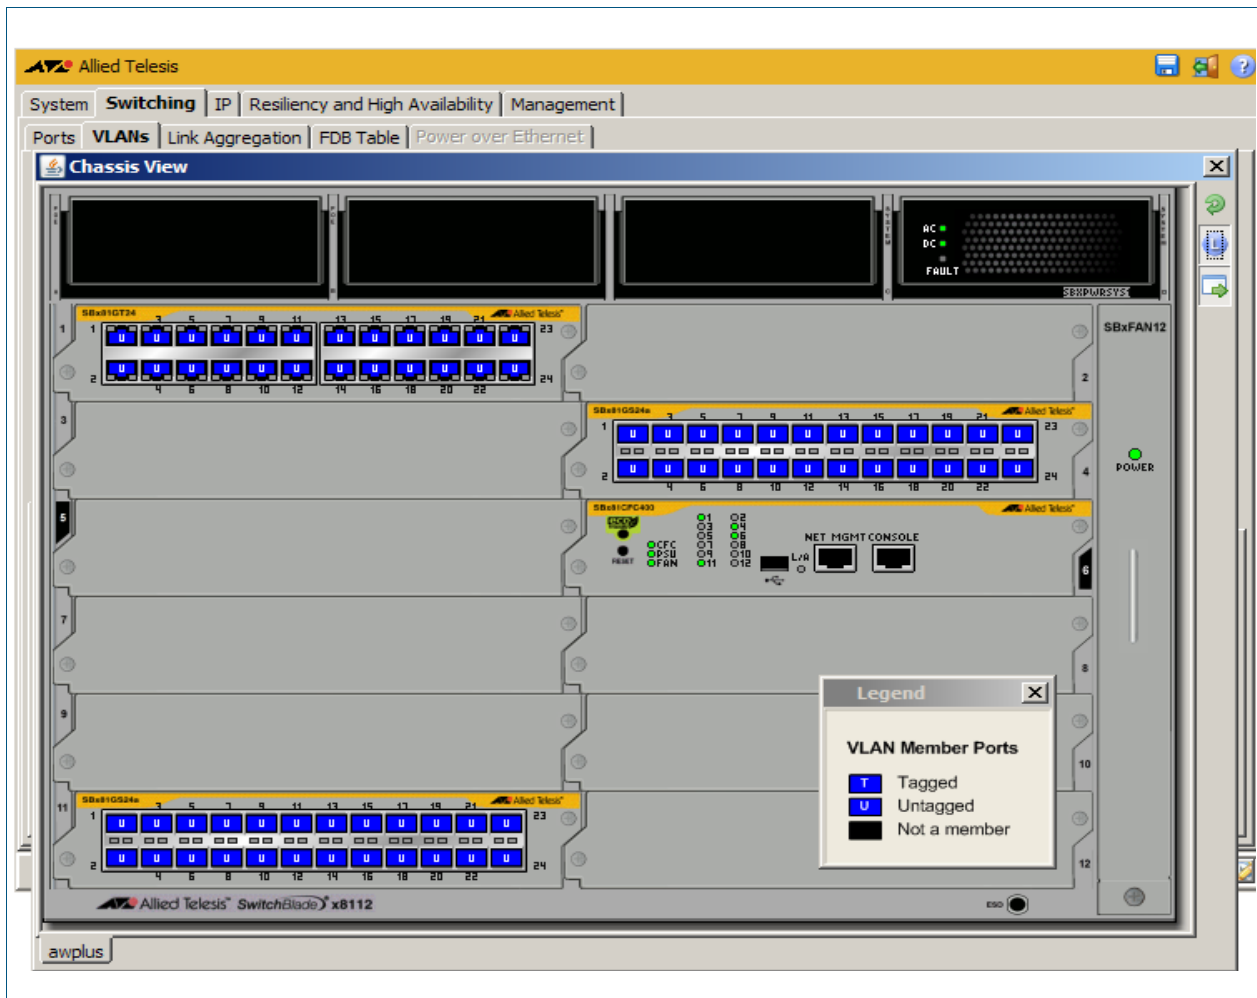

Menu Tab Example showing the **Switching > VLANs** menu tab:

Description

Label / Field / Button	Description
Port Based / VLAN ID	The VID of the VLAN that is enabled or disabled in the range 1-4094.
Port Based / VLAN Name	The ASCII name of the VLAN with a maximum length of 32 characters.
Port Based / State	The state of the VLAN, either enabled ('ACTIVE' displayed) or disabled ('INACTIVE' displayed).

Menu Tab Example showing the **Switching > VLANs > menu tab enlarged view and legend:**

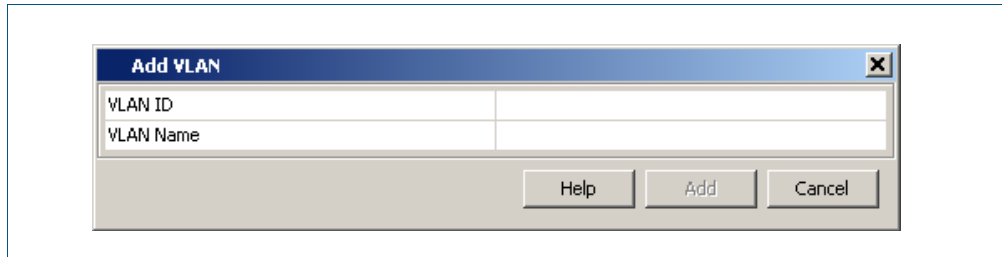

Switching > VLANs > Add VLAN

The **Switching > VLANs > Add VLAN** dialog allows you add a VLAN by specifying the VLAN ID and VLAN Name.

Configuration Dialog

Example showing the **Switching > VLANs > Add VLAN** dialog:

Description

Label / Field / Button	Description
VLAN ID	Enter the VID of the VLAN that is enabled or disabled in the range <1-4094>.
VLAN Name	Enter the ASCII name of the VLAN with a maximum length of 32 characters.

Switching > Link Aggregation

The **Switching > Link Aggregation** menu tab allows you to view, and configure Layer 2 properties:

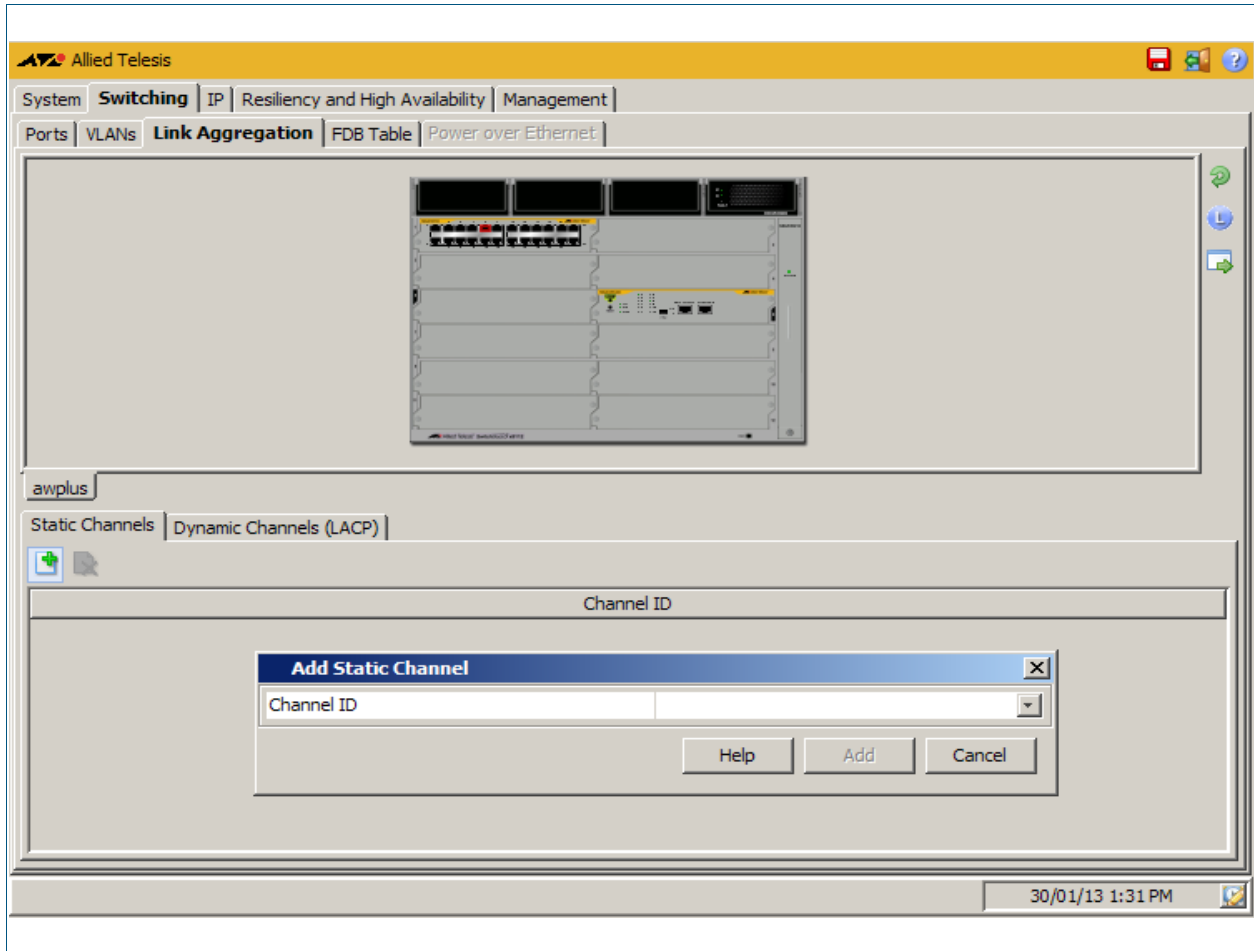

- Click on the Chassis View Pop-out icon to enlarge the chassis view.
- Right-clicking a port allows you to select assign or remove the port to a Static Channel or a Dynamic Channel (LACP - Link Aggregation Control Protocol) group.
- Define Static Channel or Dynamic Channel (LACP) groups before assigning them to ports on the front panel of the switch.
- Selecting the + icon (located below the front panel illustration of your switch) allows you to add a Static Channel or Dynamic Channel (LACP) group by specifying the Channel ID.

Note Up to 32 Static Channel groups and up to 32 Dynamic Channel (LACP) groups can be defined on a switch.

-
- Selecting the x icon (located below the front panel illustration of your switch) allows you to delete a Static Channel or Dynamic Channel (LACP) group.

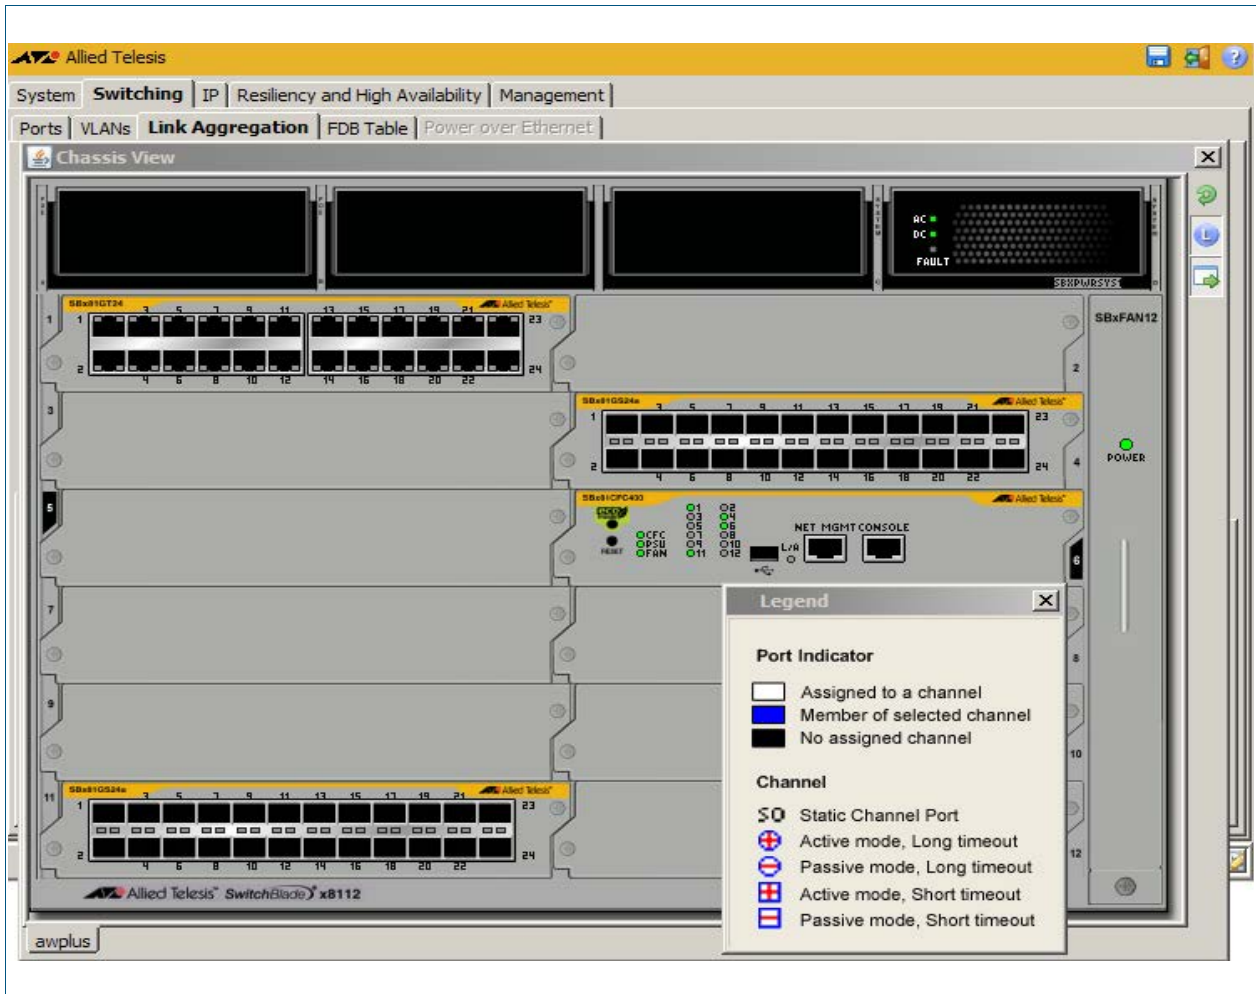

Menu Tab Example showing the **Switching > Link Aggregation** menu tab:

Description

Label / Field / Button	Description
Static Channels	Display or specify a static channel group number for an aggregated link. Up to 32 static channel groups can be created on the SwitchBlade x8100 switch.
Dynamic Channels (LACP)	Display or specify a dynamic channel group number for an LACP link. Up to 32 dynamic channel groups can be created on the switch.

Menu Tab Example showing the **Switching > Link Aggregation >** menu tab enlarged view and legend:

Switching > Link Aggregation > Add Static Channel

The **Switching > Link Aggregation > Add Static Channel** dialog allows you to assign the selected port to a Static Channel group.

Configuration Dialog

Example showing the **Switching > Link Aggregation > Add Static Channel** dialog:

Description

Label / Field / Button	Description
Channel ID	Specify a static channel group number for an interface. Up to 32 static channel groups can be created on the switch.

Switching > Link Aggregation > Add Dynamic Channel

The **Switching > Link Aggregation > Add Dynamic Channel** dialog allows you to assign the selected port to a Dynamic Channel (LACP) group.

Configuration Dialog

Example showing **Switching > Link Aggregation > Add Dynamic Channel** dialog:

Description

Label / Field / Button	Description
Channel ID	Specify a dynamic (LACP) channel group number for an interface. Up to 32 dynamic (LACP) channel groups can be created on the switch.

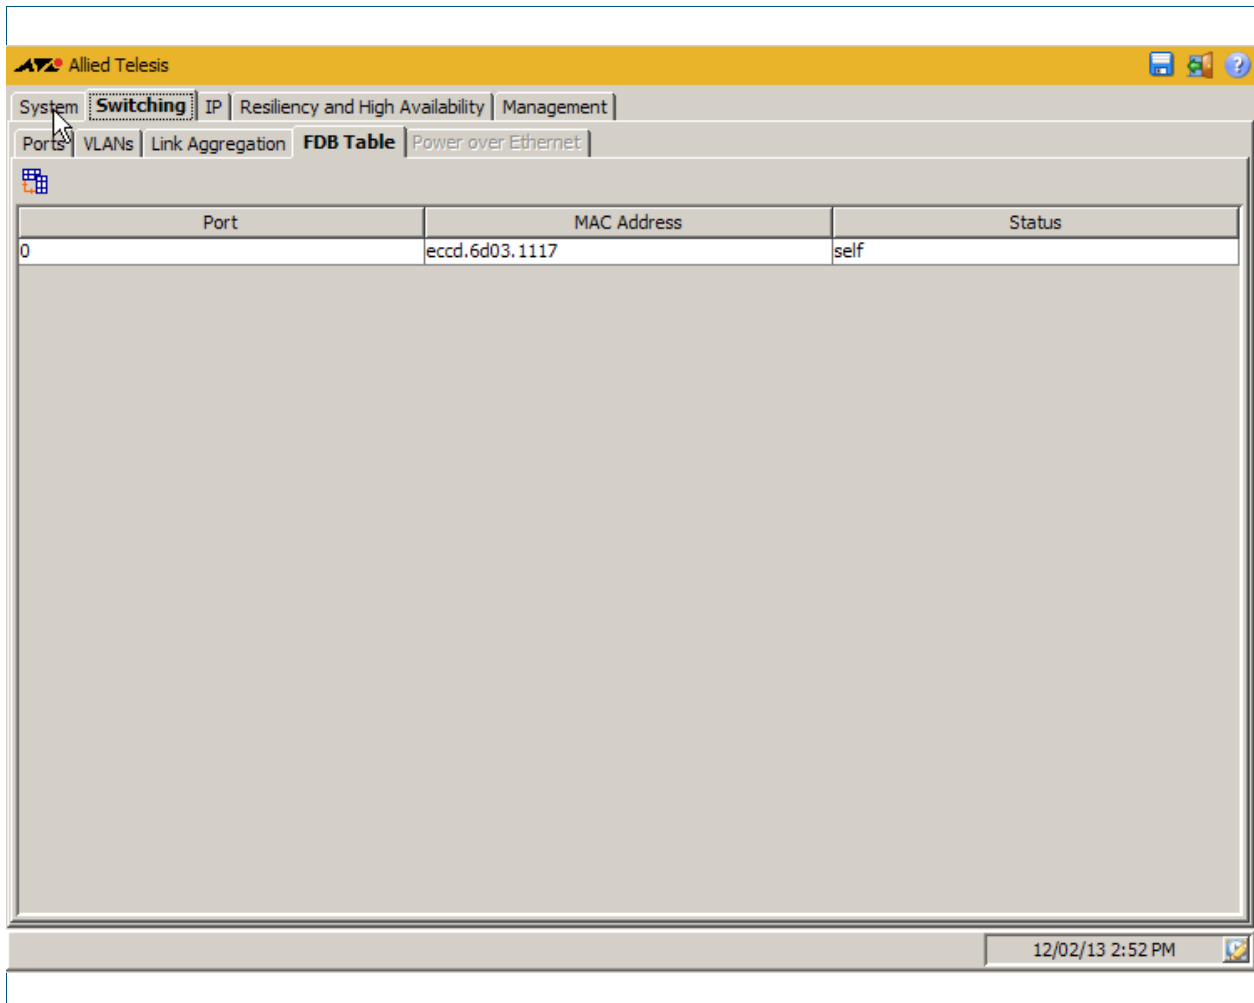

Switching > FDB Table

The **Switching > FDB Table** menu tab allows you to view the contents of the Layer 2 Forwarding Database Table.

You can change the FDB Table view to display horizontally or vertically by selecting the table view icon above the FDB Table.

You can also sort or rearrange the display of the FDB Table by Port, MAC Address, or Forwarding Status by selecting the relevant column or by dragging the relevant column respectively.

Menu Tab Example showing the **Switching > FDB Table** menu tab:

Description

Label / Field / Button	Description
FDB Table	Displays the FDB (Forwarding Database) table for the switch that shows all the available ports, MAC addresses, and port status.

IP > IP Interfaces

The **IP > IP Interfaces** menu tab allows you to view and specify the Primary and Secondary IP Addresses for VLAN and management port interfaces.

Note You may only define a Secondary IP Address for an interface after first defining its Primary IP Address.

- Select an interface then use the pen shaped icon under the Primary IP Address label to configure an IP address. You can delete an assigned Primary IP Address in the Configure Primary IP Address dialog as displayed after selecting the icon under Primary IP Address.
- Select an interface with a Primary IP Address already defined to configure a Secondary IP Address, using the + icon under the Secondary IP Address label.
- Remove a selected Secondary IP Address using the x icon under the Secondary IP Address label.

Menu Tab Example showing the **IP > IP Interfaces** menu tab:

Description

Label / Field / Button	Description
Primary IP Address	Displays and configures primary IP addressing for VLANs and management port interfaces that are defined on the switch and assigned to ports.
Secondary IP Address	Displays and configures secondary IP addressing for VLANs and management port interfaces that are defined on the switch and assigned to ports.

IP > IP Interfaces > Configure Primary IP Address

The **IP > IP Interfaces > Configure Primary IP Address** dialog allows you to configure a primary address with an IP address and a prefix length for the selected interface.

Configuration Dialog

Example showing the **IP > IP Interfaces > Configure Primary IP Address** dialog:

**Description**

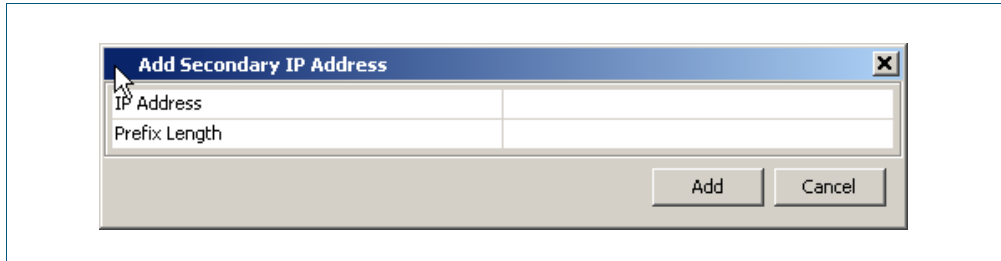

Label / Field / Button	Description
IP Address	Enter or remove an IPv4 Address in dotted decimal notation (i.e. A.B.C.D).
Prefix Length	Enter the Prefix for the IPv4 Address with the integer as used for slash notation (i.e. 24 instead of /24), not dotted decimal notation (i.e. 255.255.255.0).

IP > IP Interfaces > Add Secondary IP Address

The **IP > IP Interfaces > Add Secondary IP Address** dialog allows you to add a secondary address with an IP address and a prefix length for the selected interface (only if the selected interface already has a primary address configured).

Configuration Dialog

Example showing the **IP > IP Interfaces > Add Secondary IP Address** dialog:

Description

Label / Field / Button	Description
IP Address	Enter an IPv4 Address in dotted decimal notation (i.e. A . B . C . D).
Prefix Length	Enter the Prefix for the IPv4 Address with the integer as used for slash notation (i.e. 24 instead of / 24), not dotted decimal notation (i.e. 255 . 255 . 255 . 0).

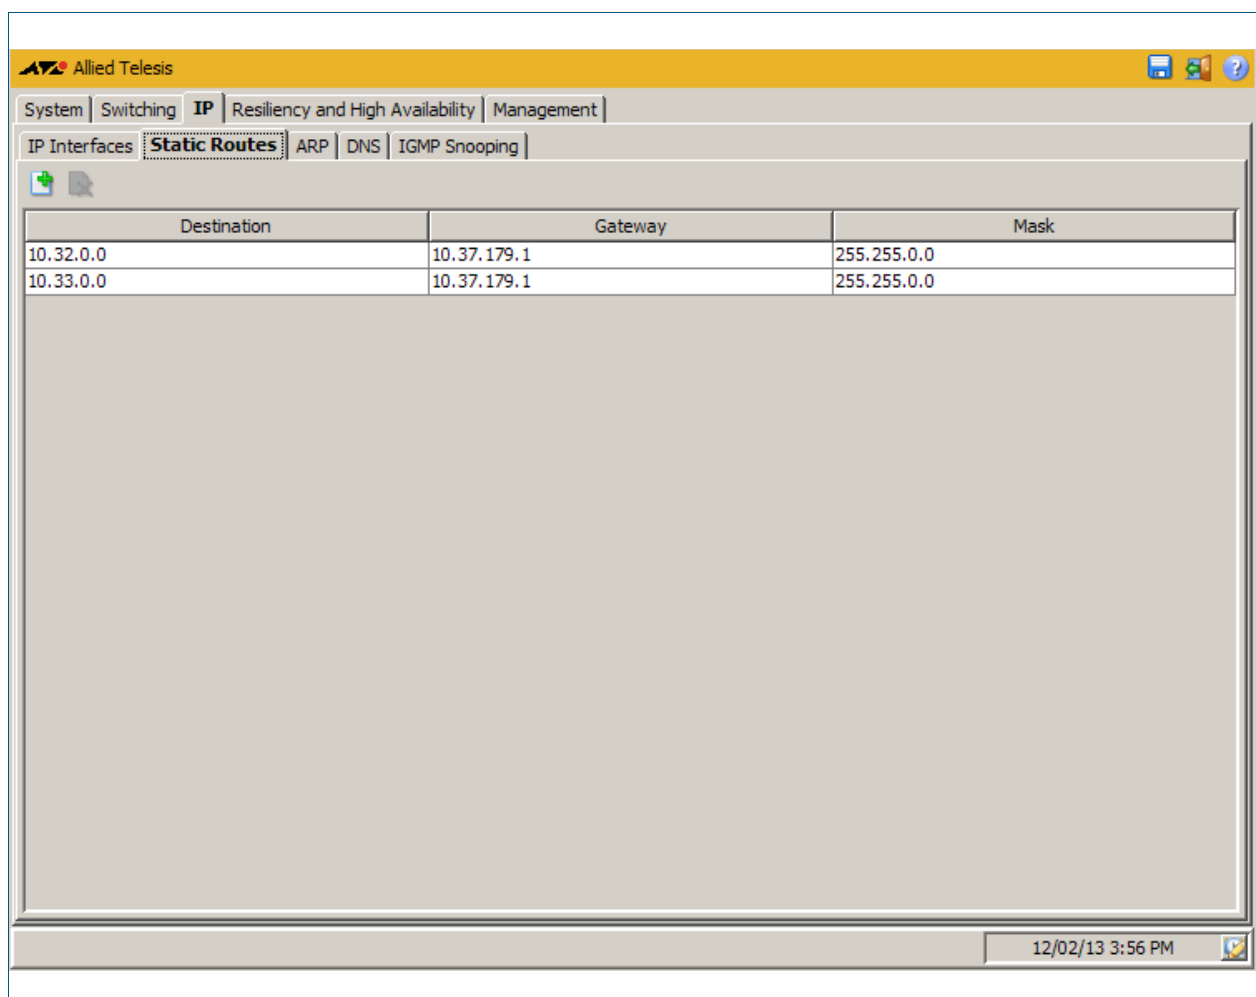

IP > Static Routes

The **IP > Static Routes** menu tab allows you to view, add, and delete static IP routes configured on the switch. Static routes are specified using destination IP addresses, masks, and gateways.

You can also sort or rearrange the display of the Static Routes by Destination, Gateway, or Mask by selecting the relevant column or by dragging the relevant column respectively.

- Selecting the + icon allows you to define a Static Route specifying destination and gateway IPv4 addresses with a dotted decimal format subnet mask.
- Selecting the x icon allows you to delete a defined Static Route.

Menu Tab Example showing the **IP > Static Routes** menu tab:

Description

Label / Field / Button

Description

Static Routes / Destination The IPv4 address of the destination subnet address.

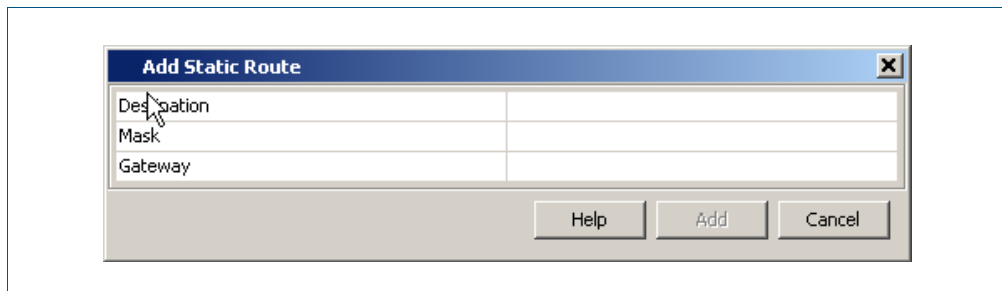

Label / Field / Button	Description(cont.)
Static Routes / Gateway	The IPv4 address of the gateway device.
Static Routes / Mask	The subnet mask in dotted decimal notation (for example, 255.255.255.0 instead of the slash notation /24).

IP > Static Routes > Add Static Route

The IP > **Static Routes** > **Add Static Route** dialog allows you to add a static IP routes on the switch. Static routes are specified using destination IP addresses, masks, and gateways.

Configuration Dialog

Example showing the **IP > Static Routes > Add Static Route** dialog:

Description

Label / Field / Button	Description
Destination	Enter the IPv4 address of the destination subnet address.
Mask	Enter the subnet mask in dotted decimal notation (for example, 255.255.255.0 instead of the slash notation /24).
Gateway	Enter the IPv4 address of the gateway device.

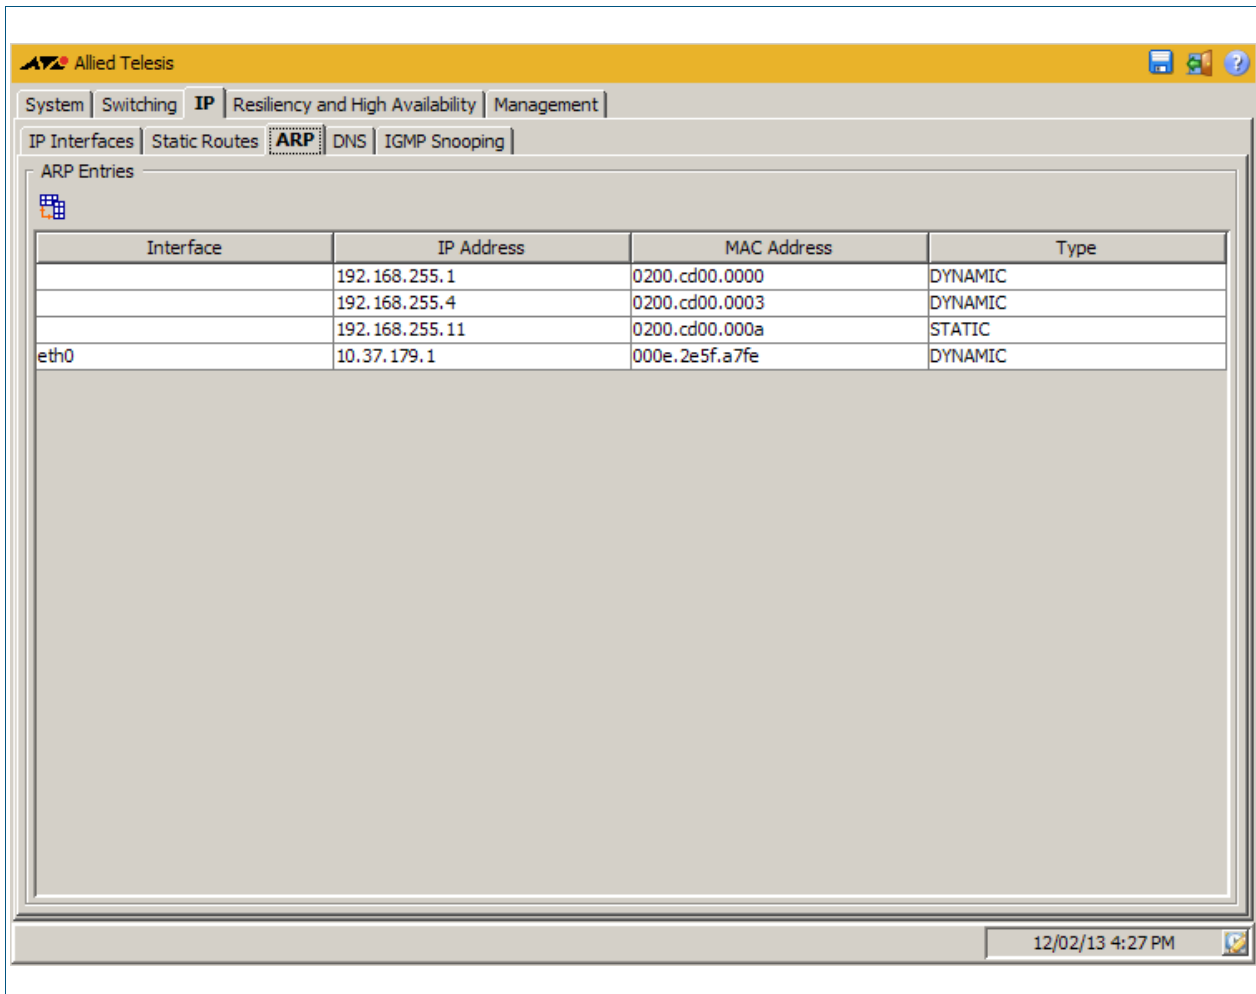

IP > ARP

The **IP > ARP** menu tab allows you to view the contents of the ARP (Address Resolution Protocol) Table.

You can change the ARP Entries view to display horizontally or vertically by selecting the table view icon above the ARP Entries.

You can also sort or rearrange the display of the ARP Entries by Interface, IP Address, MAC Address, or Type by selecting the relevant column or by dragging the relevant column respectively.

Menu Tab Example showing the **IP > ARP** menu tab:

Description

Label / Field / Button	Description
ARP Entries / Interface	Interface over which the switch is accessed, usually a VLAN.
ARP Entries / IP Address	IP address of the network device this ARP entry maps to.

Label / Field / Button	Description(cont.)
ARP Entries / MAC Address	Hardware address of the switch in hexadecimal format HHHH . HHHH . HHHH.
ARP Entries / Type	Indicates whether the ARP entry is a Static or Dynamic ARP entry. Static ARP entries are added and dynamic ARP entries are learned.

IP > DNS

The **IP > DNS** menu tab allows you to display and configure DNS (Domain Name System) server entries for the switch.

- Selecting the + icon allows you to define a DNS Server specifying the IPv4 address.
- Selecting the x icon allows you to delete a defined DNS Server.

Menu Tab Example showing the **IP > DNS** menu tab:

Description

Label / Field / Button	Description
DNS	DNS Server IPv4 address.

IP > DNS > Add DNS Server

The IP > DNS > Add DNS Server dialog allows you to add DNS (Domain Name System) server entries for the switch.

Configuration Dialog

Example showing the IP > DNS > Add DNS Server dialog:

Description

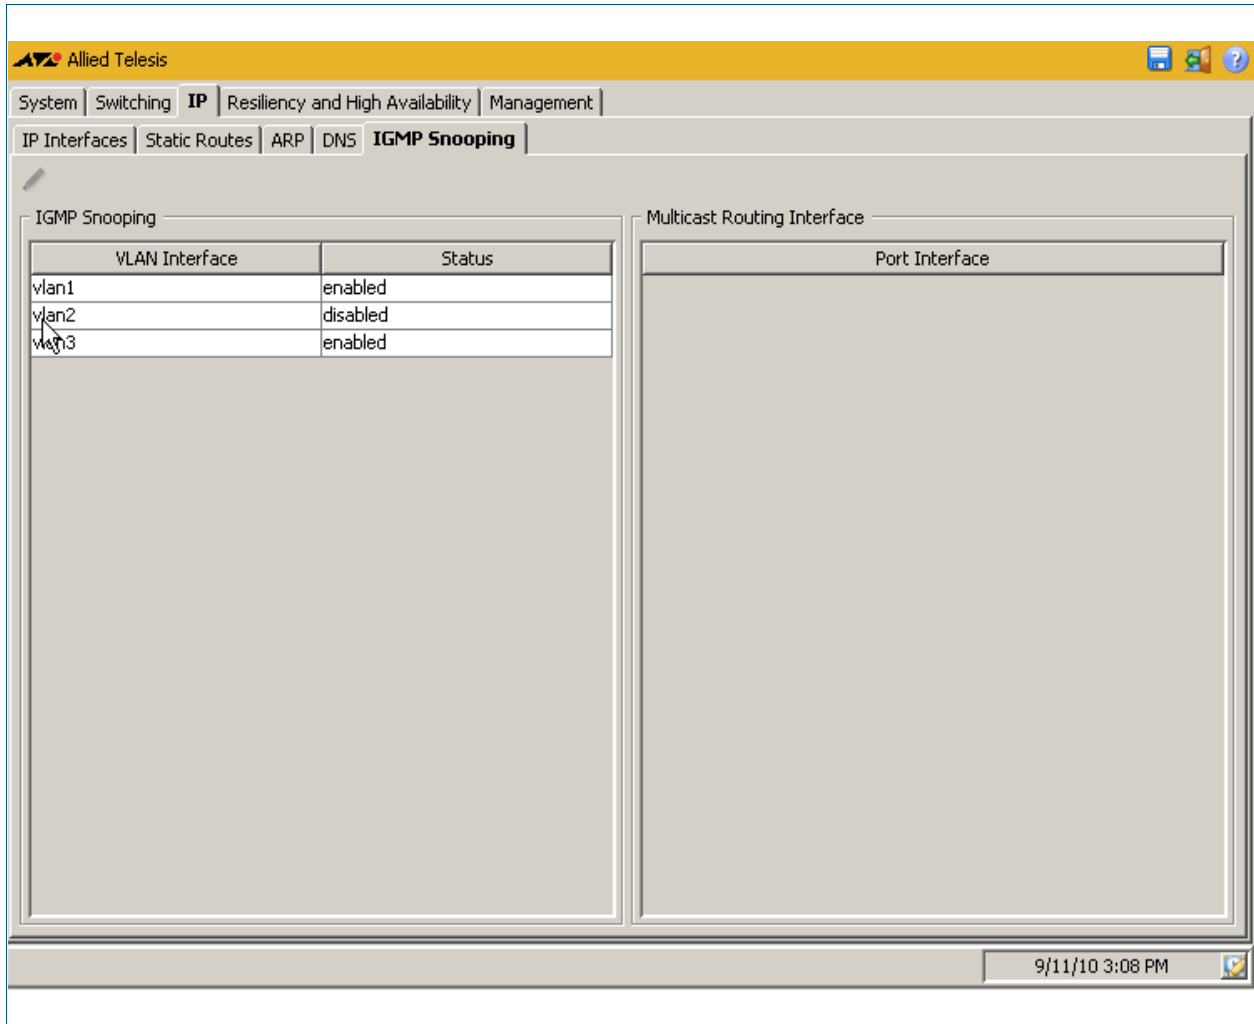

Label / Field / Button	Description
DNS	Enter an IPv4 address in dotted decimal notation (i.e. A.B.C.D) for the DNS (Domain Name System) Server you want to specify.

IP > IGMP Snooping

Menu Tab The **IP > IGMP Snooping** menu tab displays basic IGMP Snooping and Multicast Routing Interface information.

You can also configure IGMP Snooping on individual ports by selecting the VLAN interface that the port is a member of then clicking on the pen shaped icon to display the Configure IGMP Snooping dialog, where you can enable or disable IGMP snooping on desired ports.

Menu Tab Example showing the **IP > IGMP Snooping** menu tab:

Description

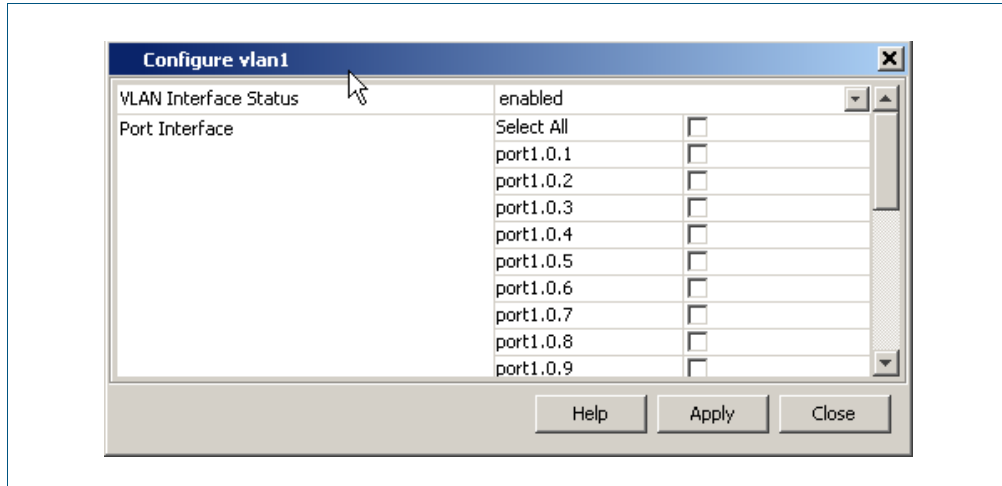

Label / Field / Button	Description
IGMP Snooping / IGMP Snooping	Displays and configures IGMP Snooping for a specified VLAN interface.
IGMP Snooping / Multicast Routing Interface	Displays and configures the specified port in the VLAN as a multicast router for IGMP Snooping.

IP > IGMP Snooping > Configure Interface

The **IP > IGMP Snooping > Configure Interface** dialog allows you to configure IGMP Snooping on individual ports. First select the VLAN interface that the port is a member of then enable or disable IGMP snooping on desired ports from this dialog.

Configuration Dialog

Example showing the **IP > IGMP Snooping > Configure Interface** dialog:

Description

Label / Field / Button	Description
VLAN Interface Status	Displays whether the selected VLAN is enabled or disabled.
Port Interface	Select the check box for a given port to allocate it to the VLAN.

Resiliency and High Availability > STP

The **Resiliency and High Availability > STP** menu tab allows you to view the configuration and status of spanning tree data: for the switch as a whole and for each port.

You can also sort or rearrange the display of the Port State table by Port, Port Priority, Port State, Port Role, STP Enabled, Port Path Cost, or Designated Bridge ID by selecting the relevant column or by dragging the relevant column respectively.

Note  STP is not configurable through the GUI. Refer to the relevant STP chapters in the AlliedWare Plus™ Software Reference to configure STP using the CLI instead.

Menu Tab Example showing the **Resiliency and High Availability > STP** menu tab:

Switch State

Mode:	Rapid	Root Path Cost:	0
Status:	Enabled	Max Age:	20
Bridge ID:	8000:eccd.6d03.1117	Hello Time:	2
Root ID:	8000:eccd.6d03.1117	Forward Delay:	15

Port State

Port	Port Priority	Port Role	Port State	STP Enabled	Port Path Cost	Designated Bridg...
port1.1.1	128	designated	forwarding	enabled	200000	8000:eccd.6d03....
port1.1.2	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....
port1.1.3	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....
port1.1.4	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....
port1.1.5	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....
port1.1.6	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....
port1.1.7	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....
port1.1.8	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....
port1.1.9	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....
port1.1.10	128	disabled	discarding	disabled	20000000	8000:eccd.6d03....

Topology Change

Topology Change:	1
Time Since Topology Change:	23 hours 31 minutes 35 seconds

12/02/13 4:48 PM

**Description:
Switch State**

Label / Field / Button	Description
Switch State / Mode	Spanning Tree Mode displayed: STP (Spanning Tree Protocol), Rapid (Rapid Spanning Tree Protocol - RSTP), or Multiple (Multiple Spanning Tree Protocol - MSTP).
Switch State / Status	Status of the Spanning Tree Mode: enabled or disabled.
Switch State / Bridge ID	Bridge ID, comprising the port priority followed by its MAC address.
Switch State / Root ID	Root Bridge ID, comprising the root priority followed by its MAC address.
Switch State / Root Path Cost	Sum of the costs for each path between the bridge port and the root bridge.
Switch State / Max Age	Time in seconds that the dynamic spanning tree configuration information is stored in the switch before it is discarded.
Switch State / Hello Time	Time in seconds between the transmission of switch spanning tree configuration information, when the switch is the Root Bridge of the spanning tree or is trying to become the Root Bridge.
Switch State / Forward Delay	Time in seconds to control how fast a port changes its spanning tree state when moving towards the forwarding state. This value is used only when the switch is acting as the root bridge. Note that Forward Delay, Max Age, and Hello Time are interrelated.

**Description:
Port State**

Label / Field / Button	Description
Port State / Port	Switch port number in the format 'portX.Y.Z' where X is the switch, Y is the XEM, and Z is the individual switch port number.
Port State / Port Priority	The lower the port priority, the higher the likelihood of the port becoming part of the active network topology.
Port State / Port Role	Displays the port role as configured in the CLI with 'spanning-tree' commands, and shows either 'rootport', 'backup', 'disabled' or 'designated' port roles.
Port State / Port State	Displays the spanning tree state for the port as configured in the CLI with 'spanning-tree' commands. Indicates spanning tree states of: disabled, blocking, listening, learning, and forwarding.
Port State / STP Enabled	Displays whether spanning-tree is enabled or disabled. Spanning tree is enabled by default.
Port State / Port Path Cost	The cost of a path for the port that determines the total cost path. The lower the total cost, the higher the priority of the path.
Port State / Designated Bridge ID	The unique parent for each bridge that connects it to the next LAN on the path towards the root bridge.

**Description:
Topology Change**

Label / Field / Button	Description
Topology Change / Topology Change	The number of STP Topology Changes that have occurred since the switch was rebooted.
Topology Change / Time Since Topology Change	The time in hours and seconds since the previous STP Topology Change occurred.

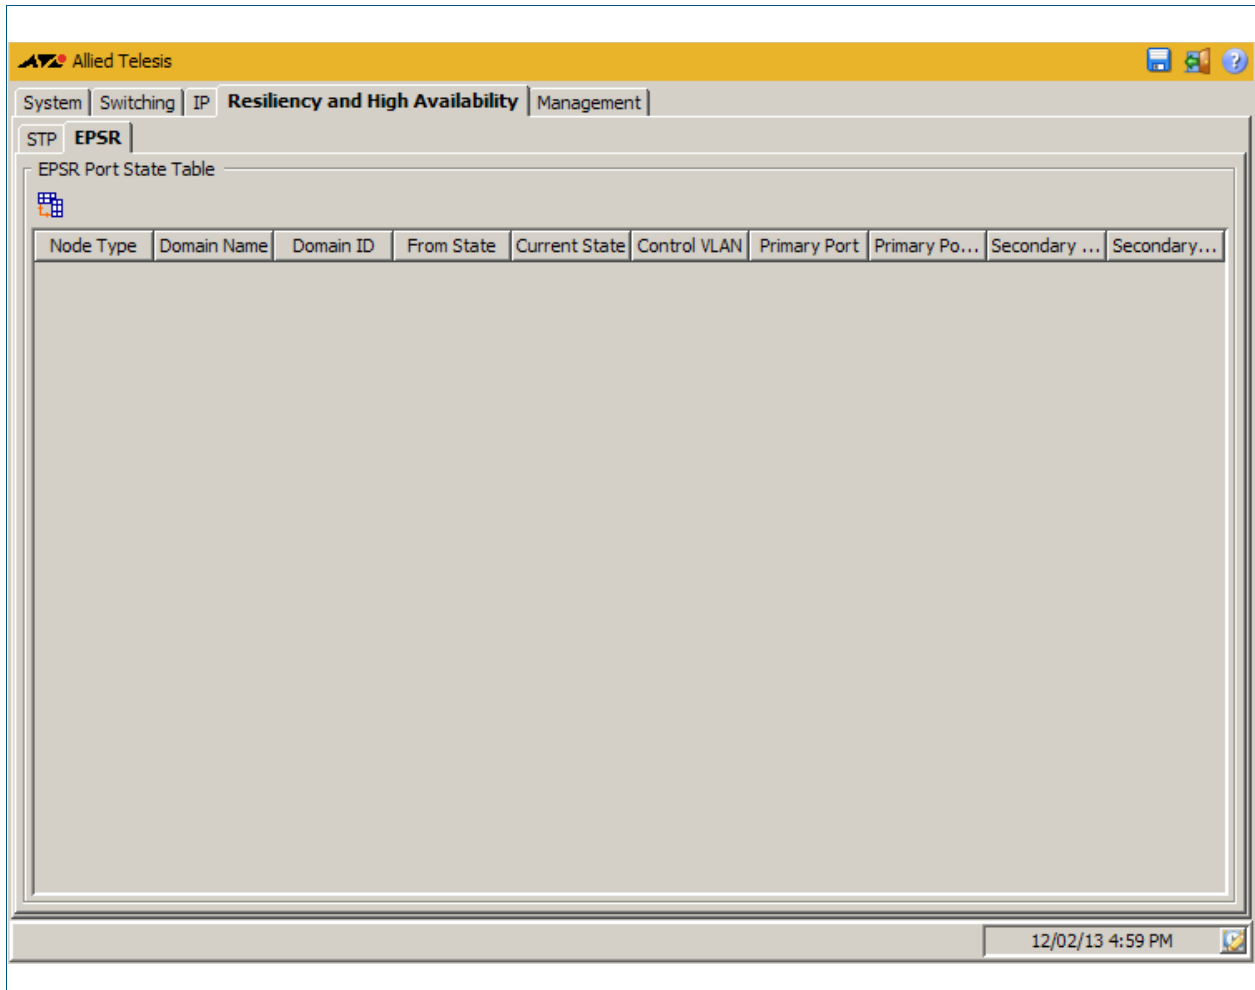

Resiliency and High Availability > EPSR

The **Resiliency and High Availability > EPSR** menu tab allows you to display the properties and status of any EPSR domains configured on the switch.

You can also sort or rearrange the display of the EPSR Port State table by Node Type, Domain Name, Domain ID, From State, Current State, Control VLAN, Primary Port, Primary Port Status, Secondary Port, or Secondary Port Status by selecting the relevant column or by dragging the relevant column respectively.

Note EPSR is not configurable through the GUI. Refer to the relevant EPSR chapters in the AlliedWare Plus™ Software Reference to configure EPSR using the CLI instead.

Menu Tab Example showing the **Resiliency and High Availability > EPSR** menu tab:

Description

Label / Field / Button	Description
EPSR Port State Table / Node Type	Displays master or transit node as configured in the CLI with the ' epsr mode ' command.
EPSR Port State Table / Domain Name	Displays the domain name. A set of instances across a ring is called a domain.
EPSR Port State Table / Domain ID	Displays the assigned domain number for the domain name.
EPSR Port State Table / From State	Displays the From EPSR state as configured in the CLI with the ' epsr state ' commands.
EPSR Port State Table / Current State	Displays the Current EPSR state as configured in the CLI with the ' epsr state ' commands.
EPSR Port State Table / Control VLAN	Displays the control VLAN as configured in the CLI with the ' epsr mode controlvlan ' command.
EPSR Port State Table / Primary Port	Displays the master node primary port interface name as configured in the CLI with the ' epsr mode primaryport ' command.
EPSR Port State Table / Primary Port Status	Displays the master node primary port interface status: up or down.
EPSR Port State Table / Secondary Port	Displays the assigned secondary port interface name.
EPSR Port State Table / Secondary Port Status	Displays the assigned secondary port interface status: up or down.

Management > Device Utilities

The **Management > Device Utilities** menu tab allows you to perform pings and reboot the switch from the GUI.

Menu Tab Example showing the **Management > Device Utilities** menu tab:

Description

Label / Field / Button	Description
Ping Utility / Host	Enter the IPv4 address or the URL that you want to ping in this field.
Ping Utility / Perform Ping	Select this button to ping the IPv4 address or URL that you entered in the Host field.

Label / Field / Button	Description(cont.)
System Uptime	Displays the elapsed time since the last reboot in hours, minutes, and seconds.
Reboot Device	Select this button to reboot your switch. You will need to login to the GUI again after you reboot your switch. Rebooting closes all Telnet / SSH / SNMP sessions on your switch.

Management > NTP

The **Management > NTP** menu tab allows you to display and configure Network Time Protocol (NTP) peer configurations on the switch.

- Selecting the + icon allows you to add an NTP association.
- Selecting the x icon allows you to delete an NTP association.

Menu Tab Example showing the **Management > NTP** menu tab:

Description

Label / Field / Button	Description
Associations / Address	The NTP peer or NTP server IPv4 address.
Associations / Status	Indicates association status, and displays ' master(synced) ', ' master(unsynced) ', ' selected ', ' candidate ', ' configured ', or ' unknown '.
Associations / Configured	Indicates if the association is configured or not, and displays ' configured ' or ' dynamic '.

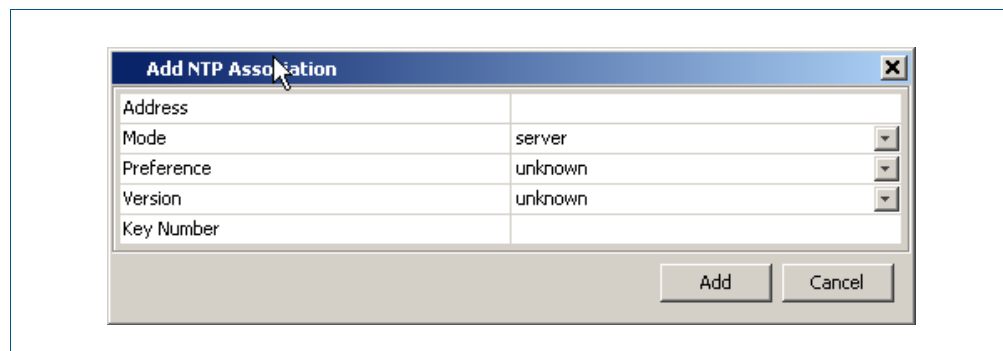

Label / Field / Button(cont.)	Description(cont.)
Associations / Reference Clock	The IPv4 address for the reference clock.
Associations / Stratum	The number of hops between the server and the accurate time source.
Associations / Poll	The time between NTP requests from the device to the server.
Associations / Reach	Shows whether or not the NTP server responded to the last request, which indicates the reachability of the NTP peer.
Associations / Delay	The round trip delay between the device and the server.
Associations / Offset	The difference between the device clock and the server clock, relative to the server clock, in milliseconds.
Associations / Dispersion	The lowest measure of error associated with peer offset based on delay.

Management > NTP > Add NTP Association

The **Management > NTP > Add NTP Association** dialog allows you configure Network Time Protocol (NTP) peer configurations on the switch.

Configuration Dialog

Example showing the **Management > NTP > Add NTP Association** dialog:

Description

Label / Field / Button	Description
Address	Enter the NTP IPv4 address for the NTP peer or NTP server used.
Mode	Select one of the <code>server</code> or <code>peer</code> options from the drop down list to specify the NTP Mode used. When using NTP server mode, the NTP server will not accept updates from clients for updates to the server's time settings. The NTP server is configured to synchronize the NTP clients. When using NTP peer mode, each device shares its time information with the other, and each device can also provide time synchronization to the other.

Label / Field / Button(cont.)	Description(cont.)
Preference	Select one of the unknown, not preferred, or preferred options from the drop down list to specify the NTP Preference used. NTP Preference is used to configure an NTP server, so the NTP server is given preference to synchronize the NTP clients.
Version	Select one of the unknown, version 1, version 2, version 3, or version 3, version 4 options from the drop down list to specify the NTP Version used.
Key Number	Enter the NTP Key Number for NTP authentication, which allows NTP to authenticate the associations with other systems for security purposes. The NTP Key Number is an integer in the range <1-4294967295>. The MD5 (Message-Digest algorithm 5) key type is supported to encrypt the NTP Key Number used for authentication.

Management > Remote CLI Access

The **Management > Remote CLI Access** menu tab allows you to enable, disable and configure Telnet and SSH.

You can create Telnet or SSH connections to the switch, and you can view a list of all current active CLI sessions on the switch from this tab.

Menu Tab Example showing the **Management > Remote CLI Access** menu tab:

Description

Label / Field / Button	Description
Telnet / Status	Displays the current Telnet status, either 'enabled' or 'disabled'.
Telnet / Configure Settings	Configures the Telnet Status. Select 'enabled' or 'disabled' to configure the status of the Telnet server on the switch.
Telnet / Start Session	Starts a Telnet session to use the CLI. After starting a Telnet session you will need to login to the switch to use the CLI.
SSH / Status	Displays the current SSH status, either 'enabled' or 'disabled'.

Label / Field / Button(cont.)	Description(cont.)
SSH / Configure Settings	Configures the SSH Status. Select 'enabled' or 'disabled' to configure the status of the SSH server on the switch. Note that relevant certificates must be installed to initiate an SSH session.
SSH / Start Session	Starts a secure SSH session to use the CLI. After starting an SSH session you will need to login to the switch to use the CLI.

Description

Label / Field / Button	Description
Active Sessions / Connection Type	A Console connection or a VTY connection.
Active Sessions / Username	Login name for a user.
Active Sessions / Privilege Level	The privilege set for a user for VTY or console connection. Privilege levels range from 0-15 with 15 the highest privilege level. Privilege levels are used in the CLI to enable or disable access to different configuration modes and commands. Privilege levels 0-14 only enables users to view system configuration and system behavior. Privilege level 15 enables users to globally configure all the interfaces on a switch.
Active Sessions / Idle Time	Time in seconds that the SSH Server waits to receive data from the SSH Client. The SSH Server disconnects when the Idle Time limit is reached.
Active Sessions / IP Address	The IPv4 address for the VTY connection.

Management > Remote CLI Access > Telnet Settings

The **Management > Remote CLI Access > Telnet Settings** dialog allows you to enable or disable Telnet.

Configuration Dialog

Example showing **Management > Remote CLI Access > Telnet Settings** dialog:

**Description**

Label / Field / Button	Description
Status	Select enabled or disabled from the drop down list on this dialog to enable or disable Telnet respectively on the switch.

Management > Remote CLI Access > SSH Settings

The **Management > Remote CLI Access > SSH Settings** dialog allows you to enable or disable SSH.

Configuration Dialog

Example showing the **Management > Remote CLI Access > SSH Settings** dialog:

Description

Label / Field / Button	Description
Status	Select enabled or disabled from the drop down list on this dialog to enable or disable SSH respectively on the switch.

Management > Logs

The **Management >Logs** menu tab allows you to view the switch logs, and export the switch logs as .csv format files.

Menu Tab Example showing the **Management > Logs** menu tab:

Description

Label / Field / Button	Description
Logs	Display, select and export the available switch log files for troubleshooting use.
Source	Select the buffered log or the permanent log available on the switch to display or export to a .csv format file for use in a spreadsheet.
Source / Refresh Log	Select this button to display an updated buffered or permanent log.
Source / Export Log	Select this option to export the log to a .csv format file for use in a spreadsheet.

Management > Logs > Export Logs

The **Management > Logs > Export Logs** dialog allows you to export the switch logs as .csv format files.

Configuration Dialog

Example showing the **Management > Logs > Export Logs** dialog:

Description

Label / Field / Button	Description
File name:	Enter the file name for the exported log file.
Files of type:	Select .csv files to export the log file as a comma separated file, so each column of the log file can be formatted in a spreadsheet.

Numerics

6to4 automatic tunneling

IPv6 transition is required to migrate from IPv4 to IPv6. One method to connect to the global IPv6 network over the existing IPv4 network is called 6to4 automatic tunneling. Although this method is called '6to4 tunneling', it does not involve discrete point-to-point tunnels. The 'tunneling' in '6to4 tunneling' refers to the fact that the IPv6 packets are encapsulated in IPv4 packets to be 'tunneled' across the IPv4 domain. Hence, '6to4 tunneling' is primarily a scheme for encapsulating IPv6 packets inside IPv4 headers.

For more information and a configuration example see [“6to4 Automatic Tunnel Configuration” on page 30.2](#).

10BaseT

10 Mbps/baseband/twisted pair. The IEEE standard for twisted pair Ethernet.

802.1X

IEEE 802.1x is an IEEE Standard for port-based Network Access Control (**NAC**). It is part of the IEEE 802.1 group of networking protocols. It provides an authentication mechanism to devices wishing to attach to a LAN, either establishing a point-to-point connection or preventing it if authentication fails. It is used for securing wireless 802.11 access points and is based on the Extensible Authentication Protocol (**EAP**). Authentication is required on a per-port basis. The main components of an 802.1X implementation are:

- The authenticator - the port on this device that wishes to enforce authentication before allowing access to services that are accessible behind it.
- The supplicant - the port that wishes to access services offered by the authenticator's system. The supplicant may be a port on a PC or other device connected to this device.
- The authentication server - a device that uses the authentication credentials supplied by the supplicant, via the authenticator, to determine if the authenticator should grant access to its services.

See [AAA](#) and [Tri-authentication](#).

For a configuration example see [“Configuring 802.1X” on page 65.7](#). For a sample configuration script see [“Sample 802.1X Authentication Configuration” on page 69.7](#).

A

AAA

AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These function can be applied in a variety of methods with a variety of servers.

Authentication is performed in the following contexts:

- Login authentication of user shell sessions on the console port, and via telnet/SSH.
- **802.1X** authentication of devices connecting to switch ports.
- **MAC authentication** of devices connecting to switch ports.
- **Web-authentication** of devices connecting to switch ports.

Accounting is performed in the following contexts:

- Accounting of console login sessions.
- Accounting of 802.1x authenticated connections.
- Accounting of MAC authenticated connections.
- Accounting of Web authenticated connections.

There are two types of servers that can be used:

- Local user database.
- **RADIUS** servers.

When 802.1X authentication, MAC authentication and Web-authentication are configured to run simultaneously on a switch port this is called tri-authentication.

For more information see [Chapter 69, AAA Introduction and Configuration](#). For a configuration example see [“Configuring AAA Login Authentication” on page 69.5](#). For sample 802.1x, MAC authentication and Web-authentication configuration scripts see [“Sample Authentication Configurations” on page 69.7](#).

Access-list

See [ACL](#).

ACL

Access Control List. An ACL is one filter, or a sequence of filters, that are applied to an interface to either block, pass, or when using QoS, apply priority to, packets that match the filter definitions. ACLs are used to restrict network access by hosts and devices and to limit network traffic. See [ACL sequence numbers](#) and [ACL types](#).

For more information see [Chapter 58, Access Control Lists Introduction](#).

ACL sequence numbers

To help manage [ACLs](#) you can apply sequence numbers to filters. This allows you to remove filters from named and numbered ACLs without having to reconfigure an ACL. The ability to add sequence numbers to filters simplifies updates through the ability to position a filter within an ACL. When you add a new filter, you can specify a sequence number to position the filter in the ACL and you can also remove a current filter in an ACL by specifying a sequence number.

For more information see [“ACL Filter Sequence Numbers” on page 58.15](#).

ACL types

[ACLs](#) are separated into two different types, software ACLs and hardware ACLs.

Hardware ACLs are applied directly to an interface, or are used for QoS [Classifications](#). They can be either named, or can use the following numeric ranges:

- 3000-3699 for Hardware IP ACLs
- 4000-4699 for Hardware MAC ACLs

For more information see [“Defining Hardware IP ACLs” on page 58.6](#) and [“Defining Hardware MAC ACLs” on page 58.5](#).

Software ACLs can be either named ACLs, using the standard or extended keyword followed by a text string, or they can use the following numeric ranges:

- 1-99
- 100-199
- 1300-1999
- 2000-2699

Software ACLs are used in features such as SNMP, IGMP, BGP and OSPF.

Address resolution

The process of resolving and mapping hardware MAC addresses into their corresponding network layer IP addresses. Depending on the underlying network, address resolution may require broadcasts on a local network.

For more information see [“ARP” on page D.4](#).

Adjacency

A state existing between two OSPF routers. These routers build their routing databases by exchanging link state advertisements, often termed hello messages. When a pair has completed the process, the routers are said to be “adjacent.”

ARP

Address Resolution Protocol. ARP is used by your device to dynamically learn the Layer 2 address of devices in its networks. Most hosts also have a MAC physical address in addition to the assigned IP address. For Ethernet, this is a 6-byte, globally unique number. ARP enables your device to learn the physical address of the host that has a given IP address.

For more information see [“Address Resolution Protocol \(ARP\)” on page 26.3](#).

AS

Autonomous System. A group of networks with a common routing infrastructure. An AS runs interior gateway protocols (IGPs) such as [RIP](#) and [OSPF](#) within its boundaries and uses exterior gateway protocols (EGPs) such as [BGP](#) to exchange routing information with other ASs.

ASCII

The *American Standard Code for Information Interchange*. A standard character-to-number encoding widely used within the computer industry.

ASIC

Application Specific Integrated Circuit. An integrated circuit (chip) manufactured to perform a specific function.

Asynchronous

Transmission in which each character is sent individually. The time intervals between transmitted characters may be of unequal length. Transmission is controlled by start and stop elements before and after each character. See [“Synchronous” on page D.29](#)

Autonegotiation

Autonegotiation lets the port adjust its speed and duplex mode to accommodate the device connected to it. When the port connects to another autonegotiating device, they negotiate the highest possible speed and **Duplex mode** for both of them.

Autonomous system

See [AS](#).

B

BGP

Border Gateway Protocol. BGP is an exterior gateway protocol that determines the best path in networks, performs optimal routing between multiple autonomous systems or domains, and exchanges routing information with other BGP systems. The RFCs 1771 (BGP4), 1654 (first BGP4 specification), and 1105, 1163, 1267 (older version of BGP) describe BGP and BGP4.

For more information see [“BGP” on page 32.3](#). For configuration examples see [“Enabling iBGP Peering using a Global Address” on page 44.23](#), [“Enabling iBGP Peering using a Link-local Address” on page 44.26](#), [“Configuring a BGP Route Reflector” on page 44.6](#), [“Configuring a BGP Confederation” on page 44.8](#), [“Configuring BGP Authentication” on page 44.11](#), [“Configuring BGP Graceful Reset” on page 44.13](#) and [“Configuring BGP Graceful Restart” on page 44.18](#).

BGP filter types

There are four filter types that can be applied to the BGP updates being exchanged between BGP peers:

- **Distribute filters** - these use ACLs and look at the individual prefixes within an update message. If a prefix within the update message matches the filter criteria then that individual prefix is filtered out or accepted depending on what action the filter entry has been configured to carry out. Note that you cannot combine distribute filters and prefix filters.
- **Path filters** - these look at the AS-Path attribute in update messages. If the AS-Path attribute in the update matches the filter criteria then the whole update message is filtered out or accepted, depending on what action the filter entry has been configured to carry out.
- **Prefix filters** - these use prefix lists and look at the individual prefixes within an update message. If a prefix within the update message matches the filter criteria then that individual prefix is filtered out or accepted depending on what action the filter entry

has been configured to carry out. Note that you cannot combine distribute filters and prefix filters.

- Route maps - these have a complex combination of match criteria and actions. They can be used to filter out routes and also to alter the attributes in update messages.

All these filter types can be used in incoming or outgoing directions. Therefore, all the filters can all be used to filter the update packets that are received from a peer, or the update packets which the router itself is sending to a peer.

BGP peers

Within the BGP protocol, the exchange of routing information is carried out between pairs of routers. Two routers create a TCP connection with each other, and exchange routing information as specific data packets within that TCP session. The routers at the ends of the TCP connection are referred to as BGP peers. Any given router can form peering relationships with multiple routers.

BGP updates

Once a router has established a BGP connection with a peer, it will start to exchange routing information with that peer. A BGP update message is the packet that is used to transfer the routing information.

BIST

Built In Self Test. A mechanism that permits the device to test itself.

Blackhole route

A blackhole route is a routing table entry that does not forward packets. A blackhole route is specified as an interface with an **ip route** command. Note that a blackhole route is also called a **Null route**.

B-MAC

Backbone MAC address.

BPDU

Bridge Protocol Data Unit. A **Spanning tree** protocol initializing packet sent at configurable intervals to exchange information among bridges in the LAN.

For information on the standardized format for MSTP BPDU messages see **“MSTP Bridge Protocol Data Units (BPDUs)” on page 18.17**.

Bridge

A device that connects two or more networks and forwards packets between them. Bridges function at the data link layer or Layer 2 of the OSI reference model. A bridge will filter, send or flood an incoming frame, base on the MAC address of that frame.

Broadcast

One device sends out data that is intended to be received and processed by every device that it reaches.

Broadcast domain

A section of an Ethernet network comprising all the devices that will receive broadcast packets sent by any device in the domain. Separated from the rest of the network by a Layer 3 switch.

BOOTP

Bootstrap Protocol. BOOTP is a UDP-based protocol that enables a booting host to dynamically configure itself without external interventions. A BOOTP server responds to requests from BOOTP clients for configuration information, such as the IP address the client should use.

B-TAG

Backbone TAG Field.

B-VID

Backbone VLAN ID (tunnel).

B-VLAN

Backbone VLAN (tunnel).

C

CHAP

Challenge Handshake Authentication Protocol. CHAP is an authentication method used by PPP servers to validate the identity of clients. CHAP verifies the identity of the client by using a three-way handshake, and the verification is based on a shared secret by the client and the server, such as the client's password.

CIST

Common and Internal Spanning Tree. The CIST is the default spanning tree instance of **MSTP**, i.e. all VLANs that are not members of particular **MSTIs** are members of the CIST. Also, an individual MST region can be regarded as a single virtual bridge by other MST regions. The spanning tree that runs between regions is the CIST. The CIST is also the spanning tree that runs between MST regions and Single Spanning Tree (SST) entities.

For more information see **“Common and Internal Spanning Tree (CIST)” on page 18.15.**

Classification

In **ACLs** and **QoS**, classification is the process of filtering and marking. Filtering involves sorting your data into appropriate traffic types. Marking involves tagging the data so that downstream ports and routers can apply appropriate service policy rules. There are two reasons to classify data:

- To provide network security (security ACLs).
- To apply service quality criteria QoS.

The main application of security ACLs is to block undesired traffic. When using ACLs though QoS, the same classification and action abilities are available, but QoS has some additional fields that it can match on and also provides the ability to perform metering, marking and remarking on packets that match the filter definitions.

For more information on QoS classification see **“Classifying your Data” on page 63.7.**

Class maps

Class maps are among the pivotal **QoS** components. They provide the means that associate the classified traffic with its appropriate QoS actions. They are the linking elements for the following functions:

- **Classification.**
- policy mapping. See **Policy maps.**
- **Premarking.**

The relationship between a class map and a policy map can be one-to-one or many-to-one.

For more information see **“Class Maps” on page 63.7.**

CLI

Command Line Interface. With three distinct modes, the CLI is very secure. In User exec mode you can view settings and troubleshoot problems but you cannot make changes to the system. In Privileged exec mode you can change system settings and restart the device. You can only make configuration changes in Global configuration mode, which reduces the risk of making accidental configuration changes.

For more information see **“How to Work with Command Modes” on page 1.7.**

C-MAC

Customer MAC Address.

Collision domain

A physical region of a local area network (LAN) in which data collisions can occur.

Control VLAN

In **EPSR**, the VLAN over which all control messages are sent and received. EPSR never blocks this VLAN.

For more information see **“Ring Components and Operation” on page 84.2.**

CoS

Class of Service. CoS is a method for classifying traffic on a packet by packet basis using information in the type-of-service (ToS) byte to provide different service levels to different traffic. See **QoS**.

For more information see **“CoS to egress queue premarking” on page 63.12.**

Cost

An indication of the overhead required to send packets across a certain interface.

C-TAG

Customer VLAN TAG.

C-VID

Customer VLAN ID.

C-VLAN

Customer VLAN.

D

Data VLAN

In **EPSR**, a VLAN that needs to be protected from loops. Each EPSR domain has one or more data VLANs.

For more information see [“Ring Components and Operation” on page 84.2.](#)

Designated bridge

Each bridge or LAN in the **Spanning tree**, except the **Root bridge**, has a unique parent, known as the designated bridge. Each LAN has a single bridge, called the designated bridge, that connects it to the next LAN on the path towards the root bridge.

For an overview of spanning tree operation see [“Spanning tree operation” on page 18.2.](#)

DHCP

Dynamic Host Configuration Protocol. A method of automatically allocating IP addresses. A DHCP server holds a pool of IP addresses from which it draws individual ones as it allocates them to users when they log on.

For more information see [Chapter 90, Dynamic Host Configuration Protocol \(DHCP\) Introduction.](#)

DHCP Leasequery

The DHCP Leasequery protocol (RFC 4388) allows a device or process, for example a DHCP relay agent, to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

For more information see [“Enable DHCP Leasequery” on page 90.6.](#)

DHCP lease probing

Probing is used by the DHCP server to check whether an IP address it wants to lease to a client is already being used by another host. Probing is configured on a per-DHCP pool basis.

For more information see [“DHCP Lease Probing” on page 90.8.](#)

DHCP relay agent option 82

Enabling the DHCP Relay Agent Option 82 feature on the switch allows the switch to insert extra information into the DHCP packets that it is relaying. The information is stored in a specific optional field in the DHCP packet, namely, the agent-information field, which has option ID 82.

Note that the DHCP Relay Agent Option 82 agent information inserted by the DHCP snooping differs from the information added by DHCP Relay. The switch cannot be configured to use both the DHCP relay agent option and DHCP snooping.

For information about the DHCP Relay Agent Option 82 information inserted by DHCP Relay see [“DHCP Relay Agent Information Option \(Option 82\)” on page 90.10](#).

For information about the DHCP Relay Agent Option 82 information inserted by DHCP snooping see [“DHCP Relay Agent Option 82” on page 80.4](#).

DHCP relay agents

DHCP relay agents pass BOOTP and DHCP messages between servers and clients. Networks where the DHCP or BOOTP server does not reside on the same IP subnet as its clients need the intermediate routers to act as relay agents.

For information on how to configure the DHCP relay agent see [“DHCP Relay Agent Introduction” on page 90.9](#).

DHCP snooping

DHCP snooping provides an extra layer of security on the switch via dynamic IP source filtering. DHCP snooping filters out traffic received from unknown, or ‘untrusted’ ports, and builds and maintains a DHCP snooping database.

With DHCP snooping, IP sources are dynamically verified, and filtered accordingly. IP packets that are not sourced from recognized IP addresses can be filtered out. This ensures the required traceability.

For more information see [Chapter 80, DHCP Snooping Introduction and Configuration](#). For a configuration example see [“Configure DHCP Snooping” on page 80.10](#).

Digital Diagnostics Monitoring (DDM)

Modern optical SFP transceivers support Digital Diagnostics Monitoring (DDM) functions. This feature allows you to monitor real-time parameters of the SFP, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitoring these parameters allows you to check on the health of all installed SFPs or a specific SFP transceiver. See also [Trouble-shoot fiber and pluggable issues](#) in [Getting Started](#).

SFP transceivers that support DDM display the following output from the [show system pluggable detail](#) and the [show system pluggable diagnostics](#) commands for monitoring SFPs:

- **Diagnostic Calibration:** Specifies whether the pluggable supports DDM Internal Calibration. **Internal** is displayed if the pluggable supports DDM Internal Calibration.
- **Power Monitoring:** Displays the received power measurement type, which can be either **OMA** (Optical Module Amplitude) or **Avg** (Average Power) measured in μW .

For further information about the DDM feature on the switch for installed SFP transceivers, see the **show system pluggable detail** command and the **show system pluggable diagnostics** command in **Chapter 8, System Configuration and Monitoring Commands**.

DLF

Destination Lookup Failure. DLF is the event of receiving a unicast Ethernet frame with an unknown destination address.

DNS

Domain Name System. DNS allows you to access remote systems by entering human-readable device host names rather than IP addresses. DNS works by creating a mapping between a device name, such as <http://www.alliedtelesis.com>, and its IP address. These mappings are held on DNS servers. The benefits of DNS are that domain names:

- Can map to a new IP address if the host's IP address changes.
- Are easier to remember than an IP address.
- Allow organizations to use a domain name hierarchy that is independent of any IP address assignment.

For more information see **"Domain Name System (DNS)" on page 26.8**.

DNS relay

DNS Relay provides the presence of a local virtual DNS server on your AlliedWare Plus™ device which can service DNS lookup requests sent to it from local hosts. The DNS Relay will usually relay the requests to an external, or upstream, DNS server.

For more information see **"DNS Relay" on page 26.10**.

DoS

Denial of Service. A generic term for attacks that reduce or stop the operation of a network.

DSCP value

The Differentiated Services Code Point within the TOS field of an IP packet header. This is a 6-bit number in the range 0-63.

Duplex mode

See **Full duplex** and **Half duplex**.

Dynamic channel group

A dynamic channel group also known as a LACP channel group, an etherchannel, or a LACP aggregator, enables a number of ports to be dynamically combined to form a single higher bandwidth logical connection. See **LACP**.

For an more information see **"Link Aggregation Control Protocol (LACP)" on page 20.3**. For a configuration example see **"Configuring an LACP Channel Group" on page 20.5**.

Dynamic Link Failover

Dynamic Link Failover (Host Attach) is a versatile feature that enables devices that do not support link aggregation to form multiple active links by using **Triggers** and **Scripts**. You can customize Dynamic Link Failover to suit almost any situation, from a simple redundant backup link to multiple active links capable of basic load-sharing.

E

EAP

Extensible Authentication Protocol. EAP carries out the authentication exchange between the supplicant and the authentication server.

EEE

The IEEE 802.3az Energy Efficient Ethernet (EEE) standard is a specification for lowering the power consumption of Ethernet devices during periods of low link utilization. If no data is being sent then the Ethernet device can enter a sleep state, called Low Power Idle (LPI), to conserve the power consumed by the Ethernet device. See the [LPI](#) glossary entry.

Etherchannel

See [Dynamic channel group](#).

Ethernet Protection Switching Ring

See [EPSR](#).

EPSR

EPSR (Ethernet Protection Switching Ring) operates on physical rings of switches (note, not on meshed networks). When all nodes and links in the ring are up, EPSR prevents a loop by blocking data transmission across one port. When a node or link fails, EPSR detects the failure rapidly and responds by unblocking the blocked port so that data can flow around the ring. The EPSR components are:

- [EPSR domain](#)
- [Master node](#)
- [Transit node](#)
- [Ring port](#)
- [Primary port](#)
- [Secondary port](#)
- [Control VLAN](#)
- [Data VLAN](#)

For more information and example configurations see [Chapter 84, EPSR Introduction and Configuration](#).

EPSR domain

A protection scheme for an Ethernet ring that consists of one or more data VLANs and a control VLAN.

For more information see [“Ring Components and Operation” on page 84.2](#).

EGP

Exterior Gateway Protocol. EGP is an obsolete protocol that has been replaced by [BGP](#). Not to be confused with the general term exterior gateway protocol.

Egress

Outgoing packet process.

Exterior Gateway Protocol

A protocol that distributes routing information to devices that connect separate autonomous systems (**ASs**).

F

FDB

Forwarding Database.

FIB

Forwarding Information Base. The **RIB** (Routing Information Base) populates the FIB with the best route to each destination. When your device receives an IP packet, and no filters are active that would exclude the packet, it uses the FIB to find the most specific route to the destination. If your device does not find a direct route to the destination, and no default route exists, it discards the packet and sends an ICMP message to that effect back to the source.

For more information see [“RIB and FIB Routing Tables” on page 33.4](#).

Full duplex

When a port is in full duplex mode, the port transmits and receives data simultaneously. See [Half duplex](#).

G

Guest VLAN

If [802.1X](#) authentication has been configured on access ports in the network, you might still want to provide limited network access to those users whose devices do not have 802.1x supplicant enabled, or who have unrecognized authentication credentials. The mechanism to achieve this is known as a Guest VLAN. The idea is that if the users device fails 802.1X authentication, or is not even performing any 802.1X authentication, then its connection port can be put into the guest VLAN.

For more information see [“Configuring a Guest VLAN” on page 2](#) and the [auth guest-vlan command on page 68.8](#). For a configuration example see [“Configuring a Guest VLAN” on page 67.2](#).

H

Half duplex

When a port is in half duplex mode, the port transmits or receives but not both at the same time. See [Full duplex](#).

Hardware ACLs

See [ACL types](#).

I

ICMP

Internet Control Message Protocol. ICMP allows networking devices to send information and control messages to other devices or hosts.

For more information see [“Internet Control Message Protocol \(ICMP\)” on page 26.13](#).

ICMPv6

Internet Control Message Protocol Version 6. ICMPv6 is an implementation of [ICMP](#) for IPv6.

For more information see [“The Internet Control Message Protocol \(ICMPv6\)” on page 28.7](#).

IGMP

Internet Group Management Protocol. IGMP is a communications protocol that hosts use to indicate that they are interested in receiving a particular multicast stream.

IGMP querier or router

A device in a subnetwork that is the coordinator for all multicast streams and IGMP membership information. Each subnet only has one active querier.

IGMP snooper

A device that spies on IGMP messages to create flow efficiencies by ensuring that multicast data streams are only sent to interested ports. A snooper can decide on the best path to send multicast packets at Layer 2 but does not initiate any IGMP communications.

For a configuration example see [“IGMP Snooping and Querier configuration example” on page 49.6](#).

IGP

Interior Gateway Protocol. A routing protocol used within an autonomous system ([AS](#)).

Ingress

Incoming packet process.

Interior Gateway Protocol

See [IGP](#).

IP directed broadcast

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a switch that is directly connected to its destination subnet, the packet is flooded as a broadcast on the destination subnet. IP directed broadcast is enabled and disabled per VLAN interface. When enabled a directed broadcast packet is forwarded to an enabled VLAN interface if received on another subnet.

IP Helper

The IP Helper feature allows the switch to receive UDP broadcasts on one subnet, and forward them as broadcasts or unicasts into another subnet, so a client can use an application which uses UDP broadcast (such as Net-BIOS) when the client and server are located in different subnets. The IP Helper feature forwards UDP broadcast network traffic to specific hosts on another subnet and/or to the broadcast address of another subnet. When the IP Helper feature is enabled on a VLAN interface, the UDP broadcast packets received on the interface are processed for forwarding out through another interface into another subnet.

IRDP

ICMP Router Discovery Protocol. If this feature is configured, the device sends router advertisements periodically and in response to router solicitations. ICMP Router Discovery messages let routers automatically advertise themselves to hosts.

For more information see [“ICMP Router Discovery Protocol \(IRDP\)” on page 26.14](#).

I-SID

Extended Service ID.

ISP

Internet Service Provider. An organization that offers its customers access to the Internet. The ISP connects its customers using a data transmission technology, such as dial-up or DSL etc.

I-TAG

Extended Service TAG.

L

LACP

Link Aggregation Control Protocol. LACP allows bundling of several physical ports to form a single logical channel providing enhanced performance and redundancy. The aggregated channel is viewed as a single link to each switch. The spanning tree views the channel as one interface and not as multiple interfaces. When there is a failure in one physical port, the other ports stay up and there is no disruption. LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).

For an more information see [“Link Aggregation Control Protocol \(LACP\)” on page 20.3](#).

LACP aggregator

See [Dynamic channel group](#).

LACP channel group

See [Dynamic channel group](#).

LAG

See [Link aggregation group](#).

Layer 3 switch

A Layer 3 switch is an optimized combination of routing software and specialized hardware. The software uses traditional methods (static routing commands, and routing protocols) to build up a table of the best routes to network destinations, and then writes them into a set of registers in the specialized forwarding hardware. The hardware then forwards packets, based on their Layer 3 address content, at very high data rates, using the values that are written into the registers.

LED

Light Emitting Diode (LED). An LED is a semiconductor that emits light by converting electrical energy. Power lights on switches and status lights on switch ports are LEDs. You can save power used by switch LEDs with the [ecofriendly led](#) command on page 8.13.

For more information and configuration examples see the section [“Save Power With the Eco-Friendly Feature” on page 1.33](#). For command information and examples see the [ecofriendly led](#) command on page 8.13. See also the [LPI](#) glossary entry.

Link aggregation group

A Link Aggregation Group is a collection of bundled switch ports for an aggregated link. Link aggregation is the bonding together of two or more data channels into a single channel that appears as single logical link of higher bandwidth increasing link performance and reliability.

For an more information see [“Link Aggregation Control Protocol \(LACP\)” on page 20.3](#). For a configuration example see [“Configuring an LACP Channel Group” on page 20.5](#)

Link-local addresses

A link-local address is an IP (Internet Protocol) address that is only used for communications in the local network, or for a point-to-point connection. Routing does not forward packets with link-local addresses. IPv6 requires a link-local address is assigned to each interface, which has the IPv6 protocol enabled, and when addresses are assigned to interfaces for routing IPv6 packets.

Note that link-local addresses are retained in the system until they are negated by using the no variant of the command that established them. See the [ipv6 enable](#) command for more information.

Also note that the link-local address is retained in the system if the global address is removed using another command, which was not used to establish the link-local address. For example, if a link local address is established with the [ipv6 enable](#) command then it will not be removed using a [no ipv6 address](#) command.

LLDP

Link Layer Discovery Protocol. LLDP is a Layer 2 protocol that enables Ethernet network devices, such as switches and routers, to transmit and/or receive device-related information to or from directly connected devices on the network, and to store such information learned about other devices. LLDP is a link level (“one hop”) protocol; LLDP information can only be sent to and received from devices that are directly connected to each other, or connected via a hub or repeater. Advertised information is not forwarded on to other devices on the network.

For more information see [Chapter 97, LLDP Introduction and Configuration](#).
For configuration examples see [“Configuring LLDP” on page 97.11](#).

LLDPDU

LLDP Data Unit. See [LLDP advertisements](#).

LLDP advertisements

LLDP transmits advertisements as packets called LLDP Data Units (LLDPDUs). An LLDPDU consists of a set of Type-Length-Value elements (TLV), each of which contains a particular type of information about the device or port transmitting it.

LLDP-MED

Link Layer Discovery Protocol Media Endpoint Discovery. LLDP-MED is an enhancement to IEEE’s 802.1AB LLDP, adding media and IP telephony-specific messages that can be exchanged between the network and endpoint devices.

For more information see [“LLDP-MED” on page 97.3](#), [“LLDP-MED: Location Identification TLV” on page 97.7](#) and [“LLDP-MED Operation” on page 97.9](#). For the procedure to configure LLDP-MED see [“Configure LLDP-MED” on page 97.14](#).

Local RADIUS server

Local RADIUS Server provides a user authentication service feature.

For more information and configuration examples see [Chapter 75, Local RADIUS Server Introduction and Configuration](#).

LPI

Low Power Idle (LPI). LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

For more information and configuration examples see the section [Save Power With the Eco-Friendly Feature command on page 1.33](#). For command information and examples see the [ecofriendly lpi command on page 8.14](#). See also the [LED](#) glossary entry.

LSA

Link State Advertisement. OSPF sends link-state advertisements (LSAs) to all other routers within the same hierarchical area. Data on attached interfaces, metrics used, and other variables, are included in OSPF LSAs. As OSPF routers accumulate link-state data, they use the Shortest Path First (SPF) algorithm to calculate the shortest path to each node.

M

MAC address learning

A key optimization in Ethernet switching is that the flooding of unicast traffic is minimized. This is based on switches knowing which port to forward traffic to for given destination MAC addresses. Switches achieve this by the simple process of noting on which ports packets arrive from given MAC addresses, as those will be the ports to which return packets to those MAC addresses will need to be forwarded. This process is referred to as MAC address learning.

MAC authentication

The way that MAC-based authentication works is that when the supplicant device starts sending packets, the authenticating switch will extract the source MAC address from the packets, and send a RADIUS request that uses this MAC address as the username and password in the request. See [AAA](#) and [Tri-authentication](#).

For a sample configuration script see "[Sample MAC Authentication Configuration](#)" on [page 69.8](#).

Master node

In [EPSR](#), the controlling node for a domain, responsible for polling the ring state, collecting error messages, and controlling the flow of traffic in the domain.

Master node states are:

- Complete - the state when there are no link or node failures on the ring.
- Failed - the state when there is a link or node failure on the ring. This state indicates that the master node received a Link-Down message or that the failover timer expired before the master node's secondary port received a Health message.

For more information see "[Ring Components and Operation](#)" on [page 84.2](#).

MD5

Message Digest 5 authentication algorithm.

Metering

See [Policing](#).

Metric

The sum of all the costs along the path to a given destination. See [Cost](#).

MLD

Multicast Listener Discovery. MLD is used to exchange membership status information between IPv6 routers that support multicasting and members of multicast groups on a network segment. Host membership in a multicast group is reported by individual member hosts, and membership status is periodically polled by multicast routers.

MLD snooping

MLD snooping is a feature whereby a Layer 2 switch listens to or “snoops” the MLD messages passing through the switch or from member hosts and multicast routers. The purpose of MLD snooping is to provide efficient Layer 2 multicast forwarding, by sending only to hosts that have expressed an interest in receiving the multicast data.

For more information see [Chapter 57, MLD and MLD Snooping Introduction and Commands](#).

MSTI

Multiple Spanning Tree Instance. **MSTP** enables the grouping and mapping of VLANs to different spanning tree instances. An MST Instance (MSTI) is a particular set of VLANs that are all using the same spanning tree.

For more information see [“Multiple Spanning Tree Instances \(MSTI\)” on page 18.12](#).

MSTP

Multiple Spanning Tree Protocol. MSTP is similar to Rapid Spanning Tree Protocol (**RSTP**) - it provides loop resolution and rapid convergence. However it also has the extra advantage of making it possible to have different forwarding paths for different multiple spanning tree instances. This enables load balancing of network traffic across redundant links. A device running MSTP is compatible with other devices running RSTP or **STP**.

For more information see [“Multiple Spanning Tree Protocol \(MSTP\)” on page 18.11](#).
For a configuration example see [“Configuring MSTP” on page 18.19](#).

MSTP regions

An MST region is a set of interconnected switches that all have the same values for the following MST configuration identification elements:

- MST configuration name - the name of the MST region.
- Revision level - the revision number of configuration.
- Configuration Digest - the mapping of which VLANs are mapped to which MST instances.

Each of the MST instances created are identified by an **MSTI** number. This number is locally significant within the MST region. Therefore, an MSTI will not span across MST regions.

For more information see [“MSTP Regions” on page 18.13](#).

Multicast

One device sends out data that is intended to be received and processed by a selected group of the devices it reaches.

N

NAC

Network Access Control. NAC provides unprecedented control over user access to the network in order to mitigate threats to network infrastructure. NAC uses **802.1X** port-based authentication with standards-compliant dynamic VLAN assignment, to assess a user's adherence to the network's security policies, and either grant authentication or offer remediation. NAC also supports alternatives to 802.1x port-based authentication, such as **Web-authentication** to enable guest access, and **MAC authentication** for end points that do not have an 802.1x supplicant. Furthermore, if multiple users share a port then multi-authentication can be used and a **Guest VLAN** can be configured to provide a catch-all for users without an 802.1x supplicant.

For more information see [Chapter 65, 802.1X Introduction and Configuration](#) and [Chapter 67, Authentication Introduction and Configuration](#).

NAS

Network Access Server. A NAS is a single point of access to a remote resource. The client connects to the NAS. The NAS then connects to another resource asking whether the client's supplied credentials are valid. Based on that answer the NAS then allows or disallows access to the resource. The NAS contains no information about what resources clients can connect to or what client credentials are valid. The NAS sends the credentials the client supplied to a resource which then validates the client.

Next hop

IP routing involves forwarding packets from one router to the next, until they reach their destination. Routers do not need to know the full path to a packet's destination, they just need to know the next router to forward the packet on to. This 'next router' is referred to as the next hop of an IP route.

Nested VLAN

See [VLAN double tagging](#).

NTP

Network Time Protocol. NTP is a protocol for synchronizing the time clocks on a collection of network devices using a distributed client/server mechanism.

For more information see [Chapter 88, NTP Introduction and Configuration](#).

Null route

A null route is a routing table entry that does not forward packets. A null route is specified as an interface with an **ip route** command. Note that a null route is also called a **Blackhole route**.

O

OSPF

Open Shortest Path First. A link-state routing protocol, OSPF is an interior gateway protocol (IGP) that uses the Shortest Path First (SPF) Dijkstra algorithm.

For more information see [Chapter 39, OSPF Introduction and Configuration](#). For configuration examples see [“Enabling OSPF on an Interface” on page 39.9](#), [“Setting priority” on page 39.11](#), [“Configuring an Area Border Router” on page 39.13](#), [“Redistributing Routes Into OSPF” on page 39.14](#), [“OSPF Cost” on page 39.16](#), [“Configuring Virtual Links” on page 39.19](#) and [“OSPF Multi-Area Loopback Configuration” on page 39.24](#).

P

PAP

Password Authentication Protocol. PAP is an authentication protocol that uses a password and is used by PPP to validate users before allowing them to access server resources. PAP transmits plain text ASCII passwords over the network so it is not secure.

PDs

Powered Devices. PDs are devices such as IP phones, wireless LAN Access Points, and network cameras. PDs receive power, in addition to data, over existing network infrastructure and cabling. See [PoE](#).

PIM-DM

Protocol Independent Multicast - Dense Mode. PIM-DM is a data-driven multicast routing protocol, which builds source-based multicast distribution trees that operate on the Flood-and-Prune principle. It requires unicast-reachability information, but does not depend on a specific unicast routing protocol. PIM-DM is a significantly less complex protocol than PIM-SM. PIM-DM works on the principle that it is probable that any given multicast stream will have at least one downstream listener. PIM-DM is ideal where many hosts subscribe to receive multicast packets, so most of the PIM Routers receive and forward all multicast packets.

For more information see [Chapter 55, PIM-DM Introduction and Configuration](#). For a configuration example see [“PIM-DM Configuration” on page 55.4](#).

PIM-SM

Protocol Independent Multicast - Sparse Mode. PIM-SM provides efficient communication between members of sparsely distributed groups - the type of groups that are most common in wide-area internetworks. PIM-SM is designed on the principle that several hosts wishing to participate in a multicast conference does not justify flooding the entire internetwork with periodic multicast traffic. PIM-SM is designed to limit multicast traffic so that only those routers interested in receiving traffic for a particular group receive the traffic.

For more information see [Chapter 51, PIM-SM Introduction and Configuration](#). For configuration examples see [“Static Rendezvous Point configuration” on page 51.7](#), [“Dynamic Rendezvous Point configuration” on page 51.9](#) and [“Bootstrap Router configuration” on page 51.11](#).

Ping

Ping tests the connectivity between two network devices to determine whether each network device can “see” the other device.

Ping-of-death attack

A type of attack on a computer that involves sending a malformed or otherwise malicious ping to a network device.

Ping polling

Ping polling is used to ensure that a device is still present, live, and contactable in the network by periodically sending a packet to an IP address and waiting for a response. Configurable actions can be performed if responses are no longer arriving.

For more information see [Chapter 105, Ping Polling Introduction and Configuration](#). For how to configure ping polling see [“Configuring Ping Polling” on page 105.4](#).

PoE

Power over Ethernet. PoE is a mechanism for supplying power to network devices over the same cabling used to carry network traffic. PoE supplies power to network devices called Powered Devices (**PDs**).

For more information see [Chapter 22, Power over Ethernet Introduction](#). For configuration examples see [“AW+ PoE and PoE+ Configuration” on page 22.14](#).

Policing

In **QoS**, once you have set-up your **Classification** and created your **Class maps**, you can start conditioning your traffic flows. One tool used for traffic conditioning is the policer (or meter). The principle of policing is to measure the data flow that matches the definitions for a particular class-map; then, by selecting appropriate data rates, allocate the flows into one of three categories, Red Yellow or Green. You then decide what action to apply to the Red, Yellow and Green data. See [Premarking](#).

For more information see [“Policing \(Metering\) Your Data” on page 63.21](#).

Policy maps

Policy maps are the means by which you apply your **Class maps** to physical switch ports. A policy map can be assigned to several ports, but a port cannot have more than one policy map assigned to it. See [QoS](#).

For more information see [“Policy Maps” on page 63.10](#).

Port bit map

An efficient method for the storage of a list of ports. Each port is represented by a single bit in a 32-bit or 64-bit value.

Port mirroring

Port mirroring enables traffic being received and transmitted on a switch port to be sent to another switch port, the mirror port, usually for the purposes of capturing the data with a protocol analyzer. The mirror port is the only switch port that does not belong to a VLAN, and therefore does not participate in any other switching. Before the mirror port can be set, it must be removed from all trunk groups and all VLANs except the default VLAN.

PPP

Point-to-Point Protocol. A data link protocol used to establish a direct connection between two networking nodes. PPP can provide connection authentication and transmission encryption. PPPoE (Point-to-Point Protocol over Ethernet) is used over broadband connections as is PPPoA (Point-to-Point Protocol over ATM) with DSL.

Premarking

In **QoS**, premarking relates to adding QoS markers to your incoming data traffic before it is metered. QoS markers can be applied at both the link layer (within the CoS field), and at the network layer (within the DSCP field). See **Policing**.

For more information see **“Premarking Your Traffic” on page 63.11**.

Primary port

In **EPSR**, a ring port on the master node. This port determines the direction of the traffic flow, and is always operational.

For more information see **“Ring Components and Operation” on page 84.2**.

Proxy ARP

Proxy ARP allows hosts that do not support routing (i.e. they have no knowledge of the network structure) to determine the physical addresses of hosts on other networks.

For more information see **“Proxy ARP” on page 26.4**.

PSE

Power Sourcing Equipment. A device that can source power, such as an Ethernet switch, is termed Power Sourcing Equipment. Power Sourcing Equipment can provide power, along with data, over existing LAN cabling to Powered Devices (**PDs**). See **PoE**.

PSU

Power Supply Unit.

Q

Query Solicitation

Query Solicitation minimizes the loss of multicast data after a topology change on networks that use **EPSR** or spanning tree (**STP**, **RSTP**, or **MSTP**) for loop protection. Without Query Solicitation, when the underlying link layer topology changes, multicast data flow can stop for up to several minutes, depending on which port goes down and how much of the IGMP query interval remained at the time of the topology change. Query Solicitation greatly reduces this disruption.

For more information see **“Query Solicitation” on page 49.9**.

QoS

Quality of Service. QoS enables you to both prioritize traffic and limit its available bandwidth. The concept of QoS is a departure from the original networking protocols, in which all traffic on the Internet or within a LAN had the same available bandwidth. Without QoS, all traffic types are equally likely to be dropped if a link becomes oversubscribed. This approach is now inadequate in many networks, because traffic levels have increased and networks often carry time-critical applications such as streams of real-time video data. QoS also enables service providers to easily supply different customers with different amounts of bandwidth. Configuring Quality of Service involves two separate stages:

- Classifying traffic into flows, according to a wide range of criteria. Classification is performed by the switch's **Class maps**.
- Acting on these traffic flows.

For more information see [Chapter 63, Quality of Service \(QoS\) Introduction](#).

Quality of Service

See [QoS](#).

R

RADIUS

Remote Authentication Dial-In User Service. RADIUS is a networking protocol that provides centralized **AAA** (Authentication Authorization and Accounting) management for clients to a network. RADIUS is a client/server protocol that runs in the application layer, using UDP (User Datagram Protocol) for data transport. RADIUS authenticates users before granting them access to network resources and can account for the usage of network resources.

For more information see [Chapter 71, RADIUS Introduction and Configuration](#). For configuration examples see ["RADIUS Configuration Examples" on page 71.15](#).

Redistribute

Advertise routes learnt from one routing protocol into another routing protocol.

Remote network MONitoring

See [RMON](#).

RIB

Routing Information Base. The RIB records all the routes that your device has learnt. Your device uses the RIB to advertise routes to its neighbor devices and to populate the **FIB** (Forwarding Information Base).

For more information see ["RIB and FIB Routing Tables" on page 33.4](#).

Ring port

In **EPSR**, a port that connects the node to the ring. On the master node, each ring port is either the primary port or the secondary port. On transit nodes, ring ports do not have roles.

For more information see **“Ring Components and Operation” on page 84.2.**

RIP

Routing Information Protocol. A simple distance vector IPv4 routing protocol, RIP is an Interior Gateway Protocol (IGP) that uses hop counts as its metrics. Given a choice of routes, RIP uses the route that takes the lowest number of hops. If multiple routes have the same hop count, RIP chooses the first route it finds. The AlliedWare Plus™ RIP module supports RFCs 1058 and 1723; the RIPv2 module supports more fields in the RIP packets, and supports security authentication features.

For more information see **“RIP” on page 32.2.** For configuration examples see **“Enabling RIP” on page 35.2**, **“Specifying the RIP Version” on page 35.4**, **“RIPv2 Authentication (Single Key)” on page 35.6**, **“RIPv2 Text Authentication (Multiple Keys)” on page 35.8** and **“RIPv2 MD5 authentication (Multiple Keys)” on page 35.12.**

RIPng

Routing Information Protocol next generation. RIPng is a simple distance vector IPv6 routing protocol. It determines the number of hops between the destination and your device, where one hop is one link. Given a choice of routes, RIPng uses the route that takes the lowest number of hops. If multiple routes have the same hop count, RIPng chooses the first route it finds. RIPng is an extension of RIPv2 to support IPv6.

For configuration examples see **“Enabling RIPng” on page 37.2** and **“Troubleshooting RIPng Adjacency” on page 37.5.**

RIPv6

See **RIPng**.

RMON

Remote Network MONitoring. RMON was developed by the IETF to support monitoring and protocol analysis of LANs with a focus on Layer 1 and 2 information in networks. RMON is an industry standard that provides the functionality in network analyzers. An RMON implementation operates in a client/server model. Monitoring devices (or ‘probes’) contain RMON agents that collect information and analyze packets. The probes are servers and the Network Management applications that communicate with them are clients.

For more information see **Chapter 100, RMON Introduction and Configuration.** For a configuration example see **“RMON Configuration Example” on page 100.4.**

Roaming Authentication

Roaming Authentication improves the usability of network security by enabling users to move within the network without requiring them to re-authenticate each time they move. If a supplicant (client device) moves from one wireless access point to another wireless access point, and the wireless access points are connected to different ports, then the switch (authenticator) recognizes that the supplicant has been authenticated and accepts the supplicant without requiring re-authentication.

For more information see **“Web-Authentication” on page 67.4.**

Root bridge

A single **Bridge** is selected to become the **Spanning tree's** unique root bridge. This is the device that advertises the lowest Bridge ID. Each bridge is uniquely identified by its Bridge ID, which comprises the bridge's root priority (a spanning tree parameter) followed by its MAC address.

For an overview of spanning tree operation see "[Spanning tree operation](#)" on [page 18.2](#).

Root path cost

A **Spanning tree** property. Each port connecting a **Bridge** to a LAN has an associated cost, called the root path cost. This is the sum of the costs for each path between the particular bridge port and the **Root bridge**. The **Designated bridge** for a LAN is the one that advertises the lowest root path cost. If two bridges on the same LAN have the same lowest root path cost, then the switch with the lowest bridge ID becomes the designated bridge.

For an overview of spanning tree operation see "[Spanning tree operation](#)" on [page 18.2](#).

Route-map

A mechanism for filtering IP routes and changing their attributes.

RSTP

Rapid Spanning Tree Protocol. RSTP is an evolution of the Spanning Tree Protocol (**STP**) which provides for faster spanning tree convergence after a topology change. A device running RSTP is compatible with other devices running STP.

For more information see "[Rapid Spanning Tree Protocol \(RSTP\)](#)" on [page 18.8](#). For a configuration example see "[Configuring RSTP](#)" on [page 18.9](#).

S

SCP

Secure Copy Protocol. SCP allows for secure file transfer to and from the switch, protecting your network from unwanted downloads and unauthorized file copying.

For more information see "[Copying with Secure Copy \(SCP\)](#)" on [page 6.16](#).

Script

A script is a sequence of commands stored as a plaintext file on a file subsystem accessible to the device, such as Flash memory. Each **Trigger** may reference multiple scripts and any script may be used by any trigger. When an event activates a trigger, the trigger executes the scripts associated with it in sequence. One script is executed completely before the next script begins.

See [Dynamic Link Failover](#).

Secondary port

In **EPSR**, a second ring port on the master node. This port remains active, but blocks all protected VLANs from operating unless the ring fails. Similar to the blocking port in an STP/RSTP instance.

For more information see **“Ring Components and Operation” on page 84.2.**

sFlow

sFlow^{®1} is an industry standard technology for monitoring high speed switched networks. It provides the ability to monitor traffic in data networks containing switches and routers.

For more information see **Chapter 107, sFlow Introduction and Configuration.** For how to configure sFlow see **“Configuring sFlow on your Switch” on page 107.6.**

sFlow agent

A network employing sFlow typically comprises a number of network (sFlow) agents that accumulate sampled data and traffic counter information. The agents then forward this data to a collector. The collector then analyses the information supplied by its agents in order to compile and display statistical profiles of the network and its traffic. The sFlow feature on your switch provides the sFlow agent capability.

For more information see **“The sFlow Agent” on page 107.3.**

sFlow collector

The sFlow collector receives traffic samples and counter information from a number of sFlow agents. These samples are received as a series of UDP datagrams. From the data contained within these datagrams, the collector is able to provide statistical and or graphical information of network traffic.

For more information see **“The sFlow Collector” on page 107.5.**

SFTP

SSH File Transfer Protocol. SFTP provides a secure way to copy files onto your device from a remote device.

For more information see **“Copying with SSH File Transfer Protocol (SFTP)” on page 6.16.**

Software ACLs

See **ACL types.**

1. sFlow[®] is a registered trademark belonging to InMon Corp, San Francisco, CA.

Spanning tree

A loop free portion of a network topology. The network topology is dynamically pruned to provide only one path for any packet. See [STP](#), [RSTP](#) and [MSTP](#).

Spanning Tree Protocol Root Guard

See [STP root guard](#).

SSH

Secure Shell. SSH is a network protocol that uses strong authentication and encryption for remote access across a nonsecure network. SSH provides sessions between a host running a SSH server and a machine with a SSH client.

For more information see [Chapter 77, Secure Shell \(SSH\) Introduction](#). For how to configure a SSH server see [“Configuring the SSH Server” on page 77.4](#). For how to configure a SSH client see [“Configuring the SSH Client” on page 77.9](#).

S-TAG

Service VLAN TAG.

Static aggregator

See [Static channel group](#).

Static channel group

A static channel group, also known as a static aggregator, enables a number of ports to be manually configured to form a single logical connection of higher bandwidth. By using static channel groups you increase channel reliability by distributing the data path over more than one physical link.

Storm-control

Storm-control enables you to specify the threshold level for broadcasting, multicast, or destination lookup failure (DLF) traffic for a port. Storm-control limits the specified traffic type to the specified threshold.

For more information see [“Storm-control” on page 14.16](#).

Storm protection

Storm protection uses [QoS](#) mechanisms to classify on traffic likely to cause a packet storm (broadcast and multicast). With QoS storm protection, several actions are possible when a storm is detected:

- You can disable the port physically.
- You can disable the port logically.
- You can disable the port for a particular VLAN.

For more information see [“Storm Protection” on page 63.30](#).

STP

Spanning Tree Protocol. STP is the original bridge protocol defined by IEEE standard 802.1D-1988. It creates a single spanning tree over a network.

For more information see [“Spanning Tree Protocol \(STP\)” on page 18.5](#). For a configuration example see [“Configuring STP” on page 18.6](#).

STP root guard

Spanning Tree Protocol Root Guard. STP Root Guard designates which devices can assume the role of **Root bridge** in an STP network. This stops an undesirable device from taking over this role, where it could either compromise network performance or cause a security weakness.

See the **spanning-tree guard root** command on page 19.42.

Subnet address

A subnet portion of an IP address. In a subnetted network, the host portion of an IP address is split into a subnet portion and a host portion using an address or subnet mask.

Subnet mask

A bit mask used to select bits from an Internet address for subnet addressing. The mask is 32 bits long and selects the network portion of the Internet address and one or more bits of the local portion. Sometimes called address mask.

Superloop

Within an EPSR ring configuration, a superloop is a data loop whose path traverses more than a single EPSR ring. This occurrence is a fault condition that is usually do to a break in a physical segment that is shared by the two rings. For a superloop condition to occur, the two physical rings must share one or more data VLANs. Superloops can be prevented by employing Superloop Protection. For more information, See **“Superloop Protection” on page 84.18**.

Switch instance

A single switch chip with its associated ports, internal data interfaces, hardware tables, and packet buffer memory.

S-VID

Service VLAN ID.

S-VLAN

Service VLAN.

Synchronous

Transmission in which the data characters and bits are transmitted at a fixed rate with the transmitter and receiver synchronized. This eliminates the need for start-stop elements, as in asynchronous transmission, but requires a flag character to be transmitted when there is no data to transmit. See **“Asynchronous” on page D.5**

T

TACACS+

TACACS+ (Terminal Access Controller Access-Control System Plus) provides a method for securely managing multiple network access points from a single management service. TACACS+ is a TCP-based access control protocol that allows a device to forward a user's username and password to an authentication server to determine whether access can be allowed. In addition to this authentication service, TACACS+ can also provide authorization and accounting services. One of the features of TACACS+ is the ability to separate authentication, authorization and accounting so that these functions can be provided independently on separate servers.

For information on the AlliedWare Plus implementation of TACACS+, see [Chapter 73, TACACS+ Introduction and Configuration](#) and [Chapter 74, TACACS+ Commands](#).

TCN

Topology Change Notification.

Thrash limiting

MAC address thrashing occurs when MAC addresses move rapidly between one or more ports or trunks, for example, due to a network loop. Thrash limiting enables you to apply actions to a port when thrashing is detected. It is supported on all port types and also on aggregated ports.

For more information see [“Thrash Limiting” on page 14.18](#)

TLV

Type-Length-Value. A single **LLDPDU** contains multiple TLVs. TLVs are short information elements that communicate complex data, such as variable length strings, in a standardized format. Each TLV advertises a single type of information, such as its device ID, type, or management addresses. See [LLDP advertisements](#).

Traceroute

Traceroute is used to discover the route that packets pass between two systems running the IP protocol. Traceroute sends an initial UDP packets with the Time To Live (TTL) field in the IP header set starting at 1. The TTL field is increased by one for every subsequent packet sent until the destination is reached. Each hop along the path between two systems responds with a TTL exceeded packet (ICMP type 11) and from this the path is determined.

Transit node

In **EPSR**, nodes other than the master node in the domain.

Transit node states are:

- Idle - the state when EPSR is first configured, before the master node determines that all links in the ring are up. In this state, both ports on the node are blocked for the data VLAN. From this state, the node can move to Links Up or Links Down.
- Links Up - the state when both the node's ring ports are up and forwarding. From this state, the node can move to Links Down.
- Links Down - the state when one or both of the node's ring ports are down. From this state, the node can move to Preforwarding.
- Pre-forwarding - the state when both ring ports are up, but one has only just come up and is still blocked to prevent loops. From this state, the transit node can move to Links Up if the master node blocks its secondary port, or to Links Down if another port goes down.

For more information see **"Ring Components and Operation" on page 84.2**.

Tri-authentication

Authentication commands enable you to specify three different types of device authentication: **802.1X** authentication, **MAC authentication**, and **Web-authentication**. All three types can be configured to run simultaneously on a switch port. The simultaneous configuration and authentication of all three types on a port is called tri-authentication.

For a configuration example see **"Tri-Authentication Configuration" on page 67.18**.

Trigger

A trigger is an ordered sequence of scripts that is executed when a certain event occurs. Each trigger may reference multiple scripts and any **Script** may be used by any trigger. When an event activates a trigger, the trigger executes the scripts associated with it in sequence. One script is executed completely before the next script begins.

See **Dynamic Link Failover**.

Type-Length-Value

See **TLV**.

U

Unicast

Two individual devices hold a conversation just between themselves.

V

VID

VLAN Identifier or VLAN ID. When you create a VLAN you give it a numerical VID which is included in VLAN-tagged Ethernet frames to and from this VLAN.

VLAN classification

A packet can be allocated VLAN membership based on its protocol, subnet, or port.

VLAN double tagging

VLAN double tagging is used to operate a number of private Layer 2 networks within a single public Layer 2 network. A VLAN double tagging implementation consists of the following port types:

- Provider ports - these connect to a service provider's Layer 2 network
- Customer edge ports - these connect to a customer's private Layer 2 network

For more information see "[VLAN Double Tagging \(VLAN Stacking\)](#)" on page 16.5. For a configuration example see "[Configuring double-tagged VLANs](#)" on page 16.6.

VLAN ID

See [VID](#).

VLAN identifier

See [VID](#).

VLAN stacking

See [VLAN double tagging](#).

VLAN tag

IEEE standard 802.1q defines an additional 4 byte tag field that can be inserted immediately following the MAC address, plus any routing fields present. This field contains a 12 bit VLAN identifier, commonly referred to as the VLAN tag. The VLAN tag is used to determine which VLAN a given frame should be forwarded to.

Other tags included in the 802.1q tag field is a Tag Protocol Identifier tag, and a Type of Service tag used to determine data priority.

Voice VLAN

Voice VLAN automatically separates voice and data traffic into two different VLANs. This automatic separation places delay-sensitive traffic into a voice-dedicated VLAN, which simplifies QoS configurations.

For more information see "[Voice VLAN](#)" on page 97.3.

VoIP

Voice over Internet Protocol. Enables the delivery of voice communications over IP networks such as the Internet or other packet-switched networks instead of over traditional telephony circuits.

VRID

Virtual Router Identifier.

VRRP

Virtual Router Redundancy Protocol. VRRP combines two or more physical switches into a logical grouping called a virtual router. The physical switches then operate together to provide a single logical gateway for hosts on the LAN. If the master fails, the other devices assume the virtual IP address.

For more information see [Chapter 82, VRRP Introduction and Configuration](#). For configuration examples see [“VRRP Configuration Examples” on page 82.14](#).

W

Web-authentication

The switch sends a login screen to the client webbrowser which must be authenticated before access is granted to the network. See [AAA](#) and [Tri-authentication](#).

For a sample configuration script see [“Sample Web-Authentication Configuration” on page 69.9](#).

Wildcard mask

A subnet mask in which bits set to 0 indicate an exact match and bits set to 1 indicate ‘don’t care’.

X

XEM

High Speed Expansion Module.
