Output Figure 33-18: Example output from the **show ip route vrf red database** command

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
              > - selected route, * - FIB route, p - stale info

O       192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C    *> 192.168.10.0/24 is directly connected, vlan1
B     > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a `*`. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the `*` nor the > symbol.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O       10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.

- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

Related commands

maximum-paths

show ip route

show ip route summary

Overview This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

Syntax
```
show ip route summary
```

Syntax (VRF-lite)
```
show ip route summary [vrf <vrf-name>|global]
```

Parameter	Description
`vrf`	Specific VRF instance.
`<vrf-name>`	The name of the VRF instance.
`global`	The global routing and forwarding table.

Mode User Exec and Privileged Exec

Example To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

Output Figure 33-19: Example output from the **show ip route summary** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
connected       5
ospf            2
Total           8
```

Example (VRF-lite) To display a summary of the current RIB entries associated with a VRF instance red, use the command:

```
awplus# show ip route summary vrf red
```

Output Figure 33-20: Example output from the **show ip route summary vrf red** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
connected       1
Total           1
FIB             0

[VRF: red]
Route Source    Networks
connected       1
ospf            2
Total           3
```

show ip vrf

Overview This command displays brief configurations for a specific VRF instance.

Syntax

```
show ip vrf <vrf-name>
```

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display brief information for the VRF instance red, use the command:

```
awplus# show ip vrf red
```

Output Figure 33-21: Example output from the show ip vrf red command

```
Name                    Default RD          Interfaces
red                     500:1               lo1, vlan1
```

Related commands show ip vrf interface

show ip vrf detail

Overview This command displays the detailed configuration for a specific VRF instance.

Syntax

```
show ip vrf detail <vrf-name>
```

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display the detailed information for all VRF instances, use the command:

```
awplus# show ip vrf detail
```

Output Figure 33-22: Example output from the **show ip detail** command, for all VRF instances

```
VRF blue; Description: VRF for customer blue
FIB ID 3; Router ID: 192.168.30.1 (automatic)
Default RD 500:3
  Interfaces:
    lo3, vlan3
  Export route-target communities
    RT: 500:3
  Import route-target communities
    RT: 500:4
  Import route-map: blue45
  No export route-map

VRF red
FIB ID 1; Router ID: 192.168.10.1 (automatic)
Default RD 500:1
  Interfaces:
    lo1, vlan1
  Export route-target communities
    RT: 500:1
  Import route-target communities
    RT: 500:1
  Import route-map: red43
  No export route-map
```

Related commands show ip vrf

show ip vrf interface

Overview This command displays protocol, operational status, and address information, for interfaces existing within either a specified VRF instance, or all VRF instances.

Syntax

```
show ip vrf interface <vrf-name>
```

Parameter	Description
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip vrf interface
```

Output Figure 33-23: Example output from the **show ip vrf interface** command

```
Interface            IP-Address          Status          Protocol   Vrf
lo1                  unassigned          admin up        running    red
lo2                  unassigned          admin up        running    green
vlan1                192.168.10.1/24     admin up        running    red
vlan2                192.168.20.1/24     admin up        running    green
```

Example To display all interfaces and IP addresses associated with the VRF instance `red`, use the command:

```
awplus# show ip vrf interface red
```

Output Figure 33-24: Example output from the **show ip vrf interface red** command

```
Interface            IP-Address          Status          Protocol   Vrf
lo1                  unassigned          admin up        running    red
vlan1                192.168.10.1/24     admin up        running    red
```

Related commands show ip vrf

show running-config vrf

Overview This command displays the running system VRF-related configurations for all VRF instances.

Syntax
```
show running-config vrf
```

Mode Privileged Exec

Example To display the running system VRF-related configurations, use the command:

```
awplus# show running-config vrf
```

Output Figure 33-25: Example output from the **show running config vrf** command

```
ip vrf red
rd 500:1
route-target export 500:1
route-target export 500:4
import map red 43
!
```

Related commands show ip vrf

snmp-server host

Overview This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

Syntax

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>]

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

Syntax (VRF-Lite)

```
snmp-server host {<ipv4-address>|<ipv6-address>} [vrf
<vrf-name>] [informs|traps] version 1|2c|3 {auth|noauth|priv}
<user-name> {<community-name>|<user-name>}

no snmp-server host {<ipv4-address>|<ipv6-address>} [vrf
<vrf-name>] [informs|traps] version 1|2c|3 {auth|noauth|priv}
<user-name> {<community-name>|<user-name>}
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.
<ipv6-address>	IPv6 trap host address in the format x:x::x:x for example, 2001:db8::8a2e:7334.
vrf *<vrf-name>*	Specify the VRF instance to use. If you do not specify an instance it will use the global VRF.

Parameter	Description
`informs`	Send Inform messages to this host.
`traps`	Send Trap messages to this host (default).
`version`	SNMP version to use for notification messages. Default: version 1.
`1`	Use SNMPv1(default).
`2c`	Use SNMPv2c.
`3`	Use SNMPv3.
`auth`	Authentication.
`noauth`	No authentication.
`priv`	Encryption.
`<community-name>`	The SNMPv1 or SNMPv2c community name.
`<user-name>`	SNMPv3 user name.

Mode Global Configuration

Examples To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name 'private', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c
private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to an IPv4 host destination 192.168.1.2 with the SNMPv2c community name 'public' and on a VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.1.2 vrf red version 2c
public
```

Command changes

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

snmp-server vrf

Overview Use this command to isolate the SNMP Agent to operate within a previously configured non-global named VRF. This means the SNMP Agent can only respond to requests from SNMP Managers operating within the same VRF.

Use the **no** variant of this command to revert the SNMP Agent to operating within the default global VRF.

Syntax

```
snmp-server vrf <vrf-name>
no snmp-server vrf
```

Parameter	Description
`vrf`	The VRF instance to operate within.
<vrf-name>	The VRF instance name.

Default Global VRF

Mode Global Configuration

Examples To configure the SNMP Agent to operate within the VRF instance named 'red', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server vrf red
```

To revert the SNMP Agent to operating within the default global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server vrf
```

Related commands show snmp-server

snmp-server

Command changes Version 5.5.2-2.1: command added

ssh

Overview Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

NOTE: *A hostname specified with SSH cannot begin with a hyphen (-) character.*

Syntax
```
ssh [ip|ipv6] [user <username>|port <1-65535>|version 2]
<remote-device> [<command>]
```

Syntax in secure mode
```
ssh [cipher
{aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-ctr}]
[hmac {hmac-sha2-256}]
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}]
[key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}]
[ip|ipv6] [user <username>|port <1-65535>|version 2]
<remote-device> [<command>]
```

Syntax (VRF-lite)
```
ssh vrf <vrf-name> [ip|ipv6] [user <username>|port
<1-65535>|version 2] <remote-device> [<command>]
```

Parameter	Description
`cipher`	The supported cipher name. Select either: aes128-cbc or aes256-cbc.
`hmac`	The supported hmac name: hmac-sha2-256
`public-key`	The supported public-key name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
`key-exchange`	The supported key-exchange name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
`vrf`	Apply the command to the specified VRF instance. When using VRF, specifying a VRF name means the command will apply to that VRF instance, and not specifying a VRF name means the command will apply to the global VRF.
<vrf-name>	The name of the VRF instance.
`ip`	Specify IPv4 SSH.
`ipv6`	Specify IPv6 SSH.

Parameter	Description
`user`	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.
	<username> User name to login on the remote server.
`port`	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.
	<1-65535> TCP port.
`version`	SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.
<remote-device>	IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.
<command>	A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

Mode User Exec and Privileged Exec

Usage notes This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

Examples To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

Example (VRF-lite) To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.

Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

Version 5.5.1-1.1: support removed for SSH protocol v1

ssh client

Overview This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the ssh client command, and restores the defaults.

This command does not affect the existing SSH sessions.

Syntax

```
ssh client {port <1-65535>|version 2|session-timeout
<0-3600>|connect-timeout <1-600>}
```

```
no ssh client {port|version|session-timeout|connect-timeout}
```

Syntax (VRF-lite)

```
ssh client {port <1-65535>|version 2|session-timeout
<0-3600>|connect-timeout <1-600>|vrf <vrf-name>}
```

```
no ssh client
{port|version|session-timeout|connect-timeout|vrf}
```

Parameter	Description
`port`	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: 22
	<1-65535> TCP port number.
`version`	The SSH version used by the client for SSH sessions. From 5.5.1-1.1 onwards, the SSH client supports only version 2
`session-timeout`	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: 0 (session timer remains off)
	<0-3600> Timeout in seconds.
`connect-timeout`	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: 30
	<1-600> Timeout in seconds.
`vrf <vrf-name>`	The VRF to use for SSH clients. Default: the global VRF.

Mode Privileged Exec

Examples To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

Example (VRF-lite) To configure SSH clients to use the VRF named 'red', use the command:

```
awplus# ssh client vrf red
```

Related commands show ssh client

ssh

Command changes Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

ssh client vrf

Overview Use this command to modify the configured VRF of the SSH client. Use this configuration for any SSH client on the device to connect to remote SSH servers.

Use the **no** variant of this command to restore the configured VRF to the default VRF (global VRF).

Syntax

```
ssh client vrf <vrf-name>
no client vrf
```

Parameter	Description
`vrf<vrf-name>`	The name of the VRF to use for SSH clients. This overrides the default.

Default Global VRF

Mode Global Configuration

Usage notes Any VRF parameter specified on the SSH client explicitly overrides the default configuration parameters. This also affects the copy commands that utilize SSH such as **copy scp** and **copy sftp**.

This change affects all new user shell sessions. Existing sessions will not be affected.

A user may override this on a per-session basis using the executive mode variant of this command.

Examples To configure the VRF named 'management' for SSH clients, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client vrf management
```

To restore to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh client vrf
```

Related commands show ssh client

ssh client

Command changes Version 5.5.2-2.1: command added

ssh server vrf

Overview Use this command to specify a VRF for the SSH server to operate within.

Use the **no** variant of this command to return the SSH server to the default VRF.

Syntax

```
ssh server vrf [<vrf-name>]
no ssh server vrf
```

Parameter	Description
<vrf-name>	The name of the VRF instance

Default The global VRF

Mode Global Configuration

Example To configure the SSH server to operate within the VRF instance named 'red', use the command:

```
awplus# configure terminal
awplus(config)# ssh server vrf red
```

To return the SSH server to operating within the global VRF instance, use the command:

```
awplus# configure terminal
awplus(config)# no ssh server vrf
```

Command changes Version 5.5.2-1.1: command added

tacacs-server host

Overview Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

Syntax

```
tacacs-server host {<host-name>|<ip-address>} [key [8]
<key-string>]
```

```
no tacacs-server host {<host-name>|<ip-address>}
```

Syntax (VRF-lite)

```
tacacs-server host {<host-name>|<ip-address>} [vrf <vrf-name>]
[key [8] <key-string>]
```

```
no tacacs-server host {<host-name>|<ip-address>} [vrf
<vrf-name>]
```

Parameter	Description
<host-name>	Server host name. The DNS name of the TACACS+ server host.
<ip-address>	The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.
vrf *<vrf-name>*	The name of a VRF instance. Use this to specify the VRF that the TACACS+ server is accessible by. Servers are uniquely identified by their address and VRF, so multiple servers can have the same address or host-name as long as the VRF is different. The default is the global VRF.
key	Set shared secret key with TACACS+ servers.
8	Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the tacacs-server key command. If no key value is specified, the global value is used.

Default No TACACS+ server is configured by default.

Mode Global Configuration

Usage A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable
- it cannot communicate with the switch properly due to the switch and the server having different secret keys

Examples

To add the server tac1.company.com as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to 'secret' on the TACACS+ server 192.168.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server tac1.company.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

Examples (VRF-lite)

To add the server tac1.company.com as the TACACS+ server host in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com vrf red
```

To remove the TACACS+ server 192.168.1.1 from the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host 192.168.1.1 vrf red
```

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

tcpdump

Overview Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press `<ctrl> + c` to stop a running tcpdump.

Syntax
```
tcpdump <line>
```

Syntax (VRF-lite)
```
tcpdump [vrf <vrf-name>] <line>
```

Parameter	Description
<line>	Specify the dump options. For more information on the options for this placeholder see http://www.tcpdump.org/tcpdump_man.html
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode Privileged Exec

Example To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

Example (VRF-lite) To start a tcpdump on interface vlan2 associated with a VRF instance red, enter the command:

```
awplus# tcpdump vrf red vlan2
```

Output Figure 33-26: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

Related commands debug ip packet interface

telnet

Overview Use this command to open a telnet session to a remote device.

Syntax

```
telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>}
[<port>]
```

Syntax (VRF-lite)

```
telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|[ipv6]
<ipv6-addr>} [<port>]
```

Parameter	Description
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
<hostname>	The host name of the remote system.
`ip`	Keyword used to specify the IPv4 address or host name of a remote system.
<ipv4-addr>	An IPv4 address of the remote system.
`ipv6`	Keyword used to specify the IPv6 address of a remote system
<ipv6-addr>	Placeholder for an IPv6 address in the format `x:x::x:x`, for example, `2001:db8::8a2e:7334`
<port>	Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535).

Mode User Exec and Privileged Exec

Examples To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port `100`, use the command:

```
awplus# telnet host.example 100
```

Example (VRF-lite) To open a telnet session to a remote host `192.168.0.1` associated with VRF instance `red`, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

timers (RIP)

Overview Use this command to adjust routing network timers.

Use the **no** variant of this command to restore the defaults.

Syntax

```
timers basic <update> <timeout> <garbage>
no timers basic
```

Parameter	Description
<update>	<5-2147483647> Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.
<timeout>	<5-2147483647> Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid.
<garbage>	<5-2147483647> Specifies the routing garbage collection timer in seconds. The default is 120 seconds.

Default Enabled

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage notes This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

Examples To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

traceroute

Overview Use this command to trace the route to the specified IPv4 host.

Syntax
```
traceroute {<ip-addr>|<hostname>}
```

Syntax (VRF-lite)
```
traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}
```

Parameter	Description
<ip-addr>	The destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<hostname>	The destination hostname.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.

Mode User Exec and Privileged Exec

Example
```
awplus# traceroute 10.10.0.5
```

Example (VRF-lite)
```
awplus# traceroute vrf red 192.168.0.1
```

version (RIP)

Overview Use this command to specify a RIP version used globally by the router.

If VRF-lite is configured, you can specify a RIP version either globally, or for a particular VRF instance.

Use the **no** variant of this command to restore the default version.

Syntax

```
version {1|2}
no version
```

Parameter	Description
1|2	Specifies the version of RIP processing.

Default Version 2

Mode RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

Usage notes RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The ip rip send version command overrides the value set by the version (RIP) command on an interface-specific basis. The ip rip receive version command allows you to configure a specific interface to accept only packets of the specified RIP version. The ip rip receive version command and the ip rip send version command override the value set by this command.

Examples To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

To specify a RIP version with VRF, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# version 1
```

Related commands ip rip receive version

ip rip send version

show running-config

vrf

Overview Use this command to add a VRF name to a DHCP server's address pool. This enables the DHCP server to become VRF-aware and allocate IP addresses which are the same as other pools.

One of the benefits of using this command is that it allows you to share DHCP leases across multiple isolated networks.

Use the **no** variant of this command to remove a VRF name from the DHCP server pool.

Syntax

```
vrf <vrf-name>
no vrf
```

Parameter	Description
<vrf-name>	The name of the specific VRF instance.

Default Global VRF

Mode DHCP Configuration

Usage notes You need to enter this **vrf** command before entering the network (DHCP) and range address commands.

For more information, see the DHCP Feature Overview and Configuration Guide.

Example To add the VRF name 'red' to the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# vrf red
```

To remove a VRF name from the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# no vrf
```

Related commands network (DHCP)

show ip dhcp pool

Command changes Version 5.5.1-1.1: command added

34 Link Health Monitoring for Switches Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Link Health Monitoring for switches.

For more information, see the Link Health Monitoring for Switches Feature Overview and Configuration Guide.

Command List

consecutive probe loss

Overview Use this command within a specific link performance profile to configure the allowable consecutive probe loss thresholds of probes that use that performance profile.

Use the **no** variant of this command to delete a consecutive probe loss threshold.

Syntax

```
consecutive-probe-loss bad-when <consecutive-probe-losses>
consecutive-probe-loss good-when <consecutive-probe-successes>
consecutive-probe-loss unreachable-when
<consecutive-probe-losses>
no consecutive-probe-loss bad-when
no consecutive-probe-loss good-when
no consecutive-probe-loss unreachable-when
```

Parameter	Description
`bad-when <consecutive-probe-losses>`	The number of probes that must be lost consecutively, at which point the associated link is considered to be bad, in a range of <1-100>.
`good-when <consecutive-probe-successes>`	The number of probes that must succeed consecutively, at which point the associated link is considered to be good, in a range of <1-100>.
`unreachable-when <consecutive-probe-losses>`	The number of probes that must be lost consecutively, at which point the associated link is considered to be unreachable, in a range of <1-100>.

Default The performance profile is disabled.

Mode Linkmon Profile Configuration

Usage notes These setting are all optional.

The **bad-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that link is considered bad. If **bad-when** is not configured, this metric will never result in a link being considered bad.

The **unreachable-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that link is considered unreachable or down. If **unreachable-when** is not configured, this metric will never result in a link being considered unreachable.

The **good-when** parameter is used to state the thresholds where if the number of probe replies that have been successfully received consecutively is equal to or above this value, then that link is considered good. If **good-when** is not configured, then when a link is considered bad or unreachable due to this metric, the first successful probe result will consider the link as good.

Example

To configure the point at or above which consecutive probe loss is unacceptable to be 10, the point at or above which consecutive probe success is acceptable to be 5, and the point at or above which consecutive probe loss indicates the destination is unreachable to be 15 for performance profile named "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# consecutive-probe-loss
bad-when 10
awplus(config-linkmon-profile)# consecutive-probe-loss
good-when 5
awplus(config-linkmon-profile)# consecutive-probe-loss
unreachable-when 15
```

To delete consecutive-probe-loss thresholds in performance profile "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# no consecutive-probe-loss
bad-when
awplus(config-linkmon-profile)# no consecutive-probe-loss
good-when
awplus(config-linkmon-profile)# no consecutive-probe-loss
unreachable-when
```

Command changes

Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

debug linkmon

Overview Use this command to enable Link Health Monitoring debugging.

Use the **no** variant of this command to disable Link Health Monitoring debugging.

Syntax

```
debug linkmon [probe|ip-address|interface|trigger]
no debug linkmon [probe|ip-address|interface|trigger]
debug linkmon probe name <name>
no debug linkmon probe name <name>
```

Parameter	Description
`probe`	Link Health Monitoring probe.
`ip-address`	IP addresses that are of interest to Link Health Monitoring.
`interface`	Interfaces that are of interest to Link Health Monitoring.
`trigger`	This debug option will show debugging for Link Health Monitoring triggers.
<name>	The name identifying a Link Health Monitoring probe or Link Health Monitoring group.

Default No debugging is enabled.

Mode Privileged Exec

Usage notes If **probe** is specified, then debug related to all Link Health Monitoring probes is enabled.

If **probe name** *<name>* is specified, then debug related to the named Link Health Monitoring probe is enabled.

If **ip-address** is specified, then debug related to configuration of IP addresses that are of interest to Link Health Monitoring are enabled. These IP addresses could influence Link Health Monitoring group members being considered up/down.

If **interface** is specified, then debug related to up/down state of Link Health Monitoring is enabled.

If **trigger** is specified, then debug related to Link Health Monitoring triggers is enabled.

Example To enable debugging on the Link Health Monitoring probe 'probe1', use the following command:

```
awplus# debug linkmon probe name probe1
```

To enable debugging on all Link Health Monitoring probes, use the following command:

```
awplus# debug linkmon probe
```

To disable debugging on all Link Health Monitoring probes, use the following command:

```
awplus# no debug linkmon probe
```

Related commands

linkmon probe

Command changes

Version 5.4.8-0.2: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

destination (linkmon-probe)

Overview Use this command to set the destination of a Link Health Monitoring probe. This is a required configuration option for probes.

Use the **no** variant of this command to remove the destination of a probe.

Syntax

```
destination {<ip-address>|<fqdn>}
no destination
```

Parameter	Description
<ip-address>	The destination of the probe, an IPv4 or IPv6 IP address.
<fqdn>	The destination of the probe, an FQDN (fully qualified domain name). The IP address of the FQDN will be automatically resolved by the DNS on the device.

Mode Linkmon ICMP Probe Configuration

Example To set the destination of a probe named 'probe1' to 192.168.2.200, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination 192.168.2.200
```

To set the destination of a probe named 'probe1' to 2001:db8:a0b:12f0::1, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination
2001:db8:a0b:12f0::1
```

To set the destination of a probe named 'probe1' to the FQDN of "google.com", use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination google.com
```

To remove the destination of a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no destination
```

Related commands linkmon probe

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

dscp (linkmon-probe)

Overview Use this command to set the DSCP value of packets used for Link Health Monitoring probes.

Use the **no** variant of this command to set it back to the default.

Syntax

```
dscp <dscp-value>
no dscp
```

Parameter	Description
<dscp-value>	The DSCP value for the probe packet in range *<0-63>*.

Default The default DSCP value is 0.

Mode Linkmon ICMP Probe Configuration

Example To set the DSCP of a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# dscp 10
```

To set the DSCP of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no dscp
```

Related commands linkmon probe

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

egress interface (linkmon-probe)

Overview Use this command to force a Link Health Monitoring probe to egress out of a specific interface.

Use the **no** variant of this command to return interface selection back to the default behavior.

Syntax

```
egress interface <interface>
no egress interface
```

Parameter	Description
<interface>	The name of the egress interface for the probe. The specified egress interface needs to be locally configured and in an up and running state.

Default No egress interface is defined by default. The egress interface will be selected using standard routing behavior to reach the probe's destination.

Mode Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

Example To set the egress interface for a probe named 'probe1' to 'vlan2', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# egress interface vlan2
```

To set the egress interface for a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no egress interface
```

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

enable (linkmon-probe)

Overview Use this command to enable individual Link Health Monitoring probes. When a probe is enabled, it will begin transmitting, processing, and storing results.

Use the **no** variant of this command to disable a probe.

Syntax

```
enable
no enable
```

Default Disabled

Mode Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

Example To enable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# enable
```

To disable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no enable
```

Related commands linkmon probe

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

interval (linkmon-probe)

Overview Use this command to set the interval between Link Health Monitoring probe packets.

Use the **no** variant of this command to set the interval back to the default.

Syntax

```
interval <probe-interval>
no interval
```

Parameter	Description
<probe-interval>	The gap between probes being transmitted. For ICMP probes, this is a range of 100-10000 milliseconds. For HTTP probes, this is a range of 30000-3600000 milliseconds.

Default For ICMP probes, the default interval is 1000 milliseconds. For HTTP probes, the default interval is 60000 milliseconds.

Mode Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

Example To set the interval of a probe named 'probe1' to 100, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# interval 100
```

To set the interval of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no interval
```

Related commands linkmon probe

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

ip-version (linkmon-probe)

Overview Use this command to set the IP version for the Link Health Monitoring ICMP probe.

Use the **no** variant of this command to set it back to the default.

Syntax

```
ip-version {4|6}
no ip-version
```

Parameter	Description
4	Internet Protocol (IPv4)
6	Internet Protocol version 6 (IPv6)

Default IPv4

Mode Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

Example To set the IP version as IPv6 for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# ip-version 6
```

To set the IP version back to the default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no ip-version
```

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

jitter

Overview Use this command to configure the thresholds for the jitter metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove jitter bad-above and jitter good-below ranges.

Syntax

```
jitter bad-above <unacceptable-jitter-point>
jitter good-below <acceptable-jitter-point>
no jitter bad-above
no jitter good-below
```

Parameter	Description
`bad-above <unacceptable-jitter-point>`	The point above which jitter is unacceptable in range *<1-1000>* in milliseconds. When a probe associated with this profile has a jitter result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.
`good-below <acceptable-jitter-point>`	The point at or below which jitter is acceptable in range *<1-1000>* in milliseconds. When a probe associated with this profile has a jitter result less than this value, the associated Link Health Monitoring member will be considered 'good'.

Mode Linkmon Profile Configuration

Usage notes If only **bad-above** is configured, then if the probe results indicate a link is above this value, then that link is considered bad. As soon as the results fall below this value, the link will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the jitter rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a link to be considered bad.

Example To configure the point above which jitter is unacceptable to be 100ms and the point at or below which jitter is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# jitter bad-above 100
awplus(config-linkmon-profile)# jitter good-below 90
```

To delete the jitter ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# no jitter bad-above
awplus(config-linkmon-profile)# no jitter good-below
```

Related commands

latency

linkmon probe

linkmon profile

Command changes

Version 5.4.8-0.2: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

latency

Overview Use this command to configure the thresholds for the latency metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove latency bad-above and latency good-below ranges.

Syntax

```
latency bad-above <unacceptable-latency-point>
latency good-below <acceptable-latency-point>
no latency bad-above
no latency good-below
```

Parameter	Description
`bad-above <unacceptable-latency-point>`	The point above which latency is unacceptable in range *<1-2000>* in milliseconds. When a probe associated with this profile has a latency result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.
`good-below <acceptable-latency-point>`	The point at or below which latency is acceptable in range *<1-2000>* in milliseconds. When a probe associated with this profile has a latency result less than this value, the associated Link Health Monitoring member will be considered 'good'.

Mode Linkmon Profile Configuration

Usage notes If only **bad-above** is configured, then if the probe results indicate a link is above this value, then that link is considered bad. As soon as the results fall below this value, the link will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the latency rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a link to be considered bad.

Example To configure the point above which latency is unacceptable to be 100ms and the point at or below which latency is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# latency bad-above 100
awplus(config-linkmon-profile)# latency good-below 90
```

To delete the latency ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# no latency bad-above
awplus(config-linkmon-profile)# no latency good-below
```

Related commands

jitter

linkmon probe

linkmon profile

Command changes

Version 5.4.8-0.2: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

linkmon probe

Overview Use this command to create a Link Health Monitoring probe and enter the appropriate Link Health Monitoring Probe Configuration Mode where this probe can be configured.

Use the **no** variant of this command to delete the Link Health Monitoring probe.

Syntax

```
linkmon probe name <probe-name> [type {icmp-ping|http-get}]
no linkmon probe name <probe-name>
```

Parameter	Description
<probe-name>	The name of the probe.
type	The type of the probe. Indicates the packet type or protocol used by the probe, either of icmp-ping (ICMP) or http-get (HTTP). This parameter is optional. If not entered, a newly created probe's type defaults to icmp-ping.

Default The default probe type for a newly created probe is **icmp-ping**. The optional parameter **type** is only required to create a probe type other than the default. The **type** parameter is not required when editing an existing probe or deleting a probe.

Mode Global Configuration

Usage notes The optional probe **type** parameter represents the packet type or protocol used in the transmission of the probe. A probe of type **icmp-ping** will present some different configuration options to a probe of type **http-get**.

An **icmp-ping** Link Health Monitoring probe requires a destination, and must be enabled for probing to begin.

An **http-get** Link Health Monitoring probe requires a URL, and must be enabled for probing to begin.

Example To create a probe named 'probe1' using the default probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the default ICMP probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 type icmp-ping
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the HTTP probe type and enter Link Health Monitoring HTTP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 http-probe
awplus(config-linkmon-http-probe)#
```

To remove a probe named 'probe1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon probe name probe1
```

Command changes

Version 5.4.8-0.2: command added

Version 5.4.8-1.1: now operates as a modal command, with the new type parameter used to determine whether to enter ICMP or HTTP probe mode

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

linkmon probe-history

Overview Use this command to create a collection instance that records the metrics gathered by a Link Health Monitoring probe.

Use the **no** variant of this command to remove the specified collection instance.

Syntax

```
linkmon probe-history [<1-65535>] probe <probe-name> interval
<1-2678400> buckets <1-65535>
```

```
no linkmon probe-history <1-65535>
```

Parameter	Description
`probe-history <1-65535>`	The ID of the probe history collection instance. If this is not set on creation then it will be automatically allocated.
`probe <probe-name>`	The name of the probe to record metrics for.
`interval <1-2678400>`	The interval that metrics are collated, in seconds.
`buckets <1-65535>`	The maximum number of metric history samples.

Mode Global Configuration

Usage notes Metrics are collated every **interval** seconds. Up to **buckets** samples of metrics are collated.

Different **interval** and **buckets** values can be used to record specific kinds of histories. For example, an **interval** value of 1 and a **buckets** value of 3600 would record per second metrics of a probe for an hour. An **interval** value of 3600 and a **buckets** value of 744 would record per hour metrics of a probe for 31 days.

Using the Web API, metric values for a sample are returned as a sum and a count. The sum can be divided by the count for an average. For example, if 10 probes have been sent during a history interval, then the metric counts would be 10 for a sample, and the sum would be the total of the metric values.

If a probe receives no reply then no metric is recorded.

Packet loss is not recorded exactly. Instead the probes sent and probe replies received is recorded.

CAUTION: *This configuration option can consume a large amount of RAM on the device, particularly if you configure high numbers of buckets. The memory is reserved when the command is entered, so if the memory consumption from this command is too high, entering the command will trigger the device's low memory management procedure. The device will continue to operate when it reaches a low memory state, but if available memory decreases further into a critical zone, a warning message will be printed and the device will reboot.*

Example

To create a Link Health Monitoring probe history collection instance with an ID of 10 for a probe named 'probe1' that collates metrics every second while keeping up to 300 samples, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe-history 10 probe probe1 interval 1 buckets 300
```

To create a Link Health Monitoring probe history collection instance with an automatically allocated ID for a probe named 'probe1' that collates metrics every 60 seconds while keeping up to 3600 samples, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe-history probe probe1 interval 60 buckets 3600
```

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

linkmon profile

Overview Use this command to create a Link Health Monitoring performance profile and enter Linkmon Profile Configuration mode where this profile can be configured.

Use the **no** variant of this command to remove a configured performance profile.

Syntax

```
linkmon profile <profile-name>
no linkmon profile <profile-name>
```

Parameter	Description
<profile-name>	The name of the performance profile.

Mode Global Configuration

Example To create a new performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)#
```

To remove a performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon profile profile1
```

sample-size (linkmon-probe)

Overview Use this command to set the sample size used for calculating latency and jitter metrics for a Link Health Monitoring probe.

Use the **no** variant of this command to set the sample size back to the default value.

Syntax

```
sample-size <1-100>
no sample-size
```

Parameter	Description
<1-100>	The number of probe samples to use when calculating the latency and jitter metrics.

Default The default sample size is 5.

Mode Linkmon ICMP Probe Configuration

Example To set the sample size a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# sample-size 10
```

To set the sample size a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no sample-size
```

service linkmon

Overview Use this command to enable the Link Health Monitoring service. This is required before any other link health monitoring configuration can be entered.

Use the **no** variant of this command to disable the Link Health Monitoring service.

Syntax

```
service linkmon
no service linkmon
```

Default The Link Health Monitoring service is disabled.

Mode Global Configuration

Example To enable the Link Health Monitoring service, use the commands:

```
awplus# configure terminal
awplus(config)# service linkmon
```

To disable the Link Health Monitoring service, use the commands:

```
awplus# configure terminal
awplus(config)# no service linkmon
```

show linkmon probe

Overview Use this command to display output for one or all link monitoring probes.

Syntax

```
show linkmon probe [<probe-name>]
```

Parameter	Description
<probe-name>	The name of the specific probe to display.

Mode User Exec and Privileged Exec

Example To show the output for all link monitoring probes, use the following command:

```
awplus# show linkmon probe
```

To show the output for a link monitoring probe named 'probe1', use the following command:

```
awplus# show linkmon probe probe1
```

Table 34-1: Parameters in the output from **show linkmon probe**

Parameter	Description
Name	The name of the probe.
Status	Whether the probe is enabled or disabled. If it is enabled, then the device will attempt to send probes if the link is up. If it is disabled, then no probes will be sent.
Type	The type of probe packet sent.
IP version	The IP version being used, IPv4 or IPv6.
Destination	The destination IP address that the probes are sent to.
Egress Interface	The interface that the probe packets should egress.
Source	The source IP address or interface.
DSCP	The DSCP value to use when sending the packet.
Packet Size	The size of a probe packet.
Interval	The number of milliseconds between sending out each probe.
Sample Size	The number of probe results to use when calculating the latency and jitter metrics.
Latency	The average latency based on the last **sample size** samples.
Jitter	The average jitter based on the last **sample size** samples.
Packet Loss	The percentage of packets lost based on the last 100 probes.

Table 34-1: Parameters in the output from **show linkmon probe** (cont.)

Parameter	Description
`Probes Sent`	The number of probe packets that have been sent.
`Last Probe Sent`	The time that the last probe packet was sent.
`Last Probe Received`	The time that the device last successfully received a probe packet.

show linkmon probe-history

Overview Use this command to show information about Link Health Monitoring probe metric history collection instances.

Syntax

```
show linkmon probe-history [<1-65535>|probe <probe-name>]
```

Parameter	Description
<1-65535>	The ID of the collection instance to show history for.
<probe-name>	The name of the probe to show history for.

Mode User Exec and Privileged Exec

Example To show all Link Health Monitoring probe history collection instances, use the following command:

```
awplus# show linkmon probe-history
```

To show a Link Health Monitoring probe history collection instance with the ID of '10', use the following command:

```
awplus# show linkmon probe-history 10
```

To show all Link Health Monitoring probe history collection instances that are using a probe named 'probe1', use the following command:

```
awplus# show linkmon probe-history probe probe1
```

Output Figure 34-2: Example output from **show linkmon probe-history**

```
awplus#show linkmon probe-history
-------------------------------------------------------------------
ID   Interval (s) Buckets  Latency (ms): Min        Max        Avg
Probe                      Jitter (ms): Min        Max        Avg
                               Packets:  Tx         Rx   Loss (%)
-------------------------------------------------------------------
10             1  300/300                94        105         99
PROBE1                                     2         11          6
                                        2978       2978       0.00
20             5  300/300                97        102         99
PROBE1                                     4          9          6
                                       14892      14892       0.00
30            10  300/300                98        101        100
PROBE1                                     5          8          6
                                       29785      29785       0.00
```

Table 34-2: Parameters in the output from **show linkmon probe-history**

Parameter	Description
`ID`	The ID of the Link Health Monitoring probe-history.
`Probe`	The name of the probe that this history is for.
`Interval`	The amount of time between each history sample (in seconds).
`Buckets`	The total number of samples that are stored.
`Latency min`	The minimum latency that is in the history.
`Latency max`	The maximum latency that is in the history.
`Latency avg`	The average latency of the samples stored in the history.
`Jitter min`	The minimum jitter that is in the history.
`Jitter max`	The maximum jitter that is in the history.
`Jitter avg`	The average jitter of the samples stored in the history.
`Packets Tx`	The total number of packets transmitted in this history.
`Packets Rx`	The total number of packets received in this history.
`Packets Loss`	The percentage of packets lost in the history.

show linkmon trigger

Overview Use this command to view the status of link health monitoring probe type triggers.

Syntax

```
show linkmon trigger [<1-250>]
```

Parameter	Description
<1-250>	The trigger ID for a link health monitoring trigger.

Mode Privileged Exec

Example To view the status of all link health monitoring triggers, use the command:

```
awplus# show linkmon trigger
```

To view the status of link health monitoring trigger 1, use the command:

```
awplus# show linkmon trigger 1
```

Output Figure 34-3: Example output from **show linkmon trigger**

```
awplus#show linkmon trigger
Trigger 1
-----------------------------------------------------------------------
Match State:           bad
Change Count:          5
Last Change:
  Current State:       good

  Change Time:         09 Feb 2021 21:41:15
  Cause:               Rx probe 'my_probe', consecutive probe
success (3>=3)

Probe:                 my_probe
Enabled:               Yes
Latest Metrics
 Latency             : 1ms
 Jitter              : 1ms
 Loss Rate           : 22.6%
 Consecutive Success : 7

Profile:               my_profile
  latency bad above                 :  - ms
  latency good below                :  - ms
  jitter bad above                  :  - ms
  jitter good below                 :  - ms
  Consecutive success good when     :  3
  Consecutive loss bad when         :  2
  Consecutive loss unreachable when :  4
```

Table 34-3: Parameters in the output from **show linkmon trigger**

Parameter	Description
Match State	If the state of the probe is the same as the match state, the trigger will activate.
Change Count	The number of times the probe has changed state.
Current State	The current state of the probe.
Previous State	The previous state of the probe.
Change Time	The timestamp when the probe last changed state.
Cause	The reason why the probe last changed state.
Probe	The name of the probe.
Enabled	Whether the probe is enabled.
Latency	The last latency metric of the probe.
Jitter	The last jitter metric of the probe.
Loss Rate	The loss rate of the probe, up to 100 metric results calculated.
Consecutive Success	The number of probes that have consecutively succeeded.
Profile	The name of the profile the probe results are being compared to. The profile determines the acceptable jitter, latency, and probe loss.

Related commands show linkmon probe

Command changes Version 5.5.1-0.1: command added

size (linkmon-probe)

Overview Use this command to set the size of the packets used by a Link Health Monitoring probe.

Use the **no** variant of this command to set the size back to the default.

Syntax

```
size <64-1500>
no size
```

Parameter	Description
<64-1500>	The size of the probe packet in bytes.

Default The default packet size is 100 bytes.

Mode Linkmon ICMP Probe Configuration

Example To set the size of a probe named 'probe1' to 1000, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# size 1000
```

To set the size of a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no size
```

Related commands linkmon probe

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

source (linkmon-probe)

Overview Use this command to set the source IP address or interface for a Link Health Monitoring probe.

Use the **no** variant of this command to return it to the default.

Syntax

```
source {<interface>|<ip-address>}
no source
```

Parameter	Description
<interface>	The name of the interface that probes are sourcing from. The specified interface needs to be locally configured with at least one valid IPv4 address, and the interface is in up and running state.
<ip-address>	The source IPv4 address for this probe. The specified IP address needs to be locally configured on an interface that is in an up-and-running state.

Default No source IP address is defined by default. The source IP address will be selected using standard routing behavior to reach the probe's destination.

Mode Linkmon ICMP Probe Configuration

Example To set the source interface as 'lo' for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# source lo
```

To set the source interface back to default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no source
```

Related commands linkmon probe

Command changes Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

url (linkmon-probe)

Overview Use this command to set the destination URL of a Link Health Monitoring probe. This is a required configuration option for http-get probes.

Use the **no** variant of this command to remove the URL.

Syntax

```
url <url>
no url
```

Parameter	Description
<url>	The destination the probe is being sent to. The URL must use ASCII characters and conform to the URL syntax in RFC 3986, with http or https protocol at the start and an optional port number on the end, such as :80, :443 or :8080.

Mode Linkmon HTTP Probe Configuration

Example To set the destination URL of a Link Health Monitoring probe named “test-probe”, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# url
http://www.alliedtelesis.co.nz/
```

Some other examples of supported URL formats:

```
awplus(config-linkmon-http-probe)# url
https://www.facebook.com/
awplus(config-linkmon-http-probe)# url
http://intranet.atlnz.lc:8080
```

To remove the URL, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# no url
```

Part 4: Multicast Applications

35 IGMP and IGMP Snooping Commands

Introduction

Overview

Devices running AlliedWare Plus use IGMP (Internet Group Management Protocol) and MLD (Multicast Listener Discovery) to track which multicast groups their clients belong to. This enables them to send the correct multimedia streams to the correct destinations. IGMP is used for IPv4 multicasting, and MLD is used for IPv6 multicasting.

This chapter describes the commands to configure IGMP Querier behaviour and selection, IGMP Snooping and IGMP Proxy.

Command List

clear ip igmp

Overview Use this command to clear all IGMP group membership records on all interfaces where it is configured .

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
clear ip igmp
```

Syntax (VRF-lite)

```
clear ip igmp [vrf <vrf-name>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Mode Privileged Exec

Example To delete all IGMP records, use the command

```
awplus# clear ip igmp
```

Related commands

clear ip igmp group

clear ip igmp interface

show ip igmp interface

show running-config

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip igmp group

Overview Use this command to clear IGMP group membership records for a specific group on either all interfaces, a single interface, or for a range of interfaces.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
clear ip igmp group *
clear ip igmp group <ip-address> <interface>
```

Syntax (VRF-lite)

```
clear ip igmp [vrf <vrf-name>] group <ip-address> <interface>
```

Parameter	Description
*	Clears all groups on all interfaces. This has the same effect as the **clear ip igmp** command.
vrf	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<ip-address>	Specifies the group whose membership records will be cleared from all interfaces, entered in the form A.B.C.D.
<interface>	Specifies the name of the interface; all groups learned on this interface are deleted.

Mode Privileged Exec

Usage notes This command applies to groups learned by IGMP, IGMP Snooping, or IGMP Proxy.

In addition to the group, an interface can be specified. Specifying this will mean that only entries with the group learned on the interface will be deleted.

Examples To delete all group records, use the command:

```
awplus# clear ip igmp group *
```

To delete records for 224.1.1.1 on vlan1, use the command:

```
awplus# clear ip igmp group 224.1.1.1 vlan1
```

Related commands

clear ip igmp

clear ip igmp interface

show ip igmp interface

show running-config

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip igmp interface

Overview Use this command to clear IGMP group membership records on a particular interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
clear ip igmp interface <interface>
```

Syntax (VRF-lite)

```
clear ip igmp [vrf <vrf-name>] interface <interface>
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<interface>	Specifies the name of the interface. All groups learned on this interface are deleted.

Mode Privileged Exec

Usage notes This command applies to interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example To delete records for VRF red on vlan2, use the command:

```
awplus# clear ip igmp vrf red interface vlan2
```

Related commands

clear ip igmp

clear ip igmp group

show ip igmp interface

show running-config

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug igmp

Overview Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
debug igmp {all|decode|encode|events|fsm|tib}
no debug igmp {all|decode|encode|events|fsm|tib}
```

Syntax (VRF-lite)

```
debug igmp [vrf <vrf-name>] {all|decode|encode|events|fsm|tib}
no debug igmp [vrf <vrf-name>]
{all|decode|encode|events|fsm|tib}
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`all`	Enable or disable all debug options for IGMP
`decode`	Debug of IGMP packets that have been received
`encode`	Debug of IGMP packets that have been sent
`events`	Debug IGMP events
`fsm`	Debug IGMP Finite State Machine (FSM)
`tib`	Debug IGMP Tree Information Base (TIB)

Modes Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug igmp all
```

Related commands show debugging igmp

undebug igmp

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip igmp

Overview Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

Syntax

```
ip igmp
no ip igmp
```

Default Disabled

Mode Interface Configuration for a VLAN interface.

Usage notes An IP address must be assigned to the interface first, before this command will work.

Example To specify an interface as an IGMP querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

Related commands

show ip igmp interface

show running-config

ip igmp access-group

Overview This command adds an access control list to a VLAN interface configured for IGMP, IGMP Snooping, or IGMP Proxy. The access control list is used to control and filter the multicast groups learned on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

Syntax

```
ip igmp access-group {<access-list-number>|<access-list-name>}
no ip igmp access-group
```

Parameter	Description
<access-list-number>	Standard IP access-list number, in the range <1-99>.
<access-list-name>	Standard IP access-list name.

Default By default there are no access lists configured on any interface.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example In the following example, hosts serviced by VLAN interface vlan2 can only join the group `225.2.2.2`:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

ip igmp flood-group

Overview Use this command to configure a static multicast group that will flood matching packets to all ports in the VLAN and not mirror any packets matching that group to the CPU.

Use the **no** variant of this command to remove an IGMP flooding group.

Syntax

```
ip igmp flood-group <ip-address> [<vlan-id>]
no ip igmp flood-group <ip-address>
```

Parameter	Description
<ip-address>	Standard IP Multicast group address, entered in the form A.B.C.D.
<vlan-id>	Layer 3 downstream interface list for Layer 3 forwarding of multicast packets.

Default Not set.

Mode Interface Configuration

Usage notes Multicast packets from an unregistered source will be mirrored to the CPU to ensure IGMP and PIM-SM knows about the group. In certain networks, it is possible for a large number of packets with a number of different sources destined for the same group address, to overwhelm a switches hardware table. This could cause packets to be stuck mirrored to the CPU forever, resulting in high CPU usage and in some cases stack failovers.

This command adds an all sources multicast entry into the switches multicast hardware table, to flood multicast packets to all ports within the VLAN without mirroring the traffic to CPU. This significantly reduces the number of hardware entries consumed.

The Layer 3 variant of this command:

```
ip igmp flood-group <ip-address> <vlan-id>
```

is only supported on one VLAN group address. Any number of the Layer 2 variants can be used.

Example To configure an IGMP flooding group to Layer 2 ports only, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan1:

```
awplus# configure terminal
awplus(config)# int vlan1
awplus(config-if)# ip igmp flood-group 239.255.255.250
```

To configure an IGMP flooding group to Layer 2 ports and Layer 3 forwarding, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan2 and forward any UDP packet to all ports in vlan3:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# ip igmp flood-group 239.255.255.250 vlan3
```

To remove an IGMP flooding group from vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# no ip igmp flood-group 239.255.255.250
```

IGMP Flooding Groups are integrated into the existing command: **show ip igmp groups**

Output Figure 35-1: Example output from **show ip igmp groups**

```
awplus#show ip igmp groups
IGMP Connected Group Membership
Group Address    Interface   Uptime    Expires  Last Reporter
239.255.255.250  vlan3000    01:20:59  stopped 0.0.0.0
```

Related commands ip igmp static-group

Command changes Version 5.5.0-2.3: command added

ip igmp flood specific-query

Overview Use this command if you want IGMP to flood specific queries to all VLAN member ports, instead of only sending the queries to multicast group member ports.

Use the **no** variant of this command if you want IGMP to only send the queries to multicast group member ports.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip igmp flood specific-query
no ip igmp flood specific-query
```

Syntax (VRF-lite)

```
ip igmp [vrf <vrf-name>] flood specific-query
no ip igmp [vrf <vrf-name>] flood specific-query
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Default By default, specific queries are flooded to all VLAN member ports.

Mode Global Configuration

Usage In an L2 switched network running IGMP, it is considered more robust to flood all specific queries. In most cases, the benefit of flooding specific queries to all VLAN member ports outweighs the disadvantages.

However, sometimes this is not the case. For example, if hosts with very low CPU capability receive specific queries for multicast groups they are not members of, their performance may degrade unacceptably. In this situation, it is desirable for IGMP to send specific queries to known member ports only. This minimizes the performance degradation of such hosts. In those circumstances, use this command to turn off flooding of specific queries.

Example To cause IGMP to flood specific queries only to multicast group member ports, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp flood specific-query
```

Related commands show ip igmp interface

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip igmp immediate-leave

Overview In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip igmp immediate-leave group-list
{<access-list-number>|<access-list-number-expanded>|
<access-list-name>}
```

```
no ip igmp immediate-leave
```

Parameter	Description
<access-list-number>	Access-list number, in the range <1-99>.
<access-list-number-expanded>	Access-list number (expanded range), in the range <1300-1999>.
<access-list-name>	Standard IP access-list name.

Default Disabled by default.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example The following example shows how to enable the immediate-leave feature on the VLAN interface vlan2 for a specific range of multicast groups:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp immediate-leave group-list 34
awplus(config-if)# exit
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

Related commands ip igmp last-member-query-interval

ip igmp last-member-query-count

Overview Use this command to set the last-member query-count value for an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ip igmp last-member-query-count <2-7>
no ip igmp last-member-query-count
```

Parameter	Description
<2-7>	Last member query count value.

Default The default last member query count value is 2.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

Related commands

ip igmp last-member-query-interval

ip igmp startup-query-count

show ip igmp interface

show running-config

ip igmp last-member-query-interval

Overview Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax

```
ip igmp last-member-query-interval <interval>
no ip igmp last-member-query-interval
```

Parameter	Description
<interval>	The frequency in milliseconds at which IGMP group-specific host query messages are sent, in the range 1000-25500.

Default 1000 milliseconds

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example To change the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-interval 2000
```

Related commands

ip igmp immediate-leave

ip igmp last-member-query-count

show running-config

ip igmp limit

Overview Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored.

Optionally, you can configure an access-list to stop certain addresses from being subject to the limit.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax

```
ip igmp limit <limit-value> [except
{<access-list-number>|<access-list-number-expanded>|
<access-list-name>}]
no ip igmp limit
```

Syntax (VRF-lite)

```
ip igmp [vrf <vrf-name>] limit <limit-value> [except
{<access-list-number>|<access-list-number-expanded>|
<access-list-name>}]
no ip igmp [vrf <vrf-name>] limit
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<limit-value>	Maximum number of group membership entries, from 2 to 2097152.
<access-list-number>	Access-list number, in the range 1 to 99.
<access-list-number-expanded>	Access-list number (expanded range), in the range 1300 to 1999.
<access-list-name>	IP access-list name.

Default 2095152

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP, IGMP Snooping, or IGMP Proxy.

Example To configure an IGMP limit of 100 group membership entries on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp limit 100
```

To configure an IGMP limit of 100 group membership entries across all interfaces on which IGMP is enabled, and exclude group 224.1.1.1 from this limitation, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp limit 100 except 1
```

Command changes Version 5.4.7-1.1: VRF-lite support added to SBx8100.

Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

ip igmp maximum-groups

Overview Use this command to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

Use the **no** variant of this command to remove the limit.

Syntax

```
ip igmp maximum-groups <0-65535>
no ip igmp maximum-groups
```

Parameter	Description
<0-65535>	The maximum number of IGMP groups clients can join on this switch port. 0 means no limit.

Default The default is 0, which means no limit

Mode Interface mode for a switch port

Usage notes We recommend using this command with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group memberships time out
- Group leaves are received via leave messages or reports

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group ***
- The port is removed from a VLAN
- The port is on a VCStack back-up member, and that member reboots or otherwise leaves the stack.

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>
awplus# show ip igmp interface <port>
```

Example To limit clients to 10 groups on port 1.0.1, which is in vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip igmp maximum-groups 10
awplus(config-if)# exit
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping fast-leave
```

Related commands

clear ip igmp group

ip igmp snooping fast-leave

show ip igmp interface

show ip igmp snooping statistics

ip igmp mroute-proxy

Overview Use this command to enable IGMP mroute proxy on this downstream interface and associate it with the upstream proxy service interface.

Use the **no** variant of this command to remove the association with the proxy-service interface.

Syntax

```
ip igmp mroute-proxy <interface>
no ip igmp mroute-proxy
```

Parameter	Description
<interface>	The name of the interface.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP Proxy.

You must also enable the IGMP proxy service on the upstream interface, using the ip igmp proxy-service command. You can associate one or more downstream mroute proxy interfaces on the device with a single upstream proxy service interface. This downstream mroute proxy interface listens for IGMP reports, and forwards them to the upstream IGMP proxy service interface.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

Example To configure vlan3 as the upstream proxy-service interface for the downstream vlan2 interface, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# interface vlan3
awplus(config-if)# ip igmp proxy-service
awplus(config-if)# ip igmp
awplus(config)# interface vlan2
awplus(config-if)# ip igmp mroute-proxy vlan3
awplus(config-if)# ip igmp
```

Related commands ip igmp

ip igmp proxy-service

ip multicast-routing

ip igmp proxy-service

Overview Use this command to enable an interface to be the upstream IGMP proxy-service interface for the device. All associated downstream IGMP mroute proxy interfaces on this device will have their memberships consolidated on this proxy service interface, according to IGMP host-side functionality.

Use the **no** variant of this command to remove the designation of the interface as an upstream proxy-service interface.

Syntax

```
ip igmp proxy-service
no ip igmp proxy-service
```

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP Proxy.

This command is used with the ip igmp mroute-proxy command to enable forwarding of IGMP reports to a proxy service interface for all forwarding entries for this interface. You must also enable the downstream IGMP mroute proxy interfaces on this device using the command ip igmp mroute-proxy.

IGMP Proxy does not work with other multicast routing protocols, such as PIM-SM or PIM-DM.

From version 5.4.7-1.1 onwards, IGMP mroute proxy interfaces do not have to be configured with an IP address before they can operate. Instead, it is possible to have an addressless interface operate as an IGMP mroute proxy interface.

This feature is useful when IGMP Proxy needs to run on many downstream interfaces. For example, you may want to use it if your device has one subscriber (multicast receiver) per VLAN, and many receivers (many VLANs) connected to the device. In such a situation, assigning IP addresses to each VLAN may not be practicable.

Note that for such interface to be able to send queries to hosts directly attached to the interface, it is necessary to enable IGMP snooping querier on the interface, using the command ip igmp snooping querier.

Example To configure vlan3 as the upstream proxy-service interface for the downstream vlan2 interface, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast-routing
awplus(config)# interface vlan3
awplus(config-if)# ip igmp proxy-service
awplus(config-if)# ip igmp
awplus(config)# interface vlan2
awplus(config-if)# ip igmp mroute-proxy vlan3
awplus(config-if)# ip igmp
```

Related commands

Command changes

Version 5.4.7-1.1: Addressless interface support added.

Version 5.4.7-1.1: VRF-lite support added to SBx8100.

Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

ip igmp querier-timeout

Overview Use this command to configure the timeout period before the device takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax

```
ip igmp querier-timeout <timeout>
no ip igmp querier-timeout
```

Parameter	Description
<timeout>	IGMP querier timeout interval value in seconds, in the range 1-65535.

Default The default timeout interval is 255 seconds.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to VLAN interfaces configured for IGMP.

The timeout value should not be less than the current active querier's general query interval.

Example To configure the device to wait 130 seconds from the time it received the last query before it takes over as the querier for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp querier-timeout 130
```

Related commands

ip igmp query-interval

show ip igmp interface

show running-config

ip igmp query-holdtime

Overview This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

Syntax

```
ip igmp query-holdtime <interval>
no ip igmp query-holdtime
```

Parameter	Description
<interval>	Query interval value in milliseconds, in the range <100-5000>.

Default By default the delay before sending IGMP General Query messages is 500 milliseconds.

Mode Interface Configuration for a VLAN interface.

Usage notes Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the device is acting as an IGMP Querier.

Use the ip igmp query-interval command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See the IGMP Feature Overview and Configuration Guide for introductory information about the Query Solicitation feature.

NOTE: *This command will function on the switch in the stand-alone mode, but it is not supported when the device forms part of a VCS Stack.*

Examples To set the IGMP query holdtime to 900 ms for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

Related commands

ip igmp query-interval

ip igmp snooping tcn query solicit

show ip igmp interface

show running-config

ip igmp query-interval

Overview Use this command to configure the period for sending IGMP General Query messages.

The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

NOTE: *The IGMP query interval must be greater than IGMP query maximum response time.*

Syntax

```
ip igmp query-interval <interval>
no ip igmp query-interval
```

Parameter	Description
<interval>	Query interval value in seconds, in the range <2-18000>.

Default The default IGMP query interval is 125 seconds.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the ip igmp query-max-response-time command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The ip igmp query-holdtime command can occasionally delay the sending of IGMP Queries.

Examples To set the period between IGMP host-query messages to 3 minutes (180 seconds) for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

To reset the period between sending IGMP host-query messages to the default (125 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-interval
```

Related commands

ip igmp query-holdtime

ip igmp query-max-response-time

ip igmp startup-query-interval

show ip igmp interface

show running-config

ip igmp query-max-response-time

Overview Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

NOTE: *The IGMP query maximum response time must be less than the IGMP query interval.*

Syntax

```
ip igmp query-max-response-time <response-time>
no ip igmp query-max-response-time
```

Parameter	Description
<response-time>	Response time value in seconds, in the range 1-3180.

Default The default IGMP query maximum response time is 10 seconds.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to interfaces configured for IGMP.

Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the ip igmp query-interval command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

Examples To set a maximum response time of 8 seconds for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-max-response-time 8
```

To reset the default maximum response time to the default (10 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-max-response-time
```

Related commands

ip igmp query-interval

show ip igmp interface

show running-config

ip igmp ra-option

Overview Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.

Use the **no** variant of this command to disable strict RA option validation.

Syntax

```
ip igmp ra-option
no ip igmp ra-option
```

Default The default state of RA validation is unset.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to interfaces configured for IGMP and IGMP Snooping.

Examples To enable strict Router Alert (RA) option validation on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

ip igmp robustness-variable

Overview Use this command to change the robustness variable value on an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ip igmp robustness-variable <1-7>
no ip igmp robustness-variable
```

Parameter	Description
<1-7>	The robustness variable value.

Default The default robustness variable value is 2.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to interfaces configured for IGMP and IGMP Snooping.

Examples To set the robustness variable to 3 on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

Related commands

show ip igmp interface

show running-config

ip igmp snooping

Overview Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the device level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

NOTE: *IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.*

Syntax

```
ip igmp snooping
no ip igmp snooping
```

Syntax (VRF-lite)

```
ip igmp [vrf <vrf-name>] snooping
no ip igmp [vrf <vrf-name>] snooping
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.

Default By default, IGMP Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a VLAN interface.

Usage notes It is possible to disable IGMP snooping globally or on a per-VLAN basis, using the command **no ipv6 igmp snooping**. However, we recommend leaving IGMP snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

Examples To enable IGMP Snooping on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

Related commands

ipv6 mld snooping

show ip igmp interface

show running-config

Command changes

Version 5.4.7-1.1: VRF-lite support added.

ip igmp snooping fast-leave

Overview Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax
```
ip igmp snooping fast-leave
no ip igmp snooping fast-leave
```

Default IGMP Snooping fast-leave processing is disabled.

Mode Interface Configuration for a VLAN interface.

Usage notes This IGMP Snooping command can only be configured on VLAN interfaces.

Example To enable fast-leave processing on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

Related commands show ip igmp interface

show running-config

ip igmp snooping mrouter

Overview Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

Syntax

```
ip igmp snooping mrouter interface <port>
no ip igmp snooping mrouter interface <port>
```

Parameter	Description
<port>	The port may be a device port (e.g. port1.0.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).

Mode Interface Configuration for a VLAN interface.

Example To configure port1.0.2 statically as a multicast router interface for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

Related commands show ip igmp snooping mrouter

ip igmp snooping querier

Overview Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

Syntax

```
ip igmp snooping querier
no ip igmp snooping querier
```

Mode Interface Configuration for a VLAN interface.

Usage notes The IGMP Snooping querier uses the `0.0.0.0` Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

NOTE: *Do not enable the IGMP Snooping Querier feature on a Layer 2 device when there is an operational IGMP Querier in the network.*

Example To configure vlan2 as a Snooping querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

Related commands

show ip igmp interface

show running-config

ip igmp snooping report-suppression

Overview Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

Syntax

```
ip igmp snooping report-suppression
no ip igmp snooping report-suppression
```

Default Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

Mode Interface Configuration for a VLAN interface.

Example To enable report suppression for IGMPv2 reports for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

Related commands show ip igmp interface

show running-config

ip igmp snooping routermode

Overview Use this command to set the destination IP addresses as router multicast addresses.

Use the **no** variant of this command to set it to the default. You can also remove a specified IP address from a custom list of multicast addresses.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip igmp snooping routermode
{all|default|ip|multicastrouter|address <ip-address>}
```

```
no ip igmp snooping routermode [address <ip-address>]
```

Syntax (VRF-lite)

```
ip igmp [vrf <vrf-name>] snooping routermode
{all|default|ip|multicastrouter|address <ip-address>}
```

```
no ip igmp [vrf <vrf-name>] snooping routermode [address
<ip-address>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
`all`	All reserved multicast addresses (224.0.0.x). Packets from all possible addresses in range 224.0.0.x are treated as coming from routers.
`default`	Default set of reserved multicast addresses. Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are treated as coming from routers.
`ip`	Custom reserved multicast addresses. Packets from custom IP address in the 224.0.0.x range are treated as coming from routers.
`multicastrouter`	Packets from DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are treated as coming from routers.
`address` *<ip-address>*	Packets from the specified multicast address are treated as coming from routers. The address must be in the 224.0.0.x range.

Default The default routermode is **default** (not **all**) and shows the following reserved multicast addresses:

```
Router mode.............Def

Reserved multicast address
         224.0.0.1
         224.0.0.2
         224.0.0.4
         224.0.0.5
         224.0.0.6
         224.0.0.9
         224.0.0.13
         224.0.0.15
         224.0.0.24
```

Mode Global Configuration

Examples To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address
224.0.0.5
```

Related commands ip igmp trusted

show ip igmp snooping routermode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip igmp snooping source-timeout

Overview Use this command to set the global IGMP Snooping source time-out value (in seconds) on the switch.

Use the **no** variant of this command to set the source time-out value to be the same as the group membership timeout.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs, then specifying a VRF name will configure the command on that VRF. If you do not specify a VRF, the command will configure the global VRF. The VRF option is only available for the global command and not the interface command.

Syntax

```
ip igmp snooping source-timeout <timeout>
no ip igmp snooping source-timeout <timeout>
```

Syntax (VRF-lite)

```
ip igmp [vrf <vrf-name>] snooping source-timeout <timeout>
no ip igmp [vrf <vrf-name>] snooping source-timeout <timeout>
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<timeout>	Time-out value in seconds *<0-86400>*

Default Global IGMP Snooping source-timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

Interface IGMP Snooping source timeout is disabled by default, and unregistered multicast will be timed-out like normal entries, unless VRF global settings override.

Mode Interface/Global Configuration

Usage notes The timeout determines how long unregistered multicast entries will be kept for. If the value '0' is specified, then effectively all unregistered multicast entries will never be timed out, and can only be cleared by using the command **clear ip igmp group**. The interface settings will always take precedence over the global setting.

Example To configure IGMP Snooping source timeout on 'vlan1', use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping source-timeout 200
```

Example To configure IGMP Snooping source timeout globally on a switch, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping source-timeout 200
```

Related commands show ip igmp snooping source-timeout

Command changes Version 5.4.7-1.1: command added

ip igmp snooping tcn query solicit

Overview Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the **no** variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip igmp snooping tcn query solicit
no ip igmp snooping tcn query solicit
```

Syntax (VRF-lite)

```
ip igmp [vrf <vrf-name>] snooping tcn query solicit
no ip igmp [vrf <vrf-name>] snooping tcn query solicit
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.

Default IGMP Snooping TCN Query Solicitation is disabled by default on the device, unless the device is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the device is the Master Node in an EPSR ring, or the device is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified interfaces using the **no** variant of this command from the Interface Configuration mode.

Mode Global Configuration, and Interface Configuration for a VLAN interface.

Usage notes Once enabled, if the device is not an IGMP Querier, on detecting a topology change, the device generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the device.

On a device that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the device that detects a topology change is an IGMP Querier then the device will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a device that is the Master Node in an EPSR ring or on a device that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the device these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the following state table that shows when Query Solicit messages are sent in these instances:

Command issued from Global Configuration	Command issued from Interface Configuration	Device is STP Root Bridge or the EPSR Master Node	IGMP Query Solicit message sent on VLAN
No	Yes	Yes	Yes
Yes	No	Yes	No
Yes	Yes	Yes	Yes

See the IGMP Feature Overview and Configuration Guide for introductory information about the Query Solicitation feature.

NOTE: *This command will function on the switch in the stand-alone mode, but it is not supported when the device forms part of a VCS Stack.*

Examples To enable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

To enable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip igmp source-address-check

Overview This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

Syntax

```
ip igmp source-address-check
no ip igmp source-address-check
```

Default Source address checking for IGMP Reports is enabled by default.

Mode Interface Configuration for a VLAN interface.

Usage notes This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The no variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

Examples To deny IGMP Reports from outside the current subnet for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp source-address-check
```

Related commands show ip igmp interface

show running-config

ip igmp ssm

Overview Use this command to define a non-default Source Specific Multicast (SSM) range of IP multicast addresses in IGMP. Incoming IGMPv1 and IGMPv2 join requests are ignored if the multicast IP address is in the SSM range and no SSM mapping is configured for these addresses. By default, the SSM range is 232/8. To define the SSM range to be other than the default, use one of the access-list parameter options.

Use the **no** variant of this command to change the SSM range in IGMP back to the default.

Syntax

```
ip igmp ssm range {<access-list-number>|<access-list-name>}
no ip igmp ssm
```

Parameter	Description
<access-list-number>	Access-list number, in the range 1 to 99.
<access-list-name>	Standard IP access-list name.

Default By default the SSM range is 232/8.

Mode Global Configuration

Examples To configure a non-default SSM range to be used in IGMP enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.0 0.0.0.255
awplus(config)# ip igmp ssm range 10
```

To return to the default configuration enter the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp ssm
```

Related commands access-list (standard numbered)

ip pim ssm

ip igmp ssm-map enable

Overview Use this command to enable Source Specific Multicast (SSM) mapping on the device.

Use the **no** variant of this command to disable SSM mapping.

Syntax

```
ip igmp ssm-map enable
no ip igmp ssm-map enable
```

Mode Global Configuration

Usage notes This command applies to VLAN interfaces configured for IGMP.

Example To enable SSM on the device enter the commands:

```
awplus# configure terminal
awplus(config)# ip igmp ssm-map enable
```

Related commands ip igmp ssm-map static

ip igmp ssm-map static

Overview Use this command to specify the static mode of defining Source Specific Multicast (SSM) mapping. SSM statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

Syntax

```
ip igmp ssm-map static
{<access-list-number>|<access-list-number-extended>|
<access-list-name>} <ip-address>
```

```
no ip igmp ssm-map static
{<access-list-number>|<access-list-number-extended>|
<access-list-name>} <ip-address>
```

Parameter	Description
<access-list-number>	Access-list number, in the range 1 to 99.
<access-list-number-extended>	Access-list number (expanded range), in the range 1300 to 1999.
<access-list-name>	Standard IP access-list name.
<ip-address>	Source address to use for static map group, entered in the form A.B.C.D.

Mode Global Configuration

Usage notes This command applies to VLAN interfaces configured for IGMP. You can use Standard numbered and Standard named ACLs plus Expanded Numbered ACLs.

Examples This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using a standard numbered ACL shown as `10`:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 10 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using an expanded numbered ACL shown as `1301`:

```
awplus# configure terminal
awplus(config)# access-list 1301 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static 1301 1.2.3.4
```

This example shows how to configure an SSM static mapping for group-address `224.1.1.1`, using a standard named ACL shown as `sales`:

```
awplus# configure terminal
awplus(config)# access-list sales permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp ssm-map static sales 1.2.3.4
```

Related commands ip igmp ssm-map enable

ip igmp static-group

Overview Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

To use Source Specific Multicast mapping to determine the source IP address of the multicast server use the **ssm-map** parameter instead of specifying the source IP address.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```
ip igmp static-group <ip-address> [source
{<ip-source-addr>|ssm-map}] [interface <port>]
```

```
no ip igmp static-group <ip-address> [source
{<ip-source-addr>|ssm-map}] [interface <port>]
```

Parameter	Description
<ip-address>	Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.
source	Optional.
<ip-source-addr>	Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.
ssm-map	This parameter uses Source Specific Multicast (SSM) Mapping to determine the source IP address associated with the specified IP Multicast group address. SSM mappings are configured using the ip igmp ssm-map static command.
interface	Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN.
<port>	The port or port range to statically forward the group out of. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2).

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to IGMP operation, or to IGMP Snooping on a VLAN interface.

Example The following example show how to statically add group and source records for IGMP on vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp
awplus(config-if)# ip igmp static-group 226.1.2.4 source
10.2.3.4
```

ip igmp startup-query-count

Overview Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

Syntax

```
ip igmp startup-query-count <startup-query-count>
no ip igmp startup-query-count
```

Parameter	Description
<startup-query-count>	Specify the IGMP startup query count, in the range 2-10.

Default The default IGMP startup query count is 2.

Mode Interface Configuration for a VLAN interface.

Example To set the IGMP startup query count to `4` on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-count 4
```

Related commands

ip igmp last-member-query-count

ip igmp startup-query-interval

ip igmp startup-query-interval

Overview Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

Use the **no** variant of this command to return an interface's configured IGMP startup query interval to the default.

Syntax

```
ip igmp startup-query-interval <startup-query-interval>
no ip igmp startup-query-interval
```

Parameter	Description
<startup-query-interval>	Specify the IGMP startup query interval, in the range of 2-1800 seconds. The value must be one quarter of the IGMP query interval value.

Default The default IGMP startup query interval is one quarter of the IGMP query interval value.

NOTE: *The IGMP startup query interval must be one quarter of the IGMP query interval.*

Mode Interface Configuration for a VLAN interface.

Example To set the IGMP startup query interval to 15 seconds for vlan2, which is one quarter of the IGMP query interval of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-interval 60
awplus(config-if)# ip igmp startup-query-interval 15
```

Related commands

ip igmp last-member-query-interval

ip igmp query-interval

ip igmp startup-query-count

ip igmp trusted

Overview Use this command to allow IGMP to process packets received on certain trusted ports only.

Use the **no** variant of this command to stop IGMP from processing specified packets if the packets are received on the specified ports or aggregator.

Syntax

```
ip igmp trusted {all|query|report|routermode}
no ip igmp trusted {all|query|report|routermode}
```

Parameter	Description
`all`	Specifies whether or not the interface is allowed to receive all IGMP and other routermode packets
`query`	Specifies whether or not the interface is allowed to receive IGMP queries
`report`	Specifies whether or not the interface is allowed to receive IGMP membership reports
`routermode`	Specifies whether or not the interface is allowed to receive routermode packets

Default By default, all ports and aggregators are trusted interfaces, so IGMP is allowed to process all IGMP query, report, and router mode packets arriving on all interfaces.

Mode Interface mode for one or more switch ports or aggregators

Usage Because all ports are trusted by default, use this command in its **no** variant to stop IGMP processing packets on ports you do not trust.

For example, you can use this command to make sure that only ports attached to approved IGMP routers are treated as router ports.

Example To stop ports port1.0.3-port1.0.6 from being treated as router ports by IGMP, use the commands:

```
awplus(config)# interface port1.0.3-port1.0.6
awplus(config-if)# no ip igmp trusted routermode
```

Related commands ip igmp snooping routermode

ip igmp version

Overview Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

Syntax

```
ip igmp version <1-3>
no ip igmp version
```

Parameter	Description
`version <1-3>`	IGMP protocol version number

Default The default IGMP version is 3.

Mode Interface Configuration for a VLAN interface.

Example To set the IGMP version to 2 for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
```

Related commands show ip igmp interface

show debugging igmp

Overview Use this command to see what debugging is turned on for IGMP.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
show debugging igmp
```

Syntax (VRF-lite)

```
show debugging igmp [vrf <vrf-name>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.

Mode User Exec and Privileged Exec

Example To display the IGMP debugging options set, enter the command:

```
awplus# show debugging igmp
```

Output Figure 35-2: Example output from the **show debugging igmp** command

```
IGMP Debugging status:
  IGMP Decoder debugging is on
  IGMP Encoder debugging is on
  IGMP Events debugging is on
  IGMP FSM debugging is on
  IGMP Tree-Info-Base (TIB) debugging is on
```

Related commands debug igmp

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp groups

Overview Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
show ip igmp groups [brief]
show ip igmp groups <ip-address> [detail]
show ip igmp groups <interface> [<ip-address>] [detail]
```

Syntax (VRF-lite)

```
show ip igmp [vrf <vrf-name>|global] groups [brief]
show ip igmp [vrf <vrf-name>|global] groups <ip-address>
[detail]
show ip igmp [vrf <vrf-name>|global] groups <interface>
[<ip-address>] [detail]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
`global`	The global routing and forwarding table
<ip-address>	Address of the multicast group, entered in the form A.B.C.D.
<interface>	Interface name for which to display local information.
`brief`	Brief display of all interfaces.
`detail`	Detailed display of the interface.

Mode User Exec and Privileged Exec

Example The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

Output Figure 35-3: Example output from **show ip igmp groups**

```
IGMP Connected Group Membership
Group Address    Interface       Uptime    Expires   Last Reporter
224.0.1.1        port1.0.1       00:00:09  00:04:17  10.10.0.82
224.0.1.24       port1.0.2       00:00:06  00:04:14  10.10.0.84
...
```

Table 35-1: Parameters in the output of **show ip igmp groups**

Parameter	Description
`Group Address`	Address of the multicast group.
`Interface`	Port through which the group is reachable.
`Uptime`	The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device.
`Expires`	Time (in hours, minutes, and seconds) until the entry expires.
`Last Reporter`	Last host to report being a member of the multicast group.

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

Version 5.4.8-2.3: **brief** parameter added.

show ip igmp interface

Overview Use this command to display the state of IGMP, IGMP Proxy service, and IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output. You can also display the number of groups a switch port belongs to.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip igmp interface [<interface>]
```

Syntax (VRF-lite)
```
show ip igmp [vrf <vrf-name>|global] interface [<interface>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name
`global`	The global routing and forwarding table
`<interface>`	The name of the interface. If you specify a switch port number, the output displays the number of groups the port belongs to, and the port's group membership limit, if a limit has been set (with the command ip igmp maximum-groups).

Mode User Exec and Privileged Exec

Output The following output shows IGMP interface status for vlan2 with IGMP Snooping enabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
```

```
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
```

The following output shows IGMP interface status for vlan2 with IGMP Snooping disabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
 IGMP Disabled, Inactive, Version 3 (default)
 IGMP interface has 0 group-record states
 IGMP activity: 0 joins, 0 leaves
 IGMP robustness variable is 2
 IGMP last member query count is 2
 IGMP query interval is 125 seconds
 IGMP query holdtime is 500 milliseconds
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 Strict IGMPv3 ToS checking is disabled on this interface
 Source Address checking is enabled
 IGMP Snooping is globally enabled
 IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
 IGMP Snooping is not enabled on this interface
 IGMP Snooping fast-leave is not enabled
 IGMP Snooping querier is not enabled
 IGMP Snooping report suppression is enabled
```

The following output displays membership information for port1.0.1:

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
    Maximum groups limit set: 10
    Number of groups port belongs to: 0
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp proxy

Overview Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip igmp proxy
```

Syntax (VRF-lite)
```
show ip igmp [vrf <vrf-name>|global] proxy
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

Output Figure 35-4: Example output from **show ip igmp proxy**

```
awplus#show ip igmp proxy
Interface vlan40 (Index 340)
Administrative status: enabled
Operational status: up
Upstream interface is vlan30
Number of multicast groups: 1
```

Related commands ip igmp proxy-service

Command changes Version 5.4.7-1.1: VRF-lite support added.

show ip igmp proxy groups

Overview Use this command to display multicast groups with receivers directly connected to the router, learned through IGMP, which use a proxy service. You can also use a filter to specify a multicast group IP address and /or interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

Syntax (VRF-lite)

```
show ip igmp [vrf <vrf-name>|global] proxy groups [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <multicast-group> [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <vlan> [detail]
show ip igmp [vrf <vrf-name>|global] proxy groups <vlan> <multicast-group> [detail]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`global`	The global routing and forwarding table
`groups`	Specify IGMP proxy group membership information.
`detail`	Specify detailed IGMPv3 source information.
<vlan>	Specify the name of a single VLAN interface, for example **vlan1**.
<multicast-group>	Specify the IPv4 address in of the multicast group, in the format A.B.C.D.

Mode User Exec

Example To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups
```

Output Figure 35-5: Example output from **show ip igmp proxy groups**

```
awplus#show ip igmp proxy groups
IGMP Connected Proxy Group Membership
Group Address    Interface            Member state
224.9.10.11      vlan10               Delay
```

Example To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups detail
```

Output Figure 35-6: Example output from **show ip igmp proxy groups detail**

```
awplus#show ip igmp proxy groups detail
Interface:      vlan10
Group:          224.9.10.11
Group mode:     Exclude
Member state:   Delay
Source list is empty

Summary :
IGMP Connected Proxy Group Membership
Group Address    Interface            Member state
224.9.10.11      vlan10               DelayDetail :
Interface:       vlan10
Group:           224.9.10.11
Group mode:      Exclude
Member state:    Delay
Source list is empty
```

Table 35-2: Parameters in the output of **show ip igmp proxy groups**

Parameter	Description
`Interface`	The interface that received the IGMP report.
`Group`	The multicast group address that has been requested by the IGMP report.
`Group mode`	**Include**mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it wants to receive traffic from. **Exclude** mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it does not want to receive traffic from.
`Member state`	**Delay** indicates that no group or source query timers are running for the specified group, otherwise the member state is shown as **Idle**.

Related commands show ip igmp proxy

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping mrouter

Overview Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip igmp snooping mrouter [interface <interface>]
```

Syntax (VRF-lite)
```
show ip igmp [vrf <vrf-name>|global] snooping mrouter
[interface <interface>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table
`interface`	A specific interface.
`<interface>`	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

Output Figure 35-7: Example output from **show ip igmp snooping mrouter**

```
VLAN    Interface   Static/Dynamic
1       port1.0.1   Statically configured
200     port1.0.2   Statically configured
```

Figure 35-8: Example output from **show ip igmp snooping mrouter interface vlan1**

```
VLAN    Interface   Static/Dynamic
1       port1.0.1   Statically configured
```

Related commands ip igmp snooping mrouter

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping routermode

Overview Use this command to display the current router mode and the list of IP addresses set as router multicast addresses from the ip igmp snooping routermode command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip igmp snooping routermode
```

Syntax (VRF-lite)
```
show ip igmp [vrf <vrf-name>|global] snooping routermode
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
`global`	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example To show the router mode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

Output Figure 35-9: Example output from **show ip igmp snooping routermode**

```
awplus#show ip igmp snooping routermode
Router mode.............Def
Reserved multicast address

         224.0.0.1
         224.0.0.2
         224.0.0.4
         224.0.0.5
         224.0.0.6
         224.0.0.9
         224.0.0.13
         224.0.0.15
         224.0.0.24
```

Related commands ip igmp snooping routermode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping source-timeout

Overview Use this command to display the configured IGMP snooping source timeouts for a specified VLAN or VLAN range.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Specifying a VRF name will show the IGMP source timeouts for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax
```
show ip igmp snooping source-timeout [interface|
<interface-range>]
```

Syntax (VRF-lite)
```
show ip igmp [vrf <vrf-name>|global] snooping source-timeout
[interface|<interface-range>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
`global`	The global routing and forwarding table
<interface-range>	The name of the VLAN interface or VLAN range

Mode Privileged Exec

Example To display the configured IGMP snooping source timeouts for all VLANs, use the command:

```
awplus# show ip igmp snooping source-timeout
```

Output Figure 35-10: Example output from **show ip igmp snooping source-timeout**

```
awplus#show ip igmp snooping source-timeout
Global IGMP snooping source-timeout is enabled (60 secs)

vlan1           enabled (300 secs)
vlan2           inherits global setting
vlan1000        inherits global settingawplus#show ip igmp
snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

Example To display the configured IGMP snooping source timeouts for VLAN1, use the command:

```
awplus# show ip igmp snooping source-timeout int vlan1
```

Output Figure 35-11: Example output from **show ip igmp snooping source-timeout int vlan1**

```
awplus#show ip igmp snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

Related commands ip igmp snooping source-timeout

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping statistics

Overview Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip igmp snooping statistics interface <interface-range>
[group [<ip-address>]]
```

Syntax (VRF-lite)
```
show ip igmp [vrf <vrf-name>|global] snooping statistics
interface <interface-range> [group [<ip-address>]]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
`global`	The global routing and forwarding table
<ip-address>	Optionally specify the address of the multicast group, entered in the form A.B.C.D.
<interface>	Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port's group membership limit, if a limit has been set (with the command ip igmp maximum-groups)

Mode Privileged Exec

Example To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

Output Figure 35-12: Example output from the **show ip igmp snooping statistics** command for VLANs

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1
Interface:      port1.0.1
Group:          224.1.1.1
Uptime:         00:00:09
Group mode:     Exclude (Expires: 00:04:10)
Last reporter:  10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:      port1.0.2
Group:          224.1.1.2
Uptime:         00:00:19
Group mode:     Exclude (Expires: 00:05:10)
Last reporter:  10.4.4.6
Source list is empty
```

Figure 35-13: Example output from the **show ip igmp snooping statistics** command for a switch port

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
    Maximum groups limit set: 10
    Number of groups port belongs to: 0
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

undebug igmp

Overview This command applies the functionality of the no debug igmp command.

36 MLD and MLD Snooping Commands

Introduction

Overview

This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

MLD and MLD Snooping commands only apply to switch ports, not Ethernet interfaces.

Before using PIM-SMv6:

- IPv6 must be enabled on an interface (ipv6 enable),
- IPv6 forwarding must be enabled globally for routing IPv6 (ipv6 forwarding), and
- IPv6 multicasting must be enabled globally (ipv6 multicast-routing).

Command List

clear ipv6 mld

Overview Use this command to clear all MLD local memberships on all interfaces.

Syntax
```
clear ipv6 mld
```

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Example To clear all MLD local memberships on all interfaces, use the command:

```
awplus# clear ipv6 mld
```

Related commands clear ipv6 mld group

clear ipv6 mld interface

clear ipv6 mld group

Overview Use this command to clear MLD specific local-membership(s) on all interfaces, for all groups or a particular group.

Syntax

```
clear ipv6 mld group {*|<ipv6-address>}
```

Parameter	Description
*	Clears all groups on all interfaces. This is an alias to the clear ipv6 mld command.
<ipv6-address>	Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Example To clear all groups on all interfaces, use the command:

```
awplus# clear ipv6 mld group *
```

Related commands

clear ipv6 mld

clear ipv6 mld interface

clear ipv6 mld interface

Overview Use this command to clear MLD interface entries.

Syntax

```
clear ipv6 mld interface <interface>
```

Parameter	Description
<interface>	Specifies name of the interface; all groups learned from this interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Example To clear the entries from vlan2, use the command:

```
awplus# clear ipv6 mld interface vlan2
```

Related commands

clear ipv6 mld

clear ipv6 mld group

debug mld

Overview Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

Syntax

```
debug mld {all|decode|encode|events|fsm|tib}
no debug mld {all|decode|encode|events|fsm|tib}
```

Parameter	Description
`all`	Debug all MLD.
`decode`	Debug MLD decoding.
`encode`	Debug MLD encoding.
`events`	Debug MLD events.
`fsm`	Debug MLD Finite State Machine (FSM).
`tib`	Debug MLD Tree Information Base (TIB).

Mode Privileged Exec and Global Configuration

Usage notes This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Examples

```
awplus# configure terminal
awplus(config)# debug mld all
awplus# configure terminal
awplus(config)# debug mld decode
awplus# configure terminal
awplus(config)# debug mld encode
awplus# configure terminal
awplus(config)# debug mld events
```

Related commands show debugging mld

ipv6 mld

Overview Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

NOTE: *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

Syntax

```
ipv6 mld
no ipv6 mld
```

Default MLD is disabled by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Example To enable MLD on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

Related commands show ipv6 mld interface

ipv6 mld access-group

Overview Use this command to control the multicast local-membership groups learned on an interface.

Use the **no** variant of this command to disable this access control.

Syntax

```
ipv6 mld access-group <IPv6-access-list-name>
no ipv6 mld access-group
```

Parameter	Description
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default No access list is configured by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Examples In the following example, the VLAN interface `vlan2` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

In the following example, the VLAN interfaces `vlan2-vlan4` will only accept MLD joins for groups in the range `ff1e:0db8:0001::/64`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard group1 permit
ff1e:0db8:0001::/64
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld access-group group1
```

ipv6 mld immediate-leave

Overview Use this command to minimize the leave latency of MLD memberships.

Use the **no** variant of this command to disable this feature.

Syntax

```
ipv6 mld immediate-leave group-list <IPv6-access-list-name>
no ipv6 mld immediate-leave
```

Parameter	Description
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default Disabled

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

Related commands ipv6 mld last-member-query-interval

ipv6 mld last-member-query-count

Overview Use this command to set the last-member query-count value.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ipv6 mld last-member-query-count <value>
no ipv6 mld last-member-query-count
```

Parameter	Description
<value>	Count value. Valid values are from 2 to 7.

Default The default last-member query-count value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

ipv6 mld last-member-query-interval

Overview Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax

```
ipv6 mld last-member-query-interval <milliseconds>
no ipv6 mld last-member-query-interval
```

Parameter	Description
<milliseconds>	The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds.

Default 1000 milliseconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example The following example changes the MLD group-specific host query message interval to 2 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

Related commands ipv6 mld immediate-leave

ipv6 mld limit

Overview Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the device as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

Syntax

```
ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]
no ipv6 mld limit
```

Parameter	Description
<limitvalue>	<2-512> Maximum number of group membership states.
<IPv6-access-list-name>	Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Default The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Examples The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range `ff1e:0db8:0001::/64` from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

Related commands

ipv6 mld immediate-leave

show ipv6 mld groups

ipv6 mld querier-timeout

Overview Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax

```
ipv6 mld querier-timeout <seconds>
no ipv6 mld querier-timeout
```

Parameter	Description
<seconds>	Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds.

Default 255 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This command applies to interfaces configured for MLD Layer 3 multicast protocols.

Example The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

Related commands ipv6 mld query-interval

ipv6 mld query-interval

Overview Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

Syntax

```
ipv6 mld query-interval <seconds>
no ipv6 mld query-interval
```

Parameter	Description
<seconds>	Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from 1 to 18000 seconds.

Default The default query interval is 125 seconds.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols.

Example The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

Related commands ipv6 mld querier-timeout

ipv6 mld query-max-response-time

Overview Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

Syntax

```
ipv6 mld query-max-response-time <seconds>
no ipv6 mld query-max-response-time
```

Parameter	Description
<seconds>	Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds.

Default 10 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols.

Example The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

ipv6 mld robustness-variable

Overview Use this command to change the robustness variable value on an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ipv6 mld robustness-variable <value>
no ipv6 mld robustness-variable
```

Parameter	Description
<value>	Valid values are from 1 to 7.

Default The default robustness variable value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer 3 multicast protocols.

Example The following example changes the robustness variable value to 3:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

ipv6 mld snooping

Overview Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

NOTE: *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

Syntax

```
ipv6 mld snooping
no ipv6 mld snooping
```

Default By default, MLD Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes It is possible to disable MLD snooping globally or on a per-VLAN basis, using the command **no ipv6 mld snooping**. However, we recommend leaving MLD snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Examples To configure MLD Snooping on the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

ipv6 mld snooping fast-leave

Overview Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax

```
ipv6 mld snooping fast-leave
no ipv6 mld snooping fast-leave
```

Default MLD Snooping fast-leave processing is disabled.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This MLD Snooping command can only be configured on VLAN interfaces.

Examples This example shows how to enable fast-leave processing on the VLAN interface vlan2.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface vlan2-vlan4.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

ipv6 mld snooping mrouter

Overview Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

Syntax

```
ipv6 mld snooping mrouter interface <port>
no ipv6 mld snooping mrouter interface <port>
```

Parameter	Description
<port>	Specify the name of the port.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.6 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Figure 36-1: Example **ipv6 mld snooping mrouter** commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.6
```

Examples

This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

Related commands

ipv6 multicast route

ipv6 mld snooping querier

Overview Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

Syntax
```
ipv6 mld snooping querier
no ipv6 mld snooping querier
```

Mode Interface Configuration for a specified VLAN interface.

Usage This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device.

Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

Example
```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping querier
```

ipv6 mld snooping report-suppression

Overview Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

Syntax

```
ipv6 mld snooping report-suppression
no ipv6 mld snooping report-suppression
```

Default Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping device. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping device to prevent 'flooding' of query responses.

Examples This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

ipv6 mld ssm-map enable

Overview Use this command to enable the Source Specific Multicast (SSM) mapping feature on the device.

Use the **no** variant of this command to disable the SSM mapping feature on the device.

Syntax

```
ipv6 mld ssm-map enable
no ipv6 mld ssm-map enable
```

Mode Global Configuration

Usage notes This command enables the SSM mapping feature for group members in the defined SSM range. Configure the group member and the SSM range using the ipv6 mld ssm-map static command.

Example This example shows how to enable the MLD SSM mapping feature on the device.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
```

Related commands ipv6 mld ssm-map static

ipv6 mld ssm-map static

Overview Use this command to statically define a Source Specific Multicast (SSM) mapping. The SSM mapping statically assigns sources to MLDv1 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.

Use the **no** variant of this command to remove the SSM map association.

Syntax

```
ipv6 mld ssm-map static <access-list-name> X:X::X:X
no ipv6 mld ssm-map static <access-list-name> X:X::X:X
```

Parameter	Description
<access-list-name>	IPv6 named standard access-list.
X:X::X:X	IPv6 source address that is associated with the above access-list. The IPv6 address uses the format X:X::X:X.

Mode Global Configuration

Usage notes Use this command to configure SSM mappings after enabling SSM mapping with the ipv6 mld ssm-map enable command.

Example This example shows how to configure an SSM static mapping for the group-address ff0e::1/128.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
awplus(config)# ipv6 access-list standard v6grp permit
ff0e::1/128
awplus(config)# ipv6 mld ssm-map static v6grp 2006::3
```

Related commands ipv6 mld ssm-map enable

ipv6 mld static-group

Overview Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```
ipv6 mld static-group <ipv6-group-address> [source
<ipv6-source-address>|ssm-map] [interface <port>]
```

```
no ipv6 mld static-group <ipv6-group-address> [source
<ipv6-source-address>|ssm-map] [interface <port>]
```

Parameter	Description
<ipv6-group-address>	Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.
<ipv6-source-address>	Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.
`ssm-map`	Mode of defining SSM mapping. SSM mapping statically assigns sources to MLDv1 groups to translate these (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM.
<port>	Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just that physical interface. If this parameter is not used, the static configuration is applied on all interfaces in the group.

Mode Interface Configuration for a specified VLAN interface.

Usage notes This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

Examples To add a static group record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

To add a static group and source record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

To add a static group record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.0.8
```

To add an SSM mapping record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
ssm-map interface port1.0.8
```

ipv6 mld version

Overview Use this command to set the current MLD protocol version on an interface.

Use the **no** variant of this command to return to the default version on an interface.

Syntax

```
ipv6 mld version <version>
no ipv6 mld version
```

Parameter	Description
<version>	MLD protocol version number. Valid version numbers are 1 and 2

Default The default MLD protocol version number is 2.

Mode Interface Configuration for a specified VLAN interface.

Usage notes This command applies to interfaces configured for MLD Layer 3 multicast protocols and MLD Snooping.

Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

Example To set the MLD protocol version to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

show debugging mld

Overview Use this command to see what debugging is turned on for MLD. MLD debugging modes are enabled with the debug mld command.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax
```
show debugging mld
```

Mode Privileged Exec

Example
```
awplus# show debugging mld
```

Output
```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

Related commands debug mld

show ipv6 mld groups

Overview Use this command to display the multicast groups that have receivers directly connected to the router and learned through MLD.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax `show ipv6 mld groups [<ipv6-address>|<interface>] [detail]`

Parameter	Description
<ipv6-address>	Optional. Specify Address of the multicast group in format X:X::X:X.
<interface>	Optional. Specify the Interface name for which to display local information.

Mode User Exec and Privileged Exec

Examples The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

Output Figure 36-2: Example output for **show ipv6 mld groups**

```
awplus#show ipv6 mld groups
MLD Connected Group Membership
Group Address     Interface            Uptime   Expires     Last Reporter
ff08::1           vlan10 (port1.0.1)   00:07:27 00:03:10    fe80::200:1ff:fe20:b5ac
```

The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

Figure 36-3: Example output for **show ipv6 mld groups detail**

```
awplus# show ipv6 mld groups detail
MLD Connected Group Membership Details for port1.0.1
Interface:      port1.0.1
Group:          ff08::1
Uptime:         00:00:13
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address                Uptime    v2 Exp    Fwd  Flags
  2001:db8::1                   00:00:13  00:04:07  Yes  R
  2002:db8::3                   00:00:13  00:04:07  Yes  R
```

show ipv6 mld interface

Overview Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 mld interface [<interface>]
```

Parameter	Description
<interface>	Interface name.

Mode User Exec and Privileged Exec

Example The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

Output Figure 36-4: Example output for **show ipv6 mld interface**

```
awplus#show ipv6 mld interface

Interface vlan1 (Index 301)
 MLD Enabled, Active, Querier, Version 2 (default)
 Internet address is fe80::215:77ff:fec9:7468
 MLD interface has 0 group-record states
 MLD activity: 0 joins, 0 leaves
 MLD robustness variable is 2
 MLD last member query count is 2
 MLD query interval is 125 seconds
 MLD querier timeout is 255 seconds
 MLD max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 MLD Snooping is globally enabled
 MLD Snooping is enabled on this interface
 MLD Snooping fast-leave is not enabled
 MLD Snooping querier is enabled
 MLD Snooping report suppression is enabled
```

show ipv6 mld snooping mrouter

Overview Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 mld snooping mrouter [<interface>]
```

Parameter	Description
<interface>	Optional. Specify the name of the VLAN interface. Note: If you do not specify a single VLAN interface, then all VLAN interfaces are shown.

Mode User Exec and Privileged Exec

Examples The following command displays the multicast router interfaces in `vlan2`:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

Output

```
awplus#show ipv6 mld snooping mrouter vlan2
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
```

The following command displays the multicast router interfaces for all VLAN interfaces:

```
awplus# show ipv6 mld snooping mrouter
```

Output

```
awplus#show ipv6 mld snooping mrouter
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
3       port1.0.4    Statically Assigned
3       port1.0.5    Statically Assigned
```

show ipv6 mld snooping statistics

Overview Use this command to display MLD Snooping statistics data.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus"_Feature Overview and Configuration Guide.

Syntax

```
show ipv6 mld snooping statistics interface <interface>
```

Parameter	Description
<interface>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example The following command displays MLDv2 statistical information for `vlan1`:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

Output

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port1.0.1
Group:          ff08::1
Uptime:         00:02:18
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address       Uptime    v2 Exp    Fwd  Flags
  2001:db8::1          00:02:18  00:02:02  Yes  R
  2001:db8::3          00:02:18  00:02:02  Yes  R
```

37 Multicast Commands

Introduction

Overview This chapter provides an alphabetical reference of multicast commands for configuring:

- IPv4 and IPv6 multicast forwarding
- IPv4 and IPv6 static multicast routes
- mroutes (routes back to a multicast source)

For commands for other multicast protocols, see:

- IGMP and IGMP Snooping Commands
- MLD and MLD Snooping Commands
- PIM-SM Commands
- PIM-SMv6 Commands
- PIM-DM Commands

NOTE: *Before using PIM-SMv6 commands, IPv6 must be enabled on an interface with the ipv6 enable command, IPv6 forwarding must be enabled globally for routing IPv6 with the ipv6 forwarding command, and IPv6 multicasting must be enabled globally with the ipv6 multicast-routing command.*

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical

networks (other than for testing purposes) nor should they appear on any public network.

Command List

clear ip mroute

Overview Use this command to delete one or more dynamically-added route entries from the IPv4 multicast routing table.

You need to do this if, for example, you want to create a static route instead of an existing dynamic route.

NOTE: *If you use this command, you should also use the clear ip igmp group command to clear IGMP group membership records.*

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
clear ip mroute {*|<ipv4-group-address>
[<ipv4-source-address>]} [pim sparse-mode]
```

Syntax (VRF-lite)
```
clear ip mroute [vrf <vrf-name>] {*|<ipv4-group-address>
[<ipv4-source-address>]} [pim sparse-mode]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`*`	Deletes all dynamically-learned IPv4 multicast routes.
`<ipv4-group-address>`	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
`<ipv4-source-address>`	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
`pim sparse-mode`	Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.

Mode Privileged Exec

Usage notes When this command is used, the Multicast Routing Information Base (MRIB) clears the specified dynamic IPv4 multicast route entries in its IPv4 multicast route table, and deletes the entries from the multicast forwarder. The MRIB also sends a "clear" message to the relevant multicast protocols.

This command does not delete static routes from the routing table or the configuration. To delete static routes, use the **no** parameter of the command ip multicast route, or the command clear ip multicast route.

Examples To delete a specific dynamic route (from 192.168.3.3 for the group 225.1.1.1), use the command:

```
awplus# clear ip mroute 225.1.1.1 192.168.3.3
```

To delete all dynamic multicast routes, use the command:

```
awplus# clear ip mroute *
```

Related commands

clear ip multicast route

ip multicast route

show ip mroute

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip mroute statistics

Overview Use this command to delete multicast route statistics entries from the IP multicast routing table.

Syntax
```
clear ip mroute statistics {*|<ipv4-group-addr>
[<ipv4-source-addr>]}
```

Syntax (VRF-lite)
```
clear ip mroute [vrf <vrf-name>] statistics
{*|<ipv4-group-address> [<ipv4-source-address>]}
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`*`	Deletes all dynamically-learned IPv4 multicast routes.
`<ipv4-group-address>`	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
`<ipv4-source-address>`	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

Mode Privileged Exec

Example
```
awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4
awplus# clear ip mroute statistics *
```

clear ip multicast route

Overview Use this command to delete all user-added static IPv4 multicast routes.

Syntax

```
clear ip multicast route *
```

Parameter	Description
*	Deletes all static IPv4 multicast routes.

Mode Privileged Exec

Usage notes This command deletes all static IPv4 multicast routes from the routing table. To delete a single static route, use the **no** parameter of the command ip multicast route. To delete dynamic routes, use the command clear ip mroute.

Example To delete all static IPv4 multicast route entries, use the command:

```
awplus# clear ip multicast route *
```

Related commands

clear ip mroute

ip multicast route

show ip mroute

clear ipv6 mroute

Overview Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table.

You need to do this if, for example, you want to create a static route instead of an existing dynamic route.

NOTE: *If you use this command, you should also use the clear ipv6 mld group command to clear MLD group membership records.*

Syntax

```
clear ipv6 mroute {*|<ipv6-group-address>
[<ipv6-source-address>]}  [pim sparse-mode]
```

Parameter	Description
*	Deletes all dynamically-learned IPv6 multicast routes.
<ipv6-group-address>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-address>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
pim sparse-mode	Clear specified IPv6 multicast route(s) for PIM Sparse Mode only.

Mode Privileged Exec

Usage notes When this command is used, the Multicast Routing Information Base (MRIB) clears the specified dynamic IPv6 multicast route entries in its IPv6 multicast route table, and deletes the entries from the multicast forwarder. The MRIB also sends a "clear" message to the relevant multicast protocols.

This command does not delete static routes from the routing table or the configuration. To delete static routes, use the **no** parameter of the command ipv6 multicast route.

Examples To delete a specific dynamic route (from ff08::1 for the group 2001::2), use the command:

```
awplus# clear ipv6 mroute 2001::2 ff08::1
```

To delete all dynamic multicast routes, use the command:

```
awplus# clear ipv6 mroute *
```

Related commands ipv6 multicast route

show ipv6 mroute

clear ipv6 mroute statistics

Overview Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

Syntax

```
clear ipv6 mroute statistics {*|<ipv6-group-address>
[<ipv6-source-address>]}
```

Parameter	Description
*	All multicast route entries.
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.

Mode Privileged Exec

Examples

```
awplus# clear ipv6 mroute statistics 2001::2 ff08::1
awplus# clear ipv6 mroute statistics *
```

ipv6 multicast forward-slow-path-packet

Overview Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the layer L3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

Syntax

```
ipv6 multicast forward-slow-path-packet
no ipv6 multicast forward-slow-path-packet
```

Default Disabled.

Mode Privileged Exec

Example To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

Related commands show ipv6 forwarding

debug nsm

Overview This command specifies a set of debug options for use by Allied Telesis authorized service personnel only.

Use the **no** variant of this command to remove debug options.

Syntax

```
debug nsm [all|events|ha|kernel]
no debug nsm [all|events|ha|kernel]
```

Parameter	Description
`all`	Enables all the nsm debugging options
`events`	Enables the nsm events debugging options
`ha`	Enables the nsm high availability debugging options
`kernel`	Enables the nsm kernel debugging options

Mode Global Configuration, Privileged Exec

Usage notes This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Related commands show debugging nsm mcast

Command changes Version 5.4.7-2.1 command added.

debug nsm mcast

Overview Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
debug nsm mcast
{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}
```

Syntax (VRF-lite)
```
debug nsm mcast [vrf <vrf-name>]
{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`all`	All IPv4 multicast debugging.
`fib-msg`	Forwarding Information Base (FIB) messages.
`mrt`	Multicast routes.
`mtrace`	Multicast traceroute.
`mtrace-detail`	Multicast traceroute detailed debugging.
`register`	Multicast PIM register messages.
`stats`	Multicast statistics.
`vif`	Multicast interface.

Mode Privileged Exec and Global Configuration

Examples To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast register
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug nsm mcast6

Overview Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Syntax

```
debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}
no debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}
```

Parameter	Description
`all`	All IPv6 multicast route debugging.
`fib-msg`	Forwarding Information Base (FIB) messages.
`mrt`	Multicast routes.
`register`	Multicast PIM register messages.
`stats`	Multicast statistics.
`vif`	Multicast interfaces.

Mode Privileged Exec and Global Configuration

Examples To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 register
```

ip mroute

Overview Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip mroute <ipv4-source-address/mask-length>
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]
```

```
no ip mroute <ipv4-source-address/mask-length>
[bgp|ospf|rip|static]
```

Syntax (VRF-lite)

```
ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]
```

```
no ip mroute [vrf <vrf-name>] <ipv4-source-address/mask-length>
[bgp|ospf|rip|static]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<ipv4-source-address/mask-length>	A multicast source IPv4 address and mask length, in dotted decimal notation in the format A.B.C.D/M.
`bgp`	BGP unicast routing protocol.
`ospf`	OSPF unicast routing protocol.
`rip`	RIP unicast routing protocol.
`static`	Specifies a static route.
<rpf-address>	A.B.C.D The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the next hop address on the path to this host.
<admin-distance>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.

Mode Global Configuration

Usage notes

Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the device with "multicast routes" back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static "multicast route" or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term "multicast route" does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples

The following example creates a static multicast IPv4 route back to the sources in the 10.10.3.0/24 subnet. The multicast route is via the host 192.168.2.3, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the 192.168.3.0/24 subnet. The multicast route is via the host 10.10.10.50. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

Validation Commands

clear ip mroute

show ip mroute

show ip rpf

Command changes

Version 5.4.6-2.1: VRF-lite support added.

ip multicast allow-register-fragments

Overview Use this command to allow PIM to register fragmented packets. It is disabled by default.

Use the **no** variant of this command to stop PIM from registering fragmented packets.

Syntax

```
ip multicast allow-register-fragments
no ip multicast allow-register-fragments
```

Default This command is disabled by default

Mode Global Configuration

Usage notes Most multicast streams are not fragmented, and therefore this command is unnecessary. By default, when IP multicast packets are fragmented, the switch attempts to reassemble them before registering the packets. This is necessary for tasks such as network address translation, or a firewall.

However, reassembly may be difficult for switches where the CPU cannot handle a large amount of traffic. In that situation, with the CPU failing to reassemble the fragmented packets, there can be a delay in forwarding multicast streams.

We do not recommend enabling this feature if a firewall or network address translation is being used. This feature should only be enabled if multicast data is fragmented and the data rate is too high for the CPU to manage reassembly.

Example To allow PIM to register fragmented packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast allow-register-fragments
```

ip multicast forward-first-packet

Overview Use this command to enable multicast to forward the first multicast packets coming to the device.

Use the **no** variant of this command to disable this feature.

Syntax

```
ip multicast forward-first-packet
no ip multicast forward-first-packet
```

Default By default, this feature is disabled.

Mode Global Configuration

Usage notes If this command is enabled, the device will forward the first packets in a multicast stream that create the multicast route, possibly causing degradation in the quality of the multicast stream, such as the pixelation of video and audio data.

NOTE: *If you use this command, ensure that the ip igmp snooping command is enabled, the default setting, otherwise the device will not process the first packets of the multicast stream correctly.*

The device will forward the first multicast packets to all interfaces which are on the same VLAN as those which asked for this multicast group.

Examples To enable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-first-packet
```

To disable the forwarding of the first multicast packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast forward-first-packet
```

ip multicast handle-igmp-immediately

Overview Use this command to allow traffic to be switched as soon as an IGMP report is received.

Use the **no** variant of this command to revert to the default setting.

Syntax

```
ip multicast handle-igmp-immediately
no ip multicast handle-igmp-immediately
```

Default Turned off. This means that traffic will be switched after either a 1 second delay or if the IGMP buffer fills with 250 packets.

Mode Global Configuration

Example To turn on this feature, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast handle-igmp-immediately
```

Related commands show running-config

Command changes Supported since software version 5.4.9-2.0

ip multicast route

Overview Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingressing on an upstream interface to a single or range of downstream interfaces.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

Syntax

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
<upstream-interface> [<downstream-interface>]

no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
[<upstream-interface> <downstream-interface>]
```

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<upstream-interface>	Upstream interface on which the multicast packets ingress.
<downstream-interface>	Downstream interface or range of interfaces to which the multicast packets are sent.

Default By default, this feature is disabled.

Mode Global Configuration

Usage notes Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with the same source IPv4 address, group IPv4 address, upstream interface and downstream interfaces. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the clear ip mroute command.

To update an existing static multicast route entry with more or a new set of downstream interfaces, you must first remove the existing static multicast route and then add the new static multicast route with all downstream interfaces specified. If you attempt to update an existing static multicast route entry with an additional interface or interfaces, an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream interface are dropped rather than

forwarded, do not specify the optional <*downstream-interface*> parameter when entering this command.

To remove a specific downstream interface from an existing static multicast route entry, specify the interface you want to remove with the <*downstream-interface*> parameter when entering the **no** variant of this command.

Examples To create a static multicast route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20
```

To create a blackhole route for the multicast source IPv4 address 2.2.2.2 and group IPv4 address 224.9.10.11, specifying the upstream VLAN interface as vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
```

To create an IPv4 static multicast route for the multicast source IPv4 address 2.2.2.2 and group IP address 224.9.10.11, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address 2.2.2.2 and group IP address 224.9.10.11, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

Related commands

clear ip mroute

clear ip multicast route

show ip mroute

ip multicast route-limit

Overview Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

Syntax

```
ip multicast route-limit <limit> [<threshold>]
no ip multicast route-limit
```

Syntax (VRF-lite)

```
ip multicast [vrf <vrf-name>] route-limit <limit> [<threshold>]
no ip multicast [vrf <vrf-name>] route-limit
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<limit>	*<1-2147483647>* Number of routes.
<threshold>	*<1-2147483647>* Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage notes This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

When VRF-lite is configured you can apply this command to a specific VRF instance. If you don't specify a specific VRF instance the command is applied to the global VRF. Note there is a hardware limit for all VRFs combined and it is possible for one VRF to consume all these routes and therefore other VRFs will not be able to create additional routes. To prevent this situation from occurring, consider the multicast route limit per VRF carefully.

Examples

```
awplus# configure terminal
awplus(config)# ip multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ip multicast route-limit
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip multicast wrong-vif-suppression

Overview Use this command to prevent unwanted multicast packets received on an unexpected interface being trapped to the CPU.

Use the no variant of this command to disable wrong VIF suppression.

Syntax

```
ip ip multicast wrong-vif-suppression
no ip multicast wrong-vif-suppression
```

Default By default, this feature is disabled.

Mode Global Configuration

Usage notes Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the debug nsm mcast6 command.

Examples To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

ip multicast-routing

Overview Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip multicast-routing
no ip multicast-routing
```

Syntax (VRF-lite)

```
ip multicast-routing [vrf <vrf-name>]
no ip multicast-routing [vrf <vrf-name>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name

Default By default, IPv4 multicast routing is off.

Mode Global Configuration

Usage notes When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Example

```
awplus# configure terminal
awplus(config)# ip multicast-routing
```

Validation Commands show running-config

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ipv6 mroute

Overview Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv6 multicast source.

Use the **no** variant of this command to delete a route to an IPv6 multicast source.

Syntax

```
ipv6 mroute <ipv6-source-address/mask-length>
[<rpf-interface>] [<rpf-address>] [rip|static]
[<admin-distance>]
```

```
no ipv6 mroute <ipv6-source-address/mask-length> [rip|static]
```

Parameter	Description
<ipv6-source-address/mask-length>	A multicast source IPv6 address and mask length, in hexadecimal notation in the format X.X::X.X/M.
`rip`	RIPng IPv6 unicast routing protocol.
`static`	Specifies a static route.
<rpf-interface>	The RPF interface or the pseudo-interface **null**.
<rpf-address>	X.X::X:X The closest known address on the IPv6 multicast route back to the specified source. This host IPv6 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host.
<admin-distance>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is `0` and the range available is `0-255`.

Mode Global Configuration

Usage notes Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to a multicast source, it uses the unicast IPv6 route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv6 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest

administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples

The following example creates a static multicast route back to the sources in the 2001::1/64 subnet. The multicast route is via the host 2002::2, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2001::1/64 static 2 2002::2
```

The following example creates a static multicast route back to the sources in the 2002::2/64 subnet. The multicast route is via the host 2001::1. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2002::2/64 2001::1
```

Validation Commands

clear ipv6 mroute

show ipv6 mroute

show ipv6 mroute

ipv6 multicast route

Overview Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream interface to a single or range of downstream interfaces.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

Syntax

```
ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
<upstream-interface> [<downstream-interface>]
```

```
no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
[<upstream-interface> <downstream-interface>]
```

Parameter	Description
<ipv6-source-addr>	Source IPv6 address, in dotted decimal notation in the format X.X::X.X.
<ipv6-group-addr>	Group IP address, in dotted decimal notation in the format X.X::X.X.
<upstream-interface>	Upstream interface on which the multicast packets ingress.
<downstream-interface>	Downstream interface or range of interfaces to which the multicast packets are sent.

Default By default, no static routes exist.

Mode Global Configuration

Usage notes Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the clear ipv6 mroute command.

To update an existing IPv6 static multicast route entry with new or additional downstream interfaces, you must first remove the existing static multicast route and then add the new static multicast route with all downstream interfaces

specified. If you attempt to update an existing static multicast route entry with an additional interface or interfaces an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream interface are dropped rather than forwarded, do not specify the optional <*downstream-interface*> parameter when entering this command.

To remove a specific downstream interface from an existing static multicast route entry, specify the interface you want to remove with the <*downstream-interface*> parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.8 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

```
awplus>enable

awplus#configure terminal

awplus(config)#interface vlan101

awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1

awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.8
```

See ipv6 mld snooping mrouter for a command description and command examples.

Examples To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal

awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address 2001::1 and group IP address ff08::1, specifying the upstream VLAN interface as vlan10, use the following commands:

```
awplus# configure terminal

awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
```

To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

clear ipv6 mroute

ipv6 mld snooping mrouter

ipv6 multicast route-limit

Overview Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the no variant of this command to return the IPv6 route limit to the default.

Syntax

```
ipv6 multicast route-limit <limit> [<threshold>]
no ipv6 multicast route-limit
```

Parameter	Description
<limit>	*<1-2147483647>* Number of routes.
<threshold>	*<1-2147483647>* Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage notes This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

ipv6 multicast-routing

Overview Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

Syntax
```
ipv6 multicast-routing
no ipv6 multicast-routing
```

Default By default, IPv6 multicast routing is off.

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Examples
```
awplus# configure terminal
awplus(config)# ipv6 multicast-routing
awplus# configure terminal
awplus(config)# no ipv6 multicast-routing
```

Validation Commands show running-config

multicast

Overview Use this command to enable a device port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the device port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

CAUTION: *We do not recommend disabling multicast routing in a live network. Some non-multicast protocols use multicast packets and will not function correctly if you disable it.*

Syntax

```
multicast
no multicast
```

Default By default, all device ports route multicast packets.

Mode Interface Configuration

Examples To disable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no multicast
```

To re-enable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# multicast
```

Validation Commands show running-config

platform multicast-ratelimit

Overview Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

Syntax

```
platform multicast-ratelimit <0-1000>
no platform multicast-ratelimit
```

Default 100 packets per second (pps)

Mode Global Configuration

Usage notes If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

Example To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

Command changes Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

platform stop-unreg-mc-flooding

Overview If a multicast stream is arriving at a network device, and that network device has received no IGMP reports that request the receipt of the stream, then that stream is referred to as "unregistered". IGMP snooping actively prevents the flooding of unregistered streams to all ports in the VLAN on which the stream is received. However, there are brief moments at which this prevention is not in operation, and an unregistered stream may be briefly flooded. This command stops this flooding during even those brief periods when IGMP snooping is not explicitly preventing the flooding.

Use the **no** variant of this command to revert to default behavior and disable this feature.

NOTE: *This command should not be used within any IPv6 networks. IPv6 neighbor discovery operation is inhibited by this feature.*

This command does not affect the flooding of Local Network Control Block IPv4 multicast packets in the address range 224.0.0.1 to 224.0.0.255 (224.0.0/24). Such packets will continue to be uninterruptedly flooded, as they need to be.

Syntax

```
platform stop-unreg-mc-flooding
no platform stop-unreg-mc-flooding
```

Default This feature is disabled by default.

Mode Global Configuration

Usage notes This command stops the periodic flooding of unknown or unregistered multicast packets when the Group Membership interval timer expires and there are no subscribers to a multicast group. If there is multicast traffic in a VLAN without subscribers, multicast traffic temporarily floods out of the VLAN when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries.

This command also stops the initial flood of multicast packets that happens when a new multicast source starts to send traffic. This flooding lasts until snooping realises that this the multicast group is arriving at the switch, and puts an entry into hardware to prevent it from being flooded.

This command is useful in networks where low-performance devices are attached. The operation of such devices can be impaired by them receiving unnecessary streams of traffic. For example, in sites where IP cameras are in use, the flooding of video streams to a whole VLAN can send enough traffic to the cameras to cause interruption of their video streaming.

Do not use this command in IPv6 networks. The following console message is displayed after entering this command to warn you of this:

```
% WARNING: IPv6 will not work with this setting enabled
% Please consult the documentation for more information
```

Examples

To enable this feature and stop multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# platform stop-unreg-mc-flooding
```

To disable this feature and allow multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform stop-unreg-mc-flooding
```

Related commands

show platform

show running-config

show debugging nsm mcast

Overview Use this command to show the status of the NSM multicast debugging.

Syntax
```
show debugging nsm mcast
```

Syntax (VRF-lite)
```
show debugging nsm mcast [<vrf-name>]
```

Parameter	Description
<vrf-name>	VRF instance name

Mode Privileged Exec

Usage notes This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Example To show debugging for NSM multicast, use the following command:

```
awplus# show debug nsm mcast
```

Output Figure 37-1: Example output from **show debug nsm mcast**

```
awplus# show debugging nsm mcast
Debugging status:
  NSM multicast vif debugging is on
  NSM multicast route debugging is on
  NSM multicast route statistics debugging is on
  NSM multicast FIB message debugging is on
  NSM multicast PIM Register message debugging is on
  NSM multicast traceroute debugging is on
  NSM multicast traceroute detailed debugging is on
```

Related commands debug nsm mcast

Command changes Version 5.4.7-2.1: command added

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2

show ip mroute

Overview Use this command to display the contents of the IPv4 multicast routing (mroute) table.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>]
[dense|sparse|static] [count|summary]
```

Syntax (VRF-lite)
```
show ip mroute [vrf <vrf-name>|global] [<ipv4-group-addr>]
[<ipv4-source-addr>] [dense|sparse|static] [count|summary]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table
`<ipv4-group-addr>`	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
`<ipv4-source-addr>`	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
`dense`	Display dense IPv4 multicast routes.
`sparse`	Display sparse IPv4 multicast routes.
`static`	Display static IPv4 multicast routes.
`count`	Display the route and packet count from the IPv4 multicast routing (mroute) table.
`summary`	Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples
```
awplus# show ip mroute 10.10.3.34 224.1.4.3
awplus# show ip mroute 10.10.5.24 225.2.2.2 count
awplus# show ip mroute 10.10.1.34 summary
```

Output The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 37-2: Example output from the **show ip mroute** command

```
awplus# show ip mroute
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:00:31, stat expires 00:02:59
Owner PIM-SM, Flags: TF
  Incoming interface: vlan2
  Outgoing interface list:
   vlan3 (1)
```

Figure 37-3: Example output from the **show ip mroute** command with the source and group IPv4 address specified

```
awplus# show ip mroute 10.10.1.52 224.0.1.3

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), uptime 00:03:24, stat expires 00:01:28
Owner PIM-SM, Flags: TF
  Incoming interface: vlan2
  Outgoing interface list:
    vlan3 (1)
```

The following is a sample output of this command displaying the packet count from the IPv4 multicast routing table:

Figure 37-4: Example output from the **show ip mroute count** command

```
awplus# show ip mroute count
IP Multicast Statistics
Total 1 routes using 132 bytes memory
Route limit/Route threshold: 2147483647/2147483647
Total NOCACHE/WRONGVIF/WHOLEPKT recv from fwd: 1/0/0
Total NOCACHE/WRONGVIF/WHOLEPKT sent to clients: 1/0/0
Immediate/Timed stat updates sent to clients: 0/0
Reg ACK recv/Reg NACK recv/Reg pkt sent: 0/0/0
Next stats poll: 00:01:10

Forwarding Counts: Pkt count/Byte count, Other Counts: Wrong If
pkts
Fwd msg counts: WRONGVIF/WHOLEPKT recv
Client msg counts: WRONGVIF/WHOLEPKT/Imm Stat/Timed Stat sent
Reg pkt counts: Reg ACK recv/Reg NACK recv/Reg pkt sent

(10.10.1.52, 224.0.1.3), Forwarding: 2/19456, Other: 0
  Fwd msg: 0/0, Client msg: 0/0/0/0,  Reg: 0/0/0
```

The following is a sample output for this command displaying the IPv4 multicast routing table in an abbreviated form:

Figure 37-5: Example output from the **show ip mroute summary** command

```
awplus# show ip mroute summary

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.1.3), 00:01:32/00:03:20, PIM-SM, Flags: TF
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip mvif

Overview Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip mvif <interface>
```

Syntax (VRF-lite)
```
show ip mvif [vrf <vrf-name>|global] <interface>
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table
`<interface>`	The interface to display information about.

Mode User Exec and Privileged Exec

Example
```
awplus# show ip mvif vlan2
```

Output Figure 37-6: Example output from the **show ip mvif** command

```
Interface     Vif   Owner     TTL  Local            Remote         Uptime
              Idx   Module         Address          Address
vlan2         0     PIM-SM    1    192.168.1.53     0.0.0.0        00:04:26
Register      1               1    192.168.1.53     0.0.0.0        00:04:26
vlan3         2     PIM-SM    1    192.168.10.53    0.0.0.0        00:04:25
```

Command changes Version 5.4.7-1.1: VRF-lite support added for SBx8100.

Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

show ip rpf

Overview Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip rpf <source-addr>
```

Syntax (VRF-lite)
```
show ip rpf [vrf <vrf-name>|global] <source-addr>
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table
`<source-addr>`	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

Mode User Exec and Privileged Exec

Example
```
awplus# show ip rpf 10.10.10.50
```

Command changes Version 5.4.7-1.1: VRF-lite support added for SBx8100.

Version 5.4.8-1.1: VRF-lite support added for x930, SBx908 GEN2.

show ipv6 mif

Overview Use this command to display the contents of the IPv6 Multicast Routing Information Base (MRIB) MIF table.

Syntax

```
show ipv6 mif [<interface>]
```

Parameter	Description
<interface>	The interface to display information about.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 mif
awplus# show ipv6 mif vlan2
```

Output Figure 37-7: Example output from the **show ipv6 mif** command

```
awplus#show ipv6 mif
Interface    Mif   Owner              Uptime
             Idx   Module
vlan3        0     MLD/MLD Proxy-Service 03:28:48
vlan2        1     MLD/MLD Proxy-Service 03:28:48
vlan1        2     MLD/MLD Proxy-Service 03:28:48
```

Figure 37-8: Example output from the **show ipv6 mif** command with the interface parameter specified

```
Interface    Mif   Owner                    TTL  Remote          Uptime
             Idx   Module                        Address
vlan2        0     MLD/MLD Proxy-Service    1    0.0.0.0         00:05:17
```

show ipv6 mroute

Overview Use this command to display the contents of the IPv6 multicast routing (mroute) table.

Syntax

```
show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>]
[{count|summary}]
```

Parameter	Description
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
`count`	Display the route and packet count from the IPv6 multicast routing (mroute) table.
`summary`	Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 mroute
awplus# show ipv6 mroute count
awplus# show ipv6 mroute summary
awplus# show ipv6 mroute 2001::2 ff08::1 count
awplus# show ipv6 mroute 2001::2 ff08::1
awplus# show ipv6 mroute 2001::2 summary
```

Output The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 37-9: Example output from the **show ipv6 mroute** command

```
awplus#show ipv6 mroute
IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface
(2001::2, ff08::1), uptime 03:18:38
Owner IMI, Flags: F
  Incoming interface: vlan2
  Outgoing interface list:
    vlan3
```

The following is a sample output of this command displaying the IPv6 multicast routing count table for a single static IPv6 Multicast route:

Figure 37-10: Example output from the **show ipv6 mroute count** command

```
awplus#show ipv6 mroute count

IPv6 Multicast Statistics
Total 1 routes using 152 bytes memory
Route limit/Route threshold: 1024/1024
Total NOCACHE/WRONGmif/WHOLEPKT recv from fwd: 6/0/0
Total NOCACHE/WRONGmif/WHOLEPKT sent to clients: 6/0/0
Immediate/Timed stat updates sent to clients: 0/0

```

show ipv6 multicast forwarding

Overview Use this command to view the status of multicast forwarding slow-path-packet setting.

Syntax

```
show ipv6 multicast forwarding
```

Mode User Exec

Example To show the status of the multicast forwarding, slow-path-packet setting, use the following command:

```
awplus# show ipv6 multicast forwarding
```

Output Figure 37-12: Example output from the **show ipv6 multicast forwarding** command:

```
ipv6 multicast forwarding is disabled
```

Related commands ipv6 multicast forward-slow-path-packet

38 PIM-SM Commands

Introduction

Overview This chapter provides an alphabetical reference of PIM-SM commands. For commands common to PIM-SM and PIM-DM, see the Multicast Commands chapter.

Command List

clear ip pim sparse-mode bsr rp-set *

Overview Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
clear ip pim sparse-mode bsr rp-set *
```

Syntax (VRF-lite)
```
clear ip pim [vrf <vrf-name>] sparse-mode bsr rp-set *
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`*`	Clears all RP sets.

Mode Privileged Exec

Usage notes For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example
```
awplus# clear ip pim sparse-mode bsr rp-set *
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip pim sparse-mode packet statistics

Overview Use this command to clear the PIM sparse mode packet statistics counter.

If the platform supports multicast for VRFs, then specifying a VRF name will clear the counters for that VRF. If you do not specify a VRF, then the counters will be cleared for the global VRF.

Syntax
```
clear ip pim sparse-mode packet statistics
```

Syntax (VRF-lite)
```
clear ip pim [<vrf-name>|global] sparse-mode packet statistics
```

Parameter	Description
<vrf-name>	The VRF instance name
`global`	The global routing and forwarding table

Mode Privileged Exec

Example The following command clears the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# clear ip pim sparse-mode statistics
```

Output Figure 38-1: Example output from **clear ip pim sparse-mode statistics**

```
awplus(config)#clear ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM    :   Total : 0   Valid : 0
Hello         :   Total : 0   Valid : 0
Register      :   Total : 0   Valid : 0
Register Stop :   Total : 0   Valid : 0
Join/Prune    :   Total : 0   Valid : 0
Bootstrap     :   Total : 0   Valid : 0
Assert        :   Total : 0   Valid : 0
Candidate-RP  :   Total : 0   Valid : 0
```

Related commands show ip pim sparse-mode packet statistics

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip mroute pim sparse-mode

Overview Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
clear ip mroute <Group-IP-address> pim sparse-mode
clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode
```

Syntax (VRF-lite)

```
clear ip mroute [vrf <vrf-name>] <Group-IP-address> pim sparse-mode
clear ip mroute [vrf <vrf-name>] <Group-IP-address> <Source-IP-address> pim sparse-mode
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<Group-IP-address>	Specify a multicast group IPv6 address, entered in the form A.B.C.D.
<Source-IP-address>	Specify a source group IP address, entered in the form A.B.C.D.

Mode Privileged Exec

Example

```
awplus# clear ip mroute  pim sparse-mode 224.0.0.0
awplus# clear ip mroute  192.168.7.1 pim sparse-mode 224.0.0.0
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug pim sparse-mode

Overview Use this command to turn on some or all PIM-SM debugging.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to turn off some or all PIM-SM debugging.

Syntax

```
debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
[packet] [state] [mtrace]
```

```
no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
[nsm] [packet] [state] [mtrace]
```

Syntax (VRF-lite)

```
debug pim [vrf <vrf-name>] sparse-mode [all] [events] [mfc]
[mib] [nexthop] [nsm] [packet] [state] [mtrace]
```

```
no debug pim [vrf <vrf-name>] sparse-mode [all] [events] [mfc]
[mib] [nexthop] [nsm] [packet] [state] [mtrace]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`all`	Activates/deactivates all PIM-SM debugging.
`events`	Activates debug printing of events.
`mfc`	Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates.
`mib`	Activates debug printing of PIM-SM MIBs.
`nexthop`	Activates debug printing of PIM-SM next hop communications.
`nsm`	Activates debugging of PIM-SM Network Services Module communications.
`packet`	Activates debug printing of incoming and/or outgoing packets.
`state`	Activates debug printing of state transition on all PIM-SM FSMs.
`mtrace`	Activates debug printing of multicast traceroute.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim sparse-mode all
```

Related commands show debugging pim sparse-mode

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug pim sparse-mode timer

Overview Use this command to enable debugging for the specified PIM-SM timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

Syntax (VRF-lite)

```
debug pim [vrf <vrf-name>] sparse-mode timer assert [at]
no debug pim [vrf <vrf-name>] sparse-mode timer assert [at]
debug pim [vrf <vrf-name>] sparse-mode timer bsr [bst|crp]
no debug pim [vrf <vrf-name>] sparse-mode timer bsr [bst|crp]
debug pim [vrf <vrf-name>] sparse-mode timer hello [ht|nlt|tht]
no debug pim [vrf <vrf-name>] sparse-mode timer hello
[ht|nlt|tht]
debug pim [vrf <vrf-name>] sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
no debug pim [vrf <vrf-name>] sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim [vrf <vrf-name>] sparse-mode timer register [rst]
no debug pim [vrf <vrf-name>] sparse-mode timer register [rst]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`assert`	Enable or disable debugging for the Assert timers.
`at`	Enable or disable debugging for the Assert Timer.

Parameter	Description
`bsr`	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
`bst`	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
`crp`	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
`hello`	Enable or disable debugging for the specified Hello timer, or all Hello timers.
`ht`	Enable or disable debugging for the Hello timer: Hello Timer.
`nlt`	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
`tht`	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
`joinprune`	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
`jt`	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
`et`	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
`ppt`	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.
`kat`	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.
`ot`	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
`register`	Enable or disable debugging for the Register timers.
`rst`	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

Related commands

show debugging pim sparse-mode

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip multicast allow-register-fragments

Overview Use this command to allow PIM to register fragmented packets. It is disabled by default.

Use the **no** variant of this command to stop PIM from registering fragmented packets.

Syntax

```
ip multicast allow-register-fragments
no ip multicast allow-register-fragments
```

Default This command is disabled by default

Mode Global Configuration

Usage notes Most multicast streams are not fragmented, and therefore this command is unnecessary. By default, when IP multicast packets are fragmented, the switch attempts to reassemble them before registering the packets. This is necessary for tasks such as network address translation, or a firewall.

However, reassembly may be difficult for switches where the CPU cannot handle a large amount of traffic. In that situation, with the CPU failing to reassemble the fragmented packets, there can be a delay in forwarding multicast streams.

We do not recommend enabling this feature if a firewall or network address translation is being used. This feature should only be enabled if multicast data is fragmented and the data rate is too high for the CPU to manage reassembly.

Example To allow PIM to register fragmented packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip multicast allow-register-fragments
```

ip pim accept-register list

Overview Use this command to configure the ability to filter out multicast sources specified by the given access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources.

Use the **no** variant of this command to revert to default.

Syntax

```
ip pim accept-register list {<100-199>|<2000-2699>|<name>}
no ip pim accept-register
```

Parameter	Description
<100-199>	IP extended access-list, identified by number.
<2000-2699>	IP extended access list, identified by number (expanded range).
<name>	IP access list, identified by name.

Default By default, the RP accepts register packets from all multicast sources.

Mode Global Configuration

Example To create an ACL that denies packets from 100.1.1.1 to any destination, and use that ACL to filter at the RP point, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 121
awplus(config-ip-ext-acl)# deny ip 100.1.1.1 0.0.0.0 any
awplus(config-ip-ext-acl)# exit
awplus(config)# ip pim accept-register list 121
```

ip pim anycast-rp

Overview Use this command to configure Anycast RP (Rendezvous Point) in a RP set.

Use the **no** variant of this command to remove the configuration.

Syntax

```
ip pim anycast-rp <anycast-rp-address> <member-rp-address>
no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]
```

Parameter	Description
<anycast-rp-address>	<A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set.
<member-rp-address>	<A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage notes Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to- one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

ip pim bsr-border

Overview Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through an interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

Syntax

```
ip pim bsr-border
no ip pim bsr-border
```

Mode Interface Configuration for a VLAN interface.

Usage notes When this command is configured on an interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

Examples The following example configures the VLAN interface vlan2 to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

ip pim bsr-candidate

Overview Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax

```
ip pim bsr-candidate <interface> [<hash>] [<priority>]
no ip pim bsr-candidate [<interface>]
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] bsr-candidate <interface> [<hash>]
[<priority>]
no ip pim [vrf <vrf-name>] bsr-candidate [<interface>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<interface>	The interface.
<hash>	<0-32> configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the <*hash*> (mask length) when specifying the <*priority*>. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 10 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim cisco-register-checksum

Overview Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable this option.

Syntax
```
ip pim cisco-register-checksum
no ip pim cisco-register-checksum
```

Syntax (VRF-lite)
```
ip pim [vrf <vrf-name>] cisco-register-checksum
no ip pim [vrf <vrf-name>] cisco-register-checksum
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example
```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim cisco-register-checksum group-list

Overview Use this command to configure the option to calculate the Register checksum over the whole packet on multicast groups specified by the access-list. This command is used to inter-operate with older Cisco IOS versions.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ip pim cisco-register-checksum group-list <acl>
no ip pim cisco-register-checksum group-list <acl>
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] cisco-register-checksum group-list
<acl>
no ip pim [vrf <vrf-name>] cisco-register-checksum group-list
<acl>
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<acl>	The standard, expanded or named ACL to use.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum group-list 34
awplus(config)# access-list 34 permit 224.0.1.3
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim crp-cisco-prefix

Overview Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to revert to the default settings.

Syntax

```
ip pim crp-cisco-prefix
no ip pim crp-cisco-prefix
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] crp-cisco-prefix
no ip pim [vrf <vrf-name>] crp-cisco-prefix
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim crp-cisco-prefix
awplus# configure terminal
awplus(config)# no ip pim crp-cisco-prefix
```

Related commands ip pim rp-candidate

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim dr-priority

Overview Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim dr-priority <priority>
no ip pim dr-priority [<priority>]
```

Parameter	Description
<priority>	Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority.

Default The default is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

Related commands ip pim ignore-rp-set-priority

ip pim exclude-genid

Overview Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface.This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ip pim exclude-genid
no ip pim exclude-genid
```

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Example To exclude the GenID option on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
```

ip pim ext-srcs-directly-connected

Overview Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

Syntax

```
ip pim ext-srcs-directly-connected
no ip pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

ip pim hello-holdtime (PIM-SM)

Overview This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax

```
ip pim hello-holdtime <holdtime>
no ip pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello-interval). Otherwise, it retains the configured value.

Example To set the hello-hold time value on interface vlan2 use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-SM)

Overview This command configures a hello-interval value.

Use the **no** variant of this command to reset the hello-interval to the default.

Syntax

```
ip pim hello-interval <interval>
no ip pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds.

Mode Interface Configuration for a VLAN interface.

Usage When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello-interval). Otherwise, the hello-holdtime value is the configured value.

Example To set the hello-interval value on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim ignore-rp-set-priority

Overview Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

Syntax

```
ip pim ignore-rp-set-priority
no ip pim ignore-rp-set-priority
```

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim ignore-rp-set-priority
```

ip pim jp-timer

Overview Use this command to set the PIM-SM join/prune timer. Note that the value the device puts into the holdtime field of the join/prune packets it sends to its neighbors is 3.5 times the join/prune timer value set using this command.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 60 seconds, which corresponds to a join/prune packet holdtime of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip pim jp-timer <1-65535>
no ip pim jp-timer [<1-65535>]
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] jp-timer <1-65535>
no ip pim [vrf <vrf-name>] jp-timer [<1-65535>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<1-65535>	Specifies the join/prune timer value. The default value is 60 seconds.

Default The default join/prune timer value is 60 seconds.

Mode Global Configuration

Example To set the join/prune timer value to 300 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim jp-timer 300
```

To return the join/prune timer to its default value of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim jp-timer
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim neighbor-filter (PIM-SM)

Overview This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim neighbor-filter {<number>|<accesslist>}
no ip pim neighbor-filter {<number>|<accesslist>}
```

Parameter	Description
<number>	<1-99> Standard IP access-list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

ip pim register-rate-limit

Overview Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip pim register-rate-limit <1-65535>
no ip pim register-rate-limit
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] register-rate-limit <1-65535>
no ip pim [vrf <vrf-name>] register-rate-limit
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-rate-limit 3444
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-rp-reachability

Overview Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
ip pim register-rp-reachability
no ip pim register-rp-reachability
```

Syntax (VRF-lite)
```
ip pim [vrf <vrf-name>] register-rp-reachability
no ip pim [vrf <vrf-name>] register-rp-reachability
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Example
```
awplus# configure terminal
awplus(config)# ip pim register-rp-reachability
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-source

Overview Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip pim register-source [<source-address>|<interface>]
no ip pim register-source
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] register-source
[<source-address>|<interface>]
no ip pim [vrf <vrf-name>] register-source
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<source-address>	The IP address, entered in the form A.B.C.D, to be used as the source of the register packets.
<interface>	The name of the interface to be used as the source of the register packets.

Usage notes The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-source 10.10.1.3
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-suppression

Overview Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the ip pim rp-register-kat command is not used.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax

```
ip pim register-suppression <1-65535>
no ip pim register-suppression
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] register-suppression <1-65535>
no ip pim [vrf <vrf-name>] register-suppression
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<1-65535>	Register suppression time in seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-suppression 192
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim rp-address

Overview Use this command to statically configure the RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP address for multicast groups.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip pim rp-address <ip-address> group-list <group-prefix>
[override]
```

```
no ip pim rp-address <ip-address> group-list <group-prefix>
[override]
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] rp-address <ip-address> group-list
<group-prefix> [override]
```

```
no ip pim [vrf <vrf-name>] rp-address <ip-address>  group-list
<group-prefix> [override]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<ip-address>	IP address of RP, entered in the form `A.B.C.D`.
<group-prefix>	Multicast group IP prefix address of RP, entered in the form `A.B.C.D/M`
`override`	Enables statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage notes The AlliedWare Plus PIM-SM implementation supports multiple static RPs. It also supports usage of static RP and the BSR (Bootstrap Router) mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP address configured by the BSR, and the statically configured RP address are both available for a group range, then the RP address configured through the BSR is chosen over the statically configured RP address, unless the 'override' parameter is specified, in which case, the static RP will be chosen.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses.

When selecting static RPs for a group range, the first element (which is the static RP with highest IP address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

NOTE: *A unique RP address may only be specified once as a static RP.*

Example

```
awplus# configure terminal
awplus(config)# ip pim rp-address 192.0.2.10 group-list
233.252.0.0/24 override
```

Figure 38-2: Output from the **show ip pim sparse-mode rp mapping** command

```
awplus#show ip pim sp rp mapping
PIM Group-to-RP Mappings
Group(s): 233.252.0.0/24, Static
    RP: 192.0.2.10
         Uptime: 00:00:17
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-0.5: Replaced <acl> parameter with <group-list> parameter.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim rp-candidate

Overview Use this command to make the router an RP (Rendezvous Point) candidate, using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
ip pim rp-candidate <interface> [priority <priority>] [interval <interval>] [grouplist <acl>]
no ip pim rp-candidate [<interface>]
```

Syntax (VRF-lite)
```
ip pim [vrf <vrf-name>] rp-candidate <interface> [priority <priority>] [interval <interval>] [grouplist <acl>]
no ip pim [vrf <vrf-name>] rp-candidate [<interface>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
<interface>	Interface name.
`priority` *<priority>*	The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP.
`interval` *<interval>*	The advertisement interval, from 1 to 16383 seconds.
`grouplist` *<acl>*	The standard, expanded or named ACL to use.

Default The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage notes Entering the command **ip pim rp-candidate** *<interface>* without one of the optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

Examples To specify a priority of 3, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

To use the ACL numbered 3 to specify the group prefixes that are advertised in association with the RP address, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 group-list 3
```

To stop the device from being an RP candidate on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim rp-register-kat

Overview Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip pim rp-register-kat <1-65535>
no ip pim rp-register-kat
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] rp-register-kat <1-65535>
no ip pim [vrf <vrf-name>] rp-register-kat
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<1-65535>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SM KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ip pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ip pim rp-register-kat
```

Related commands ip pim rp-address

ip pim rp-candidate

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim sparse-mode

Overview Use this command to enable PIM-SM on an interface.

Use the **no** variant of this command to disable PIM-SM on an interface.

Syntax

```
ip pim sparse-mode
no ip pim sparse-mode
```

Mode Interface Configuration for a VLAN interface.

Examples To enable PIM-SM on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode
```

To disable PIM-SM on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
```

ip pim sparse-mode join-prune-batching

Overview Use this command to enable batching of Join and Prune messages in PIM-SM. This functionality reduces the number of PIM packets that must be sent to maintain a large number of groups

When using VRF-lite, you can use this command to enable Join and Prune batching in PIM-SM for a named VRF instance.

Use the **no** variant of this command to disable batching of Join and Prune messages in PIM-SM.

Syntax

```
ip pim sparse-mode join-prune-batching
no ip pim sparse-mode join-prune-batching
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>]sparse-mode join-prune-batching
no ip pim [vrf <vrf-name>]sparse-mode join-prune-batching
```

Parameter	Description
`vrf`	Apply this command to a VRF instance.
`<vrf-name>`	The name of the VRF instance.

Default Disabled.

Mode Global Configuration

Examples To enable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode join-prune-batching
```

To disable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode join-prune-batching
```

Example (VRF-lite) To enable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf red sparse-mode join-prune-batching
```

To disable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf red sparse-mode
join-prune-batching
```

Related commands ip pim sparse-mode wrong-vif-suppression

Command changes Version 5.4.8-2.3: command added.

ip pim sparse-mode passive

Overview Use this command to enable and disable passive mode operation for local members on an interface.

Use the **no** variant of this command to disable passive mode operation for local members on an interface.

Syntax

```
ip pim sparse-mode passive
no ip pim sparse-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the ip pim sparse-mode command. To turn off PIM activities on an interface, use the **no ip pim sparse-mode** command.

Examples To enable passive mode on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
```

To disable passive mode on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
```

ip pim sparse-mode wrong-vif-suppression

Overview Use this command to permit or block multicast packets that arrive on the wrong interface.

When using VRF-lite, you can use this command to enable wrong VIF suppression for a named VRF instance.

Use the **no** variant of this command to disable wrong VIF suppression.

Syntax

```
ip pim sparse-mode wrong-vif-suppression
no ip pim sparse-mode wrong-vif-suppression
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>]sparse-mode wrong-vif-suppression
no ip pim [vrf <vrf-name>]sparse-mode wrong-vif-suppression
```

Parameter	Description
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

Default Disabled.

Mode Global Configuration

Usage notes This command enables wrong VIF suppression for PIM sparse-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

Examples To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode wrong-vif-suppression
```

Example (VRF-lite) To enable wrong VIF suppression for the VRF instance ‘green’, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf green sparse-mode
wrong-vif-suppression
```

To disable wrong VIF suppression for the VRF instance ‘green’, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf green sparse-mode
wrong-vif-suppression
```

Related commands ip pim sparse-mode join-prune-batching

Command changes Version 5.4.8-2.3: command added.

ip pim spt-threshold

Overview This command turns on the ability for the last-hop PIM router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

NOTE: *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip pim spt-threshold
no ip pim spt-threshold
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] spt-threshold
no ip pim [vrf <vrf-name>] spt-threshold
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.

Mode Global Configuration

Examples To enable the last-hop PIM-SM router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold
```

To stop the last-hop PIM-SM router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip pim spt-threshold
```

Related commands ip pim spt-threshold group-list

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim spt-threshold group-list

Overview Use this command to turn on the ability for the last-hop PIM router to switch to SPT (shortest-path tree) for multicast group addresses specified by the given access-list.

The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.

Use the **no** variant of this command to turn off switching to the SPT.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
ip pim spt-threshold group-list <acl>
no ip pim spt-threshold group-list [<acl>]
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>] spt-threshold group-list <acl>
no ip pim [vrf <vrf-name>] spt-threshold group-list [<acl>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name
<acl>	The standard, expanded or named ACL to use.

Mode Global Configuration

Usage notes Turn on/off the ability for the last-hop PIM router to switch to SPT for multicast group addresses specified by the given access-list.

Example

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold group-list 1
awplus(config)# access-list 1 permit 224.0.1.3
```

Related commands ip pim spt-threshold

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim ssm

Overview Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8.

To define the SSM range to be other than the default, use the access-list parameter option.

Use the **no** variant of this command to disable the SSM range.

Syntax

```
ip pim ssm default
ip pim ssm range {<access-list>|<named-access-list>}
no ip pim ssm
```

Parameter	Description
`default`	Use 232/8 as the range for SSM.
<access-list>	<1-99> Simple access-list.
<named-access-list>	Named Standard Access List.

Default By default, the command is disabled.

Mode Global Configuration

Usage When an SSM range of IP multicast addresses is defined by this command, the no (*,G) or (S,G,rpt) state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

Examples To configure the SSM service for the IP address range defined by access list 10, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 10 permit 225.1.1.1
awplus(config)# ip pim ssm range 10
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

service pim

Overview Use this command to enable PIM sparse mode services.

Use the **no** version of the command to disable unused PIM sparse mode services.

Syntax

```
service pim
no service pim
```

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

Example To disable the PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim
```

Output Figure 38-3: Example output from **no service pim**

```
awplus(config)#no service pim
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-0.1: command added

show debugging pim sparse-mode

Overview This command displays the status of the debugging of the system.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show debugging pim sparse-mode
```

Syntax (VRF-lite)
```
show debugging pim [vrf <vrf-name>|global] sparse-mode
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 38-4: Output from **show debugging pim sparse-mode**

```
Debugging status:
  PIM event debugging is on
  PIM Hello THT timer debugging is on
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on
  PIM incoming packet debugging is on
  PIM outgoing packet debugging is on
```

Related commands debug pim sparse-mode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode bsr-router

Overview Use this command to show the Bootstrap Router (BSR) (v2) address.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip pim sparse-mode bsr-router
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global] sparse-mode bsr-router
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table

Mode User Exec and Privileged Exec

Output Figure 38-5: Output from the **show ip pim sparse-mode bsr-router** command

```
PIMv2 Bootstrap information
  BSR address: 10.10.11.35 (?)
  Uptime:      00:00:38, BSR Priority: 0, Hash mask length: 10
  Expires:     00:01:32
  Role: Non-candidate BSR
  State: Accept Preferred
```

show ip pim sparse-mode interface

Overview Use this command to show PIM-SM interface information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip pim sparse-mode interface
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global] sparse-mode interface
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`global`	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example To display information about PIM-SM interfaces, use the command:

```
awplus# show ip pim sparse-mode interface
```

Output Figure 38-6: Example output from **show ip pim sparse-mode interface**

```
Total configured interfaces: 100   Maximum allowed: 100
Total active interfaces:     100

Address          Interface VIFindex Ver/   Nbr    DR         DR
                                    Mode   Count  Prior

...
```

Table 1: Parameters in the output from the **show ip pim sparse-mode interface** command

Parameters	Description
`Total configured interfaces`	The number of configured PIM Sparse Mode interfaces.
`Maximum allowed`	The maximum number of PIM Sparse Mode interfaces that can be configured.
`Total active interfaces`	The number of active PIM Sparse Mode interfaces.
`Address`	Primary PIM-SM address.
`Interface`	Name of the PIM-SM interface.
`VIF Index`	The Virtual Interface index of the interface.
`Ver/Mode`	PIM version/Sparse mode.
`Nbr Count`	Neighbor count of the PIM-SM interface.
`DR Priority`	Designated Router priority.
`DR`	The IP address of the Designated Router.

show ip pim sparse-mode interface detail

Overview Use this command to show detailed information on a PIM-SM interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip pim sparse-mode interface detail
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global] sparse-mode interface
detail
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table

Mode User Exec and Privileged Exec

Output Figure 38-7: Example output from the **show ip pim sparse-mode interface detail** command

```
vlan3 (vif 3):
  Address 192.168.1.149, DR 192.168.1.149
  Hello period 30 seconds, Next Hello in 15 seconds
  Triggered Hello period 5 seconds
  Neighbors:
   192.168.1.22

vlan2 (vif 0):
  Address 10.10.11.149, DR 10.10.11.149
  Hello period 30 seconds, Next Hello in 18 seconds
  Triggered Hello period 5 seconds
  Neighbors:
   10.10.11.4
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode local-members

Overview Use this command to show detailed local member information on an interface configured for PIM-SM. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SM.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip pim sparse-mode local-members [<interface>]
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global] sparse-mode local-members
[<interface>]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`global`	The global routing and forwarding table
<interface>	Optional. Specify the interface.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SM information for all PIM-SM configured interfaces, use the command:

```
awplus# show ip pim sparse-mode local-members
```

To show detailed PIM-SM information for the PIM-SM configured interface vlan1, use the command:

```
awplus# show ip pim sparse-mode local-members vlan1
```

Output Figure 38-8: Example output from the **show ip pim sparse-mode local-members** command

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:
    (*, 224.0.0.4) : Include

vlan203:
    (*, 223.0.0.3) : Include
```

Output Figure 38-9: Example output from the **show ip pim sparse-mode local-members** command on a specific interface.

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:
    (*, 224.0.0.4) : Include
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode mroute

Overview Use this command to display the IP multicast routing table or the IP multicast routing table based on a specific address or addresses.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the multicast routing table for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax

```
show ip pim sparse-mode mroute brief
show ip pim sparse-mode mroute
show ip pim sparse-mode mroute <group-address>
show ip pim sparse-mode mroute <source-address>
show ip pim sparse-mode mroute <source-address> <group-address>
```

Syntax (VRF-lite)

```
show ip pim [vrf <vrf-name>|global] sparse-mode mroute brief
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<group-address>
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<source-address>
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
<source-address> <group-address>
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`global`	The global routing and forwarding table
`brief`	Shows only a summary of the number of each type of multicast entry and the cache.
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.

Mode Privileged Exec

Usage notes Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

Example To display the IP multicast routing table for the address 40.40.40.11, enter the command:

```
awplus# show ip pim sparse-mode mroute 40.40.40.11
```

Output Figure 38-10: Example output from **show ip pim sparse-mode mroute brief**

```
awplus#show ip pim sparse-mode mroute brief

Related commands show ip pim sparse-mode mroute detail

Command changes

Version 5.4.7-1.1: VRF-lite support added to SBx8100.

Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

Version 5.4.8-2.1: **brief** parameter added.

show ip pim sparse-mode mroute detail

Overview Use this command to display detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the PIM-SM RP mappings for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax

```
show ip pim sparse-mode mroute [<group-address>] detail
show ip pim sparse-mode mroute [<source-address>] detail
show ip pim sparse-mode mroute [<group-address>
<source-address>] detail
show ip pim sparse-mode mroute [<source-address>
<group-address>] detail
```

Syntax (VRF-lite)

```
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<group-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<source-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<group-address> <source-address>] detail
show ip pim [vrf <vrf-name>|global] sparse-mode mroute
[<source-address> <group-address>] detail
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`global`	The global routing and forwarding table.
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.
`detail`	Show detailed information.

Usage notes Based on the group and source address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Examples The following example commands show detailed entries for IP multicast routing tables:

```
awplus# show ip pim sparse-mode mroute detail
awplus# show ip pim sparse-mode mroute 40.40.40.11 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
detail
```

Output Figure 38-12: Example output from **show ip pim sparse-mode mroute detail**

```

```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode neighbor

Overview Use this command to show the PIM-SM neighbor information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip pim sparse-mode neighbor [<interface>] [<ip-address>]
[detail]
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global] sparse-mode neighbor
[<interface>] [<ip-address>] [detail]
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`global`	The global routing and forwarding table
<interface>	Interface name. Show neighbors on an interface.
<ip-address>	Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D.
`detail`	Show detailed information.

Mode Privileged Exec

Examples To show the neighbor information for all interfaces, use the command:

```
awplus# show ip pim sparse-mode neighbor
```

To show the neighbor information for vlan5, use the command:

```
awplus# show ip pim sparse-mode neighbor vlan5 detail
```

Output Figure 38-13: Example output from the **show ip pim sparse-mode neighbor** command

```
Neighbor          Interface   Uptime/Expires    Ver   DR
Address                                               Priority/
Mode
10.10.0.9         vlan2       00:55:33/00:01:44 v2    1 /
10.10.0.136       vlan2       00:55:20/00:01:25 v2    1 /
10.10.0.172       vlan2       00:55:33/00:01:32 v2    1 / DR
192.168.0.100     vlan3       00:55:30/00:01:20 v2    N / DR
```

Figure 38-14: Example output from the **show ip pim sparse-mode neighbor interface detail** command

```
Nbr 10.10.3.180 (vlan5), DR

 DR priority: 100, Gen ID: 625159467,
 Secondary addresses:
  192.168.30.1
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode nexthop

Overview Use this command to see the next hop information as used by PIM-SM.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip pim sparse-mode nexthop
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global]sparse-mode nexthop
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table

Mode User Exec and Privileged Exec

Example
```
awplus# show ip pim sparse-mode nexthop
```

Figure 38-15: Example output from the **show ip pim sparse-mode nexthop** command

```
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination Type Nexthop Nexthop Nexthop      Nexthop    Metric Pref  Refcnt
                 Num     Addr                 Ifindex    Name
_____________________________________________________________________________
10.10.0.9   .RS.  1      0.0.0.0  4           0           0        1
```

Table 2: Parameters in output of the **show ip pim sparse-mode nexthop** command

Parameter	Description
`Destination`	The destination address for which PIM-SM requires next hop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of next hops to the destination. PIM-SM always uses only 1 next hop.
`Nexthop Addr`	The address of the primary next hop gateway.

Table 2: Parameters in output of the **show ip pim sparse-mode nexthop** command (cont.)

Parameter	Description
`Nexthop IfIndex`	The interface on which the next hop gateway can be reached.
`Nexthop Name`	The name of next hop interface.
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode packet statistics

Overview Use this command to display the current packet receive counts for PIM sparse-mode.

If the device supports multicast for VRFs, then specifying a VRF name will show the PIM sparse-mode packet statistics for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax
```
show ip pim sparse-mode packet statistics
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global] sparse-mode packet
statistics
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table

Mode Privileged Exec

Example The following command displays the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# show ip pim sparse-mode statistics
```

Output Figure 38-16: Example output from **show ip pim sparse-mode statistics**

```
awplus(config)#show ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM     :   Total : 25   Valid : 25
Hello          :   Total : 14   Valid : 14
Register       :   Total : 5   Valid : 5
Register Stop  :   Total : 0   Valid : 0
Join/Prune     :   Total : 0   Valid : 0
Bootstrap      :   Total : 6   Valid : 6
Assert         :   Total : 0   Valid : 0
Candidate-RP   :   Total : 0   Valid : 0
```

Example The following command displays the current packet receive counts for PIM sparse-mode on VRF Red:

```
awplus# configure terminal
awplus(config)# show ip pim vrf red sparse-mode statistics
```

Output Figure 38-17: Example output from **show ip pim vrf red sparse-mode statistics**

```
awplus(config)#show ip pim vrf red sparse-mode statistics
[VRF: red]
PIM-SM Receive Packet Statistics :
All PIM-SM    :   Total : 32   Valid : 32
Hello         :   Total : 19   Valid : 19
Register      :   Total : 5   Valid : 5
Register Stop :   Total : 0   Valid : 0
Join/Prune    :   Total : 0   Valid : 0
Bootstrap     :   Total : 8   Valid : 8
Assert        :   Total : 0   Valid : 0
Candidate-RP  :   Total : 0   Valid : 0
```

Related commands clear ip pim sparse-mode packet statistics

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode rp-hash

Overview Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax
```
show ip pim sparse-mode rp-hash <group-addr>
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global] sparse-mode rp-hash
<group-addr>
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
<vrf-name>	The VRF instance name.
`global`	The global routing and forwarding table.
<group-addr>	The group address for which to find the RP, entered in the form A.B.C.D.

Mode User Exec and Privileged Exec

Example
```
awplus# show ip pim sparse-mode rp-hash 224.0.1.3
```

Figure 38-18: Output from the **show ip pim sparse-mode rp-hash** command

```
RP: 10.10.11.35
Info source: 10.10.11.35, via bootstrap
```

Related commands show ip pim sparse-mode rp mapping

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode rp mapping

Overview Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

If the platform supports multicast for VRFs then specifying a VRF name will show the PIM-SM RP mappings for that VRF or use global for the global VRF. Not specifying a VRF will display the information for all VRFs.

Syntax
```
show ip pim sparse-mode rp mapping
```

Syntax (VRF-lite)
```
show ip pim [vrf <vrf-name>|global] sparse-mode rp mapping
```

Parameter	Description
`vrf`	Applies the command to the specified VRF instance.
`<vrf-name>`	The VRF instance name.
`global`	The global routing and forwarding table.

Mode Privileged Exec

Example
```
awplus# show ip pim sparse-mode rp mapping
```

Output Figure 38-19: Example output from **show ip pim sparse-mode rp mapping**

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
  RP: 10.10.0.9
    Info source: 10.10.0.9, via bootstrap, priority 192
         Uptime: 16:52:39, expires: 00:02:50
```

Related commands show ip pim sparse-mode rp-hash

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

undebug all pim sparse-mode

Overview Use this command to disable all PIM-SM debugging.

Use this command if the device supports multicast for VRFs. This command will disable all PIM-SM debugging for all VRFs.

Syntax
```
undebug all pim sparse-mode
```

Mode Privileged Exec

Example
```
awplus# undebug all pim sparse-mode
```

Related commands debug pim sparse-mode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

39 PIM-SMv6 Commands

Introduction

Overview

This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see Multicast Commands. For an overview of PIM-SMv6, see the PIM-SMv6 Feature Overview and Configuration Guide.

IPv6 must be enabled on an interface with the ipv6 enable command, IPv6 forwarding must be enabled globally for routing IPv6 with the ipv6 forwarding command, and IPv6 multicasting must be enabled globally with the ipv6 multicast-routing command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

NOTE: *The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.*

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

Command List

clear ipv6 mroute pim

Overview Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

NOTE: *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

Syntax

```
clear ipv6 mroute [*] pim sparse-mode
```

Parameter	Description
*	Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries.

Mode Privileged Exec

Example

```
awplus# clear ipv6 mroute pim sparse-mode
awplus# clear ipv6 mroute * pim sparse-mode
```

clear ipv6 mroute pim sparse-mode

Overview Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

NOTE: *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

Syntax

```
clear ipv6 mroute <Group-IPv6-add> pim sparse-mode
clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim
sparse-mode
```

Parameter	Description
<Group-IPv6-add>	Specify a multicast group IPv6 address, entered in the form X:X::X:X.
<Source-IPv6-add>	Specify a source group IPv6 address, entered in the form X:X::X:X.

Mode Privileged Exec

Example

```
awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode
awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim sparse-mode
```

clear ipv6 pim sparse-mode bsr rp-set *

Overview Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

NOTE: *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

Syntax

```
clear ipv6 pim sparse-mode bsr rp-set *
```

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ipv6 pim sparse-mode bsr rp-set *
```

debug ipv6 pim sparse-mode

Overview Use this command to activate PIM-SMv6 debugging.

Use the **no** variant of this command to deactivate PIMv6 debugging.

Note that the undebug ipv6 pim sparse-mode command is an alias of the **no** variant of this command.

Syntax

```
debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
[nsm] [state] [timer]
```

```
no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib]
[nexthop] [nsm] [state] [timer]
```

Parameter	Description
`all`	Activates/deactivates all PIM-SMv6 debugging.
`events`	Activates debug printing of PIM-SMv6 events.
`mfc`	Activates debug printing of MFC (Multicast Forwarding Cache).
`mib`	Activates debug printing of PIM-SMv6 MIBs.
`nexthop`	Activates debug printing of PIM-SMv6 next hop communications.
`nsm`	Activates debugging of PIM-SMv6 NSM (Network Services Module) communications.
`state`	Activates debug printing of state transition on all PIM-SMv6 FSMs.
`timer`	Activates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode nexthop
```

Validation output

Figure 39-1: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing **multiple debug ipv6 pim sparse-mode** commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is on
  PIM MFC debugging is off
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is off
  PIM Hello NLT timer debugging is off
  PIM Hello THT timer debugging is off
  PIM Join/Prune JT timer debugging is off
  PIM Join/Prune ET timer debugging is off
  PIM Join/Prune PPT timer debugging is off
  PIM Join/Prune KAT timer debugging is off
  PIM Join/Prune OT timer debugging is off
  PIM Assert AT timer debugging is off
  PIM Register RST timer debugging is off
  PIM Bootstrap BST timer debugging is off
  PIM Bootstrap CRP timer debugging is off
  PIM mib debugging is off
  PIM nsm debugging is off
  PIM nexthop debugging is off
```

Related commands

show debugging ipv6 pim sparse-mode

undebug all ipv6 pim sparse-mode

undebug ipv6 pim sparse-mode

debug ipv6 pim sparse-mode packet

Overview Use this command to activate PIM-SMv6 packet debugging.

Use the no variant of this command to deactivate PIMv6 packet debugging.

Syntax

```
debug ipv6 pim sparse-mode packet {in|out}
no debug ipv6 pim sparse-mode packet {in|out}
```

Parameter	Description
`packet`	Activates debug printing of incoming and/or outgoing IPv6 packets.
`in`	Specify incoming packet debugging.
`out`	Specify outgoing packet debugging.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

Related commands

show debugging ipv6 pim sparse-mode

undebug all ipv6 pim sparse-mode

debug ipv6 pim sparse-mode timer

Overview Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

Syntax

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

Parameter	Description
`assert`	Enable or disable debugging for the Assert timers.
`at`	Enable or disable debugging for the Assert Timer.
`bsr`	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
`bst`	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
`crp`	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
`hello`	Enable or disable debugging for the specified Hello timer, or all Hello timers.
`ht`	Enable or disable debugging for the Hello timer: Hello Timer.
`nlt`	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
`tht`	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
`joinprune`	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
`jt`	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
`et`	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
`ppt`	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.

Parameter	Description
`kat`	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.
`ot`	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
`register`	Enable or disable debugging for the Register timers.
`rst`	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

Related commands show debugging ipv6 pim sparse-mode

ipv6 pim accept-register

Overview Use this command to configure the ability to filter out multicast sources specified by the given software IPv6 access-list at the Rendezvous Point (RP), so that the RP will accept/refuse to perform the register mechanism for the packets sent by the specified sources. By default, the RP accepts register packets from all multicast sources.

Use the **no** variant of this command to revert to default.

Syntax

```
ipv6 pim accept-register list{<access-list>}
no ipv6 pim accept-register
```

Parameter	Description
<access-list>	Specify a Standard or an Extended software IPv6 Access list. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim accept-register list G2
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus# configure terminal
awplus(config)# no ipv6 pim accept-register
```

ipv6 pim anycast-rp

Overview Use this command to configure Anycast RP (Rendezvous Point) in an RP set.

Use the **no** variant of this command to remove the configuration.

Syntax

```
ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>
no ipv6 pim anycast-rp <anycast-rp-address>
[<member-rp-address>]
```

Parameter	Description
<anycast-rp-address>	<X:X::X:X> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.
<member-rp-address>	<A:B::C:D> Specify an Anycast RP (Rendezvous Point)IPv6 address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage notes Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IPv6 address range from many sources, resulting in packets addressed to destination addresses in this range being routed to the nearest source announcing the given destination IPv6 address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

ipv6 pim bsr-border

Overview Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through an interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

Syntax

```
ipv6 pim bsr-border
no ipv6 pim bsr-border
```

Mode Interface Configuration for a VLAN interface.

Usage When this command is configured on an interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM- SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

Examples The following example configures the VLAN interface vlan2 to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

ipv6 pim bsr-candidate

Overview Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax

```
ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]
no ipv6 pim bsr-candidate [<interface>]
```

Parameter	Description
<interface>	Specify the interface.
<hash>	<0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the *<hash>* (mask length) when specifying the *<priority>*. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 126 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

ipv6 pim cisco-register-checksum

Overview Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax
```
ipv6 pim cisco-register-checksum
no ipv6 pim cisco-register-checksum
```

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum
awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

ipv6 pim cisco-register-checksum group-list

Overview Use this command to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by the software IPv6 access-list. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ipv6 pim cisco-register-checksum group-list <IPv6-access-list>
no ipv6 pim cisco-register-checksum group-list
<IPv6-access-list>
```

Parameter	Description
<IPv6-access-list>	Optional. Specify a Standard or Extended software IPv6 access list. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs. Use this parameter to configure the option to calculate the Register Checksum over the whole packet on multicast groups as specified by an IPv6 access list entered after this command.

Mode Global Configuration

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum group-list G1
awplus(config)# ipv6 access-list standard G1 permit
ff0x::db8:0:0/96
```

ipv6 pim crp-cisco-prefix

Overview Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

Syntax
```
ipv6 pim crp-cisco-prefix
no ipv6 pim crp-cisco-prefix
```

Mode Global Configuration

Example
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix
awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

Related commands ipv6 pim rp-candidate

ipv6 pim dr-priority

Overview Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 pim dr-priority <priority>
no ipv6 pim dr-priority [<priority>]
```

Parameter	Description
<priority>	Specify the Designated Router priority value, in the range 0 to 4294967294. Note that a higher value has a higher preference or higher priority.

Default The default value is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface.

Examples To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

Related commands ipv6 pim ignore-rp-set-priority

ipv6 pim exclude-genid

Overview Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ipv6 pim exclude-genid
no ipv6 pim exclude-genid
```

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface.

Examples To exclude the GenID option in Hello packets on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
```

To include the GenID option in Hello packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

ipv6 pim ext-srcs-directly-connected

Overview Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

Syntax

```
ipv6 pim ext-srcs-directly-connected
no ipv6 pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

ipv6 pim hello-holdtime

Overview This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax

```
ipv6 pim hello-holdtime <holdtime>
no ipv6 pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello-holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage Each time the hello-interval is updated, the hello-holdtime is also updated, according to the following rules:

If the hello-holdtime is not configured; or if the hello-holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello-interval). Otherwise, it retains the configured value.

Examples To configure a hello-holdtime of 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
```

To reset the hello-holdtime to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-holdtime
```

ipv6 pim hello-interval

Overview This command configures a hello-interval value for PIM-SMv6.

Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

Syntax

```
ipv6 pim hello-interval <interval>
no ipv6 pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface.

Usage When the hello-interval is configured, and the hello-holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello-interval). Otherwise, the hello-holdtime value is the configured value.

Example To set the hello-interval to 123 seconds on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
```

To set the hello-interval to the default on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-interval
```

ipv6 pim ignore-rp-set-priority

Overview Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

Syntax
```
ipv6 pim ignore-rp-set-priority
no ipv6 pim ignore-rp-set-priority
```

Mode Global Configuration

Usage This command is used to inter-operate with older Cisco IOS versions.

Example
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority
awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

ipv6 pim jp-timer

Overview Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the device puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

Syntax

```
ipv6 pim jp-timer <1-65535>
no ipv6 pim jp-timer [<1-65535>]
```

Parameter	Description
<1-65535>	Specifies the Join/Prune timer value. The default value is 210 seconds.

Default The default PIM-SMv6 join/prune timer value is 210 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300
awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

ipv6 pim neighbor-filter

Overview This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 pim neighbor-filter <IPv6-accesslist>
no ipv6 pim neighbor-filter <IPv6-accesslist>
```

Parameter	Description
<IPv6-accesslist>	Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter. See the IPv6 Software Access Control List (ACL) Commands chapter for supported IPv6 ACLs.

Default By default, there is no neighbor filtering applied to an interface.

Mode Interface Configuration for a VLAN interface.

Example To enable filtering on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config)# ipv6 enable
awplus(config-if)# ipv6 pim neighbor-filter filter1
awplus(config-if)# ipv6 access-list standard filter1 deny
fe80:20e:cff:fe01:facc
awplus(config-if)# ipv6 access-list standard filter1 permit any
awplus(config-if)# exit
```

ipv6 pim register-rate-limit

Overview Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit and reset to the default rate limit.

Syntax

```
ipv6 pim register-rate-limit <1-65535>
no ipv6 pim register-rate-limit
```

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Default The default is 0, as reset with the **no** variant, which also specifies an unlimited rate limit.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444
awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit 3444
```

ipv6 pim register-rp-reachability

Overview Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax
```
ipv6 pim register-rp-reachability
no ipv6 pim register-rp-reachability
```

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Examples
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability
awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

ipv6 pim register-source

Overview Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

Syntax

```
ipv6 pim register-source [<source-IPv6-address>|<interface>]
no ipv6 pim register-source
```

Parameter	Description
<source-IPv6-address>	The IPv6 address, entered in the form X:X::X:X, to be used as the source of the register packets.
<interface>	The name of the interface to be used as the source of the register packets.

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

Mode Global Configuration

Examples To configure the register source as 3ffe::24:2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
```

To configure the register source as vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
```

To change back to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

ipv6 pim register-suppression

Overview Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax

```
ipv6 pim register-suppression <1-65535>
no ipv6 pim register-suppression
```

Parameter	Description
<1-65535>	Register suppression on time in seconds.

Mode Global Configuration

Default The default PIM-SMv6 register suppression time is 60 seconds, and is restored with the no variant of this command.

Usage Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the ipv6 pim rp-register-kat command is not used.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192
awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

ipv6 pim rp-address

Overview Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

Syntax

```
ipv6 pimv6 rp-address <IPv6-address> [<IPv6-access-list>]
[override]
```

```
no ipv6 pim rp-address <IPv6-address> [<IPv6-access-list>]
[override]
```

Parameter	Description
<IPv6-address>	Specify the IPv6 address of the Rendezvous Point, entered in the form `X:X::X:X`.
<IPv6-access-list>	Specify a Standard or an Extended software IPv6 access-list name. See IPv6 Software Access Control List (ACL) Commands for supported IPv6 ACLs.
`override`	Specify this optional parameter keyword to enable any statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage notes The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ipv6 pim rp-address** command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

A single static-RP can be configured for multiple group ranges using software IPv6 access- lists (ACLs). However, configuring multiple static RPs (using **ipv6 pim rp-address** command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range `ff00::/8` (without using IPv6 ACLs) or for specific group ranges (when using IPv6 ACLs).

For example, configuring **ipv6 pim rp-address 3ffe:10:10:5::153** will configure static-RP `3ffe:10:10:5::153` for the default group range `ff00::/8`. Configuring **ipv6 pim rp-address 3ffee:20:20:5::153 grp-list** will configure static-RP `3ffe:20:20:5::153` for all the group ranges represented by permit filters in the defined named **grp-list** ACL.

If multiple static-RPs are available for a group range, then one with the highest IPv6 address is chosen.

Only `permit` filters in IPv6 ACL are considered as valid group ranges. The default `permit` filter `::/0` is converted to the default multicast filter `ff00::/8`.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IPv6 address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the ipv6 pim rp-address command. Commands with the override keyword take precedence over dynamically learned mappings.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-address 3ffe:30:30:5::153 G2
awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

Related commands

ipv6 pim rp-candidate

ipv6 pim rp-register-kat

ipv6 pim rp-candidate

Overview Use this command to make the device an RP (Rendezvous Point) candidate, using the IPv6 address of the specified interface.

Use the **no** variant of this command to stop the device from being an RP candidate.

Syntax

```
ipv6 pim rp-candidate <interface> [priority <priority>|interval
<interval>|grouplist <accesslist>]
```

```
no ipv6 pim rp-candidate [<interface>]
```

Parameter	Description
<interface>	The interface name.
priority *<priority>*	The RP candidate priority for this interface on this device, from 0 to 255. The lower the priority value, the more likely this candidate is to become the RP.
interval *<interval>*	The advertisement interval, from 1 to 16383 seconds.
grouplist *<accesslist>*	A Standard or an Extended software IPv6 access list name. See the IPv6 Software Access Control List (ACL) Commands chapter for supported IPv6 ACLs.

Default The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage notes Note that issuing the command **ipv6 pim rp-candidate** *<interface>* without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

Examples To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

To use the ACL named G2 to specify the group prefixes that are advertised in association with the RP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard G2 permit
2001:db8::/128
awplus(config)# ipv6 pim rp-candidate vlan2 group-list G2
```

Related commands

ipv6 pim rp-address

ipv6 pim rp-register-kat

ipv6 pim rp embedded

Overview Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

Syntax

```
ipv6 pim rp embedded
no ipv6 pim rp embedded
```

Mode Global Configuration

Default Embedded RP is enabled by default in the AlliedWare Plus implementation of PIM-SMv6.

Examples The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

ipv6 pim rp-register-kat

Overview Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

Syntax

```
ipv6 pim rp-register-kat <1-65535>
no ipv6 pim rp-register-kat
```

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SMv6 KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

Related commands ipv6 pim rp-address

ipv6 pim rp-candidate

ipv6 pim sparse-mode

Overview Use this command to enable PIM-SMv6 on an interface.

Use the **no** variant of this command to disable PIM-SMv6 on an interface.

Syntax

```
ipv6 pim sparse-mode
no ipv6 pim sparse-mode
```

Mode Interface Configuration for a VLAN interface.

Examples To enable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
```

To disable PIM-SMv6 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
```

ipv6 pim sparse-mode passive

Overview Use this command to enable and disable PIM-SMv6 passive mode operation for local members on an interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on an interface.

Syntax

```
ipv6 pim sparse-mode passive
no ipv6 pim sparse-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

Examples To enable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
```

To disable passive mode on vlan2, use the commands

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
```

ipv6 pim spt-threshold

Overview This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

NOTE: *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

Syntax

```
ipv6 pim spt-threshold
no ipv6 pim spt-threshold
```

Mode Global Configuration

Examples To enable the last-hop PIM-SMv6 router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

Related commands ipv6 pim spt-threshold group-list

ipv6 pim spt-threshold group-list

Overview Use this command to turn on/off the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree) for multicast group addresses as specified by the given software IPv6 access-list.

Use the **no** variant of this command to turn off switching to the SPT.

NOTE: *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

Syntax

```
ipv6 pim spt-threshold group-list <IPv6-access-list>
no ipv6 pim spt-threshold group-list <IPv6-access-list>
```

Parameter	Description
<IPv6-access-list>	Specify a Standard or an Extended software IPv6 access-list name. See the IPv6 Software Access Control List (ACL) Commands chapter for supported IPv6 ACLs.

Mode Global Configuration

Examples To enable the last-hop PIM-SMv6 router to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold group-list G1
awplus(config)# ipv6 access-list standard G1 permit
2001:db8::/128
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT for groups specified by the ACL named G1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold group-list G1
```

Related commands ipv6 pim spt-threshold

ipv6 pim ssm

Overview Use this command to define the Source Specific Multicast (SSM) range of IPv6 multicast addresses. PIM-SMv6 routers will only install (S,G) entries for multicast groups (addresses) residing in the SSM range.

Use the **no** variant of this command to disable the SSM range.

Syntax

```
ipv6 pim ssm {default|range <named-access-list>}
no ipv6 pim ssm
```

Parameter	Description
`default`	Use FF3x::/32 as the range for SSM.
`range`	Specify an ACL for group range to be used for SSM.
`<named-access-list>`	Specify a named standard access list.

Default By default, the command is disabled.

Mode Global Configuration

Usage Any (*,G) or (S,G,rpt) joins received for multicast groups (addresses) within the range are not installed in PIM-SMv6 mroute table.

Examples To configure the SSM service for the IPv6 address range defined by IPv6 access list 'IPv6-PIM-SSM-RANGE', use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard IPv6-PIM-SSM-RANGE
permit ff3e::/32
awplus(config)# ipv6 pim ssm range IPv6-PIM-SSM-RANGE
```

To use the default address range for PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 pim ssm default
```

To disable PIM-SSM, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ssm
```

ipv6 pim unicast-bsm

Overview Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on an interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on an interface.

Syntax
```
ipv6 pim unicast-bsm
no ipv6 pim unicast-bsm
```

Mode Interface Configuration for a VLAN interface.

Default Unicast BSM is disabled by default on an interface.

Usage This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

Examples To enable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
```

To disable BSM messages on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

service pim6

Overview Use this command to enable IPv6 PIM sparse mode services.

Use the **no** version of the command to disable unused IPv6 PIM sparse mode services.

Syntax

```
service pim6
no service pim6
```

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

Example To disable the IPv6 PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim6
```

Output Figure 39-2: Example output from **no service pim6**

```
awplus(config)#no service pim6
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-0.1: command added

show debugging ipv6 pim sparse-mode

Overview Use this command to see what debugging is turned on for PIM-SMv6.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show debugging ipv6 pim sparse-mode
```

Mode User Exec and Privileged Exec

Example To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 39-3: Example output from the **show debugging ipv6 pim sparse-mode** command

```
awplus#show debugging ipv6 pim sparse-mode
Debugging status:
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is on
  PIM Hello NLT timer debugging is on
  PIM Hello THT timer debugging is on

  PIM Bootstrap BST timer debugging is on
  PIM Bootstrap CRP timer debugging is on
```

Related commands debug ipv6 pim sparse-mode

undebug ipv6 pim sparse-mode

show ipv6 pim sparse-mode bsr-router

Overview Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode bsr-router
```

Mode User Exec and Privileged Exec

Example To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

Output Figure 39-4: Example output from the **show ipv6 pim sparse-mode bsr-router** command

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:203::213 (?)
  Uptime:      00:36:25, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:46
  Role: Candidate BSR
  State: Candidate BSR

  Candidate RP: 2001:5::211(vlan5)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:43
```

show ipv6 pim sparse-mode rp mapping

show ipv6 pim sparse-mode neighbor

show ipv6 pim sparse-mode interface

Overview Use this command to show PIM-SMv6 interface information.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode interface [detail]
```

Parameter	Description
`detail`	Show detailed information.

Mode User Exec and Privileged Exec

Examples To display information about all PIM-SMv6 interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface
```

```
awplus#show ipv6 pim sparse-mode interface

```

Table 1: Parameters in the output from the **show ipv6 pim sparse-mode interface** command

Parameters	Description
`Address`	Primary PIM-SMv6 address.
`Interface`	Name of the PIM-SMv6 interface.
`VIF Index`	The Virtual Interface index of the interface.
`Ver/Mode`	PIMv6 version/Sparse mode.
`Nbr Count`	Neighbor count of the PIM-SMv6 interface.
`DR Priority`	Designated Router priority.
`DR`	The IPv6 address of the Designated Router.

show ipv6 pim sparse-mode local-members

Overview Use this command to show detailed local member information on an interface configured for PIM-SMv6. If you do not specify an interface then detailed local member information is shown for all interfaces configured for PIM-SMv6.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode local-members [<interface>]
```

Parameter	Description
<interface>	Optional Specify the interface.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output Figure 39-6: Example output from the **show ipv6 pim sparse-mode local-members** command

```
awplus#show ipv6 pim sparse-mode local-members

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include
```

show ipv6 pim sparse-mode mroute

Overview Use this command to display the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be entered simultaneously; two source IPv6 addresses cannot be entered simultaneously.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode mroute
show ipv6 pim sparse-mode mroute <group-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
show ipv6 pim sparse-mode mroute <group-IPv6-address>
<source-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
<group-IPv6-address>
show ipv6 pim sparse-mode mroute brief
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.
<source-IPv6-address>	Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree.
`brief`	Brief display.

Mode User Exec and Privileged Exec

Usage notes Note that when a feature license is enabled, the output for the show ipv6 pim sparse-mode mroute command will only show 100 interfaces because of the terminal display width limit. Use the show ipv6 pim sparse-mode mroute detail command to display detailed entries of the IPv6 multicast routing table.

Examples

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
awplus# show ipv6 pim sparse-mode mroute brief
```

show ipv6 pim sparse-mode mroute detail

Overview Use this command to display detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode mroute
[<group-IPv6-address>|<source-IPv6-address>] detail
```

```
show ipv6 pim sparse-mode mroute [<group-IPv6-address>
<source-IPv6-address>] detail
```

```
show ipv6 pim sparse-mode mroute [<source-IPv6-address>
<group-IPv6-address>] detail
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that group.
<source-IPv6-address>	Source IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that source.
`detail`	Show detailed information.

Usage notes Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

show ipv6 pim sparse-mode neighbor

Overview Use this command to show the PIM-SMv6 neighbor information.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode neighbor [<interface>]
[<IPv6-address>] [detail]
```

Parameter	Description
<interface>	Interface name. Show neighbors on an interface.
<IPv6-address>	Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X.
detail	Show detailed information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode neighbor

```

Table 2: Parameters in output of the **show ipv6 pim sparse-mode nexthop** command

Parameter	Description
Destination	The destination address for which PIM-SMv6 requires next hop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.
Nexthop Addr	The address of the primary next hop gateway.
Nexthop IfIndex	The interface on which the next hop gateway can be reached.
Nexthop Name	The name of next hop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

show ipv6 pim sparse-mode rp-hash

Overview Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>
```

Parameter	Description
<IPv6-group-addr>	The IPv6 group address used to find the RP, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp-hash ff04:10
```

Figure 39-14: Output from the **show ipv6 pim sparse-mode rp-hash** command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
    RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap
```

Related commands show ipv6 pim sparse-mode rp mapping

show ipv6 pim sparse-mode rp mapping

Overview Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode rp mapping
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp mapping
```

Figure 39-15: Output from the **show ipv6 pim sparse-mode rp mapping** command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
         Uptime: 05:36:40
```

Related commands show ipv6 pim sparse-mode rp-hash

show ipv6 pim sparse-mode rp nexthop

Overview Use this command to display the RP (Rendezvous Point) next hop information used by PIM-SMv6.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode rp nexthop <RP-group-addr>
```

Parameter	Description
<RP-group-addr>	Specify the RP group address used to display next hop RP information, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
```

Figure 39-16: Example output from the **show ipv6 pim sparse-mode rp nexthop** command

```
awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination           Type  Nexthop Nexthop Nexthop  Nexthop Metric     Pref   Refcnt
                            Num     Addr    Ifindex  Name
_____________________________________________________________________________________
3ffe:10:10:5::153     .RS.  1       fe80::20e:cff:fe01:facc  2     30   110    1
```

Table 3: Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command

Parameter	Description
`Destination`	The destination address for which PIM-SMv6 requires next hop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.
`Nexthop Addr`	The address of the primary next hop gateway.
`Nexthop IfIndex`	The interface on which the next hop gateway can be reached.
`Nexthop Name`	The name of next hop interface.

Table 3: Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command (cont.)

Parameter	Description
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

undebug all ipv6 pim sparse-mode

Overview Use this command to disable all PIM-SMv6 debugging.

Syntax
```
undebug all ipv6 pim sparse-mode
```

Mode Privileged Exec

Example
```
awplus# undebug all ipv6 pim sparse-mode
```

Related commands debug ipv6 pim sparse-mode

undebug ipv6 pim sparse-mode

Overview Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the no variant of the debug ipv6 pim sparse-mode command.

Syntax

```
undebug ipv6 pim sparse-mode [all] [events] [mfc] [mib]
[nexthop] [nsm] [state] [timer]
```

Parameter	Description
`all`	Deactivates all PIM-SMv6 debugging.
`events`	Deactivates debug printing of PIM-SMv6 events.
`mfc`	Deactivates debug printing of MFC (Multicast Forwarding Cache).
`mib`	Deactivates debug printing of PIM-SMv6 MIBs.
`nexthop`	Deactivates debug printing of PIM-SMv6 next hop communications.
`nsm`	Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications.
`state`	Deactivates debug printing of state transition on all PIM-SMv6 FSMs.
`timer`	Deactivates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode nexthop
```

Validation Output

Figure 39-17: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing the **undebug ipv6 pim sparse-mode all** command

```
awplus#undebug ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:

40 PIM-DM Commands

Introduction

Overview This chapter provides an alphabetical reference of PIM-DM commands. For commands common to PIM-SM and PIM-DM, see Multicast Commands.

Command List

debug pim dense-mode all

Overview This command enables PIM-DM debugging.

The **no** variant of this command disables PIM-DM debugging.

Syntax

```
debug pim dense-mode all
no debug pim dense-mode all
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode all
```

Output Figure 40-1: Example output from the **debug pim dense-mode all** command

```
PIM event debugging is on

PIM MFC debugging is on

PIM state debugging is on

PIM packet debugging is on

PIM incoming packet debugging is on

PIM outgoing packet debugging is on
```

Validation Commands show debugging pim dense-mode

Related commands debug pim dense-mode context

debug pim dense-mode decode

debug pim dense-mode encode

debug pim dense-mode fsm

debug pim dense-mode mrt

debug pim dense-mode nexthop

debug pim dense-mode nsm

debug pim dense-mode vif

debug pim dense-mode context

Overview This command enables debugging of general configuration context.

The **no** variant of this command disables debugging of general configuration context.

This command also enables debugging of general configuration and Virtual Routing (VR), and Virtual Routing and Forwarding (VRF) context.

The **no** variant of this command also disables debugging of general configuration and Virtual Routing (VR), and Virtual Routing and Forwarding (VRF) context.

Syntax

```
debug pim dense-mode context
no debug pim dense-mode context
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode context
```

Related commands

debug pim dense-mode all

debug pim dense-mode decode

debug pim dense-mode encode

debug pim dense-mode fsm

debug pim dense-mode mrt

debug pim dense-mode nexthop

debug pim dense-mode nsm

debug pim dense-mode vif

debug pim dense-mode decode

Overview This command enables debugging of the PIM-DM message decoder.

The **no** variant of this command disables debugging of the PIM-DM message decoder.

Syntax

```
debug pim dense-mode decode
no debug pim dense-mode decode
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode decoder
```

debug pim dense-mode encode

debug pim dense-mode fsm

debug pim dense-mode mrt

debug pim dense-mode nexthop

debug pim dense-mode nsm

debug pim dense-mode vif

debug pim dense-mode encode

Overview This command enables debugging of the PIM-DM message encoder.

The **no** variant of this command disables debugging of the PIM-DM message encoder.

Syntax

```
debug pim dense-mode encode
no debug pim dense-mode encode
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode encoder
```

debug pim dense-mode decode

debug pim dense-mode fsm

debug pim dense-mode mrt

debug pim dense-mode nexthop

debug pim dense-mode nsm

debug pim dense-mode vif

debug pim dense-mode fsm

Overview This command enables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

The **no** variant of this command disables debugging of Finite-State Machine (FSM) specific information of all Multicast Routing Table (MRT) and MRT Virtual Multicast Interface (MRT-VIF) entries.

Syntax

```
debug pim dense-mode fsm
no debug pim dense-mode fsm
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode fsm
```

debug pim dense-mode decode

debug pim dense-mode encode

debug pim dense-mode fsm

debug pim dense-mode nexthop

debug pim dense-mode nsm

debug pim dense-mode vif

debug pim dense-mode nexthop

Overview This command enables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

The **no** variant of this command disables debugging of Reverse Path Forwarding (RPF) neighbor next hop cache handling.

Syntax

```
debug pim dense-mode nexthop
no debug pim dense-mode nexthop
```

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim dense-mode nexthop
```

ip pim dense-mode

Overview This command enables or disables PIM-DM operation from Interface mode on the current VLAN interface. This command also disables passive mode on the VLAN interface if passive mode has been enabled using an ip pim dense-mode passive command.

The **no** variant of this command disables all PIM-DM activities on the interface.

Syntax
```
ip pim dense-mode
no ip pim dense-mode
```

Mode Interface Configuration for a VLAN interface.

Example
```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode
```

ip pim dense-mode passive

Overview This command enables PIM-DM passive mode operation from Interface mode on the current VLAN interface.

The **no** variant of this command disables passive mode.

Syntax

```
ip pim dense-mode passive
no ip pim dense-mode passive
```

Mode Interface Configuration for a VLAN interface.

Usage Configuring a VLAN interface as a passive PIM-DM interface indicates that the VLAN interface is connected to a stub network (i.e. a network that does not contain any PIM Routers). So, multicast streams that arrive on other PIM-DM interfaces can be routed to hosts on the passive PIM-DM interface, but no PIM neighbor relationships will be formed on the passive PIM-DM interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dense-mode passive
```

ip pim dense-mode wrong-vif-suppression

Overview Use this command to permit or block packets that arrive on the wrong VLAN Interface (VIF) for PIM dense-mode.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable dense-mode wrong VIF suppression

Syntax

```
ip pim dense-mode wrong-vif-suppression
no ip pim dense-mode wrong-vif-suppression
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>]dense-mode wrong-vif-suppression
no ip pim [vrf <vrf-name>]dense-mode wrong-vif-suppression
```

Parameter	Description
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

Default Disabled.

Mode Global Configuration

Usage notes This command enables wrong VIF suppression for PIM dense-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

Examples To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim dense-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim dense-mode wrong-vif-suppression
```

Example (VRF-lite) To enable wrong VIF suppression for the VRF instance 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf blue sparse-mode
wrong-vif-suppression
```

To disable wrong VIF suppression for the VRF instance 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf blue sparse-mode
wrong-vif-suppression
```

Command changes Version 5.4.8-2.3: command added.

ip pim ext-srcs-directly-connected

Overview Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

Syntax

```
ip pim ext-srcs-directly-connected
no ip pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface.

Example To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

ip pim hello-holdtime (PIM-DM)

Overview This command configures a **hello-holdtime**. The PIM **hello-holdtime** on a VLAN interface is the period which the router will wait to receive a hello from neighbors on that interface. If the router does not receive a hello from a given neighbor within that period, then it will decide that the neighbor is no longer an active PIM Router, and will terminate the neighbor relationship.

You cannot configure a **hello-holdtime** value that is less than the current **hello-interval**. Each time the **hello-interval** is updated, the **hello-holdtime** is also updated, according to the following rules:

- If the **hello-holdtime** is not configured; or if the hello holdtime is configured and less than the current **hello-interval** value, it is modified to 3.5 times the **hello-interval** value.
- Otherwise, it retains the configured value.

Use the **no** variant of this command to return the hello-holdtime value to its default of 3.5 times the current hello-interval value.

Syntax

```
ip pim hello-holdtime <holdtime>
no ip pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-DM)

Overview This command configures a PIM **hello-interval** value. The PIM **hello-interval** on a VLAN interface is the period at which the router will transmit PIM hello messages on that interface.

When the **hello-interval** is configured, and the **hello-holdtime** is not configured, or when the configured **hello-holdtime** value is less than the new **hello-interval** value; the **hello-holdtime** value is modified to 3.5 times the **hello-interval** value. Otherwise, the **hello-holdtime** value is the configured value. The default is 30 seconds.

Use the **no** variant of this command to reset the **hello-interval** to the default.

Syntax

```
ip pim hello-interval <interval>
no ip pim hello-interval
```

Parameter	Description
<interval>	*<1-65535>* The value in seconds (no fractional seconds accepted).

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
```

ip pim max-graft-retries

Overview This command configures PIM-DM to send a limited number of Graft message retries, after which time the device will remove all information regarding the particular (Source, Group), or until the device receives an acknowledgment, whichever occurs first.

The **no** variant of this command configures PIM-DM to send Graft message retries until the device receives an acknowledgment, which is the default behavior.

Syntax

```
ip pim max-graft-retries <1-65535>
no pim max-graft-retries
```

Parameter	Description
`no`	Negate a command or set its defaults.
`ip`	Internet Protocol (IP).
`pim`	PIM Interface commands.
`max-graft-retries`	PIM Graft message retries.
<1-65535>	Graft message retries before ceasing Graft message retries.

Default By default, Graft retries are sent by PIM-DM until the device receives an acknowledgment.

Mode Interface Configuration for a VLAN interface.

Usage Graft messages are used to reduce the join latency when a previously pruned branch of the source tree must be grafted back, when a member joins the group after the PIM-DM device has sent a Prune message to prune unwanted traffic. Graft messages are the only PIM-DM messages that receive an acknowledgment.

If Graft messages were not used, then the member waiting for pruned off traffic would have to wait up to 3 minutes for the periodic re-flooding to occur to begin receiving multicast traffic again. By using Grafts, the Prune can be reversed much faster than waiting for periodic re-flooding to begin receiving multicast traffic again.

Examples To configure PIM-DM on the VLAN interface vlan2 to send a maximum of 10 Graft message retries, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim max-graft-retries 10
```

To configure PIM-DM on the VLAN interface vlan2 to send Graft message retries forever, which is the default behavior, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim max-graft-retries
```

Validation Commands

show ip mroute

show ip pim dense-mode mroute

show running-config

ip pim neighbor-filter (PIM-DM)

Overview Enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-DM will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim neighbor-filter [<number>|<accesslist>]
no ip pim neighbor-filter [<number>|<accesslist>]
```

Parameter	Description
<number>	*<1-99>* Standard IP access list number.
<accesslist>	IP access list name.

Default By default, there is no filtering.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim neighbor-filter 14
```

ip pim propagation-delay

Overview This command configures the PIM **propagation-delay** value. The PIM **propagation-delay** is the expected delay in the transfer of PIM messages across the VLAN interface that it is attached to.

Use the **no** variant of this command to return the **propagation-delay** to the default (1000 milliseconds).

Syntax

```
ip pim propagation-delay <delay>
no ip pim propagation-delay
```

Parameter	Description
<delay>	*<1000-5000>* The value in milliseconds. The default is 1000 milliseconds.

Default The propagation-delay is set to 1000 milliseconds by default.

Mode Interface Configuration for a VLAN interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim propagation-delay 2000
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim propagation-delay
```

ip pim state-refresh origination-interval

Overview This command configures a PIM **state-refresh origination-interval** value. The origination interval is the number of seconds between PIM state refresh control messages. The default is 60 seconds.

Use the **no** variant of this command to return the origination interval to the default.

Syntax

```
ip pim state-refresh origination-interval <interval>
no ip pim state-refresh origination-interval
```

Parameter	Description
<interval>	*<1-100>* The integer value in seconds (no fractional seconds accepted). The default **state-refresh origination-interval** value is 60.

Default The state-refresh origination-interval is set to 60 seconds by default, and is reset using negation.

Mode Interface Configuration for a VLAN interface.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim state-refresh origination-interval 65
```

service pdm

Overview Use this command to enable PIM dense mode services.

Use the **no** version of the command to disable unused PIM dense mode services.

Syntax

```
service pdm
no service pdm
```

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

Example To disable the PIM dense mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pdm
```

Output Figure 40-2: Example output from **no service pdm**

```
awplus(config)#no service pdm
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-0.1: command added

show debugging pim dense-mode

Overview This command displays the status of the debugging of the system.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show debugging pim dense-mode
```

Mode User Exec and Privileged Exec

Output Figure 40-3: Example output from the show debugging pim dense-mode command

```
PIM-DM Debugging status:

PIM-DM VR-VRF Context debugging is off
  PIM-DM Decoder debugging is off
  PIM-DM Encoder debugging is off
  PIM-DM FSM debugging is off
  PIM-DM MRT debugging is off
  PIM-DM NHOP debugging is off
  PIM-DM NSM debugging is off
  PIM-DM VIF debugging is off
```

Related commands debug pim dense-mode all

show ip pim dense-mode interface

Overview This command displays the PIM-DM interface information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim dense-mode interface
```

Mode User Exec and Privileged Exec

Example To display information about the PIM-DM interfaces, use the command:

```
awplus# show ip pim dense-mode interface
```

Output

```
Total configured interfaces: 24   Maximum allowed: 32
Total active interfaces:     22

Address          Interface VIFIndex Ver/   Nbr
                                    Mode   Count
192.168.1.53/24  vlan2     0        v2/D   2
192.168.2.1      vlan3     2        v2/D   0
...
Note that this screen has been edited to remove any additional
interfaces.
```

Table 1: Parameters in the output of the **show ip pim dense-mode interface** command

Parameter	Description
`Total configured interfaces`	The number of configured PIM Dense Mode interfaces.
`Maximum allowed`	The maximum number of PIM Dense Mode interfaces that can be configured.
`Total active interfaces`	The number of active PIM Dense Mode interfaces.
`Address`	Primary PIM-DM address.
`Interface`	Name of the PIM-DM interface.
`VIF Index`	The Virtual Interface index of the VLAN.
`Ver/Mode`	PIM version/Dense mode.
`Nbr Count`	Neighbor count of the PIM-DM interface.

Related commands

ip pim dense-mode

show ip pim dense-mode neighbor

show ip pim dense-mode interface detail

Overview This command displays detailed information on a PIM-DM interface.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ip pim dense-mode interface detail
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode interface detail
```

Output Figure 40-4: Example output from the **show ip pim dense-mode interface detail** command

```
vlan2 (vif-id: 0):

 Address 192.168.1.53/24
  Hello period 30 seconds, Next Hello in 30 seconds

  Neighbors:
   192.168.1.152/32
   192.168.1.149/32
  vlan3 (vif-id: 2):
   Address 192.168.10.53/24
   Hello period 30 seconds, Next Hello in 8 seconds
   Neighbors: none
```

show ip pim dense-mode mroute

Overview Use this command to display the IP PIM-DM multicast routing table.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ip pim dense-mode mroute
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode mroute
```

Output Figure 40-5: Example output from the **show ip pim dense-mode mroute** command

```
PIM-DM Multicast Routing Table

(192.168.10.52, 224.1.1.1)
 Source directly connected on vlan3
  State-Refresh Originator State: Originator
   Upstream IF: vlan3, State: Forwarding
   Downstream IF List:
   vlan2, in 'olist':
   Downstream State: NoInfo
   Assert State: NoInfo
```

show ip pim dense-mode neighbor

Overview This command displays PIM-DM neighbor information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim dense-mode neighbor
```

Mode User Exec and Privileged Exec

Usage notes The total number of PIM-DM neighbors is restricted to 500 PIM-DM neighbors.

When the 500 PIM-DM neighbor limit is reached, as a result of receiving hello packets from new PIM-DM neighbors, a log entry will be issued to the log file in the below format:

```
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
-----------------------------------------------------------------
2008 Dec 10 00:58:39 user.err x908 PIM-DM[1150]: [VIF] Nbr
Create: Cannot create more than 500 neighbours - ignoring
neighbour 100.0.1.247/32 on vlan100
```

Example

```
awplus# show ip pim dense-mode neighbor
```

Output Figure 40-6: Example output from the **show ip pim dense-mode neighbor** command

```
Total number of neighbors: 500
Neighbor-Address  Interface            Uptime/Expires    Ver
192.168.1.152     vlan2                17:15:42/00:01:28 v2
192.168.1.149     vlan2                17:15:34/00:01:34 v2
```

show ip pim dense-mode neighbor detail

Overview This command displays detailed PIM-DM neighbor information.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ip pim dense-mode neighbor detail
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim dense-mode neighbor detail
```

Output Figure 40-7: Example output from the **show ip pim dense-mode neighbor detail** command

```
Neighbor 192.168.1.152 (vlan2)
Up since 17:16:20, Expires in 00:01:20
Neighbor 192.168.1.149 (vlan2)
Up since 17:16:12, Expires in 00:01:26
```

show ip pim dense-mode nexthop

Overview This command displays the next hop information as used by PIM-DM. In the context of PIM-DM, the term ' **next hop**' refers to the next hop router on the path back to the source address of a multicast stream.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip pim dense-mode nexthop
```

Mode User Exec and Privileged Exec

Example
```
awplus# show ip pim dense-mode nexthop
```

Output Figure 40-8: Example output from the **show ip pim dense-mode neighbor nexthop** command

```
Destination      Nexthop    Nexthop     Nexthop       Metric Pref
                 Num        Addr        Interface
192.168.10.52    1          0.0.0.0     vlan2         3      1
```

Table 2: Parameters in the output of the **show ip pim dense-mode neighbor nexthop** command

Parameter	Description
Destination	Destination address for which PIM-DM requires next hop information.
Nexthop Num	Number of next hops to the destination. PIM can only use one next hop.
Nexthop Addr	Address of the current next hop gateway.
Nexthop Interface	Name of the next hop interface.
Metric	Metric of the route towards the destination.
Preference	Preference of the route towards the destination.

undebug all pim dense-mode

Overview Use this command from the Global Configuration mode to disable all PIM-DM debugging.

Syntax

```
undebug all pim dense-mode
```

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# undebug all pim dense-mode
```

41 Multicast Source Discovery Protocol (MSDP) Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Multicast Source Discovery Protocol (MSDP).

For more information, see the Multicast Source Discovery Protocol (MSDP) Feature Overview and Configuration Guide.

Command List

clear ip msdp sa-cache

Overview Use this command to clear all the source-active (SA) messages in the SA-cache. The SA-cache contains multicast SA messages that are being sent to or received from MSDP peers.

Syntax
```
clear ip msdp sa-cache
```

Mode Privileged Exec

Example To remove all entries in the SA-cache, use the commands:

```
awplus# clear ip msdp sa-cache
```

Related commands show ip msdp sa-cache

Command changes Version 5.5.1-0.1: command added

debug msdp

Overview Use this command to enable debugging for MSDP.

Use the **no** variant of this command to disable debugging for MSDP.

Syntax

```
debug msdp all
debug msdp state
debug msdp packet [in|out]
no debug msdp all
no debug msdp state
no debug msdp packet [in|out]
```

Parameter	Description
`all`	Enable all MSDP debugging options.
`state`	Enable debugging for the MSDP peer state.
`packet`	Enable debugging for MSDP packets.
`in`	Enable debugging for incoming MSDP packets.
`out`	Enable debugging for outgoing MSDP packets.

Default Debugging is disabled.

Mode Global Configuration or Privileged Exec

Example To enable debugging for the MSDP peer state, use the command:

```
awplus# debug msdp state
```

To enable debugging for incoming MSDP packets, use the command:

```
awplus# debug msdp packet in
```

To disable all MSDP debugging, use the command:

```
awplus# no debug msdp all
```

Related commands debug msdp timer

show debugging msdp

Command changes Version 5.5.1-0.1: command added

debug msdp timer

Overview Use this command to enable debugging for the specified MSDP timers.

Use the **no** variant of this command to disable debugging for MSDP timers.

Syntax

```
debug msdp timer [connect|hold|keep-alive|sa-advert|sa-state]
no debug msdp timer
[connect|hold|keep-alive|sa-advert|sa-state]
```

Parameter	Description
`connect`	Debugging for the connect retry timer.
`hold`	Debugging for the peer hold-time timer.
`keep-alive`	Debugging for the keep-alive timer.
`sa-advert`	Debugging for the SA-advertisement timer.
`sa-state`	Debugging for the SA-cache timer.

Default Debugging is disabled.

Mode Privileged Exec

Example To enable debugging for all timers, use the command:

```
awplus# debug msdp timer
```

To enable debugging for the connect retry timer, use the command:

```
awplus# debug msdp timer connect
```

To disable debugging for the peer hold-time timer, use the command:

```
awplus# no debug msdp timer hold
```

Related commands debug msdp

show debugging msdp

Command changes Version 5.5.1-0.1: command added

ip msdp hold-time

Overview Use this command to configure the global MSDP hold-time timeout.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to reset the hold-time timeout to the default (75 seconds).

Syntax

```
ip msdp hold-time <15-75>
no ip msdp hold-time
```

Parameter	Description
<15-75>	The hold-time timeout (in seconds).

Default 75 seconds.

Mode Global Configuration

Example To configure the hold-time timeout to 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp hold-time 60
```

To reset the hold-time timeout to the default of 75 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp hold-time
```

ip msdp mesh-group member hold-time

ip msdp mesh-group member keep-alive

ip msdp peer

ip msdp peer hold-time

ip msdp peer keep-alive

ip msdp sa-cache-timeout

Command changes Version 5.5.1-0.1: command added

ip msdp keep-alive

Overview Use this command to configure the global MSDP keep-alive timeout.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to reset the keep-alive timeout to the default (60 seconds).

Syntax

```
ip msdp keep-alive <10-60>
no ip msdp keep-alive
```

Parameter	Description
<10-60>	The keep-alive timeout (in seconds).

Default 60 seconds.

Mode Global Configuration

Example To configure the keep-alive timeout to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp keep-alive 45
```

To reset the keep-alive timeout to the default of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp keep-alive
```

ip msdp peer keep-alive

ip msdp sa-cache-timeout

Command changes Version 5.5.1-0.1: command added

ip msdp mesh-group

Overview Use this command to create an MSDP mesh-group with an associated local source address.

Use the **no** variant of this command to delete an MSDP mesh-group.

Syntax

```
ip msdp mesh-group <group-name> local-address <ip-address>
no ip msdp mesh-group <group-name>
```

Parameter	Description
<group-name>	The name of the MSDP mesh-group.
<ip-address>	The IPv4 local address.

Default No mesh-groups are configured.

Mode Global Configuration

Example To create an MSDP mesh-group named 'group' with a local address of 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group local-address
192.168.1.5
```

To delete an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group
```

Command changes Version 5.5.1-0.1: command added

ip msdp mesh-group member

Overview Use this command to include an MSDP peer as a member of an MSDP mesh-group. The mesh-group needs to be configured with the ip msdp mesh-group command before members can be added.

Use the **no** variant of this command to remove an MSDP peer from an MSDP mesh-group.

Syntax

```
ip msdp mesh-group <group-name> member <ip-address>
no ip msdp mesh-group <group-name> member <ip-address>
```

Parameter	Description
<group-name>	The name of the MSDP mesh-group.
<ip-address>	The IPv4 address of the peer.

Default Peers are not included in a mesh-group.

Mode Global Configuration

Example To add the peer at 192.168.1.3 to an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group member 192.168.1.3
```

To remove the peer at 192.168.1.3 from an MSDP mesh-group named 'group', use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group member 192.168.1.3
```

Command changes Version 5.5.1-0.1: command added

ip msdp mesh-group member hold-time

Overview Use this command to configure the MSDP hold-time timeout for an MSDP mesh-group member.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to delete the mesh-group member-specific hold-time timeout.

Syntax

```
ip msdp mesh-group <group-name> member <ip-address> hold-time
<15-75>
```

```
no ip msdp mesh-group <group-name> member <ip-address>
hold-time
```

Parameter	Description
<group-name>	The name of a mesh-group.
<ip-address>	The IPv4 address of the mesh-group member.
<15-75>	The hold-time timeout (in seconds).

Default MSDP mesh-group members use the global hold-time timeout (75 seconds by default).

Mode Global Configuration

Example To configure the hold-time timeout for a member of mesh-group 'group' at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# ip msdp mesh-group group 192.168.1.5 hold-time
45
```

To delete the specific hold-time timeout configured for the member at 192.168.1.5, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ip msdp mesh-group group 192.168.1.5
hold-time
```

Command changes

Version 5.5.1-0.1: command added

ip msdp mesh-group member keep-alive

Overview Use this command to configure the MSDP keep-alive timeout for an MSDP mesh-group member.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to delete the mesh-group member-specific keep-alive timeout.

Syntax

```
ip msdp mesh-group <group-name> member <ip-address> keep-alive
<10-60>
```

```
no ip msdp mesh-group <group-name> member <ip-address>
keep-alive
```

Parameter	Description
<group-name>	The name of a mesh-group.
<ip-address>	The IPv4 address of the mesh-group member.
<10-60>	The keep-alive timeout (in seconds).

Default MSDP mesh-group members use the global keep-alive timeout (60 seconds by default).

Mode Global Configuration

Example To configure the keep-alive timeout for a member of mesh-group 'group' at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp mesh-group group 192.168.1.5 keep-alive
45
```

To delete the specific keep-alive timeout configured for the member at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp mesh-group group 192.168.1.5
keep-alive
```

Command changes

Version 5.5.1-0.1: command added

ip msdp peer

Overview Use this command to configure a new MSDP peer.

Use the **no** variant of this command to remove an MSDP peer.

Syntax

```
ip msdp peer <ip-address> local-address <local-address>
no ip msdp peer <ip-address> [local-address <local-address>]
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
<local-address>	The local IPv4 address to listen and send from.

Default No MSDP peers are configured.

Mode Global Configuration

Example To configure an MSDP peer at 192.168.1.3 with a local address of 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.3 local-address
192.168.1.5
```

ip msdp peer hold-time

Overview Use this command to configure the MSDP hold-time timeout for an MSDP peer.

The hold-time timeout defines how long a peer will wait between MSDP messages before dropping the connection. It is important that the hold-time timeout is greater than the keep-alive timeout configured on each peer. The global hold-time will be overridden if a specific hold-time timeout is configured for an individual peer.

Use the **no** variant of this command to delete the peer-specific hold-time timeout.

Syntax

```
ip msdp peer <ip-address> hold-time <15-75>
no ip msdp peer <ip-address> hold-time
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
<15-75>	The hold-time timeout (in seconds).

Default MSDP peers use the global hold-time timeout (75 seconds by default).

Mode Global Configuration

Example To configure the hold-time timeout for the peer at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 hold-time 45
```

To delete the specific hold-time timeout configured for the peer at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 hold-time
```

Command changes Version 5.5.1-0.1: command added

ip msdp peer keep-alive

Overview Use this command to configure the MSDP keep-alive timeout for an MSDP peer.

The keep-alive timeout defines the period between keep-alive messages being sent to each peer. It is important that the keep-alive timeout is less than the hold-time timeout configured on each peer device. The global keep-alive will be overridden if a specific keep-alive timeout is configured for an individual peer.

Use the **no** variant of this command to delete the peer-specific keep-alive timeout.

Syntax

```
ip msdp peer <ip-address> keep-alive <10-60>
no ip msdp peer <ip-address> keep-alive
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
<10-60>	The keep-alive timeout (in seconds).

Default MSDP peers use the global keep-alive timeout (60 seconds by default).

Mode Global Configuration

Example To configure the keep-alive timeout for the peer at 192.168.1.5 to 45 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 keep-alive 45
```

To delete the specific keep-alive timeout configured for the peer at 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 keep-alive
```

Command changes Version 5.5.1-0.1: command added

ip msdp peer rp-filter

Overview Use this command to configure filters for incoming and outgoing SA messages for a peer based on the RP address. You can configure filters for a peer to permit or deny SA messages based on the RP addresses. The filters use an access list where the source must match the SA RP address; the destination address is unused.

Use the **no** variant of this command to remove the filters.

Syntax

```
ip msdp peer <ip-address> rp-filter in
{<100-199>|<2000-2699>|<access-list>}
```

```
ip msdp peer <ip-address> rp-filter out
{<100-199>|<2000-2699>|<access-list>}
```

```
no ip msdp peer <ip-address> rp-filter [in|out]
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
in	The incoming filter.
out	The outgoing filter.
<100-199>	IP extended access list.
<2000-2699>	IP extended access list (expanded range).
<access-list>	Access list name.

Default No RP filters are configured.

Mode Global Configuration

Example To configure an incoming RP filter for 192.168.1.5 using IP extended access list 100, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 100 permit ip 172.16.48.133/32
1.1.1.1/32
awplus(config)# ip msdp peer 192.168.1.5 rp-filter in 100
```

To configure an outgoing RP filter for 192.168.1.5 using an access list named 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 rp-filter out list1
```

To remove an incoming RP filter for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 rp-filter in
```

To remove all RP filters for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 rp-filter
```

Related commands

ip msdp peer

ip msdp peer sg-filter

show ip msdp peer

Command changes

Version 5.5.1-0.1: command added

ip msdp peer sg-filter

Overview Use this command to configure filters for a peer to permit or deny SA messages based on the source and group addresses. The filters use an access list where the source must match the SA source address, and the destination must match the SA group address.

Use the **no** variant of this command to remove the filters.

Syntax

```
ip msdp peer <ip-address> sg-filter in
{<100-199>|<2000-2699>|<access-list>}
```

```
ip msdp peer <ip-address> sg-filter out
{<100-199>|<2000-2699>|<access-list>}
```

```
no ip msdp peer <ip-address> sg-filter [in|out]
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
in	The incoming filter.
out	The outgoing filter.
<100-199>	IP extended access list.
<2000-2699>	IP extended access list (expanded range).
<access-list>	Access list name.

Default No SG filters are configured.

Mode Global Configuration

Example To configure an incoming SG filter for 192.168.1.5 using IP extended access list 100, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 100 permit ip 172.16.48.133/32
1.1.1.1/32
awplus(config)# ip msdp peer 192.168.1.5 sg-filter in 100
```

To configure an outgoing SG filter for 192.168.1.5 using an access list named 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 sg-filter out list1
```

To remove an incoming SG filter for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 sg-filter in
```

To remove all SG filters for 192.168.1.5, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 sg-filter
```

Related commands

ip msdp peer rp-filter

show ip msdp peer

Command changes

Version 5.5.1-0.1: command added

ip msdp sa-cache-timeout

Overview Use this command to configure the MSDP Source-Active cache expiry timeout. The MSDP Source-Active cache timeout determines how long entries can exist in the cache before they expire.

Use the **no** variant of this command to reset the timeout to the default (75 seconds).

Syntax

```
ip msdp sa-cache-timeout <75-300>
no ip msdp sa-cache-timeout
```

Parameter	Description
<75-300>	How long cache entries exist before they expire (in seconds).

Default 75 seconds

Mode Global Configuration

Example To configure the MSDP Source-Active cache timeout to 255 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp sa-cache-timeout 255
```

To reset the MSDP Source-Active cache timeout to the default of 75 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp sa-cache-timeout
```

Command changes Version 5.5.1-0.1: command added

msdp default peer

Overview Use this command to configure an MSDP peer as a default peer. SA messages from the default peer will be accepted without Peer Reverse Path Forwarding (Peer-RPF) checks for the peer address against the advertised RP. It is possible to configure multiple default peers, however only one of the active peers that are configured as default will be recognized as the default.

Use the **no** variant of this command to remove an MSDP peer as a default peer.

Syntax

```
ip msdp peer <ip-address> default-peer
no ip msdp peer <ip-address> default-peer
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.

Default No default peer is configured.

Mode Global Configuration

Example To configure existing MSDP peer 192.168.1.5 as the default peer, use the commands:

```
awplus# configure terminal
awplus(config)# ip msdp peer 192.168.1.5 default-peer
```

To remove MSDP peer 192.168.1.5 as the default peer, use the commands:

```
awplus# configure terminal
awplus(config)# no ip msdp peer 192.168.1.5 default-peer
```

Related commands ip msdp peer

show ip msdp peer

Command changes Version 5.5.1-0.1: command added

show debugging msdp

Overview Use this command to display which MSDP debugging options are currently enabled. Debugging is either on or off for each option.

Syntax

```
show debugging msdp
```

Mode Privileged Exec

Example To display which MSDP debugging options are enabled, use the command:

```
awplus# show debugging msdp
```

Output Figure 41-1: Example output from **show debugging msdp**

```
awplus# show debugging msdp
MSDP debugging status:
  MSDP state debugging is on
  MSDP incoming packet debugging is on
  MSDP outgoing packet debugging is off
  MSDP peer hold timer debugging is off
  MSDP peer connect timer debugging is off
  MSDP peer keep-alive timer debugging is off
  MSDP source-active state timer debugging is on
  MSDP source-active advertisement timer debugging is off
```

Table 41-1: Parameters in the output from **show debugging msdp**

Parameter	Description
MSDP state	If enabled, shows when a peer has a change of state.
MSDP incoming packet	If enabled, shows when MSDP packets are received by the device.
MSDP outgoing packet	If enabled, shows when MSDP packets are transmitted by the device.
MSDP peer hold timer	If enabled, shows activity related to the peer hold timer, for example, when the timer starts, expires, or is reset.
MSDP peer connect timer	If enabled, shows activity related to the peer hold timer, for example, when the timer starts or expires.
MSDP peer keep-alive timer	If enabled, shows activity related to the peer keep-alive timer, for example, when the timer starts, expires, or is reset.

Table 41-1: Parameters in the output from **show debugging msdp** (cont.)

Parameter	Description
MSDP source-active state timer	If enabled, shows activity related to the source-active state timer, for example, when the timer starts, expires, or is reset.
MSDP source-active advertisement timer	If enabled, shows activity related to the source-active advertisement timer, for example, when the timer starts, expires, or is reset.

Command changes

Version 5.5.1-0.1: command added

show ip msdp mesh-group

Overview Use this command to show information about the MSDP mesh-groups and the members within them.

Syntax

```
show ip msdp mesh-group [detail]
show ip msdp mesh-group <group-name> [detail]
show ip msdp mesh-group <group-name> member <ip-address>
[detail]
```

Parameter	Description
`detail`	Show detailed information about the mesh groups.
<group-name>	The name of a mesh-group.
<ip-address>	The IPv4 address of a member of the mesh-group.

Mode Privileged Exec

Example To show brief information about every mesh-group and the members within, use the command:

```
awplus# show ip msdp mesh-group
```

To show information about mesh-group 'group2' and all of its members, use the command:

```
awplus# show ip msdp mesh-group group2
```

To show information about member 172.16.48.133 inside mesh-group 'group2', use the commands:

```
awplus# show ip msdp mesh-group group2 member 172.16.48.133
```

To show detailed information about member 172.16.48.133 inside mesh-group 'group2', use the commands:

```
awplus# show ip msdp mesh-group group2 member 172.16.48.133
detail
```

Output Figure 41-2: Example output from **show ip msdp mesh-group**

```
awplus# show ip msdp mesh-group

Table 41-2: Parameters in the output from **show ip msdp mesh-group**

Parameter	Description
Default peer	Yes, if the peer is a default peer, and No if not.
Mesh-group	If the peer is a member of a mesh-group then the name of the mesh-group will be displayed, otherwise "--".
Keep Alive receive	The number of keep alive messages the peer has received.
Keep Alive transmit	The number of keep alive messages the peer has transmitted.
Keep Alive receive error	The number of keep alive messages that have been received that contained errors.
Source active receive	The number of source active messages the peer has received.
Source active transmit	The number of source active messages the peer has transmitted.
Source active receive error	The number of source active messages that have been received that contained errors.
Unknown TLV receive	The number of messages received by the peer that were not keep alive or source active messages.
Peer Hold	The seconds remaining until the peer hold timer expires, at which point the peer connection ends.
Keep Alive	The seconds remaining until the keep alive timer expires, at which point the peer will send out a keep alive message.
Connect Retry	The seconds remaining till the connect retry timer expires, at which point another attempt is made to connect to the peer.

Table 41-2: Parameters in the output from **show ip msdp mesh-group** (cont.)

Parameter	Description
SG filter out	The name of the filter based on the source and group address of outgoing source active messages.
SG filter in	The name of the filter based on the source and group address of incoming source active messages.
RP filter out	The name of the filter based on the RP address of outgoing source active messages.
RP filter in	The name of the filter based on the RP address of incoming source active messages.
Out permit	The number of SA messages that have been permitted to send.
Out deny	The number of SA messages that have been denied from being sent.
In permit	The number of SA messages that have been permitted to be received.
In deny	The number of SA messages that have been denied to be received.

Command changes

Version 5.5.1-0.1: command added

show ip msdp peer

Overview Use this command to display MSDP peers, their addresses, and their current status. Use the **detail** parameter to display additional information on timers, filters, and counters.

Syntax

```
show ip msdp peer [<ip-address>] [detail]
```

Parameter	Description
<ip-address>	The IPv4 address of the peer.
detail	Display additional information on timers, filters, and counters.

Mode Privileged Exec

Example To show the results for all MSDP peers, use the command:

```
awplus# show ip msdp peer
```

To show the results for MSDP peer 192.168.1.3, use the command:

```
awplus# show ip msdp peer 192.168.1.3
```

To show detailed results for MSDP peer 192.168.1.3, use the command:

```
awplus# show ip msdp peer 192.168.1.3 detail
```

Output Figure 41-6: Example output from **show ip msdp peer**

ip msdp peer rp-filter

ip msdp peer sg-filter

msdp default peer

show ip msdp sa-cache

Command changes Version 5.5.1-0.1: command added

show ip msdp sa-cache

Overview Use this command to display information about the MSDP Source Address Cache (SA-cache) entries.

Entries that are Local (Yes) are learned from the local multicast route table. They will expire when they are removed from the local multicast route table, and the MSDP expiry is always set to 0. Local entries will be advertised to MSDP peers.

Entries that are Local (No) have been received via an MSDP SA-message from an MSDP peer. They will expire when the expiry timer reaches 0, unless they are refreshed from the peer. SA-cache entries that are not local are advertised to PIM.

Syntax
```
show ip msdp sa-cache
```

Mode Privileged Exec

Example To show information about the MSDP SA-cache entries, use the command:

```
awplus# show ip msdp sa-cache
```

Output Figure 41-9: Example output from **show ip msdp sa-cache**

```
awplus# show ip msdp sa-cache

MSDP Source-Active cache:

Source-Active advertisement expiry (secs): 51

RP Address     Source Address  Group Address  Local  Expiry (secs)
-----------------------------------------------------------------
172.16.48.133  10.36.20.1      232.0.0.8      Yes               0
172.16.48.133  10.36.20.1      239.254.1.1    Yes               0
172.16.48.133  10.36.20.1      239.254.1.2    Yes               0
172.16.48.133  10.36.20.1      239.254.1.3    Yes               0
172.16.48.133  10.36.20.1      239.254.1.4    Yes               0
172.16.48.133  10.36.20.1      239.254.1.7    Yes               0
172.16.48.133  10.36.20.1      239.254.1.8    Yes               0
172.16.48.133  10.36.20.1      239.254.1.9    Yes               0
```

Table 41-4: Parameters in the output from **show ip msdp sa-cache**

Parameter	Description
Source-Active advertisement expiry (secs)	The number of seconds until the RP will advertise its sources by sending out SA messages.
RP Address	The RP address of the cache entry.
Source Address	The source address of the cache entry.
Group Address	The group address of the cache entry.

Table 41-4: Parameters in the output from **show ip msdp sa-cache** (cont.)

Parameter	Description
Local	Whether the entry is local, Yes or No.
Expiry (secs)	The number of seconds until the entry expires.

Part 5: Access and Security

42 IPv4 Hardware Access Control List (ACL) Commands

Introduction

Overview This chapter provides an alphabetical reference of IPv4 Hardware Access Control List (ACL) commands. It contains detailed command information and command examples about IPv4 hardware ACLs, which you can apply directly to interfaces using the access-group command.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself.

Most ACL command titles include information in parentheses:

- When the command title ends with words in parentheses, these words indicate usage instead of keywords to enter into the CLI. For example, the title **access-list (numbered hardware ACL for ICMP)** indicates that the command is used to create an ACL with the syntax:

```
access-list <3000-3699> <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>]
```

- When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named hardware ACL: ICMP entry)** represents a command with the syntax:

```
[<sequence-number>] <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Sub-modes Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 42-1: IPv4 Hardware Access List Commands and Prompts

Command Name	Command Mode	Prompt
show interface access-group	Privileged Exec	awplus#
show access-list (IPv4 Hardware ACLs)	Privileged Exec	awplus#
show acl-group ip address	Privileged Exec	awplus#
show acl-group ip port	Privileged Exec	awplus#
show interface access-group	Privileged Exec	awplus#
access-list (numbered hardware ACL for IP packets)	Global Configuration	awplus(config)#
access-list (numbered hardware ACL for ICMP)	Global Configuration	awplus(config)#
access-list (numbered hardware ACL for IP protocols)	Global Configuration	awplus(config)#
access-list (numbered hardware ACL for TCP or UDP)	Global Configuration	awplus(config)#
access-list (numbered hardware ACL for MAC addresses)	Global Configuration	awplus(config)#
access-list hardware (named hardware ACL)	Global Configuration	awplus(config)#
acl-group ip address	Global Configuration	awplus(config)#
acl-group ip port	Global Configuration	awplus(config)#
(named hardware ACL entry for IP packets)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
(named hardware ACL entry for ICMP)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
(named hardware ACL entry for IP protocols)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
(named hardware ACL entry for TCP or UDP)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
(named hardware ACL entry for MAC addresses)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
commit (IPv4)	IPv4 Hardware ACL Configuration	awplus(config-ip-hw-acl)#
ip (ip-host-group)	ACL Host Group Configuration	awplus(config-ip-host-group)#
(acl-group ip port range)	ACL Port Group Configuration	awplus(config-ip-port-group)#
access-group	Interface Configuration	awplus(config-if)#

References

For descriptions of ACLs, and further information about rules when applying them, see the ACL Feature Overview and Configuration Guide.

Command List

access-group

Overview This command adds or removes a hardware-based access-list to or from a switch port interface or interfaces. The number of hardware numbered and named access-lists that can be added to a switch port interface is determined by the available memory in hardware-based packet classification tables.

This command works in Interface Configuration mode to apply hardware access-lists to selected switch port interfaces.

The **no** variant of this command removes the selected access-list from an interface.

Syntax

```
access-group
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]
```

```
no access-group
[<3000-3699>|<4000-4699>|<hardware-access-list-name>]
```

Parameter	Description
<3000-3699>	Hardware IP access-list.
<4000-4699>	Hardware MAC access-list.
<hardware-access-list-name>	The hardware access-list name.

Mode Interface Configuration for a switch port interface or interfaces

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage notes First create an IP access-list that applies the appropriate permit/deny requirements with the access-list (numbered hardware ACL for IP packets) command, the access-list (numbered hardware ACL for MAC addresses) command or the access-list hardware (named hardware ACL) command. Then use this command to apply this hardware access- list to a specific port or port range. Note that this command will apply the access-list only to incoming data packets.

To apply ACLs to an LACP aggregated link, apply it to all the individual switch ports in the aggregated group. To apply ACLs to a static channel group, apply it to the static channel group itself. An ACL can even be applied to a static aggregated link that spans more than one switch instance (Link Aggregation Commands).

Note that you cannot apply software numbered ACLs to switch port interfaces with the access-group command. This command will only apply hardware ACLs.

NOTE: *Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.*

Examples

To add the numbered hardware access-list 3005 to switch port interface port1.0.1, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# access-group 3005
```

To add the named hardware access-list "hw-acl" to switch port interface port1.0.2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# access-group hw-acl
```

To apply an ACL to static channel group 2 containing switch port1.0.3 and port1.0.4, use the commands:

```
awplus# configure terminal

```

Related commands

access-list hardware (named hardware ACL)

access-list (numbered hardware ACL for IP packets)

access-list (numbered hardware ACL for MAC addresses)

show interface access-group

access-list (numbered hardware ACL for ICMP)

Overview This command creates an access-list for use with hardware classification. The access-list will match on ICMP packets that have the specified source and destination IP addresses and, optionally, ICMP type. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
access-list <3000-3699> <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>]

no access-list <3000-3699>
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description	
<3000-3699>	An ID number for this hardware IP access-list.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`icmp`	Match against ICMP packets	
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`host` *<ip-addr>*	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.
	`host` *<ip-addr>*	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.

Parameter	Description	
	<ip-addr> <reverse-mask>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
`icmp-type` *<number>*	The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:	
	0	Echo replies.
	3	Destination unreachable messages.
	4	Source quench messages.
	5	Redirect (change route) messages.
	8	Echo requests.
	11	Time exceeded messages.
	12	Parameter problem messages.
	13	Timestamp requests.
	14	Timestamp replies.
	15	Information requests.
	16	Information replies.
	17	Address mask requests.
	18	Address mask replies.
`vlan` *<1-4094>*	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

ICMP ACLs will match any ICMP packet that has the specified source and destination IP addresses and ICMP type. The ICMP type is an optional parameter.

Examples

To create an access-list that will permit ICMP packets with a source address of 192.168.1.0/24 with any destination address and an ICMP type of 5 enter the following commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit icmp 192.168.1.0/24 any icmp-type 5
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

access-list (numbered hardware ACL for IP packets)

Overview

This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
access-list <3000-3699> <action> ip <source-ip> <dest-ip> [vlan <1-4094>]
no access-list <3000-3699>
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Table 42-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

Parameter	Description	
<3000-3699>	An ID number for this hardware IP access-list.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`ip`	Match against IP packets	
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`host` *<ip-addr>*	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.
	`host` *<ip-addr>*	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.

Table 42-2: IP and ICMP parameters in **access-list (hardware IP numbered)**

Parameter	Description	
	<ip-addr> *<reverse-mask>*	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
`vlan <1-4094>`	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

Examples To create an access-list that will permit IP packets with a source address of 192.168.1.1 and any destination address, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit ip 192.168.1.1/32 any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

access-list (numbered hardware ACL for IP protocols)

Overview This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination IP addresses and IP protocol number. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

The optional **vlan** parameter can be used to match tagged (802.1q) packets.

The **no** variant of this command removes the previously specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
access-list <3000-3699> <action> proto <1-255> <source-ip>
<dest-ip> [vlan <1-4094>]

no access-list <3000-3699>
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Table 42-3: Parameters in **access-list (hardware IP numbered)**

Parameter	Description	
<3000-3699>	An ID number for this hardware IP access-list.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`proto` *<1-255>*	The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.	
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`host` *<ip-addr>*	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.
	`host` *<ip-addr>*	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.

Table 42-3: Parameters in **access-list (hardware IP numbered)** (cont.)

Parameter	Description	
	<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
`vlan` *<1-4094>*	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Table 42-4: IP protocol number and description

139-252	Unassigned / IANA
253	Use for experimentation and testing / RFC3692
254	Use for experimentation and testing / RFC3692
255	Reserved / IANA

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

Examples To create an access-list that will deny all IGMP packets (IP protocol 2) from the 192.168.0.0 network, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 deny proto 2 192.168.0.0/16
any
```

To destroy the access-list with an access-list identity of 3000 enter the following commands:

```
awplus# configure terminal
awplus(config)# no access-list 3000
```

access-list (numbered hardware ACL for MAC addresses)

Overview

This command creates an access-list for use with hardware classification. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination address if an address does not matter.

Once you have configured the ACL, you can use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified MAC hardware filter access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
access-list <4000-4699> <action> {<source-mac>|any}
{<dest-mac>|any} [vlan <1-4094>] [inner-vlan
<1-4094>]

no access-list <4000-4699>
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<4000-4699>	An ID number for this hardware IP access-list.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
<source-mac>	The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
`any`	Match against any source MAC address.
<dest-mac>	The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
`any`	Match against any destination MAC address.
`vlan` *<1-4094>*	Match against the specified ID in the packet's VLAN tag.
`inner-vlan` *<1-4094>*	Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), where the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 4000-4699 match on packets that have the specified source and destination MAC addresses.

Examples

To create an access-list that will permit packets with a source MAC address of 0000.00ab.1234 and any destination address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4000 permit 0000.00ab.1234
0000.0000.0000 any
```

To create an access-list that will permit packets if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit 0000.00ab.1234
0000.0000.FFFF any
```

To create an access-list that will send a copy of packets to the mirror port if their source MAC address starts with 0000.00ab, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 copy-to-mirror 0000.00ab.1234
0000.0000.FFFF any
```

You also need to configure the mirror port with the mirror interface command.

To destroy the access-list with an access-list identity of 4000 enter the commands:

```
awplus# configure terminal
awplus(config)# no access-list 4000
```

access-list (numbered hardware ACL for TCP or UDP)

Overview

This command creates an access-list for use with hardware classification. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

Once you have configured the ACL, you can use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

You can use the optional **vlan** parameter to match tagged (802.1q) packets.

The **no** variant of this command removes the specified IP hardware access-list.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
access-list <3000-3699> <action> {tcp|udp} <source-ip>
[<source-ports>] <dest-ip> [<dest-ports>] [vlan <1-4094>]

no access-list <3000-3699>
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description	
<3000-3699>	An ID number for this hardware IP access-list.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`tcp`	Match against TCP packets.	
`udp`	Match against UDP packets.	
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`host` *<ip-addr>*	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<source-ports>	Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:	
	`eq` <0-65535>	Match a single port number.
	`lt` <0-65535>	Match all port numbers that are less than the specified port number.
	`gt` <0-65535>	Match all port numbers that are greater than the specified port number.
	`ne` <0-65535>	Match all port numbers except the specified port number.

Parameter	Description	
	`range <start-port> <end-port>`	Match a range of port numbers.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.
	`host <ip-addr>`	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ports>	Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:	
	`eq <0-65535>`	Match a single port number.
	`lt <0-65535>`	Match all port numbers that are less than the specified port number.
	`gt <0-65535>`	Match all port numbers that are greater than the specified port number.
	`ne <0-65535>`	Match all port numbers except the specified port number.
	`range <start-port> <end-port>`	Match a range of port numbers.
`vlan <1-4094>`	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode Global Configuration

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes This command creates an ACL for use with hardware classification. Once you have configured the ACL, use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

ACLs numbered in the range 3000-3699 match on packets that have the specified source and destination IP addresses.

Examples

To create an access-list that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 permit tcp any 192.168.1.1/32 eq 80
```

To create an access-list that will copy TCP packets to the mirror port, if they have a destination address of 192.168.1.1, a destination port of 80, and any source address and source port, enter the commands:

```
awplus# configure terminal
awplus(config)# access-list 3000 copy-to-mirror tcp any 192.168.1.1/32 eq 80
```

You also need to configure the mirror port with the mirror interface command.

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

access-list hardware (named hardware ACL)

Overview This command creates a named hardware access-list and puts you into IPv4 Hardware ACL Configuration mode, where you can add filter entries to the ACL.

Once you have configured the ACL, you can use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map.

The **no** variant of this command removes the specified named hardware ACL.

Syntax

```
access-list hardware <name>
no access-list hardware <name>
```

Parameter	Description
<name>	Specify a name for the hardware ACL.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage notes Use this command to name a hardware ACL and enter the IPv4 Hardware ACL Configuration mode. If the named hardware ACL does not exist, it will be created after entry. If the named hardware ACL already exists, then this command puts you into IPv4 Hardware ACL Configuration mode for that existing ACL.

Entering this command moves you to the IPv4 Hardware ACL Configuration mode (config-ip-hw-acl prompt), so you can enter ACL filters with sequence numbers. From this prompt, configure the filters for the ACL. See the ACL Feature Overview and Configuration Guide for complete examples of configured sequenced numbered ACLs.

NOTE: *Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.*

Examples To create the hardware access-list named “ACL-1” and enter the IPv4 Hardware ACL Configuration mode to specify the ACL filter entry, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware ACL-1
awplus(config-ip-hw-acl)#
```

To remove the hardware access-list named “ACL-1”, use the commands:

```
awplus# configure terminal
awplus(config)# no access-list hardware ACL-1
```

acl-group ip address

Overview Use this command to create a new named IPv4 ACL group that contains one or more IPv4 host or subnets.

This command creates a named IPv4 ACL group and enters the ACL Host Group config mode. IPv4 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv4 hosts.

Use the **no** variant of this command to delete an IPv4 ACL group.

Syntax

```
acl-group ip address <group>
no acl-group ip address <group>
```

Parameter	Description
<group>	The name of the IPv4 ACL group.

Default No ACL groups exist by default.

Mode Global Configuration

Example To create an IPv4 ACL group named IPV4 _GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv4 ACL group named IPV4 _GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip address IPV4_GROUP1
```

Related commands ip (ip-host-group)

show acl-group ip address

Command changes Version 5.5.0-1.1: command added

acl-group ip port

Overview Use this command to create a new named port ACL group that contains one or more port rules for an ACL.

This command creates a named port ACL group and enters the ACL Port Group config mode. Port matching rules can be added to or removed from this group. This host group can be used to match on source or destination ports when used with an ACL.

Use the **no** variant of this command to delete a port ACL group.

Syntax

```
acl-group ip port <group>
no acl-group ip port <group>
```

Parameter	Description
<group>	The name of the port ACL group.

Default No ACL groups exist by default.

Mode Global Configuration

Example To create a port ACL group named PORT_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)#
```

To delete a port ACL group named PORT_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ip port PORT_GROUP1
```

Related commands (acl-group ip port range)

show acl-group ip port

Command changes Version 5.5.0-1.1: command added

(acl-group ip port range)

Overview Use this command to add one or more protocol port rules on a port ACL group. These port matching rules are used to simplify large ACL configs where many ACLs block or permit on the same service ports.

Use the **no** variant of this command to remove a rule match on protocol ports.

Syntax

```
eq <0-65535>
lt <0-65535>
gt <0-65535>
ne <0-65535>
range <0-65535> <0-65535>
no eq <0-65535>
no lt <0-65535>
no gt <0-65535>
no ne <0-65535>
no range <0-65535> <0-65535>
```

Parameter	Description
`eq`	The protocol port matches if equal to this number.
`lt`	The protocol port matches if less than this number.
`gt`	The protocol port matches if greater than this number.
`ne`	The protocol port matches if not equal to this number.
`range`	The protocol port matches if it is in this range.
<0-65535>	The port number.

Default The port ACL group will match on all ports by default.

Mode IP ACL Port Group Configuration

Example To add the rule match on protocol ports equal to 20 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# eq 20
```

To add the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# range 20 50
```

To add the rule match on protocol ports greater than 20 except 30 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# gt 20
awplus(config-ip-port-group)# ne 30
```

To remove the rule match on protocol ports between 20 and 50 on a port ACL group, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip port PORT_GROUP1
awplus(config-ip-port-group)# no range 20 50
```

Version 5.5.0-1.1: command added

clear access-list counters

Overview Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

Syntax

```
clear access-list counters [<acl>]
```

Parameter	Description
<acl>	Clear the counters for only the specified ACL. You can enter the ACL name or number.

Mode Privileged Exec

Usage notes To view the counter values, use the command show access-list counters.

Example To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

Related commands show access-list counters

Command changes Version 5.5.2-2.1: command added

commit (IPv4)

Overview Use this command to commit the IPv4 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv4 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv4 ACLs to synchronize.

Syntax

```
commit
```

Mode IPv4 Hardware ACL Configuration

Usage notes Normally, when an IPv4 hardware ACL is edited, the new configuration state of the IPv4 ACL is not written to hardware until you exit IPv4 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the exit command to exit configuration modes, potentially leading to IPv4 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv4 hardware ACL filter ensures that it is updated in the hardware immediately.

Example To update the hardware with the IPv4 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# access-list hardware my-hw-list
awplus(config-ip-hw-acl)# commit
```

Related commands access-list hardware (named hardware ACL)

ip (ip-host-group)

Overview Use this command to add an IPv4 host or subnet to an IPv4 ACL group. Adding IPv4 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv4 host or subnet from an IPv4 ACL group.

Syntax

```
ip {any|<match-ip>}
no ip {any|<match-ip>}
```

Parameter	Description	
`any`	Match any IP address.	
<match-ip>	The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses:	
	<ip-addr>	Match a single host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask>	Match any IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.

Default No hosts or subnets are in an IPv4 ACL group by default.

Mode IP ACL Host Group Configuration

Example To add the subnet 192.168.1.0/24 to an IPv4 ACL group IPV4_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# ip 192.168.1.0/24
```

To remove the subnet 192.168.1.0/24 from an IPv4 ACL group IPV4_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ip address IPV4_GROUP1
awplus(config-ip-host-group)# no ip 192.168.1.0/24
```

Related commands

acl-group ip address

show acl-group ip address

Command changes

Version 5.5.0-1.1: command added

(named hardware ACL entry for ICMP)

Overview

Use this command to add a new ICMP filter entry to the current hardware access-list. The filter will match on any ICMP packet that has the specified source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current hardware access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its ICMP filter profile without specifying its sequence number (e.g. **no permit icmp 192.168.1.0/24 any icmp-type 11**).

You can find the sequence number by running the show access-list (IPv4 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> icmp <source-ip> <dest-ip>
[icmp-type <number>] [vlan <1-4094>]

no <sequence-number>

no <action> icmp <source-ip> <dest-ip> [icmp-type <number>]
[vlan <1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description	
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`icmp`	Match against ICMP packets	
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`host` *<ip-addr>*	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.
	`host` *<ip-addr>*	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.

Parameter	Description	
	<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
`icmp-type <number>`	The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:	
	0	Echo replies.
	3	Destination unreachable messages.
	4	Source quench messages.
	5	Redirect (change route) messages.
	8	Echo requests.
	11	Time exceeded messages.
	12	Parameter problem messages.
	13	Timestamp requests.
	14	Timestamp replies.
	15	Information requests.
	16	Information replies.
	17	Address mask requests.
	18	Address mask replies.
`vlan <1-4094>`	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode IPv4 Hardware ACL Configuration (accessed by running the command access-list hardware (named hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command access-list hardware (named hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other "named hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a

new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples

To add an access-list filter entry with a sequence number of 100 to the access-list named "my-list" that will permit ICMP packets with a source address of 192.168.1.0/24, any destination address and an ICMP type of 5, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 100 permit icmp 192.168.1.0/24 any
icmp-type 5
```

To remove an access-list filter entry with a sequence number of 100 from the access-list named "my-list", use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no 100
```

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named hardware ACL entry for IP packets)

Overview

Use this command to add an IP packet filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ip 192.168.0.0/16 any**).

You can find the sequence number by running the show access-list (IPv4 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> ip <source-ip> <dest-ip>
[<source-mac> <dest-mac>] [vlan <1-4094>]

no <sequence-number>

no <action> ip <source-ip> <dest-ip> [<source-mac> <dest-mac>]
[vlan <1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description	
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`ip`	Match against IP packets	
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`dhcpsnooping`	Match the source address learned from the DHCP Snooping binding database.
	`host` *<ip-addr>*	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.
	`host` *<ip-addr>*	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.

Parameter	Description	
	<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<source-mac>	The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:	
	`any`	Match against any source MAC address.
	<source-mac>	The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
	`dhcpsnooping`	Match the source address learned from the DHCP Snooping binding database.
<dest-mac>	The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:	
	`any`	Match against any destination MAC address.
	<dest-mac>	The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
`vlan` *<1-4094>*	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode IPv4 Hardware ACL Configuration (accessed by running the command access-list hardware (named hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command access-list hardware (named hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other "named hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the access-list named "my-list" that will permit any IP packet with a source address of 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any
```

To add a filter entry to the access-list named "my-list" that will permit any IP packet with a source address of 192.168.1.1and a MAC source address of ffee.ddcc.bbaa, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit ip 192.168.1.1/32 any mac
ffee.ddcc.bbaa 0000.0000.0000 any
```

To add a filter entry to the access-list named "my-list" that will deny all IP packets on vlan 2, use the commands:

```
awplus# enable
awplus(config)# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# deny ip any any vlan 2
```

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named hardware ACL entry for IP protocols)

Overview

Use this command to add an IP protocol type filter entry to the current hardware access-list. The filter will match on IP packets that have the specified IP protocol number, and the specified IP and/or MAC addresses. You can use the value **any** instead of source or destination IP or MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 192.168.0.0/16 any**).

You can find the sequence number by running the show access-list (IPv4 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> proto <1-255> <source-ip>
<dest-ip> [<source-mac> <dest-mac>] [vlan <1-4094>]

no <sequence-number>

no <action> proto <1-255> <source-ip> <dest-ip> [<source-mac>
<dest-mac>] [vlan <1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Table 42-5: Parameters in IP protocol ACL entries

Parameter	Description	
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`proto` *<1-255>*	The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.	
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`dhcpsnooping`	Match the source address learned from the DHCP Snooping binding database.
	`host` *<ip-addr>*	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> *<reverse-mask>*	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.

Table 42-5: Parameters in IP protocol ACL entries (cont.)

Parameter	Description	
	`host <ip-addr>`	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	`<ip-addr>/<prefix>`	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	`<ip-addr> <reverse-mask>`	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
`<source-mac>`	The source MAC address to match against. You can specify a single MAC address, a range (through a mask), the address learned from DHCP snooping, or any:	
	`any`	Match against any source MAC address.
	`<source-mac>`	The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
	`dhcpsnooping`	Match the source address learned from the DHCP Snooping binding database.
`<dest-mac>`	The destination MAC address to match against. You can specify a single MAC address, a range (through a mask), or any:	
	`any`	Match against any destination MAC address.

Table 42-5: Parameters in IP protocol ACL entries (cont.)

Parameter	Description	
	<dest-mac>	The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
`vlan` *<1-4094>*	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.

255	Reserved / IANA

Mode IPv4 Hardware ACL Configuration (accessed by running the command access-list hardware (named hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, run the command access-list hardware (named hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other "named hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples

To add a filter entry to the access-list named "my-list" that will deny all IGMP packets (protocol 2) from the 192.168.0.0 subnet, and give it a sequence number of 50, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# 50 deny proto 2 192.168.0.0/16 any
```

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named hardware ACL entry for MAC addresses)

Overview

Use this command to add a MAC address filter entry to the current hardware access-list. The access-list will match on packets that have the specified source and destination MAC addresses. You can use the value **any** instead of source or destination MAC address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit mac aaaa.bbbb.cccc 0000.0000.0000 any**).

You can find the sequence number by running the show access-list (IPv4 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> mac {<source-mac>|any}
{<dest-mac>|any} [vlan <1-4094>] [inner-vlan <1-4094>]

no <sequence-number>

no <action> mac {<source-mac>|any} {<dest-mac>|any} [vlan
<1-4094>] [inner-vlan <1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.

Values for the <action> parameter	
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.
<action>	The action that the switch will take on matching packets. See the table above for valid values.
`mac`	Match against MAC address
<source-mac>	The source MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
`any`	Match against any source MAC address.
<dest-mac>	The destination MAC address to match against, followed by the mask. Enter the address in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. Enter the mask in the format <HHHH.HHHH.HHHH>, where each *H* is a hexadecimal number. For a mask, each value is either 0 or F, where FF = Ignore, and 00 = Match.
`any`	Match against any destination MAC address.
`vlan` *<1-4094>*	Match against the specified ID in the packet's VLAN tag.
`inner-vlan` *<1-4094>*	Match against the inner VLAN tag (VID). This parameter is used within double-tagged VLANs. It is sometimes referred to as the C-TAG (Customer VLAN TAG), and the vlan VID tag is referred to as the S-TAG (Service VLAN TAG).

Mode IPv4 Hardware ACL Configuration (accessed by running the command access-list hardware (named hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command access-list hardware (named hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other "named hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the access-list named "my-list" that will permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit mac 0000.00ab.1234
0000.0000.0000 any
```

To remove a filter entry that permit packets with a source MAC address of 0000.00ab.1234 and any destination MAC address, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# no permit mac 0000.00ab.1234
0000.0000.0000 any
```

(named hardware ACL entry for TCP or UDP)

Overview

Use this command to add a TCP or UDP filter entry to the current hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

If you specify a sequence number, the switch inserts the new filter at the specified location. Otherwise, the switch adds the new filter to the end of the access-list.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no permit udp 192.168.0.0/16 any**).

You can find the sequence number by running the show access-list (IPv4 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> {tcp|udp} <source-ip>
[<source-ports>] <dest-ip> [<dest-ports>] [vlan <1-4094>]

no <sequence-number>

no <action> {tcp|udp} <source-ip> [<source-ports>] <dest-ip>
[<dest-ports>] [vlan <1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description	
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`tcp`	Match against TCP packets.	
`udp`	Match against UDP packets.	
<source-ip>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`host <ip-addr>`	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask>	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<source-ports>	Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:	
	`eq <0-65535>`	Match a single port number.
	`lt <0-65535>`	Match all port numbers that are less than the specified port number.
	`gt <0-65535>`	Match all port numbers that are greater than the specified port number.

Parameter	Description	
	`ne <0-65535>`	Match all port numbers except the specified port number.
	`range <start-port> <end-port>`	Match a range of port numbers.
<dest-ip>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.
	`host <ip-addr>`	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask>	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ports>	Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:	
	`eq <0-65535>`	Match a single port number.
	`lt <0-65535>`	Match all port numbers that are less than the specified port number.
	`gt <0-65535>`	Match all port numbers that are greater than the specified port number.
	`ne <0-65535>`	Match all port numbers except the specified port number.
	`range <start-port> <end-port>`	Match a range of port numbers.
`vlan` *<1-4094>*	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode IPv4 Hardware ACL Configuration (accessed by running the command access-list hardware (named hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes

To use this command, first run the command access-list hardware (named hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ip-hw-acl)#
```

Then use this command (and the other "named hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL. You can insert a new filter entry into the middle of an existing list by specifying the appropriate sequence number. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Then use the access-group or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Example

To add a filter entry to access-list named "my-list" that will permit TCP packets with a destination address of 192.168.1.1, a destination port of 80, from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware my-list
awplus(config-ip-hw-acl)# permit tcp any 192.168.1.1/32 eq 80
```

show access-list (IPv4 Hardware ACLs)

Command changes

Version 5.5.3-0.1: **deny-and-not-cpu** action parameter added on x230, x550, x930, x950, SBx908 GEN2 Series switches

Version 5.5.3-0.1: **log** parameter added on x220, x320, x530, x550, x950, SBx908 GEN2 Series switches

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

show access-list (IPv4 Hardware ACLs)

Overview Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list.

Syntax

```
show access-list
[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|
<4000-4499>|<access-list-name>]
```

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (standard - expanded range).
<2000-2699>	IP extended access-list (extended - expanded range).
<3000-3699>	Hardware IP access-list.
<4000-4499>	Hardware MAC access-list.
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Examples To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
    deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
    deny 192.168.10.0, wildcard bits 0.0.0.255
    deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
    permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
    permit tcp any 192.0.2.0/24
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
    deny 192.168.10.0, wildcard bits 0.0.0.255
    deny 192.168.12.0, wildcard bits 0.0.0.255
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show access-list
```

```
Hardware IP access list 3000
    4 permit ip any any
Hardware IP access list 3001
    4 deny ip 192.168.0.0/24 any
Hardware IP access list dacl-port1.0.49-eccd.6dc9.c0d2 (dynamic)
    4 permit ip 192.168.1.0/24 192.168.2.0/24
    8 deny ip 192.168.1.0/24 any
```

The following error message is displayed if you try to show an undefined access-list.

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

Related commands

access-list extended (named)

access-list (numbered hardware ACL for MAC addresses)

access-list hardware (named hardware ACL)

show access-list counters

Overview Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

Syntax

```
show access-list counters [<acl>]
```

Parameter	Description
<acl>	Display the number of packets that match only the specified ACL. You can enter the ACL name or number.

Mode User Exec and Privileged Exec

Usage notes This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command clear access-list counters.

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

Example To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

Output Figure 42-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

Output Figure 42-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 42-7: Parameters in the output from **show access-list counters**

Parameter	Description
Packet Hits	The number of packets that match the ACL. The count includes both dropped and allowed packets.

Related commands

clear access-list counters

show interface access-group

Command changes

Version 5.5.2-2.1: reading the counters no longer clears them

Version 5.5.1-2.1: command added

show acl-group ip address

Overview Use this command to show the hosts and subnets in a named IPv4 ACL group.

Syntax

```
show acl-group ip address <group>
```

Parameter	Description
<group>	The name of the IPv4 ACL group.

Mode Privileged Exec

Example To show all hosts and subnets in an IPv4 ACL group IPV4_GROUP1, use the command:

```
awplus# show acl-group ip address IPV4_GROUP1
```

Output Figure 42-3: Example output from **show acl-group ip address IPV4_GROUP1**

```
awplus#show acl-group ip address IPV4_GROUP1
Host Group: IPV4_GROUP1

 192.168.1.2/32
 192.168.2.5/32
 10.0.0.0/8
```

Related commands acl-group ip address

ip (ip-host-group)

Command changes Version 5.5.0-1.1: command added

show acl-group ip port

Overview Use this command to show the port rules in a named port ACL group.

Syntax

```
show acl-group ip port <group>
```

Parameter	Description
<group>	The name of the port ACL group.

Mode Privileged Exec

Example To show all port rules in a port ACL group PORT_GROUP1, use the command:

```
awplus# show acl-group ip port PORT_GROUP1
```

Output Figure 42-4: Example output from **show acl-group ip port PORT_GROUP1**

```
awplus#show acl-group ip port PORT_GROUP1
Port Group: PORT_GROUP1

 eq 11
 gt 20
 lt 503
 ne 500
```

Related commands (acl-group ip port range)

acl-group ip port

Command changes Version 5.5.0-1.1: command added

show interface access-group

Overview Use this command to display the access groups attached to a port. If an access group is specified, then the output only includes the ports that the specified access group is attached to. If no access group is specified then this command displays all access groups that are attached to the ports that are specified with <port-list>.

Note that **access group** is the term given for an access-list when it is applied to an interface.

NOTE: *This command will function on the switch in stand-alone mode, but is not supported when the switch forms part of a VCStack.*

Syntax

```
show interface <port-list> access-group
[<3000-3699>|<4000-4699>]
```

Parameter	Description
<port-list>	Specify the ports to display information. A port-list can be either: • a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2) • a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.6 or port1.0.1-port1.0.6 or po1-po2 • a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-1.0.6. Do not mix switch ports, static channel groups, and LACP channel groups in the same list.
`access group`	Select the access group whose details you want to show.
<3000-3699>	Specifies the Hardware IP access-list.
<4000-4699>	Specifies the Hardware MAC access-list.

Mode User Exec and Privileged Exec

Example To show all access-lists attached to port1.0.1, use the command:

```
awplus# show interface port1.0.1 access-group
```

Output Figure 42-5: Example output from the **show interface access-group** command

```
Interface port1.0.1
  access-group 3000
  access-group 3002
  access-group 3001
```

Related commands access-group

43 IPv4 Software Access Control List (ACL) Commands

Introduction

Overview This chapter provides an alphabetical reference for the IPv4 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv4 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the ACL Feature Overview and Configuration Guide.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the Link Aggregation Feature Overview_and_Configuration_Guide.
- Link Aggregation Commands

NOTE: *Text in parenthesis in command names indicates usage not keyword entry. For example,* ***access-list hardware (named)*** *indicates named IPv4 hardware ACLs entered as* `access-list hardware <name>` *where <name> is a placeholder not a keyword.*

Parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI, such as ***(access-list standard numbered filter)*** *represents command entry in the format shown in the syntax:*

```
[<sequence-number>] {deny|permit} {<source-address>|host
<host-address>|any}
```

NOTE: *Software ACLs will* ***deny*** *access unless* ***explicitly permitted*** *by an ACL action.*

Sub-modes Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 43-1: IPv4 Software Access List Commands and Prompts

Command Name	Command Mode	Prompt
clear ip prefix-list	Privileged Exec	`awplus#`
show ip access-list	Privileged Exec	`awplus#`
show ip prefix-list	Privileged Exec	`awplus#`
access-group	Global Configuration	`awplus(config)#`
access-list (extended named)	Global Configuration	`awplus(config)#`
access-list (extended numbered)	Global Configuration	`awplus(config)#`
access-list (standard named)	Global Configuration	`awplus(config)#`
access-list (standard numbered)	Global Configuration	`awplus(config)#`
ip prefix-list	Global Configuration	`awplus(config)#`
maximum-access-list	Global Configuration	`awplus(config)#`
(access-list extended ICMP filter)	IPv4 Extended ACL Configuration	`awplus(config-ip-ext-acl)#`
(access-list extended IP filter)	IPv4 Extended ACL Configuration	`awplus(config-ip-ext-acl)#`
(access-list extended IP protocol filter)	IPv4 Extended ACL Configuration	`awplus(config-ip-ext-acl)#`
(access-list extended TCP UDP filter)	IPv4 Extended ACL Configuration	`awplus(config-ip-ext-acl)#`
(access-list standard named filter)	IPv4 Standard ACL Configuration	`awplus(config-ip-std-acl)#`
(access-list standard numbered filter)	IPv4 Standard ACL Configuration	`awplus(config-ip-std-acl)#`

Command List

access-list extended (named)

Overview

This command configures an extended named access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL name and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

Syntax [to enter the sub-mode]

```
access-list extended <list-name>
no access-list extended <list-name>
```

Parameter	Description
<list-name>	A user-defined name for the access-list

Syntax [icmp]

```
access-list extended <list-name> {deny|permit} icmp <source>
<destination> [icmp-type <type-number>] [log]
no access-list extended <list-name> {deny|permit} icmp <source>
<destination> [icmp-type <type-number>] [log]
```

Table 43-2: Parameters in the access-list extended (named) command - icmp

Parameter	Description
<list-name>	A user-defined name for the access-list.
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.
icmp	The access-list matches only ICMP packets.
icmp-type	Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.

Table 43-2: Parameters in the access-list extended (named) command - icmp

Parameter	Description	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.

Table 43-2: Parameters in the access-list extended (named) command - icmp

Parameter	Description	
<type-number>	The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:	
	0	Echo replies.
	3	Destination unreachable messages.
	4	Source quench messages.
	5	Redirect (change route) messages.
	8	Echo requests.
	11	Time exceeded messages.
	12	Parameter problem messages.
	13	Timestamp requests.
	14	Timestamp replies.
	15	Information requests.
	16	Information replies.
	17	Address mask requests.
	18	Address mask replies.
`log`	Logs the results.	

Syntax [tcp|udp]

```
access-list extended <list-name> {deny|permit} {tcp|udp}
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>] <destination> [eq <destport>|lt <destport>|gt
<destport>|ne <destport>] [log]
```

```
no access-list extended <list-name> {deny|permit} {tcp|udp}
<source> [eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>] <destination> [eq <destport> |lt <destport>|gt
<destport>|ne <destport>][log]
```

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

Parameter	Description
<list-name>	A user-defined name for the access-list.
`deny`	The access-list rejects packets that match the type, source, and destination filtering specified with this command.
`permit`	The access-list permits packets that match the type, source, and destination filtering specified with this command.
`tcp`	The access-list matches only TCP packets.
`udp`	The access-list matches only UDP packets.

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

Parameter	Description	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/ *<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/ *<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
<sourceport>	The source port number, specified as an integer between 0 and 65535.	
<destport>	The destination port number, specified as an integer between 0 and 65535.	
`eq`	Matches port numbers equal to the port number specified immediately after this parameter.	
`lt`	Matches port numbers less than the port number specified immediately after this parameter.	
`gt`	Matches port numbers greater than the port number specified immediately after this parameter.	

Table 43-3: Parameters in the access-list extended (named) command - tcp|udp

Parameter	Description
ne	Matches port numbers not equal to the port number specified immediately after this parameter.
log	Log the results.

Syntax [proto|any| ip]

```
access-list extended <list-name> {deny|permit} {proto
<ip-protocol>|any|ip} {<source>} {<destination>} [log]
```

```
no access-list extended <list-name>{deny|permit} {proto
<ip-protocol>|any|ip}{<source>}{<destination>}[log]
```

Table 43-4: Parameters in the access-list extended (named) command - proto|ip|any

Parameter	Description	
<list-name>	A user-defined name for the access-list.	
deny	The access-list rejects packets that match the type, source, and destination filtering specified with this command.	
permit	The access-list permits packets that match the type, source, and destination filtering specified with this command.	
proto	Matches only a specified type of IP Protocol.	
any	The access-list matches any type of IP packet.	
ip	The access-list matches only IP packets.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	any	Matches any source IP address.
	host *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/*<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering 192.168.1.1 0.0.0.255 is the same as entering 192.168.1.1/24.

Table 43-4: Parameters in the access-list extended (named) command - proto|ip|any (cont.)

Parameter	Description	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host` *<ip-addr>*	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/ *<prefix>*	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	<ip-addr> *<reverse-mask>*	Alternatively, you can enter a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`.
`log`	Logs the results.	
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.	

Table 43-5: IP protocol number and description

Protocol Number	Protocol Description [RFC]
1	Internet Control Message [RFC792]
2	Internet Group Management [RFC1112]
3	Gateway-to-Gateway [RFC823]
4	IP in IP [RFC2003]
5	Stream [RFC1190] [RFC1819]
6	TCP (Transmission Control Protocol) [RFC793]
8	EGP (Exterior Gateway Protocol) [RFC888]
9	IGP (Interior Gateway Protocol) [IANA]

253	Use for experimentation and testing / RFC3692
254	Use for experimentation and testing / RFC3692
255	Reserved / IANA

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage Use this command when configuring access-lists for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list extended** followed by only the name. Entering only the name moves you to the IPv4 Extended ACL Configuration mode for the selected access-list.

From there you can configure your access-lists by using the commands (access-list extended ICMP filter), (access-list extended IP filter), and (access-list extended IP protocol filter).

Note that packets must match both the source and the destination details.

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples

You can enter the extended named ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24 eq 12 log
```

Alternatively, you can enter the extended named ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list extended TK
awplus(config-ip-ext-acl)# deny tcp 2.2.2.3/24 eq 14 3.3.3.4/24 eq 12 log
```

Related commands

(access-list extended ICMP filter)

(access-list extended IP filter)

(access-list extended TCP UDP filter)

show interface access-group

show ip access-list

show running-config

access-list (extended numbered)

Overview

This command configures an extended numbered access-list that permits or denies packets from specific source and destination IP addresses. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Extended ACL Configuration mode. Once in that mode, you can create an ACL filter entry. This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified extended named access-list.

Syntax [to enter the sub-mode]

```
access-list {<100-199>|<2000-2699>}
no access-list {<100-199>|<2000-2699>}
```

Syntax [to create an ACL entry]

```
access-list {<100-199>|<2000-2699>} {deny|permit} ip <source> <destination>
no access-list {<100-199>|<2000-2699>} {deny|permit} ip <source> <destination>
```

Parameter	Description	
<100-199>	IP extended access-list.	
<2000-2699>	IP extended access-list (expanded range).	
`deny`	Access-list rejects packets that match the source and destination filtering specified with this command.	
`permit`	Access-list permits packets that match the source and destination filtering specified with this command.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host` *<ip-addr>*	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr> *<reverse-mask>*	An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`. This matches any source IP address within the specified subnet.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	

Parameter	Description	
	`any`	Matches any destination IP address.
	`host <ip-addr>`	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	`<ip-addr> <reverse-mask>`	An IPv4 address, followed by a reverse mask in dotted decimal format. For example, entering `192.168.1.1 0.0.0.255` is the same as entering `192.168.1.1/24`. This matches any destination IP address within the specified subnet.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use this command when configuring access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Extended ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the commands (access-list extended ICMP filter), (access-list extended IP filter), and (access-list extended IP protocol filter).

Note that packets must match both the source and the destination details.

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples You can enter the extended ACL in the Global Configuration mode together with the ACL filter entry on the same line, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101 deny ip 172.16.10.0 0.0.0.255 any
```

Alternatively, you can enter the extended ACL in Global Configuration mode before specifying the ACL filter entry in the IPv4 Extended ACL Configuration mode, as shown below:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# deny ip 172.16.10.0 0.0.0.255 any
```

Related commands

(access-list extended ICMP filter)

(access-list extended IP filter)

(access-list extended TCP UDP filter)

show interface access-group

show ip access-list

show running-config

(access-list extended ICMP filter)

Overview Use this ACL filter to add a new ICMP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an ICMP filter entry from the current extended access-list. You can specify the ICMP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its ICMP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the show access-list (IPv4 Software ACLs) command.

Syntax [icmp]

```
[<sequence-number>] {deny|permit} icmp <source> <destination>
[icmp-type <icmp-value>] [log]
```

```
no {deny|permit} icmp <source> <destination>[icmp-type
<icmp-value>] [log]
```

```
no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
deny	Access-list rejects packets that match the source and destination filtering specified with this command.	
permit	Access-list permits packets that match the source and destination filtering specified with this command.	
icmp	ICMP packet type.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any	Matches any source IP address.
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	any	Matches any destination IP address.

Parameter	Description
`icmp-type`	The ICMP type.
`<icmp-value>`	The value of the ICMP type.
`log`	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: *The access control list being configured is selected by running the access-list (extended numbered) command or the access-list extended (named) command, with the required access control list number, or name - but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples To add a new entry in access-list called 'my-list' that will reject ICMP packets from 10.0.0.1 to 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny icmp 10.0.0.1/32 192.168.1.1/32
```

Use the following commands to add a new filter at sequence number 5 position of the access-list called 'my-list'. The filter will accept the ICMP type 8 packets from 10.1.1.0/24 network, to 192.168.1.0 network:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit icmp 10.1.1.0/24
192.168.1.0/24 icmp-type 8
```

Related commands

access-group

show interface access-group

show running-config

show ip access-list

(access-list extended IP filter)

Overview Use this ACL filter to add a new IP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the show access-list (IPv4 Software ACLs) command.

Syntax [ip]

```
[<sequence-number>] {deny|permit} ip <source> <destination>
no {deny|permit} ip <source> <destination>
no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
`deny`	Access-list rejects packets that match the source and destination filtering specified with this command.	
`permit`	Access-list permits packets that match the source and destination filtering specified with this command.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	`any`	Matches any source IP address.
	`host <ip-addr>`	Matches a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr> *<reverse-mask>*	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter `192.168.1.1 0.0.0.255`.

Parameter	Description	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	`any`	Matches any destination IP address.
	`host <ip-addr>`	Matches a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr> *<reverse-mask>*	Alternatively, enter an IPv4 address followed by a reverse mask in dotted decimal format. For example, enter `192.168.1.1 0.0.0.255`.

Mode Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: *The access control list being configured is selected by running the access-list (extended numbered) command or the access-list extended (named) command, with the required access control list number, or name - but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Example 1 [list-number] First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a numbered extended access-list `101`:

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the numbered extended access- list 101 that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

Example 2 [list-name] First use the following commands to enter the IPv4 Extended ACL Configuration mode and define a named access-list called ‘my-acl’:

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)#
```

Then use the following commands to add a new entry to the named access-list 'my-acl' that will reject packets from 10.0.0.1 to 192.168.1.1:

```
awplus(config-ip-ext-acl)# deny ip host 10.0.0.1 host
192.168.1.1
awplus(config-ip-ext-acl)# 20 permit ip any any
```

Example 3 [list-number]

Use the following commands to remove the access-list filter entry with sequence number `20` from extended numbered access-list `101`.

```
awplus# configure terminal
awplus(config)# access-list 101
awplus(config-ip-ext-acl)# no 20
```

Example 4 [list-name]

Use the following commands to remove the access-list filter entry with sequence number `20` from extended named access-list `my-acl`:

```
awplus# configure terminal
awplus(config)# access-list extended my-acl
awplus(config-ip-ext-acl)# no 20
```

(access-list extended IP protocol filter)

Overview Use this ACL filter to add a new IP protocol type filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes an IP protocol filter entry from the current extended access-list. You can specify the IP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its IP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the show access-list (IPv4 Software ACLs) command.

Syntax [proto]

```
[<sequence-number>] {deny|permit} proto <ip-protocol> <source> <destination> [log]
no {deny|permit} proto <ip-protocol> <source> <destination> [log]
no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
deny	Access-list rejects packets that match the source and destination filtering specified with this command.	
permit	Access-list permits packets that match the source and destination filtering specified with this command.	
proto *<ip-protocol>*	<1-255> Specify IP protocol number, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any	Matches any source IP address.

Parameter	Description	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	`any`	Matches any destination IP address.
`log`	Log the results.

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: *The access control list being configured is selected by running the access-list (extended numbered) command or the access-list extended (named) command, with the required access control list number, or name - but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Example 1 [creating a list] Use the following commands to add a new access-list filter entry to the access-list named 'my-list' that will reject IP packets from source address 10.10.1.1/32 to destination address 192.68.1.1/32:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny ip 10.10.1.1/32 192.168.1.1/32
```

Example 2 [adding to a list]

Use the following commands to add a new access-list filter entry at sequence position 5 in the access-list named 'my-list' that will accept packets from source address 10.10.1.1/24 to destination address 192.68.1.1/24:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit ip 10.10.1.1/24
192.168.1.1/24
```

Related commands

access-list extended (named)

access-list (extended numbered)

show interface access-group

show ip access-list

show running-config

(access-list extended TCP UDP filter)

Overview Use this ACL filter to add a new TCP or UDP filter entry to the current extended access-list. If the sequence number is specified, the new filter is inserted at the specified location. Otherwise, the new filter is added at the end of the access-list.

The **no** variant of this command removes a TCP or UDP filter entry from the current extended access-list. You can specify the TCP or UDP filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its TCP or UDP filter profile without specifying its sequence number.

Note that the sequence number can be found by running the show access-list (IPv4 Software ACLs) command.

Syntax [tcp|udp]

```
[<sequence-number>] {deny|permit} {tcp|udp} <source> {eq
<sourceport> |lt <sourceport>|gt <sourceport>|ne <sourceport>}
<destination> [eq <destport>|lt <destport>|gt <destport>|ne
<destport>] [log]
```

```
no [<sequence-number>] {deny|permit} {tcp|udp} <source> {eq
<sourceport> |lt <sourceport>|gt <sourceport>|ne <sourceport>}
<destination> [eq <destport>|lt <destport>|gt <destport>|ne
<destport>] [log]
```

```
no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
deny	Access-list rejects packets that match the source and destination filtering specified with this command.	
permit	Access-list permits packets that match the source and destination filtering specified with this command.	
tcp	The access-list matches only TCP packets.	
udp	The access-list matches only UDP packets.	
<source>	The source address of the packets. You can specify a single host, a subnet, or all sources. The following are the valid formats for specifying the source:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any source IP address within the specified subnet.
	any	Matches any source IP address.
<sourceport>	The source port number, specified as an integer between 0 and 65535.	

Parameter	Description	
<destination>	The destination address of the packets. You can specify a single host, a subnet, or all destinations. The following are the valid formats for specifying the destination:	
	<ip-addr>/<prefix>	An IPv4 address, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
	`any`	Matches any destination IP address.
<destport>	The destination port number, specified as an integer between 0 and 65535.	
`eq`	Matches port numbers equal to the port number specified immediately after this parameter.	
`lt`	Matches port numbers less than the port number specified immediately after this parameter.	
`gt`	Matches port numbers greater than the port number specified immediately after this parameter.	
`ne`	Matches port numbers not equal to the port number specified immediately after this parameter.	
`log`	Log the results.	

Mode IPv4 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: *The access control list being configured is selected by running the access-list (extended numbered) command or the access-list extended (named) command, with the required access control list number, or name - but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Example 1 [creating a list] To add a new entry to the access-list named 'my-list' that will reject TCP packets from 10.0.0.1 on TCP port 10 to 192.168.1.1 on TCP port 20, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# deny tcp 10.0.0.1/32 eq 10
192.168.1.1/32 eq 20
```

Example 2 [adding to a list]

To insert a new entry with sequence number 5 into the access-list named 'my-list' that will accept UDP packets from 10.1.1.0/24 network to 192.168.1.0/24 network on UDP port 80, use the commands:

```
awplus# configure terminal
awplus(config)# access-list extended my-list
awplus(config-ip-ext-acl)# 5 permit udp 10.1.1.0/24
192.168.1.0/24 eq 80
```

Related commands

access-list extended (named)

access-list (extended numbered)

show interface access-group

show ip access-list

show running-config

access-list standard (named)

Overview This command configures a standard named access-list that permits or denies packets from a specific source IP address. You can:

- use this command to enter a new or existing ACL name and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command (access-list standard named filter). This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard named access-list.

Syntax [to enter the sub-mode]

```
access-list standard <standard-acl-name>
no access-list standard <standard-acl-name>
```

Syntax [to create an ACL entry]

```
access-list standard <standard-acl-name> {deny|permit}
{any|<ip-addr>/<prefix>}
no access-list standard <standard-acl-name> {deny|permit}
{any|<ip-addr>/<prefix>}
```

Parameter	Description
<standard-acl-name>	Specify a name for the standard access-list.
deny	The access-list rejects packets that match the source filtering specified with this command.
permit	The access-list permits packets that match the source filtering specified with this command.
any	Match any source IP address.
<ip-addr>/<prefix>	Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use this command when configuring a standard named access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list standard** followed by only the name. Entering only the name moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From

there you can configure your access-lists by using the command (access-list standard named filter).

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples

To define a standard access-list named 'my-list' and deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list deny any
```

Alternatively, to define a standard access-list named 'my-list' and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from any source, use the commands:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 5 deny any
```

Related commands

(access-list standard named filter)

show interface access-group

show ip access-list

show running-config

access-list (standard numbered)

Overview This command configures a standard numbered access-list that permits or denies packets from a specific source IP address. You can:

- use this command to enter a new or existing ACL number and enter the IPv4 Standard ACL Configuration mode. Once in that mode, you can create an ACL filter entry using the command (access-list standard numbered filter). This approach lets you give the entry a sequence number.
- or, use this command to create an ACL and an ACL filter entry at the same time. With this approach, you cannot give the entry a sequence number, so the entry will go after any existing entries.

The **no** variant of this command removes a specified standard numbered access-list.

Syntax [to enter the sub-mode]

```
access-list {<1-99>|<1300-1999>}
no access-list {<1-99>|<1300-1999>}
```

Syntax [to create an ACL entry]

```
access-list {<1-99>|<1300-1999>} {deny|permit} <source>
no access-list {<1-99>|<1300-1999>} {deny|permit} <source>
```

Parameter	Description	
<1-99>	IP standard access-list.	
<1300-1999>	IP standard access-list (expanded range).	
`deny`	Access-list rejects packets from the specified source.	
`permit`	Access-list accepts packets from the specified source.	
<source>	The source address of the packets. The following are the valid formats for specifying the source:	
	<ip-addr> <reverse-mask>	A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, `192.168.1.0 0.0.0.255` (equivalent to 192.168.1.0/24).
	<ip-addr>	A single source address to match. The source address is specified in dotted decimal format.
	`host` *<ip-addr>*	A single source address to match. The source address is specified in dotted decimal format.
	`any`	Any source address.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use this command when configuring a standard numbered access-list for filtering IP software packets.

You can either create access-lists from within this command, or you can enter **access-list** followed by only the number. Entering only the number moves you to the IPv4 Standard ACL Configuration mode for the selected access-list. From there you can configure your access-lists by using the command (access-list standard numbered filter).

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples To create ACL number 67 that will deny packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67 deny 172.16.10.0 0.0.0.255
```

Alternatively, to define ACL number 67 and enter the IPv4 Standard ACL Configuration mode, and then create ACL entry 5 to deny any packets from subnet 172.16.10.0, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 67
awplus(config-ip-std-acl)# 5 deny 172.16.10.0 0.0.0.255
```

Related commands (access-list standard numbered filter)

show interface access-group

show ip access-list

show running-config

(access-list standard named filter)

Overview This ACL filter adds a source IP address filter entry to a current named standard access-list. If the sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current named standard access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number (e.g. **no deny any**).

Note that you can find the sequence number by running the show access-list (IPv4 Software ACLs) command.

Syntax

```
[<sequence-number>] {deny|permit} {any|<ip-addr>/<prefix> [exact-match]}
no <sequence-number>
no {deny|permit} {any|<ip-addr>/<prefix> [exact-match]}
```

Parameter	Description
`<sequence-number>`	`<1-65535>` The sequence number for the filter entry of the selected access control list.
`deny`	Access-list rejects packets of the source filtering specified.
`permit`	Access-list allows packets of the source filtering specified
`any`	Match any source IP address.
`<ip-addr>/<prefix>`	Match the source address of the packets. Specify an IPv4 address in dotted decimal format, followed by a forward slash, then the prefix length. This matches any destination IP address within the specified subnet.
`exact-match`	Specify an exact IP prefix to match on.

Mode IPv4 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: *The access control list being configured is selected by running the access-list standard (named) command with the required access control list name, but with no further parameters selected.*

Software ACLs will ***deny*** *access unless* ***explicitly permitted*** *by an ACL action.*

Examples

Use the following commands to add a new filter entry to access-list 'my-list' that will reject IP address 10.1.1.1:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# deny 10.1.1.1/32
```

Use the following commands to insert a new filter entry into access-list 'my-list' at sequence position number 15 that will accept IP network 10.1.2.0:

```
awplus# configure terminal
awplus(config)# access-list standard my-list
awplus(config-ip-std-acl)# 15 permit 10.1.2.0/24
```

Related commands

access-list standard (named)

show interface access-group

show ip access-list

show running-config

(access-list standard numbered filter)

Overview This ACL filter adds a source IP address filter entry to a current standard numbered access-list. If a sequence number is specified, the new filter entry is inserted at the specified location. Otherwise, the new filter entry is added at the end of the access-list.

The **no** variant of this command removes a source IP address filter entry from the current standard numbered access-list. You can specify the source IP address filter entry for removal by entering either its sequence number (e.g. **no 10**), or by entering its source IP address filter profile without specifying its sequence number.

Note that the sequence number can be found by running the show access-list (IPv4 Software ACLs) command.

Syntax

```
[<sequence-number>] {deny|permit} <source>
no {deny|permit} <source>
no <sequence-number>
```

Parameter	Description	
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.	
deny	Access-list rejects packets of the type specified.	
permit	Access-list allows packets of the type specified	
<source>	The source address of the packets. The following are the valid formats for specifying the source:	
	<ip-addr> <reverse-mask>	A source subnet, specified by entering the address and a reverse mask in dotted decimal format. For example, 192.168.1.0 0.0.0.255 (equivalent to 192.168.1.0/24).
	<ip-addr>	A single source address to match. The source address is specified in dotted decimal format.
	host *<ip-addr>*	A single source address to match. The source address is specified in dotted decimal format.
	any	Any source address.

Mode IPv4 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes

An ACL can be configured with multiple ACL filters using sequence numbers. If the sequence number is omitted, the next available multiple of 4 will be used as the sequence number for the new filter. A new ACL filter can be inserted into the middle of an existing list by specifying the appropriate sequence number.

NOTE: *The access control list being configured is selected by running the access-list (standard numbered) command with the required access control list number but with no further parameters selected.*

*Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Example

To add a new entry accepting the IP network 10.1.1.0/24 at the sequence number 15 position, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 99
awplus(config-ip-std-acl)# 15 permit 10.1.2.0 0.0.0.255
```

Related commands

access-list (standard numbered)

show interface access-group

show ip access-list

show running-config

clear ip prefix-list

Overview Use this command to reset the hit count to zero in the prefix-list entries.

Syntax `clear ip prefix-list [<list-name>] [<ip-address>/<mask>]`

Parameter	Description
<list-name>	The name of the prefix-list.
<ip-address>/<mask>	The IP prefix and length.

Mode Privileged Exec

Example To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

dos

Overview Use this command to configure Denial-of-Service (DoS) protection features for a port. Six different DoS attacks can be detected: IP Options, Land, Ping-of-Death, Smurf, Synflood and Teardrop.

When the attack is detected, three different actions are available:

- Shutdown the port for one minute
- Cause an SNMP trap.
- Send traffic to the mirror port

Syntax

```
dos {ipoptions|land|ping-of-death|smurf broadcast
<ip-address>|synflood|teardrop} action {shutdown|trap|mirror}
```

Parameter	Description
`dos`	Denial-Of-Service.
`ipoptions`	IP Options attack.
`land`	Land attack.
`ping-of-death`	Large ping attack.
`smurf`	Ping to broadcast address.
`broadcast`	Broadcast.
`<ip-address>`	Local IP Broadcast Address.
`synflood`	SYN flood attack.
`teardrop`	IP fragmentation attack.
`action`	Action.
`shutdown`	Shutdown port.
`trap`	Trap to SNMP.
`mirror`	Send packets to mirror port.

Mode Interface Configuration for a switch port interface.

Default DoS attack detection is not configured by default on any switch port interface.

Usage notes See the below table for more information about the DoS attacks recognized by this command:

Type of DoS attack	Description
ipoptions	This type of attack occurs when an attacker sends packets containing bad IP options to a victim node. There are many different types of IP options attacks and this software does not try to distinguish between them. Rather, if this defense is activated, the number of ingress IP packets containing IP options is counted. If the number exceeds 20 packets per second, the switch considers this a possible IP options attack. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.
land	This type of attack occurs when the Source IP and Destination IP address are the same. This can cause a target host to be confused. Since packets with the same source and destination addresses should never occur, these packets are dropped when this attack is enabled. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.
ping-of-death	This type of attack results from a fragmented packet which, when reassembled, would exceed the maximum size of a valid IP datagram. To detect this attack, the final fragment of ICMP packets has to be sent to the CPU for inspection. This defense can therefore load the CPU. Note that the extra CPU load will not affect normal traffic switching between ports, but other protocols such as IGMP and STP may be affected. This defense is not recommended where a large number of fragmented packets are expected.
smurf	This type of attack is an ICMP ping packet to a broadcast address. Although routers should not forward packets to local broadcast addresses anymore (see RFC2644), the Smurf attack can still be explicitly discarded with this command. In order for the Smurf attack to work, the broadcast IP address is required. Any ICMP Ping packet with this destination address is considered an attack. This defense does not require the CPU to monitor packets, so does not put extra load on the switch's CPU.
synflood	In this type of attack, an attacker, seeking to overwhelm a victim with TCP connection requests, sends a large number of TCP SYN packets with bogus source addresses to the victim. The victim responds with SYN ACK packets, but since the original source addresses are bogus, the victim node does not receive any replies. If the attacker sends enough requests in a short enough period, the victim may freeze operations once the requests exceed the capacity of its connections queue. To defend against this form of attack, a switch port monitors the number of ingress TCP-SYN packets it receives. An attack is recorded if a port receives more 60 TCP-SYN packets per second.
teardrop	In this DoS attack, an attacker sends a packet in several fragments with a bogus offset value, used to reconstruct the packet, in one of the fragments to a victim. This results in the victim being unable to reassemble the packet, possibly causing it to freeze operations.

Examples

To configure **smurf** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos smurf broadcast 192.168.1.0 action shutdown
```

To configure **land** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos land action shutdown
```

To configure **ipoptions** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ipoptions action shutdown
```

To configure **ping-of-death** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos ping-of-death action shutdown
```

To configure **synflood** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos synflood action shutdown
```

To configure **teardrop** DoS detection on port1.0.1, and shutdown the interface if an attack is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# dos teardrop action shutdown
```

Related commands

show dos interface

ip prefix-list

Overview Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

Syntax

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]
ip prefix-list <list-name> description <text>
ip prefix-list sequence-number
no ip prefix-list <list-name> [seq <1-429496725>]
no ip prefix-list <list-name> [description <text>]
no ip prefix-list sequence-number
```

Parameter	Description
<list-name>	Specifies the name of a prefix list.
seq *<1-429496725>*	Sequence number of the prefix list entry.
deny	Specifies that the prefixes are excluded from the list.
permit	Specifies that the prefixes are included in the list.
<ip-prefix>	Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M.
any	Any prefix match. Same as **0.0.0.0/0 le 32**.
ge*<0-32>*	Specifies the minimum prefix length to be matched.
le*<0-32>*	Specifies the maximum prefix length to be matched.
<text>	Text description of the prefix list.
sequence-number	Specify sequence numbers included or excluded in prefix list.

Mode Global Configuration

Usage notes When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example

In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

show access-list (IPv4 Software ACLs)

Overview Use this command to display the specified access-list, or all access-lists if none have been specified. Note that only defined access-lists are displayed. An error message is displayed for an undefined access-list

Syntax

```
show access-list
[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<3000-3699>|
<4000-4499>|<access-list-name>]
```

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (standard - expanded range).
<2000-2699>	IP extended access-list (extended - expanded range).
<3000-3699>	Hardware IP access-list.
<4000-4499>	Hardware MAC access-list.
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Examples To show all access-lists configured on the switch:

```
awplus# show access-list
```

```
Standard IP access list 1
    deny 172.16.2.0, wildcard bits 0.0.0.255
Standard IP access list 20
    deny 192.168.10.0, wildcard bits 0.0.0.255
    deny 192.168.12.0, wildcard bits 0.0.0.255
Hardware IP access list 3001
    permit ip 192.168.20.0 255.255.255.0 any
Hardware IP access list 3020
    permit tcp any 192.0.2.0/24
awplus#show access-list 20
```

To show the access-list with an ID of 20:

```
awplus# show access-list 20
```

```
Standard IP access-list 20
    deny 192.168.10.0, wildcard bits 0.0.0.255
    deny 192.168.12.0, wildcard bits 0.0.0.255
```

Note the following error message is displayed if you attempt to show an undefined access-list:

```
awplus# show access-list 2
```

```
% Can't find access-list 2
```

show dos interface

Overview Use this command to display the Denial-of-Service (DoS) features configured on a switch port interface from the dos command. See the dos command for descriptions of DoS attack types.

Syntax `show dos interface {<port-list>}`

Parameter	Description
<port-list>	Specify the switch port or port list to display DoS configuration options set with the dos command.

Mode Privileged Exec

Output Figure 43-1: Example output from the **show dos interface** command prior to a DoS attack

```
awplus#configure terminal
Enter configuration commands, one per line. End with CTNTL/Z.
awplus(config)#interface port1.0.1
awplus(config-if)#dos synflood action shutdown
awplus(config-if)#exit
awplus(config)#exit
awplus#show dos interface port1.0.1

DoS settings  for interface port1.0.1
----------------------------------------
Port status          : Enabled
ipoptions            : Disabled
land                 : Disabled
ping-of-death        : Disabled
smurf                : Disabled
synflood             : Enabled
   Action            : Shutdown port
   Attacks detected  : 0
teardrop             : Disabled
awplus#
```

Figure 43-2: Example output from the **show dos interface** command after a **synflood** DoS attack

```
awplus#show dos interface port1.0.1

DoS settings for interface port1.0.1
----------------------------------------
Port status          : Enabled
ipoptions            : Disabled
land                 : Disabled
ping-of-death        : Disabled
smurf                : Disabled
synflood             : Enabled
   Action            : Shutdown port
   Attacks detected  : 1
teardrop             : Disabled
awplus#
```

Table 44: Parameters in the **show dos interface** command output:

Type of DoS attack	Description
`Port status`	Displays `Enabled` when the port is configured as being administratively up after issuing the **no shutdown** command. Displays `Disabled` when the port is configured as being administratively down with the **shutdown** command.
`ipoptions`	Displays `Enabled` when the **ipoptions** parameter is configured with the dos command, plus the action (`Shutdown port`, `Mirror port`, or `Trap port`) and the number of instances of any **ipoptions** DoS attacks that have occurred on the interface. Displays `Disabled` when the **ipoptions** parameter is not configured with the dos command.
`land`	Displays `Enabled` when the **land** parameter is configured with the dos command, plus the action (`Shutdown port`, `Mirror port`, or `Trap port`) and the number of instances of any **land** DoS attacks that have occurred on the interface. Displays `Disabled` when the **land** parameter is not configured with the dos command.
`ping-of-death`	Displays `Enabled` when the **ping-of-death** parameter is configured with the dos command, plus the action (`Shutdown port`, `Mirror port`, or `Trap port`) and the number of instances of any **ping-of-death** DoS attacks that have occurred on the interface. Displays `Disabled` when the **ping-of-death** parameter is not configured with the dos command.

Table 44: Parameters in the **show dos interface** command output: (cont.)

Type of DoS attack	Description
`smurf`	Displays `Enabled` when the **smurf** parameter is configured with the dos command, plus the action (`Shutdown port`, `Mirror port`, or `Trap port`) and the number of instances of any **smurf** DoS attacks that have occurred on the interface. Displays `Disabled` when the **smurf** parameter is not configured with the dos command.
`synflood`	Displays `Enabled` when the **synflood** parameter is configured with the dos command, plus the action (`Shutdown port`, `Mirror port`, or `Trap port`) and the number of instances of any **synflood** DoS attacks that have occurred on the interface. Displays `Disabled` when the **synflood** parameter is not configured with the dos command.
`teardrop`	Displays `Enabled` when the **teardrop** parameter is configured with the dos command, plus the action (`Shutdown port`, `Mirror port`, or `Trap port`) and the number of instances of any **teardrop** DoS attacks that have occurred on the interface. Displays `Disabled` when the **teardrop** parameter is not configured with the dos command.

Related commands dos

show ip access-list

Overview Use this command to display IP access-lists.

Syntax
```
show ip access-list
[<1-99>|<100-199>|<1300-1999>|<2000-2699>|<access-list-name>]
```

Parameter	Description
<1-99>	IP standard access-list.
<100-199>	IP extended access-list.
<1300-1999>	IP standard access-list (expanded range).
<2000-2699>	IP extended access-list (expanded range).
<access-list-name>	IP named access-list.

Mode User Exec and Privileged Exec

Example
```
awplus# show ip access-list
```

Output Figure 43-3: Example output from the **show ip access-list** command

```
Standard IP access-list 1
    permit 172.168.6.0, wildcard bits 0.0.0.255
    permit 192.168.6.0, wildcard bits 0.0.0.255
```

show ip prefix-list

Overview Use this command to display the IPv4 prefix-list entries.

Note that this command is valid for RIP and BGP routing protocols only.

Syntax

```
show ip prefix-list [<name>|detail|summary]
```

Parameter	Description
<name>	Specify the name of a prefix list in this placeholder.
`detail`	Specify this parameter to show detailed output for all IPv4 prefix lists.
`summary`	Specify this parameter to show summary output for all IPv4 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

Related commands ip prefix-list

vty access-class (numbered)

Overview For IPv4, use this command to set a standard numbered software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IP addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit deny-all filter as the final entry in the ACL. So a typical configuration would be to permit a specific address, or range of addresses, and rely on the deny-all filter to block all other access.

Use the **no** variant of this command to remove the access list.

Syntax

```
vty access-class {<1-99>|<1300-1999>}
no vty access-class [<1-99>|<1300-1999>]
```

Parameter	Description
<1-99>	IPv4 standard access-list number
<1300-1999>	IPv4 standard access-list number (expanded range)

Mode Global Configuration

Examples To set access-list 4 to be the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vty access-class 4
```

To remove access-list 4 from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vty access-class 4
```

Output Figure 43-4: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class

vty access-class 4
```

Related commands

show running-config

vty ipv6 access-class (named)

44 IPv6 Hardware Access Control List (ACL) Commands

Introduction

Overview This chapter provides an alphabetical reference for the IPv6 Hardware Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 hardware ACLs, which are applied directly to interfaces using the ipv6 traffic-filter command.

For information about ACLs, see the ACL Feature Overview and Configuration Guide.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- Link Aggregation Feature Overview_and_Configuration_Guide.
- Link Aggregation Commands

Most ACL command titles include usage information in parentheses. When the command title is completely surrounded by parentheses, the title indicates the type of ACL filter instead of keywords to enter into the CLI. For example, the title **(named IPv6 hardware ACL: IP protocol entry)** represents a command with the syntax:

```
[<sequence-number>] <action> proto <1-255> <source-addr>
<dest-addr> [vlan <1-4094>]
```

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Sub-modes Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 44-1: IPv6 Hardware Access List Commands and Prompts

Command Name	Command Mode	Prompt
show acl-group ipv6 address	Privileged Exec	`awplus#`
show ipv6 access-list (IPv6 Hardware ACLs)	Privileged Exec	`awplus#`
acl-group ipv6 address	Global Configuration	`awplus(config)#`
ipv6 access-list (named IPv6 hardware ACL)	Global Configuration	`awplus(config)#`
ipv6 traffic-filter	Interface Configuration	`awplus(config-if)#`
commit (IPv6)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`
(named IPv6 hardware ACL: IPv6 packet entry)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`
(named IPv6 hardware ACL: ICMP entry)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`
(named IPv6 hardware ACL: IP protocol entry)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`
(named IPv6 hardware ACL: TCP or UDP entry)	IPv6 Hardware ACL Configuration	`awplus(config-ipv6-hw-acl)#`
ipv6 (ipv6-host-group)	IPv6 ACL Host Group Configuration	`awplus(config-ipv6-host-group)#`

Command List

acl-group ipv6 address

Overview Use this command to create a new named IPv6 ACL group that contains one or more IPv6 host or subnets.

This command creates a named IPv6 ACL group and enters the ACL Host Group config mode. IPv6 hosts or subnets can be added to or removed from this group. This host group can be used as a source or destination match for any hardware ACL to simplify large ACL configs with lots of IPv6 hosts.

Use the **no** variant of this command to delete an IPv6 ACL group.

Syntax

```
acl-group ipv6 address <group>
no acl-group ipv6 address <group>
```

Parameter	Description
<group>	The name of the IPv6 ACL group.

Default No ACL groups exist by default.

Mode Global Configuration

Example To create an IPv6 ACL group named IPV6 _GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ip-host-group)#
```

To delete an IPv6 ACL group named IPVv6 _GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# no acl-group ipv6 address IPV6_GROUP1
```

Related commands ipv6 (ipv6-host-group)

show acl-group ipv6 address

Command changes Version 5.5.0-1.1: command added

clear access-list counters

Overview Use this command to reset the hardware access-list counters to zero. The access-list counters show the number of packets that match your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments.

Syntax

```
clear access-list counters [<acl>]
```

Parameter	Description
<acl>	Clear the counters for only the specified ACL. You can enter the ACL name or number.

Mode Privileged Exec

Usage notes To view the counter values, use the command show access-list counters.

Example To clear the counters for the ACL named ACL-1, use the command:

```
awplus# clear access-list counters ACL-1
```

Related commands show access-list counters

Command changes Version 5.5.2-2.1: command added

commit (IPv6)

Overview Use this command to commit the IPv6 ACL filter configuration entered at the console to the hardware immediately without exiting the IPv6 Hardware ACL Configuration mode.

This command forces the associated hardware and software IPv6 ACLs to synchronize.

Syntax

```
commit
```

Mode IPv6 Hardware ACL Configuration

Usage notes Normally, when an IPv6 hardware ACL is edited, the new configuration state of the IPv6 ACL is not written to hardware until you exit IPv6 Hardware ACL Configuration mode. By entering this command you can ensure that the current state of a hardware access-list that is being edited is written to hardware immediately.

Scripts typically do not include the exit command to exit configuration modes, potentially leading to IPv6 ACL filters in hardware not being correctly updated. Using this **commit** command in a configuration script after specifying an IPv6 hardware ACL filter ensures that it is updated in the hardware.

Example To update the hardware with the IPv6 ACL filter configuration, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)# commit
```

Related commands ipv6 access-list (named IPv6 hardware ACL)

ipv6 (ipv6-host-group)

Overview Use this command to add an IPv6 host or subnet to an IPv6 ACL group. Adding IPv6 hosts and subnets to an ACL group allows you to simplify ACL config when the same IP addresses are required for many ACLs.

Use the **no** variant of this command to remove an IPv6 host or subnet from an IPv6 ACL group.

Syntax

```
ipv6 {any|<match-ip>}
no ipv6 {any|<match-ip>}
```

Parameter	Description	
any	Match any IP address.	
<match-ip>	The addresses to match against. You can specify a single host or a subnet. The following are the valid formats for specifying the addresses:	
	<ipv6-addr>	Specifies a single host address. The IPv6 address uses the format X:X::X:X.
	<ipv6-addr>/<prefix>	Specifies an address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64, or has the value 128.
	<ipv6-addr> <reverse-mask>	An IPv6 host and a reverse mask in format X:X::X:X.

Default No hosts or subnets are in an IPv6 ACL group by default.

Mode IPv6 ACL Host Group Configuration

Example To add the subnet 2001:DB8::/32 to an IPv6 ACL group IPV6_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# ipv6 2001:DB8::/32
```

To remove the subnet 2001:DB8::/32 from an IPv6 ACL group IPV6_GROUP1, use the commands:

```
awplus# configure terminal
awplus(config)# acl-group ipv6 address IPV6_GROUP1
awplus(config-ipv6-host-group)# no ipv6 2001:DB8::/32
```

Related commands

Command changes

Version 5.5.0-1.1: command added

ipv6 access-list (named IPv6 hardware ACL)

Overview Use this command to either create a new IPv6 hardware access-list, or to select an existing IPv6 hardware access-list in order to apply a filter entry to it.

Use the **no** variant of this command to delete an existing IPv6 hardware access-list.

NOTE: *Before you can delete an access-list, you must first remove it from any interface it is assigned to.*

Syntax

```
ipv6 access-list <ipv6-access-list-name>
no ipv6 access-list <ipv6-access-list-name>
```

Parameter	Description
<ipv6-access-list-name>	Specify an IPv6 access-list name.

Mode Global Configuration

Default Any traffic on an interface controlled by a hardware ACL that does not explicitly match a filter is permitted.

Usage notes Use IPv6 hardware named access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 hardware named access-list when a match is encountered.

This command moves you to the (config-ipv6-hw-acl) prompt for the selected IPv6 hardware named access-list number. From there you can configure the filters for this selected IPv6 hardware named access-list.

Once you have configured the ACL, use the ipv6 traffic-filter or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

Examples To create an IPv6 access-list named “my-ipv6-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-ipv6-acl
awplus(config-ipv6-hw-acl)#
```

To delete the IPv6 access-list named “my-ipv6-acl”, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list my-ipv6-acl
```

Related commands (named IPv6 hardware ACL: ICMP entry)

ipv6 traffic-filter

Overview This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

Use the **no** variant of this command to remove an IPv6 hardware-based access-list from an interface.

Syntax

```
ipv6 traffic-filter <ipv6-access-list-name>
no ipv6 traffic-filter <ipv6-access-list-name>
```

Parameter	Description
<ipv6-access-list-name>	Hardware IPv6 access-list name.

Mode Interface Configuration (to apply an IPv6 hardware ACL to a specific switch port).

Usage notes This command adds an IPv6 hardware-based access-list to an interface. The number of access-lists that can be added is determined by the amount of available space in the hardware-based packet classification tables.

Examples To add access-list “acl1” as a traffic-filter to interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ipv6 traffic-filter acl1
```

To remove access-list “acl1” as a traffic-filter from interface port1.0.1, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no ipv6 traffic-filter acl1
```

Related commands

ipv6 access-list (named IPv6 hardware ACL)

(named IPv6 hardware ACL: ICMP entry)

(named IPv6 hardware ACL: IPv6 packet entry)

(named IPv6 hardware ACL: IP protocol entry)

(named IPv6 hardware ACL: TCP or UDP entry)

show ipv6 access-list (IPv6 Hardware ACLs)

(named IPv6 hardware ACL: ICMP entry)

Overview

Use this command to add a new ICMP filter entry to the current IPv6 hardware access-list. The filter will match on any ICMP packet that has the specified IPv6 source and destination IP addresses and (optionally) ICMP type. You can specify the value **any** if source or destination address does not matter.

The **no** variant of this command removes a filter entry from the current IPv6 hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny icmp 2001:0db8::0/64 any**).

You can find the sequence number by running the show ipv6 access-list (IPv6 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> icmp <source-addr> <dest-addr>
[icmp-type <number>] [vlan <1-4094>]

no <sequence-number>

no <action> icmp <source-addr> <dest-addr> [icmp-type <number>]
[vlan <1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description	
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`icmp`	Match against ICMP packets.	
<source-addr>	The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source host.
	<ipv6-src-address/ prefix-length>	Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
	<ipv6-src-address> <ipv6-src-wildcard>	Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
	`host` *<ipv6-source-host>*	Match a single source host address. The IPv6 address uses the format X:X::X:X.
<dest-addr>	The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination host.
	<ipv6-dest-address/ prefix-length>	Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.

Parameter	Description	
	`<ipv6-dest-address>` `<ipv6-dest-wildcard>`	Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
	`host <ipv6-dest-host>`	Match a single destination host address. The IPv6 address uses the format X:X::X:X.
`icmp-type <number>`	The type of ICMP message to match against, as defined in RFC792 and RFC950. Values include:	
	0	Echo replies.
	3	Destination unreachable messages.
	4	Source quench messages.
	5	Redirect (change route) messages.
	8	Echo requests.
	11	Time exceeded messages.
	12	Parameter problem messages.
	13	Timestamp requests.
	14	Timestamp replies.
	15	Information requests.
	16	Information replies.
	17	Address mask requests.
	18	Address mask replies.
`vlan <1-4094>`	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode IPv6 Hardware ACL Configuration (accessed by running the command ipv6 access-list (named IPv6 hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command ipv6 access-list (named IPv6 hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the ipv6 traffic-filter or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the ACL named "my-acl", to block ICMP packets sent from network 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny icmp 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named "my-acl" that blocks all ICMP packets sent from network 2001:0db8::0/ 64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny icmp 2001:0db8::0/64 any
```

To specify an ACL named "my-acl1" and add a filter entry that blocks all ICMP6 echo requests, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
```

To specify an ACL named "my-acl2" and add a filter entry that blocks all ICMP6 echo requests on the default VLAN (vlan1), enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl2
awplus(config-ipv6-hw-acl)# deny icmp any any icmp-type 128
vlan 1
```

To remove a filter entry that blocks all ICMP6 echo requests from the ACL named "my-acl1", enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl1
awplus(config-ipv6-hw-acl)# no deny icmp any any icmp-type 128
```

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named IPv6 hardware ACL: IPv6 packet entry)

Overview Use this command to add an IPv6 packet filter entry to the current hardware access-list. The filter will match on IPv6 packets that have the specified source and destination IPv6 address and (optionally) prefix. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny ipv6 2001:0db8::0/64 any**).

You can find the sequence number by running the show ipv6 access-list (IPv6 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> ipv6 <source-addr> <dest-addr>
[vlan <1-4094>]
```

```
no <sequence-number>
```

```
no <action> ipv6 <source-addr> <dest-addr> [vlan <1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description	
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`ipv6`	Match against IPv6 packets	
<source-addr>	The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source host.
	<ipv6-src-address/ prefix-length>	Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
	<ipv6-src-address> <ipv6-src-wildcard>	Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
	`host` *<ipv6-source-host>*	Match a single source host address. The IPv6 address uses the format X:X::X:X.
<dest-addr>	The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination host.
	<ipv6-dest-address/ prefix-length>	Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.

Parameter	Description	
	<ipv6-dest-address> *<ipv6-dest-wildcard>*	Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
	host *<ipv6-dest-host>*	Match a single destination host address. The IPv6 address uses the format X:X::X:X.
vlan *<1-4094>*	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode IPv6 Hardware ACL Configuration (accessed by running the command ipv6 access-list (named IPv6 hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command ipv6 access-list (named IPv6 hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the ipv6 traffic-filter or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples To add a filter entry to the ACL named "my-acl" to block IPv6 traffic sent from network 2001:0db8::0/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny ipv6 2001:0db8::0/64 any
```

To remove a filter entry from the ACL named "my-acl" that blocks all IPv6 traffic sent from network 2001:0db8::0/ 64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny ipv6 2001:0db8::0/64 any
```

(named IPv6 hardware ACL: IP protocol entry)

Overview

Use this command to add an IP protocol type filter entry to the current IPv6 hardware access-list. The filter will match on IPv6 packets that have the specified IP protocol number, and the specified IPv6 addresses. You can use the value **any** instead of source or destination IPv6 address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny proto 2 2001:0db8::0/64 any**).

You can find the sequence number by running the show ipv6 access-list (IPv6 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> proto <1-255> <source-addr>
<dest-addr> [vlan <1-4094>]

no <sequence-number>

no <action> proto <1-255> <source-addr> <dest-addr> [vlan
<1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Table 44-2: Parameters in IP protocol ACL entries

Parameter	Description	
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`proto` *<1-255>*	The IP protocol number to match against, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.	
<source-addr>	The source addresses to match against. You can specify a single host, a range, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source host.
	<ipv6-src-address/ prefix-length>	Match the specified source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
	<ipv6-src-address> <ipv6-src-wildcard>	Match the specified IPv6 source address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
	`host` *<ipv6-source-host>*	Match a single source host address. The IPv6 address uses the format X:X::X:X.
<dest-addr>	The destination addresses to match against. You can specify a single host, a range, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination host.

Table 44-2: Parameters in IP protocol ACL entries (cont.)

Parameter	Description	
	<ipv6-dest-address/ prefix-length>	Match the specified destination address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
	<ipv6-dest-address> <ipv6-dest-wildcard>	Match the specified destination address, masked using wildcard bits. The IPv6 address uses the format X:X::X:X. In the wildcard bits, 1 represents bits to ignore, and 0 represents bits to match.
	`host` *<ipv6-dest-host>*	Match a single destination host address. The IPv6 address uses the format X:X::X:X.
`vlan` *<1-4094>*	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Table 44-3: IP protocol number and description

Protocol Number	Protocol Description [RFC]

Mode IPv6 Hardware ACL Configuration (accessed by running the command ipv6 access-list (named IPv6 hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes To use this command, first run the command ipv6 access-list (named IPv6 hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the ipv6 traffic-filter or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples

To add a filter entry to the ACL named "my-acl" to deny IGMP packets from 2001:0db8::0/64 , use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny proto 2 2001:0db8::0/64 any
```

To remove a filter entry that blocks IGMP packets from network 2001:0db8::0/64 from the ACL named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny proto 2 2001:0db8::0/64 any
```

Version 5.4.7-2.1: **send-to-vlan-port** action parameter added on GS900MX, GS980MX, XS900MX, SBx8100, SBx908 GEN2, x950 Series switches

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

(named IPv6 hardware ACL: TCP or UDP entry)

Overview

Use this command to add a TCP or UDP filter entry to the current IPv6 hardware access-list. The access-list will match on TCP or UDP packets that have the specified source and destination IP addresses and optionally, port values. You can use the value **any** instead of source or destination IP address if an address does not matter.

The **no** variant of this command removes a filter entry from the current hardware access-list. You can specify the filter entry for removal by entering either its sequence number (e.g. **no 100**), or by entering its filter profile without specifying its sequence number (e.g. **no deny tcp 2001:0db8::0/64 any**).

You can find the sequence number by running the show ipv6 access-list (IPv6 Hardware ACLs) command.

Hardware ACLs will **permit** access unless **explicitly denied** by an ACL action.

CAUTION: *Specifying a "send" action enables you to use ACLs to redirect packets from their original destination. Use such ACLs with caution. They could prevent control packets from reaching the correct destination, such as EPSR healthcheck messages, AMF messages, and VCStack messages.*

Syntax

```
[<sequence-number>] <action> {tcp|udp} <source-addr>
[<source-ports>] <dest-addr> [<dest-ports>] [vlan <1-4094>]

no <sequence-number>

no <action> {tcp|udp} <source-addr> [<source-ports>]
<dest-addr> [<dest-ports>] [vlan <1-4094>]
```

The following actions are available for hardware ACLs:

Values for the <action> parameter	
`deny`	Reject packets that match the source and destination filtering specified with this command.
`permit`	Permit packets that match the source and destination filtering specified with this command.
`copy-to-cpu`	Send a copy of matching packets to the CPU.
`copy-to-mirror`	Send a copy of matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-mirror`	Send matching packets to the mirror port. Use the **mirror interface** command to configure the mirror port.
`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Values for the <action> parameter	
`send-to-cpu`	Send matching packets to the CPU.
`deny-and-not-cpu`	Drop the packet and make sure that it isn't sent to the switch's CPU. Use this action if you want to drop packets that AlliedWare Plus would normally send to the switch's CPU.

Parameter	Description	
<sequence-number>	The sequence number for the filter entry of the selected access control list, in the range 1-65535. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.	
<action>	The action that the switch will take on matching packets. See the table above for valid values.	
`tcp`	Match against TCP packets.	
`udp`	Match against UDP packets.	
<source-addr>	The source addresses to match against. You can specify a single host, a subnet, or all source addresses. The following are the valid formats for specifying the source:	
	`any`	Match any source IP address.
	`host` *<ip-addr>*	Match a single source host with the IP address given by *<ip-addr>* in dotted decimal notation.
	<ip-addr>/<prefix>	Match any source IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	<ip-addr> <reverse-mask>	Match any source IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<source-ports>	Match source TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:	
	`eq <0-65535>`	Match a single port number.
	`lt <0-65535>`	Match all port numbers that are less than the specified port number.
	`gt <0-65535>`	Match all port numbers that are greater than the specified port number.

Parameter	Description	
	`ne <0-65535>`	Match all port numbers except the specified port number.
	`range <start-port> <end-port>`	Match a range of port numbers.
<dest-addr>	The destination addresses to match against. You can specify a single host, a subnet, or all destination addresses. The following are the valid formats for specifying the destination:	
	`any`	Match any destination IP address.
	`host <ip-addr>`	Match a single destination host with the IP address given by *<ip-addr>* in dotted decimal notation.
	`<ip-addr>/ <prefix>`	Match any destination IP address within the specified subnet. Specify the subnet by entering the IPv4 address, then a forward slash, then the prefix length.
	`<ip-addr> <reverse-mask>`	Match any destination IP address within the specified subnet. Specify the subnet by entering a reverse mask in dotted decimal format. For example, entering "192.168.1.1 0.0.0.255" is the same as entering 192.168.1.1/24.
<dest-ports>	Match destination TCP or UDP port numbers. Port numbers are specified as integers between 0 and 65535. You can specify one or more port numbers as follows:	
	`eq <0-65535>`	Match a single port number.
	`lt <0-65535>`	Match all port numbers that are less than the specified port number.
	`gt <0-65535>`	Match all port numbers that are greater than the specified port number.
	`ne <0-65535>`	Match all port numbers except the specified port number.
	`range <start-port> <end-port>`	Match a range of port numbers.
`vlan <1-4094>`	The VLAN to match against. The ACL will match against the specified ID in the packet's VLAN tag.	

Mode IPv6 Hardware ACL Configuration (accessed by running the command ipv6 access-list (named IPv6 hardware ACL))

Default On an interface controlled by a hardware ACL, any traffic that does not explicitly match a filter is permitted.

Usage notes

To use this command, first run the command ipv6 access-list (named IPv6 hardware ACL) and enter the desired access-list name. This changes the prompt to:

```
awplus(config-ipv6-hw-acl)#
```

Then use this command (and the other "named IPv6 hardware ACL: entry" commands) to add filter entries. You can add multiple filter entries to an ACL.

If you specify a sequence number, the new entry is inserted at the specified location. If you do not specify a sequence number, the switch puts the entry at the end of the ACL and assigns it the next available multiple of 4 as its sequence number.

Once you have configured the ACL, use the ipv6 traffic-filter or the match access-group command to apply this ACL to a port, VLAN or QoS class-map. Note that the ACL will only apply to incoming data packets.

Examples

To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 to the hardware IPv6 access-list named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
```

To add a filter entry that blocks all SSH traffic from network 2001:0db8::0/64 on the default VLAN (vlan1) to the hardware IPv6 access-list named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# deny tcp 2001:0db8::0/64 any eq 22
vlan 1
```

To remove an ACL filter entry that blocks all SSH traffic from network 2001:0db8::0/64 from the hardware IPv6 access-list named "my-acl", use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list my-acl
awplus(config-ipv6-hw-acl)# no deny tcp 2001:0db8::0/64 any eq
22
```

Version 5.4.6-2.1: **send-to-vlan-port** action parameter added on IX5, x230, x310, x510, x930 Series switches

platform hwfilter-size

Overview You can use this command to control the configuration of hardware Access Control Lists (ACLs), which determines the total available number and functionality of hardware ACLs.

For this command to take effect, you need to reboot the affected service.

You cannot attach an IPv6 ACL to a port if the ACL contains a specified source or destination IPv6 address or both and the **hw-filter size** setting is **ipv4-limited-ipv6**. If you do so, a diagnostic message will be generated.

Syntax

```
platform hwfilter-size {ipv4-limited-ipv6|ipv4-full-ipv6}
```

Parameter	Description
`hwfilter-size`	Configure hardware ACLs command.
`ipv4-full-ipv6`	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic, including filtering on source or destination IPv6 addresses, or both; however, this will reduce the total number of filters available in the hardware table.
`ipv4-limited-ipv6`	Configure hardware ACLs to filter IPv4 traffic, MAC addresses and IPv6 traffic. Source or destination IPv6 addresses or both are not filtered.

Default The default mode is **ipv4-limited-ipv6**.

Mode Global Configuration

Example To configure hardware ACLs to filter IPv4 and IPv6 traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# platform hwfilter-size ipv4-full-ipv6
```

Related commands show platform

ipv6 access-list (named IPv6 hardware ACL)

show access-list counters

Overview Use this command to show the number of packets that match one or all of your hardware ACLs. Every time a hardware ACL allows or drops a packet, its counter increments. This lets you check your ACL configuration.

Syntax

```
show access-list counters [<acl>]
```

Parameter	Description
<acl>	Display the number of packets that match only the specified ACL. You can enter the ACL name or number.

Mode User Exec and Privileged Exec

Usage notes This command displays the counter values since the last time they were cleared. To clear the counter values, enter the command clear access-list counters.

To accurately measure the number of packet hits per ACL, you need to read the counters for all ACLs frequently.

Example To show the number of packets that match all hardware ACLs, use the following command:

```
awplus# show access-list counters
```

Output Figure 44-1: Example output from **show access-list counters**

```
awplus#show access-list counters
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
ACL-2
Packet Hits: 0
ACL-3
Packet Hits: 1
```

Output Figure 44-2: Example output from **show access-list counters ACL-1**

```
awplus#show access-list counters ACL-1
Hardware ACL Packet Counters

ACL-1
Packet Hits: 17
```

Table 44-4: Parameters in the output from **show access-list counters**

Parameter	Description
Packet Hits	The number of packets that match the ACL. The count includes both dropped and allowed packets.

Related commands

clear access-list counters

show interface access-group

Command changes

Version 5.5.2-2.1: reading the counters no longer clears them

Version 5.5.1-2.1: command added

show acl-group ipv6 address

Overview Use this command to show the hosts and subnets in a named IPv6 ACL group.

Syntax

```
show acl-group ipv6 address <group>
```

Parameter	Description
<group>	The name of the IPv6 ACL group.

Mode Privileged Exec

Example To show all hosts and subnets in an IPv6 ACL group IPV6_GROUP1, use the command:

```
awplus# show acl-group ipv6 address IPV6_GROUP1
```

Output Figure 44-3: Example output from **show acl-group ipv6 address IPV6_GROUP1**

```
awplus#show acl-group ipv6 address IPV6_GROUP1
Host Group: IPV6_GROUP1

 2001:DB8::/32
 2001:DB9::1/128
```

Related commands acl-group ipv6 address

ipv6 (ipv6-host-group)

Command changes Version 5.5.0-1.1: command added

show ipv6 access-list (IPv6 Hardware ACLs)

Overview Use this command to display all configured hardware IPv6 access-lists or the IPv6 access-list specified by name. Omitting the optional name parameter will display all IPv6 ACLs.

Syntax

```
show ipv6 access-list [<name>]
```

Parameter	Description
<name>	Hardware IPv6 access-list name.

Mode User Exec and Privileged Exec

Example To show all configured IPv6 access-lists use the command:

```
awplus# show ipv6 access-list
```

Output Figure 44-4: Example output from the **show ipv6 access-list** command

```
IPv6 access-list deny_ssh
  deny tcp abcd::0/64 any eq 22
```

ACLs that are added dynamically during port authentication will be displayed with the label 'dynamic':

```
awplus# show ipv6 access-list
```

```
Named Standard IPv6 access list red
   10 deny   any

Named Extended IPv6 access list blue
   10 deny   ip any any

Hardware IPv6 access list dacl-port1.0.45-2477.03fe.ded4-ipv6 (dynamic)
    4 deny ipv6 any any
```

45 IPv6 Software Access Control List (ACL) Commands

Introduction

Overview This chapter provides an alphabetical reference for the IPv6 Software Access Control List (ACL) commands, and contains detailed command information and command examples about IPv6 software ACLs as applied to Routing and Multicasting, which are not applied to interfaces.

For information about ACLs, see the ACL Feature Overview and Configuration Guide.

To apply ACLs to an LACP channel group, apply it to all the individual switch ports in the channel group. To apply ACLs to a static channel group, apply it to the static channel group itself. For more information on link aggregation see the following references:

- the Link Aggregation Feature Overview_and_Configuration_Guide.
- Link Aggregation Commands

Note that text in parenthesis in command names indicates usage not keyword entry. For example, **ipv6-access-list (named)** indicates named IPv6 ACLs entered as:

```
ipv6-access-list<name>
```

where <*name*> is a placeholder not a keyword.

Note also that parenthesis surrounding ACL filters indicates the type of ACL filter not the keyword entry in the CLI. For example, **(ipv6 access-list standard IPv6 filter)** represents command entry in the format shown in the syntax:

```
[<sequence-number>] {deny|permit}
{<source-ipv6-address/prefix-length>|any}
```

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Sub-modes Many of the ACL commands operate from sub-modes that are specific to particular ACL types. The following table shows the CLI prompts at which ACL commands are entered.

Table 45-1: IPv6 Software Access List Commands and Prompts

Command Name	Command Mode	Prompt
show ipv6 access-list (IPv6 Software ACLs)	Privileged Exec	`awplus#`
ipv6 access-list extended (named)	Global Configuration	`awplus(config)#`
ipv6 access-list standard (named)	Global Configuration	`awplus(config)#`
(ipv6 access-list extended IP protocol filter)	IPv6 Extended ACL Configuration	`awplus(config-ipv6-ext-acl)#`
(ipv6 access-list extended TCP UDP filter)	IPv6 Extended ACL Configuration	`awplus(config-ipv6-ext-acl)#`
(ipv6 access-list standard filter)	IPv6 Standard ACL Configuration	`awplus(config-ipv6-std-acl)#`

Command List

ipv6 access-list extended (named)

Overview

Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny IP, ICMP, TCP, UDP packets or ICMP packets with a specific value based on the source or destination.

The **no** variant of this command removes a specified IPv6 extended access-list.

Syntax [list-name]

```
ipv6 access-list extended <list-name>
no ipv6 access-list extended <list-name>
```

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access-list.

Syntax [any|icmp|ip]

```
ipv6 access-list extended <list-name> {deny|permit}
{any|icmp|ip} {<ipv6-source-address/prefix-length>|any}
{<ipv6-destination-address/prefix-length>|any} [<icmp-type
<icmp-type>][log]
no ipv6 access-list extended <list-name> {deny|permit}
{any|icmp|ip} {<ipv6-source-address/prefix-length>|any}
{<ipv6-destination-address/prefix-length>|any} [<icmp-type
<icmp-type>][log]
```

Syntax [tcp|udp]

```
ipv6 access-list extended <list-name> {deny|permit} {tcp|udp}
{<ipv6-source-address/prefix-length>|any} {eq <sourceport>|lt
<sourceport>|gt <sourceport>|ne
<sourceport>}{<ipv6-destination-address/prefix-length>|any}
{eq <destport>|lt <destport>|gt <destport>|ne <destport>} [log]
no ipv6 access-list extended <list-name> {deny|permit}
{tcp|udp} {<ipv6-source-address/prefix-length>|any} {eq
<sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>}{<ipv6-destination-addr/prefix-length>|any} {eq
<destport>|lt <destport>|gt <destport>|ne <destport>} [log]
```

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access-list.
deny	The IPv6 software extended access-list rejects packets that match the type, source, and destination filtering specified with this command.
permit	The IPv6 software extended access-list permits packets that match the type, source, and destination filtering specified with this command.

Parameter	Description
any	For ICMP|IP The IPv6 software extended access-list matches any type of packet.
ip	For ICMP|IP The IPv6 software extended access-list matches only IP packets.
icmp	For ICMP|IP The IPv6 software extended access-list matches only ICMP packets.
tcp	For TCP/UDP The IPv6 software extended access-list matches only TCP packets.
udp	For TCP/UDP The IPv6 software extended access-list matches only UDP packets.
<ipv6-source-address/prefix-length>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<ipv6-destination-address/prefix-length>	Specifies a destination address and prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Matches any IPv6 address.
<sourceport>	For TCP/UDP The source port number, specified as an integer between 0 and 65535.
<destport>	For TCP/UDP The destination port number, specified as an integer between 0 and 65535.
icmp-type	For ICMP|IP Matches only a specified type of ICMP messages. This is valid only when the filtering is set to match ICMP packets.
eq	For TCP/UDP Matches port numbers equal to the port number specified immediately after this parameter.
lt	For TCP/UDP Matches port numbers less than the port number specified immediately after this parameter.
gt	For TCP/UDP Matches port numbers greater than the port number specified immediately after this parameter.
ne	For TCP/UDP Matches port numbers not equal to the port number specified immediately after this parameter.

Parameter	Description	
<icmp-type>	For ICMP|IP The ICMP type, as defined in RFC792 and RFC950. Specify one of the following integers to create a filter for the ICMP message type:	
	0	Echo replies.
	3	Destination unreachable messages.
	4	Source quench messages.
	5	Redirect (change route) messages.
	8	Echo requests.
	11	Time exceeded messages.
	12	Parameter problem messages.
	13	Timestamp requests.
	14	Timestamp replies.
	15	Information requests.
	16	Information replies.
	17	Address mask requests.
	18	Address mask replies.
`log`	Logs the results.	

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

For backwards compatibility you can either create IPv6 extended access-lists from within this command, or you can enter `ipv6 access-list extended` followed by only the IPv6 extended access-list name. This latter (and preferred) method moves you to the `(config-ipv6-ext-acl)` prompt for the selected IPv6 extended access-list number, and from here you can configure the filters for this selected access-list.

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Example 1 [creating a list]

To add a new filter to the access-list named `my-list` that will reject incoming ICMP packets from 2001:0db8::0/64 to 2001:0db8::f/64, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# icmp 2001:0db8::0/64
2001:0db8::f/64
```

Example 2 [adding to a list]

To insert a new filter at sequence number `5` of the access-list named `my-list`that will accept ICMP type 8 packets from the 2001:0db8::0/64 network to the 2001:0db8::f/64 network, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 icmp 2001:0db8::0/64
2001:0db8::f/64
```

Example 3 [list with filter]

To create the access-list named TK to deny TCP protocols, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended TK deny tcp any eq 14
any lt 12 log
```

Version 5.5.1-0.1: Support for the **no** variant added

ipv6 access-list extended proto

Overview Use this command when configuring an IPv6 extended access-list for filtering frames that permit or deny packets with a specific value based on the IP protocol number specified.

The **no** variant of this command removes a specified IPv6 extended access-list with an IP protocol number.

Syntax

```
ipv6 access-list extended <list-name> {deny|permit} proto
<ip-protocol>} {<ipv6-source-address/prefix>|any}
{<ipv6-destination-address/prefix>|any} [log]
```

```
no ipv6 access-list extended <list-name> {deny|permit} proto
<ip-protocol>{<ipv6-source-address/prefix>|any}
{<ipv6-destination-address/prefix>|any} [log]
```

Parameter	Description
<list-name>	A user-defined name for the IPv6 software extended access- list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
proto	The IP Protocol type specified by its protocol number in the range 1 to 255.
<ip-protocol>	The IP protocol number, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.
<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
<ipv6-destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any destination address or remote address.
log	Log the results.

136	UDPLite / RFC3828
137	MPLS-in-IP / RFC4023
138	MANET Protocols / RFC-ietf-manet-iana-07.txt

Table 45-2: IP protocol number and description (cont.)

Protocol Number	Protocol Description [RFC]
139-252	Unassigned / IANA
253	Use for experimentation and testing / RFC3692
254	Use for experimentation and testing / RFC3692
255	Reserved / IANA

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use IPv6 extended access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 extended access-list when a match is encountered.

The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter `any` may be specified if an address does not matter.

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples To create the IPv6 access-list named `ACL-1` to deny IP protocol `9` packets from `2001:0db8:1::1/128` to `2001:0db8:f::1/128`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended ACL-1 deny proto 9
2001:0db8:1::1/128 2001:0db8:f::1/128
```

To remove the IPv6 access-list named `ACL-1` to deny IP protocol `9` packets from `2001:0db8:1::1/128` to `2001:0db8:f::1/128`, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 access-list extended ACL-1 deny proto
10 2001:0db8:1::1/128 2001:0db8:f::1/128
```

Related commands

ipv6 access-list extended (named)

(ipv6 access-list extended IP protocol filter)

show ipv6 access-list (IPv6 Software ACLs)

show running-config

(ipv6 access-list extended IP protocol filter)

Overview Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol specified, to the current extended IPv6 access-list. If a sequence is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with or without an IP protocol filter entry, from the current extended IPv6 access-list. You can specify the ACL filter entry by entering either its sequence number, or its filter entry profile.

Syntax [ip|proto]

```
[<sequence-number>] {deny|permit} {ip|any|proto <ip-protocol>}
{<ipv6-source-address/prefix>|any}
{<ipv6-destination-address/prefix>|any} [log]

no {deny|permit} {ip|any|proto <ip-protocol>}
{<ipv6-source-address/prefix>|any}
{<ipv6-destination-address/prefix>|any} [log]

no [<sequence-number>]
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
ip	IP packet.
any	Any packet.
proto *<ip-protocol>*	<1-255> Specify IP protocol number, as defined by IANA (Internet Assigned Numbers Authority www.iana.org/assignments/protocol-numbers) See below for a list of IP protocol numbers and their descriptions.
<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
<ipv6- destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any destination address or remote address.
log	Log the results.

Mode IPv6 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes The filter entry will match on any IP protocol type packet that has the specified source and destination IPv6 addresses and the specified IP protocol type. The parameter `any` may be specified if an address does not matter.

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples To add a new ACL filter entry to the extended IPv6 access-list named `my-list` with sequence number `5` rejecting the IPv6 packet from `2001:db8:1:1` to `2001:db8:f:1`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny ip 2001:db8:1::1/128
2001:db8:f::1/128
```

To remove the ACL filter entry to the extended IPv6 access-list named `my-list` with sequence number `5`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

Related commands

ipv6 access-list extended (named)

show ipv6 access-list (IPv6 Software ACLs)

show running-config

(ipv6 access-list extended TCP UDP filter)

Overview Use this ACL filter to add a filter entry for an IPv6 source and destination address and prefix, with a TCP (Transmission Control Protocol) or UDP (User Datagram Protocol) source and destination port specified, to the current extended IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source and destination address and prefix, with a TCP or UDP source and destination port specified, from the current extended IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [tcp|udp]

```
[<sequence-number>] {deny|permit} {tcp|udp}
{<ipv6-source-address/prefix>|any} {eq <sourceport>|lt
<sourceport>|gt <sourceport>|ne <sourceport>}
{<IPv6-destination-address/prefix>|any} {eq <destport>|lt
<destport>|gt <destport>|ne <destport>} [log]
```

```
no {deny|permit} {tcp|udp} {<ipv6-source-address/prefix>|any}
{eq <sourceport>|lt <sourceport>|gt <sourceport>|ne
<sourceport>}} {<IPv6-destination-address/prefix>|any} {eq
<destport>|lt <destport>|gt <destport>|ne <destport>} [log]
```

```
no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
tcp	TCP packet.
udp	UDP packet.
<ipv6-source-address/prefix>	IPv6 source address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
any	Any source address or local address.
eq	Equal to.
lt	Less than.
gt	Greater than.
ne	Not equal to.
<sourceport>	The source port number, specified as an integer between 0 and 65535.

Parameter	Description
<ipv6-destination-address/prefix>	IPv6 destination address, or local address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<destport>	The destination port number, specified as an integer between 0 and 65535.
`log`	Log the results.

Mode IPv6 Extended ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes The filter entry will match on any packet that has the specified source and destination IPv6 addresses and the specified TCP or UDP source and destination port. The parameter `any` may be specified if an address does not matter.

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples To add a new filter entry with sequence number `5` to the access-list named `my-list` to reject TCP packets from 2001:0db8::0/64 port `10` to 2001:0db8::f/64 port `20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny tcp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To add a new filter entry with sequence number `5` to the extended IPv6 access-list named `my-list` to reject UDP packets from 2001:0db8::0/64 port `10` to 2001:0db8::f/ 64 port `20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# 5 deny udp 2001:0db8::0/64 eq 10
2001:0db8::f/64 eq 20
```

To remove the filter entry with sequence number `5`to the extended IPv6 access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list extended my-list
awplus(config-ipv6-ext-acl)# no 5
```

Related commands ipv6 access-list extended (named)

show ipv6 access-list (IPv6 Software ACLs)

show running-config

ipv6 access-list standard (named)

Overview This command configures an IPv6 standard access-list for filtering frames that permit or deny IPv6 packets from a specific source IPv6 address.

The **no** variant of this command removes a specified IPv6 standard access-list.

Syntax [list-name]

```
ipv6 access-list standard <ipv6-acl-list-name>
no ipv6 access-list standard <ipv6-acl-list-name>
```

Parameter	Description
<ipv6-acl-list-name>	A user-defined name for the IPv6 software standard access-list.

Syntax [deny|permit]

```
ipv6 access-list standard <ipv6-acl-list-name> [{deny|permit}
{<ipv6-source-address/prefix-length>|any} [exact-match]]
no ipv6 access-list standard <ipv6-acl-list-name>
[{deny|permit} {<ipv6-source-address/prefix-length>|any}
[exact-match]]
```

Parameter	Description
<ipv6-acl-list-name>	A user-defined name for the IPv6 software standard access-list.
`deny`	The IPv6 software standard access-list rejects packets that match the type, source, and destination filtering specified with this command.
`permit`	The IPv6 software standard access-list permits packets that match the type, source, and destination filtering specified with this command.
<ipv6-source-address/ prefix-length>	Specifies a source address and prefix length. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
`any`	Matches any source IPv6 address.
`exact-match`	Exact match of the prefixes.

Mode Global Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage notes Use IPv6 standard access-lists to control the transmission of IPv6 packets on an interface, and restrict the content of routing updates. The switch stops checking the IPv6 standard access-list when a match is encountered.

For backwards compatibility you can either create IPv6 standard access-lists from within this command, or you can enter `ipv6 access-list standard` followed by only the IPv6 standard access-list name. This latter (and preferred) method moves you to the `(config-ipv6-std-acl)` prompt for the selected IPv6 standard access-list, and from here you can configure the filters for this selected IPv6 standard access-list.

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Example To enter the IPv6 Standard ACL Configuration mode for the access-list named `my-list`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)#
```

Related commands

(ipv6 access-list standard filter)

show ipv6 access-list (IPv6 Software ACLs)

show running-config

(ipv6 access-list standard filter)

Overview Use this ACL filter to add a filter entry for an IPv6 source address and prefix length to the current standard IPv6 access-list. If a sequence number is specified, the new entry is inserted at the specified location. Otherwise, the new entry is added at the end of the access-list.

The **no** variant of this command removes a filter entry for an IPv6 source address and prefix from the current standard IPv6 access-list. You can specify the filter entry for removal by entering either its sequence number, or its filter entry profile.

Syntax [icmp]

```
[<sequence-number>] {deny|permit}
{<ipv6-source-address/prefix-length>|any}
no {deny|permit} {<ipv6-source-address/prefix-length>|any}
no <sequence-number>
```

Parameter	Description
<sequence-number>	<1-65535> The sequence number for the filter entry of the selected access control list.
deny	Specifies the packets to reject.
permit	Specifies the packets to accept.
<ipv6-source-address/prefix-length>	IPv6 source address and prefix-length in the form X:X::X:X/P.
any	Any IPv6 source host address.

Mode IPv6 Standard ACL Configuration

Default Any traffic controlled by a software ACL that does not explicitly match a filter is denied.

Usage The filter entry will match on any IPv6 packet that has the specified IPv6 source address and prefix length. The parameter `any` may be specified if an address does not matter.

NOTE: *Software ACLs will **deny** access unless **explicitly permitted** by an ACL action.*

Examples To add an ACL filter entry with sequence number `5` that will deny any IPv6 packets to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# 5 deny any
```

To remove the ACL filter entry that will deny any IPv6 packets from the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no deny any
```

Alternately, to remove the ACL filter entry with sequence number `5` to the standard IPv6 access-list named `my-list`, enter the commands:

```
awplus# configure terminal
awplus(config)# ipv6 access-list standard my-list
awplus(config-ipv6-std-acl)# no 5
```

Related commands

ipv6 access-list standard (named)

show ipv6 access-list (IPv6 Software ACLs)

show running-config

ipv6 prefix-list

Overview Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

Syntax

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]
ipv6 prefix-list <list-name> description <text>
no ipv6 prefix-list <list-name> [seq <1-429496725>]
no ipv6 prefix-list <list-name> [description <text>]
```

Parameter	Description
`<list-name>`	Specifies the name of a prefix list.
`seq <1-429496725>`	Sequence number of the prefix list entry.
`deny`	Specifies that the prefixes are excluded from the list.
`permit`	Specifies that the prefixes are included in the list.
`<ipv6-prefix>`	Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M.
`any`	Any prefix match. Same as ::0/0 le 128.
`ge <0-128>`	Specifies the minimum prefix length to be matched.
`le <0-128>`	Specifies the maximum prefix length to be matched.
`description`	Prefix list specific description.
`<text>`	Up to 80 characters of text description of the prefix list.

Mode Global Configuration

Usage notes When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

Example To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

Related commands

match ipv6 address

show ipv6 prefix-list

show running-config ipv6 prefix-list

show ipv6 access-list (IPv6 Software ACLs)

Overview Use this command to display all configured IPv6 access-lists or the IPv6 access-list specified by name.

Syntax

```
show ipv6 access-list [<access-list-name>]
show ipv6 access-list standard [<access-list-name>]
show ipv6 access-list extended [<access-list-name>]
```

Parameter	Description
<access-list-name>	Only display information about an IPv6 access-list with the specified name.
`standard`	Only display information about standard access-lists.
`extended`	Only display information about extended access-lists.

Mode User Exec and Privileged Exec

Example To show all configured IPv6 access-lists, use the following command:

```
awplus# show ipv6 access-list
```

Output Figure 45-1: Example output from **show ipv6 access-list**

```
IPv6 access-list deny_icmp
  deny icmp any any vlan 1

IPv6 access-list deny_ssh
  deny tcp abcd::0/64 any eq 22
```

Example To show the IPv6 access-list named **deny_icmp,** use the following command:

```
awplus# show ipv6 access-list deny_icmp
```

Output Figure 45-2: Example output from **show ipv6 access-list** for a named ACL

```
IPv6 access-list deny_icmp
  deny icmp any any vlan 1
```

Related commands

ipv6 access-list extended (named)

(ipv6 access-list extended IP protocol filter)

ipv6 access-list standard (named)

(ipv6 access-list extended TCP UDP filter)

(ipv6 access-list standard filter)

show ipv6 prefix-list

Overview Use this command to display the prefix-list entries.

Note that this command is valid for RIPng and BGP4+ routing protocols only.

Syntax

```
show ipv6 prefix-list [<name>|detail|summary]
```

Parameter	Description
<name>	Specify the name of an individual IPv6 prefix list.
`detail`	Specify this parameter to show detailed output for all IPv6 prefix lists.
`summary`	Specify this parameter to show summary output for all IPv6 prefix lists.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

Related commands ipv6 prefix-list

vty ipv6 access-class (named)

Overview For IPv6, use this command to set a standard named software access list to be the management ACL. This is then applied to all available VTY lines for controlling remote access by Telnet and SSH. This command allows or denies packets containing the IPv6 addresses included in the ACL to create a connection to your device.

ACLs that are attached using this command have an implicit 'deny-all' filter as the final entry in the ACL. A typical configuration is to permit a specific address, or range of addresses, and rely on the 'deny-all' filter to block all other access.

Use the **no** variant of this command to remove the access list.

Syntax

```
vty ipv6 access-class <access-name>
no vty ipv6 access-class [<access-name>]
```

Parameter	Description
<access-name>	Specify an IPv6 standard software access-list name

Mode Global Configuration

Examples To set the named standard access-list named **access-ctrl** to be the IPv6 management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# vty ipv6 access-class access-ctrl
```

To remove **access-ctrl** from the management ACL, use the following commands:

```
awplus# configure terminal
awplus(config)# no vty ipv6 access-class access-ctrl
```

Output Figure 45-3: Example output from the **show running-config** command

```
awplus#show running-config|grep access-class

vty ipv6 access-class access-ctrl
```

46 QoS and Policy-based Routing Commands

Introduction

Overview

This chapter provides an alphabetical reference for Quality of Service commands.

QoS uses ACLs. For more information about ACLs, see the ACL Feature Overview and Configuration Guide.

For more information about PBR, see the Policy-Based Routing Feature Overview and Configuration Guide.

Command List

class

Overview Use this command to associate an existing class-map to a policy or policy-map (traffic classification), and to enter Policy Map Class Configuration mode to configure the class- map.

Use the **no** variant of this command to delete an existing class-map.

If your class-map does not exist, you can create it by using the class-map command.

Syntax

```
class {<name>|default}
no class <name>
```

Parameter	Description
<name>	Name of the (already existing) class-map.
`default`	Specify the default class-map.

Mode Policy Map Configuration

Example The following example creates the policy-map `pmap1`(using the policy-map command), then associates this to an already existing class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)#
```

Related commands class-map

policy-map

class-map

Overview Use this command to create a class-map.

Use the **no** variant of this command to delete the named class-map.

Syntax

```
class-map <name>
no class-map <name>
```

Parameter	Description
<name>	Name of the class-map to be created.

Mode Global Configuration

Example This example creates a class-map called `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)#
```

clear mls qos interface policer-counters

Overview Resets an interface's policer counters to zero. You can either clear a specific class-map, or you can clear all class-maps by not specifying a class map.

Syntax

```
clear mls qos interface <port> policer-counters [class-map
<class-map>]
```

Parameter	Description
`<port>`	The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4).
`class-map`	Select a class-map.
`<class-map>`	Class-map name.

Mode Privileged Exec

Example To reset the policy counters to zero for all class-maps for port1.0.4, use the command:

```
awplus# clear mls qos interface port1.0.4 policer-counters
```

Related commands show mls qos interface policer-counters

clear mls qos interface queue-counters

Overview Use this command to clear the QoS queue counters for an interface.

Syntax

```
clear mls qos interface <interface> queue-counters
```

Parameter	Description
<interface>	The interface to clear the counters for. This can be a switchport, a static channel group, or a dynamic (LACP) channel group.

Mode Privileged Exec

Example To clear the egress queue counters on interface port1.0.1, use the command:

```
awplus# clear mls qos interface port1.0.1 queue-counters
```

To clear the egress queue counters on the static aggregator sa1, use the command:

```
awplus# clear mls qos interface sa1 queue-counters
```

Related commands show mls qos interface queue-counters

Command changes Version 5.5.2-2.1: command added

default-action

Overview Sets the action for the default class-map belonging to a particular policy-map. The action for a non-default class-map depends on the action of any ACL that is applied to the policy-map.

The default action can therefore be thought of as specifying the action that will be applied to any data that does not meet the criteria specified by the applied matching commands.

Use the **no** variant of this command to reset to the default action of 'permit'.

Syntax

```
default-action <action>
no default-action
```

Parameter		Description
<action>	`permit`	Packets to permit.
	`deny`	Packets to deny.
	`send-to-cpu`	Specify packets to send to the CPU.
	`copy-to-cpu`	Specify packets to copy to the CPU.
	`copy-to-mirror`	Specify packets to copy to the mirror port.
	`send-to-mirror`	Specify packets to send to the mirror port.
	`send-to-vlan-port vlan <vid> port <port-number>`	Send matching packets to the specified port, tagged with the specified VLAN. The specified port must belong to the specified VLAN.

Default The default is **permit**.

Mode Policy Map Configuration

Examples To set the action for the default class-map to deny, use the command:

```
awplus(config-pmap)# default-action deny
```

To set the action for the default class-map to copy-to-mirror for use with the mirror interface command, use the command:

```
awplus(config-pmap)# default-action copy-to-mirror
```

Related commands mirror interface

description (QoS policy-map)

Overview Adds a textual description of the policy-map. This can be up to 80 characters long.

Use the **no** variant of this command to remove the current description from the policy-map.

Syntax

```
description <line>
no description
```

Parameter	Description
<line>	Up to 80 character long line description.

Mode Policy Map Configuration

Example To add the description, VOIP traffic, use the command:

```
awplus(config-pmap)# description VOIP traffic
```

egress-rate-limit

Overview Use this command to limit the amount of traffic that can be transmitted per second from this port.

Use the **no** variant of this command to disable the limiting of traffic egressing on the interface.

Syntax

```
egress-rate-limit <rate-limit>
no egress-rate-limit
```

Parameter	Description
<rate-limit>	Bandwidth <1-10000000 units per second> (usable units: k, m, g). The egress rate limit can be configured in multiples of 64kbps. If you configure a value that is not an exact multiple of 64kbps, then the value will be rounded up to the nearest higher exact multiple of 64kbps. The minimum is 64 Kb. The default unit is Kb (**k**), but Mb (**m**) or Gb (**g**) can also be specified. The command syntax is not case sensitive, so a value such as 20m or 20M will be interpreted as 20 megabits.

Mode Interface Configuration

Examples To enable egress rate limiting on a port, with a limit of approximately 500Mbps, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit 500m
```

To disable egress rate limiting on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit
```

Related commands egress-rate-limit overhead

egress-rate-limit overhead

Overview Use this command to allow for the size of packet preamble and inter-packet gap (the "overhead") in egress queue rate limiting on switch ports.

Doing this keeps the rate limit at the same percentage of line rate for all packet sizes. Otherwise, the percentage of line rate changes with packet size, because of the size of the overhead relative to smaller packets. This means smaller packets take up a larger percentage of the line rate.

Use the **no** variant of this command to turn off the overhead allowance.

Syntax

```
egress-rate-limit overhead <bytes>
no egress-rate-limit overhead
```

Parameter	Description
<bytes>	The number of bytes to allow for overhead. For standard ethernet packets, use a value of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes).

Default No overhead allowance

Mode Interface Configuration

Example To configure an overhead allowance of 20 bytes (8 bytes of preamble and a inter-packet gap of 12 bytes) on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# egress-rate-limit overhead 20
```

To return port1.0.1 to the default of no overhead allowance, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no egress-rate-limit overhead
```

Related commands egress-rate-limit

Command changes Version 5.4.9-2.1: command added

match access-group

Overview Use this command to apply an ACL to a class-map or VLAN.

Use the **no** variant of this command to remove the match.

Syntax

```
match access-group {<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}
no match access-group
{<hw-IP-ACL>|<hw-MAC-ACL>|<hw-named-ACL>}
```

Parameter	Description
<hw-IP-ACL>	Specify a hardware IP ACL number in the range <3000-3699>.
<hw-MAC-ACL>	Specify a hardware MAC ACL number in the range <4000-4699>.
<hw-named-ACL>	Specify a hardware named ACL (IP, IPv6 or MAC address entries).

Mode Class Map or VLAN Access-Map

Usage notes First create an access-list that applies the appropriate action to matching packets. Then use the **match access-group** command to apply this access-list as desired. Note that this command will apply the access-list matching only to *incoming* data packets.

Examples To configure a class-map named "cmap1", which matches traffic against access-list 3001, which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 permit ip any any
awplus(config)# class-map cmap1
awplus(config-cmap)# match access-group 3001
```

To configure a class-map named "cmap2", which matches traffic against access-list 4001, which allows MAC traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 4001 permit any any
awplus(config)# class-map cmap2
awplus(config-cmap)# match access-group 4001
```

To configure a class-map named "cmap3", which matches traffic against access-list "hw_acl", which allows IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list hardware hw_acl
awplus(config-ip-hw-acl)# permit ip any any
awplus(config)# class-map cmap3
awplus(config-cmap)# match access-group hw_acl
```

To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

Related commands

class-map

vlan access-map

Command changes

Version 5.4.6-2.1: support for VLAN access-maps added

match cos

Overview Use this command to define a COS to match against incoming packets.

Use the **no** variant of this command to remove CoS.

Syntax

```
match cos <0-7>
no match cos
```

Parameter	Description
<0-7>	Specify the CoS value.

Mode Class Map Configuration

Examples To set the class-map's CoS to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match cos 4
```

To remove CoS from a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match cos
```

match dscp

Overview Use this command to define the DSCP to match against incoming packets.

Use the **no** variant of this command to remove a previously defined DSCP.

Syntax

```
match dscp <0-63>
no match dscp
```

Parameter	Description
<0-63>	Specify DSCP value (only one value can be specified).

Mode Class Map Configuration

Usage Use the **match dscp** command to define the match criterion after creating a class-map.

Examples To configure a class-map named `cmap1` with criterion that matches DSCP 56, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match dscp 56
```

To remove a previously defined DSCP from a class-map named cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match dscp
```

Related commands class-map

match eth-format protocol

Overview This command sets the Ethernet format and the protocol for a class-map to match on.

Select one Layer 2 format and one Layer 3 protocol when you issue this command.

Use the **no** variant of this command to remove the configured Ethernet format and protocol from a class-map.

Syntax

```
match eth-format <layer-two-format> protocol
<layer-three-protocol>
```

```
no match eth-format protocol
```

The following eth-formats and protocols are available (note that not all options are available on all AlliedWare Plus switch models):

Parameter	Description
<layer-two-formats>	
802dot2-tagged	802.2 Tagged Packets (enter the parameter name).
802dot2-untagged	802.2 Untagged Packets (enter the parameter name).
ethii-tagged	EthII Tagged Packets (enter the parameter name).
ethii-untagged	EthII Untagged Packets (enter the parameter name).
ethii-any	EthII Tagged or Untagged Packets (enter the parameter name).
netwareraw-tagged	Netware Raw Tagged Packets (enter the parameter name).
netwareraw-untagged	Netware Raw Untagged Packets (enter the parameter name).
snap-tagged	SNAP Tagged Packets (enter the parameter name).
snap-untagged	SNAP Untagged Packets (enter the parameter name).
<layer-three-protocols>	
<word>	A Valid Protocol Number in hexidecimal.
any	Note that the parameter "any" is only valid when used with the netwarerawtagged and netwarerawuntagged protocol options.
sna-path-control	Protocol Number 04 (enter the parameter name or its number).
proway-lan	Protocol Number 0E (enter the parameter name or its number).
eia-rs Protocol	Number 4E (enter the parameter name or its number).
proway Protocol	Number 8E (enter the parameter name or its number).

Parameter	Description
ipx-802dot2	Protocol Number E0 (enter the parameter name or its number).
netbeui	Protocol Number F0 (enter the parameter name or its number).
iso-clns-is	Protocol Number FE (enter the parameter name or its number).
xdot75-internet	Protocol Number 0801(enter the parameter name or its number).
nbs-internet	Protocol Number 0802 (enter the parameter name or its number).
ecma-internet	Protocol Number 0803 (enter the parameter name or its number).
chaosnet	Protocol Number 0804 (enter the parameter name or its number).
xdot25-level-3	Protocol Number 0805 (enter the parameter name or its number).
arp Protocol	Number 0806 (enter the parameter name or its number).
xns-compat	Protocol Number 0807 (enter the parameter name or its number).
banyan-systems	Protocol Number 0BAD (enter the parameter name or its number).
bbn-simnet	Protocol Number 5208 (enter the parameter name or its number).
dec-mop-dump-ld	Protocol Number 6001 (enter the parameter name or its number).
dec-mop-rem-cdons	Protocol Number 6002 (enter the parameter name or its number).
dec-decnet	Protocol Number 6003 (enter the parameter name or its number).
dec-lat	Protocol Number 6004 (enter the parameter name or its number).
dec-diagnostic	Protocol Number 6005 (enter the parameter name or its number).
dec-customer	Protocol Number 6006 (enter the parameter name or its number).
dec-lavc	Protocol Number 6007 (enter the parameter name or its number).
rarp	Protocol Number 8035 (enter the parameter name or its number).
dec-lanbridge	Protocol Number 8038 (enter the parameter name or its number).

Parameter	Description
dec-encryption	Protocol Number 803D (enter the parameter name or its number).
appletalk	Protocol Number 809B (enter the parameter name or its number).
ibm-sna	Protocol Number 80D5 (enter the parameter name or its number).
appletalk-aarp	Protocol Number 80F3 (enter the parameter name or its number).
snmp	Protocol Number 814CV.
ethertalk-2	Protocol Number 809B (enter the parameter name or its number).
ethertalk-2-aarp	Protocol Number 80F3 (enter the parameter name or its number).
ipx-snap	Protocol Number 8137 (enter the parameter name or its number).
ipx-802dot3	Protocol Number FFFF (enter the parameter name or its number).
ip	Protocol Number 0800 (enter the parameter name or its number).
ipx	Protocol Number 8137 (enter the parameter name or its number).
ipv6	Protocol Number 86DD (enter the parameter name or its number).

Mode Class Map Configuration

Examples To set the eth-format to ethii-tagged and the protocol to 0800 (IP) for class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match eth-format ethii-tagged protocol
0800
awplus(config-cmap)# match eth-format ethii-tagged protocol ip
```

To remove the eth-format and the protocol from the class-map cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match eth-format protocol
```

match inner-cos

Overview Sets the Inner CoS for a class-map to match on.

Use the **no** variant of this command to remove CoS.

Syntax

```
match inner-cos <0-7>
no match inner-cos
```

Parameter	Description
<0-7>	Specify the Inner CoS value.

Mode Class Map Configuration

Examples To set the class-map's inner-cos to 4, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-cos 4
```

To remove CoS from the class-map, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-cos
```

match inner-vlan

Overview Use this command to define the inner VLAN ID as match criteria.

Use the **no** variant of this command to disable the VLAN ID used as match criteria.

Syntax

```
match inner-vlan <1-4094>
no match inner-vlan
```

Parameter	Description
<1-4094>	The VLAN number.

Mode Class Map Configuration

Usage notes This command is used in double-tagged networks to match on a VLAN ID belonging to the client network. For more information on VLAN double-tagged networks, see the VLAN_Feature Overview and Configuration Guide.

Examples To configure a class-map named `cmap1` to match traffic from inner VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match inner-vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match inner-vlan
```

match ip-precedence

Overview Use this command to identify IP precedence values as match criteria.

Use the **no** variant of this command to remove IP precedence values from a class-map.

Syntax

```
match ip-precedence <0-7>
no match ip-precedence
```

Parameter	Description
<0-7>	The precedence value to be matched.

Mode Class Map Configuration

Example To configure a class-map named `cmap1` to match all IPv4 packets with a precedence value of `5`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match ip-precedence 5
```

match mac-type

Overview Use this command to set the MAC type for a class-map to match on.

Use **no** variant of this command to remove the MAC type match entry.

Syntax

```
match mac-type {l2bcast|l2mcast|l2ucast}
no match mac-type
```

Parameter	Description
`l2bcast`	Layer 2 Broadcast traffic.
`l2mcast`	Layer 2 Multicast traffic.
`l2ucast`	Layer 2 Unicast traffic.

Mode Class Map Configuration

Examples To set the class-map's MAC type to Layer 2 multicast, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match mac-type l2mcast
```

To remove the class-map's MAC type entry, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match mac-type
```

match tcp-flags

Overview Sets one or more TCP flags (control bits) for a class-map to match on.

Use the **no** variant of this command to remove one or more TCP flags for a class-map to match on.

Syntax

```
match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]
no match tcp-flags [ack] [fin] [psh] [rst] [syn] [urg]
```

Parameter	Description
ack	Acknowledge.
fin	Finish.
psh	Push.
rst	Reset.
syn	Synchronize.
urg	Urgent.

Mode Class Map Configuration

Examples To set the class-map's TCP flags to **ack** and **syn**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# match tcp-flags ack syn
```

To remove the TCP flags **ack** and **rst**, use the commands:

```
awplus# configure terminal
awplus(config)# class-map
awplus(config-cmap)# no match tcp-flags ack rst
```

match vlan

Overview Use this command to define the VLAN ID as match criteria.

Use the **no** variant of this command to disable the VLAN ID used as match criteria.

Syntax

```
match vlan <1-4094>
no match vlan
```

Parameter	Description
<1-4094>	The VLAN number.

Mode Class Map Configuration

Examples To configure a class-map named `cmap1` to include traffic from VLAN 3, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# match vlan 3
```

To disable the configured VLAN ID as a match criteria for the class-map named `cmap1`, use the commands:

```
awplus# configure terminal
awplus(config)# class-map cmap1
awplus(config-cmap)# no match vlan
```

mls qos cos

Overview This command assigns a CoS (Class of Service) user-priority value to untagged frames entering a specified interface. By default, all untagged frames are assigned a CoS value of 0.

Use the **no** variant of this command to return the interface to the default CoS setting for untagged frames entering the interface.

Syntax

```
mls qos cos <0-7>
no mls qos cos
```

Parameter	Description
<0-7>	The Class of Service, user-priority value.

Default By default, all untagged frames are assigned a CoS value of 0. Note that for tagged frames, the default behavior is not to alter the CoS value.

Mode Interface Configuration

Example To assign a CoS user priority value of 2 to all untagged packets entering port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# mls qos cos 2
```

mls qos enable

Overview Use this command to enable QoS.

Use the **no** variant of this command to globally disable QoS and remove all QoS configuration. The **no** variant of this command removes all class-maps, policy-maps, and policers that have been created. Running the **no mls qos** command will therefore remove all pre-existing QoS configurations on the switch.

Mode Global Configuration

Syntax

```
mls qos enable
no mls qos
```

Example To enable QoS on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# mls qos enable
```

mls qos map cos-queue

Overview Use this command to set the default CoS to egress queue mapping. This is the default queue mapping for packets that do not get assigned an egress queue via any other QoS functionality.

Use the **no** variant of this command to reset the cos-queue map back to its default setting. The default mappings for this command are:

```
CoS Priority :      0 1 2 3 4 5 6 7
---------------------------------
CoS QUEUE:          2 0 1 3 4 5 6 7
```

Syntax

```
mls qos map cos-queue <cos-priority> to <queue-number>
no mls qos map cos-queue
```

Parameter	Description
<cos-priority>	CoS priority value. Can take a value between 0 and 7.
<queue-number>	Queue number. Can take a value between 0 and 7.

Mode Global Configuration

Examples To map CoS 2 to queue 0, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map cos-queue 2 to 0
```

To set the cos-queue map back to its defaults, use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map cos-queue
```

Related commands show mls qos interface

mls qos map premark-dscp

Overview This command configures the premark-dscp map. It is used when traffic is classified by a class-map that has trust dscp configured. Based on a lookup DSCP, the map determines new QoS settings for the traffic.

The **no** variant of this command resets the premark-dscp map to its defaults. If no DSCP is specified then all DSCP entries will be reset to their defaults.

Syntax

```
mls qos map premark-dscp <0-63> to
{[new-dscp <0-63>][new-cos <0-7>]
[new-bandwidth-class {green|yellow|red}]}
```

```
no mls qos map premark-dscp [<0-63>]
```

Parameter	Description
`premark-dscp <0-63>`	The DSCP value on ingress.
`new-dscp <0-63>`	The DSCP value that the packet will have on egress. If unspecified, this value will remain the DSCP ingress value.
`new-cos <0-7>`	The CoS value that the packet will have on egress. If unspecified, this value will retain its value on ingress.
`new-bandwidth-class`	Modify Egress Bandwidth-class. If unspecified, this value will be set to green.
`green`	Egress Bandwidth-class green (marked down Bandwidth-class).
`yellow`	Egress Bandwidth-class yellow (marked down Bandwidth-class).
`red`	Egress Bandwidth-class red (marked down Bandwidth-class).

Mode Global Configuration

Usage notes With the trust dscp command set, this command (**mls qos map premark-dscp**) enables you to remap the DSCP, CoS, output queue, or bandwidth class values.

However, note that you cannot simultaneously change the DSCP and CoS, because they use the same byte in the IP header.

Example To set the entry for DSCP `1` to use a new DSCP of `2`, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-dscp 2
```

Example To set the entry for DSCP 1 to use a new CoS of 3, and a new bandwidth class of yellow, use the command:

```
awplus# configure terminal
awplus(config)# mls qos map premark-dscp 1 to new-cos 3
new-bandwidth-class yellow
```

Example To reset the entry for DSCP 1 use the command:

```
awplus# configure terminal
awplus(config)# no mls qos map premark-dscp 1
```

Related commands

show mls qos maps premark-dscp

trust dscp

mls qos queue name

Overview Use this command to give a name and optional description to a specific egress queue.

Use the **no** variant of this command to remove the name and description from an egress queue.

Syntax

```
mls qos queue <0-7> name <name> [description <description>]
no mls qos queue <0-7> name
```

Parameter	Description
<0-7>	The number of the egress queue to name.
<name>	The name you want to give the egress queue. The name can contain any printable ASCII character (ASCII 33-126), except for spaces.
<description>	The description you want to give the egress queue. The description can contain any printable ASCII character (ASCII 32-126), including spaces.

Default Queues have no name or description

Mode Global Configuration

Example To give queue 6 the name 'Video' and the description 'Real-time interactive, broadcast video', use the commands:

```
awplus# configure terminal
awplus(config)# mls qos queue 6 name Video description Real-time
interactive, broadcast video
```

To remove the name and description from queue 6, use the commands:

```
awplus# configure terminal
awplus(config)# no mls qos queue 6 name
```

Command changes Version 5.5.2-2.1: command added

no police

Overview Use this command to disable any policer previously configured on the class-map.

Syntax

```
no police
```

Mode Policy Map Class Configuration

Usage notes This command disables any policer previously configured on the class-map.

Example To disable policing on a class-map, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# no police
```

Related commands

police single-rate action

police twin-rate action

police single-rate action

Overview Configures a single-rate policer for a class-map.

Syntax

```
police single-rate <cir> <cbs> <ebs> action
{drop-red|remark-transmit}
```

Parameter	Description	
<cir>	Specify the Committed Information Rate (CIR) (1-100000000 kbps).	
<cbs>	Specify the Committed Burst Size (CBS) (0-16777216 bytes).	
<ebs>	Specify a Excess Burst Size (EBS) (0-16777216 bytes).	
action	Specify the action if the rate is exceeded.	
	drop-red	Drop the red packets.
	remark-transmit	Modify the packets using the remark map, then transmit. You can configure the remark map using the remark-map command.

Mode Policy Map Class Configuration

Usage notes You can use a policer to meter the traffic classified by the class-map and assign it to one of three bandwidth classes.

The bandwidth classes are green (conforming), yellow (partially-conforming), and red (non-conforming). A single-rate policer is based on three values. These are the average rate, minimum burst and maximum burst.

Color	Definition
green	The traffic rate is less than the average rate and minimum burst.
yellow	The traffic rate is between the minimum burst and the maximum burst.
red	The traffic rate exceeds the average rate and the maximum burst.

Using an action of drop-red means that any packets classed as red are discarded.

NOTE: *This command will not take effect when applied to a class-map that attaches to a channel group whose ports span processor instances.*

Note that the remark-map does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green- colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red,** the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red- colored traffic. If **action** is set to **drop-red**, then red

traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

Example To configure a single rate meter measuring traffic of 100 Mbps that drops a sustained burst of traffic over this rate, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police single-rate 100000 1875000
1875000 action drop-red
```

Related commands

no police

police twin-rate action

remark-map

police twin-rate action

Overview Configures a twin-rate policer for a class-map.

Syntax

```
police twin-rate <cir> <pir> <cbs> <pbs> action
{drop-red|remark-transmit}
```

Parameter	Description	
<cir>	Specify the Committed Information Rate (CIR) (1-100000000 kbps).	
<pir>	Specify the Peak Information Rate (PIR) (1-100000000 kbps).	
<cbs>	Specify the Committed Burst Size (CBS) (0-16777216 bytes).	
<pbs>	Specify the Peak Burst Size (PBS) (0-16777216 bytes).	
action	Specify the action if rate is exceeded.	
	drop-red	Drop the red packets.
	remark-transmit	Modify the packets using the remark map, then transmit. You can configure the remark map using the remark-map command.

Mode Policy Map Class Configuration

Usage notes A policer can be used to meter the traffic classified by the class-map and as a result will be given one of three bandwidth classes. These are green (conforming), yellow (partially- conforming), and red (non-conforming).

A twin-rate policer is based on four values. These are the minimum rate (CIR), minimum burst size (CBS), maximum rate (PIR), and maximum burst size (PBS). The following table shows how these values define the bandwidth classes.

Bandwidth Class	Definition
green	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is less than that set for the CBS.
yellow	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that is between those set for the CBS and the PBS.
red	The sum of the number of existing (buffered) bytes plus those arriving at the port per unit time results in a value that exceeds that set for the PBS.

Using an action of drop-red means that any packets classed as red will be discarded.

Using an action of remark-transmit means that the packet will be remarked with the values configured in the policed-dscp map. The index into this map is determined by the DSCP in the packet.

Note that the remark-map does not only apply to red traffic. If a remark-map is configured on the same class-map as the policer, then the remark-map will apply to green- colored and yellow-colored traffic irrespective of the value configured on the **action** parameter of the policer. So, even if **action** is configured to **drop-red,** the remark-map will be applied to green and yellow traffic. So, the **action** parameter only applies to red-colored traffic. If **action** is set to **drop-red**, then red traffic is dropped; if **action** is set to **remark-transmit**, then the red traffic has the action of the remark map applied to it, and is then transmitted.

Example To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps, and drop red packets, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action drop-red
```

To configure a twin rate meter measuring a minimum rate of 10 Mbps and a maximum rate of 20 Mbps that uses the premark map to remark any non-conforming traffic, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map name
awplus(config-pmap)# class classname
awplus(config-pmap-c)# police twin-rate 10000 20000 1875000
3750000 action remark-transmit
```

Related commands

no police

police single-rate action

policy-map

Overview Use this command to create a policy-map and to enter Policy Map Configuration mode to configure the specified policy-map.

Use the **no** variant of this command to delete an existing policy-map.

Syntax

```
policy-map <name>
no policy-map <name>
```

Parameter	Description
<name>	Name of the policy-map.

Mode Global Configuration

Example To create a policy-map called pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)#
```

Related commands class-map

priority-queue

Overview This command configures strict priority-based scheduling on the specified egress queues. You must specify at least one queue.

Syntax

```
priority-queue [0][1][2][3][4][5][6][7]
```

Parameter	Description
`[0][1]...[7]`	Specify the queues that will use strict priority scheduling. With strict priority scheduling, the switch will completely empty the highest numbered queue first, then start processing the next lowest numbered queue.

Mode Interface Configuration.

Usage notes By default, the queues on all ports are set for priority queuing. You can change the queue emptying sequence to weighted round robin, by using the wrr-queue weight queues command. You can then use the priority-queue command to reset the selected queues to priority queuing.

Note that the emptying sequence for priority queuing is always highest queue number to lowest queue number.

Example To apply priority-based scheduling to egress queues 1 and 2, use the commands:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#priority-queue 1 2
```

Related commands

show mls qos interface

show mls qos interface queue-counters

remark-map

Overview Use this command to configure the remark map. If a re-mark map is applied to a class, and a policer is also applied to the same class, then:

- green and yellow traffic will all be acted upon by the remark-map, and
- red traffic will be either dropped or acted upon by the remark-map, depending on whether the policer **action** is set to **drop-red** or **remark-transmit**.

The **no** variant of this command resets the remark map to its defaults. Specifying the bandwidth class is optional. If no bandwidth class is specified, then all bandwidth classes are reset to their defaults.

Syntax

```
remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}
```

```
no remark-map [bandwidth-class {green|yellow|red}] to {[new-dscp <0-63>] [new-bandwidth-class {green|yellow|red}]}
```

Parameter	Description
`bandwidth-class`	Specify the bandwidth class of packets to remark.
`green`	Remark green packets.
`yellow`	Remark yellow packets.
`red`	Remark red packets.
`new-dscp`	Specify the new DSCP value.
<0-63>	The DSCP value.
`new-bandwidth-class`	Specify the new bandwidth class.
`green`	Remark the packet green.
`yellow`	Remark the packet yellow.
`red`	Remark the packet red.

Mode Policy Map Class Configuration

Examples To remark the policed green traffic to a new DSCP of 2 and a new bandwidth class of yellow, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to new-dscp 2 new-bandwidth-class yellow
```

To remark the policed green traffic to a new DSCP of 2, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark-map bandwidth-class green to
new-dscp 2
```

To reset the DSCP for all bandwidth classes, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no remark-map to new-dscp
```

Related commands

police single-rate action

police twin-rate action

remark new-cos

Overview This command enables you to configure and remark either or both of:

- the CoS flag in the data packet
- the input into the CoS to queue map, thus changing the destination egress queue.

Syntax

```
remark new-cos <0-7> [internal|external|both]
no remark new-cos [internal|external|both]
```

Parameter	Description
`<0-7>`	The new value for the CoS flag and/or the input into the CoS to queue map.
`external`	Remarks the CoS flag in the packet.
`internal`	Remarks the new-CoS input into the CoS to queue map.
`both`	Remarks (with the same value) both the CoS flag in the packet and the input to the CoS to queue map.

Mode Policy Map Class Configuration

Usage notes The default CoS to Queue mappings are shown in the following table:

CoS Value	0	1	2	3	4	5	6	7
Egress Queue No	2	0	1	3	4	5	6	7

The relationship between this command and the CoS to queue map is shown in the following figure.

Figure 46-1: Remarking and the CoS to Q map

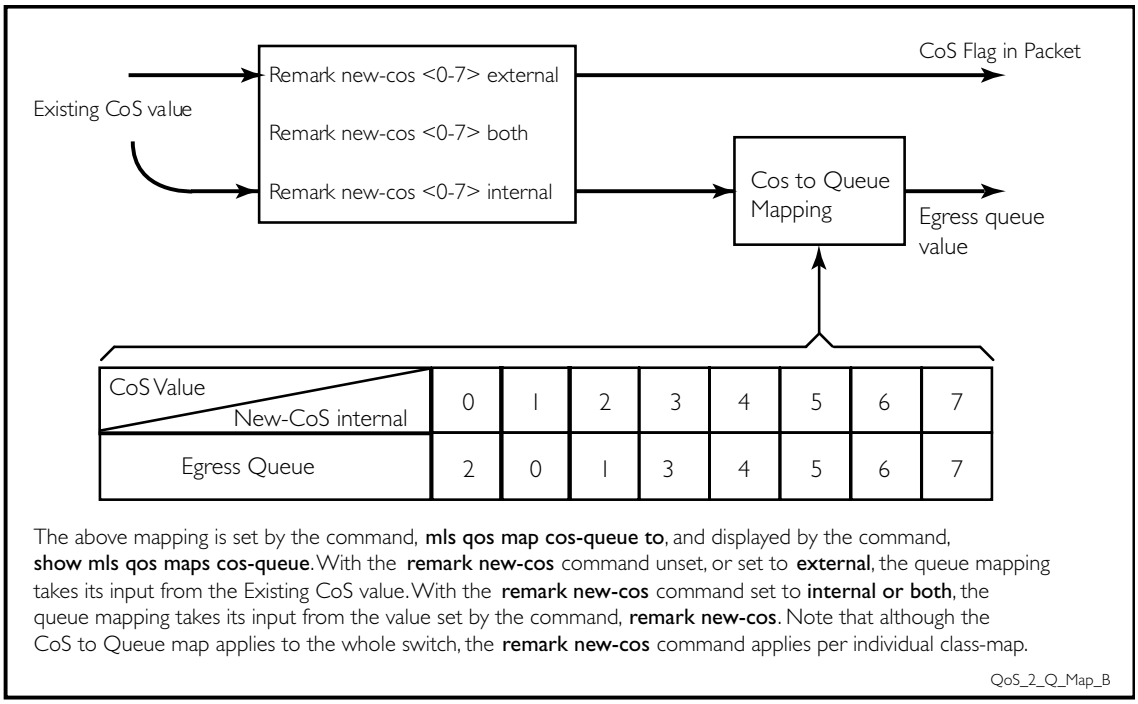

Table 46-1: CoS to egress queue remarking function

Input	Command	Output
CoS field = 1	Remark new-cos (not configured)	CoS value = 1 Packet sent to egress queue 0
CoS field = 1	Remark new-cos 2 external	CoS value = 2 Packet sent to egress queue 0
CoS set to 1	Remark new-cos 2 internal	CoS value = 1 Packet sent to egress queue 1
CoS set to 1	Remark new-cos 2 both	CoS value = 2 Packet sent to egress queue 1
Note: This table assumes that the CoS to Queue map is set to its default values.		

Example For policy-map "pmap3" and class-map "cmap1", set the CoS value to 2 and also set the input to the CoS to queue map so that the traffic is assigned to egress queue 1:

```
awplus# configure terminal
awplus(config)# policy-map pmap3
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# remark new-cos 2 both
```

Related commands

mls qos map cos-queue

show mls qos maps cos-queue

service-policy input

Overview Use this command to apply a policy-map to the input of an interface.

Use the **no** variant of this command to remove a policy-map and interface association.

Syntax

```
service-policy input <policy-map>
no service-policy input <policy-map>
```

Parameter	Description
<policy-map>	Policy map name that will be applied to the input.

Mode Interface Configuration

Usage notes This command can be applied to switch ports or static channel groups, but not to dynamic (LACP) channel groups.

Example To apply a policy-map named `pmap1` to interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
wplus(config-if)# service-policy input pmap1
```

set ip next-hop (PBR)

Overview Use this command to configure policy-based routing. When this command is set, all packets that match a selected class-map will be forwarded to the specified next hop.

The **no** variant of this command removes the next-hop address (in the context of its policy-map and class-map) from the configuration.

Syntax

```
set ip next-hop <ip-addr>
no set ip next-hop
```

Parameter	Description
<ip-addr>	The IP address of the next hop destination.

Mode Policy Map Class Configuration

Usage notes

Combining conventional and policy-based routing

In typical deployments of policy-based routing, some traffic types require conventional routing (i.e. via the routes in the IP routing table) while other traffic types require policy-based routing.

Where the traffic to be policy-routed is a subset of the traffic that is to be conventionally routed, then the configuration is reasonably simple. To configure this, make a policy-map that contains one or more class-maps that match the traffic to be policy routed. Then configure their next-hop with this command (**set ip next-hop**). The remaining traffic will be conventionally routed according to the rules set for the default class-map, providing that this is not subject to the **set ip next-hop.**

The situation becomes more complex if the traffic requiring conventional routing is a subset of the traffic to be policy-routed. To configure this, make a policy-map that contains one, or more, class-maps that match the requirement for conventional routing. Do not configure these class-maps with a **set ip next-hop** command. Then identify the remaining class-maps that require policy-based routing and apply the **set ip next-hop** command to them. Note that this remaining traffic could be just the default class-map, if all other traffic types were to be policy-routed.

Also note that the order in which the class-maps are configured in the policy-map is important, because traffic is matched against the class-maps in the order that they were assigned to the policy-map.

For more information about PBR, see the Policy-Based Routing Feature Overview and Configuration Guide.

Example To forward packets to 192.168.1.1 if they match the class-map called cmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# set ip next-hop 192.168.1.1
```

Related commands class-map

show class-map

Overview Use this command to display the QoS class-maps' criteria for classifying traffic.

Syntax

```
show class-map [<class-map-name>]
```

Parameter	Description
<class-map-name>	Name of the class-map.

Mode User Exec and Privileged Exec

Example To display a QoS class-map's match criteria for classifying traffic, use the command:

```
awplus# show class-map cmap1
```

Output Figure 46-2: Example output from the **show class-map** command

```
awplus#show class-map

    CLASS-MAP-NAME: myClass
    Match Mac Type: 2 l2mcast

    CLASS-MAP-NAME: default
```

show mls qos

Overview Use this command to display whether QoS is enabled or disabled on the switch.

Syntax

```
show mls qos
```

Mode User Exec and Privileged Exec

Example To display whether QoS is enabled or disabled, use the command:

```
awplus# show mls qos
```

Output Figure 46-3: Example output from the **show mls qos** command

```
awplus#show mls qos
 Enable
```

Related commands mls qos enable

show mls qos interface

Overview Displays the current settings for the interface. This includes its default CoS and queue, scheduling used for each queue, and any policies/maps that are attached.

Syntax

```
show mls qos interface [<port>]
```

Parameter	Description
<port>	Switch port.

Mode User Exec and Privileged Exec

Example To display current CoS and queue settings for interface port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1
```

Output Figure 46-4: Example output from the **show mls qos interface** command for port1.0.1

```
awplus#show mls qos interface port1.0.1

Interface: port1.0.1

```

Table 46-2: Parameters in the output of the show mls qos interface command

Parameter	Description
`Number of egress queues`	The total number of egress queues available on this interface.
`Egress Queue`	Number of this egress queue.
`Status`	Queue can either be enabled or disabled.
`Scheduler`	The scheduling mode being used for servicing the transmission of packets on this port.

Table 46-2: Parameters in the output of the show mls qos interface command

Parameter	Description
`Queue Limit`	The percentage of the port's buffers that have been allocated to this queue.
`Egress Rate Limit`	The amount of traffic that can be transmitted via this queue per second. 0 Kb means there is currently no rate-limiting enabled.
`Egress Traffic Shaping Overhead`	The number of bytes specified to allow for the size of packet preamble and inter-packet gap (the "overhead") in egress queue rate limiting. Use the egress-rate-limit overhead command to change this.

Command changes

Version 5.5.1-0.1: DSCP queue mapping removed from output

show mls qos interface policer-counters

Overview This command displays an interface's policer counters. This can either be for a specific class-map or for all class-maps attached to the interface. If no class-map is specified then all class-map policer counters attached to the interface are displayed.

Syntax

```
show mls qos interface <port> policer-counters [class-map
<class-map>]
```

Parameter	Description
<port>	Switch port.
class-map	Select a class-map.
<class-map>	Class-map name.

Mode User Exec and Privileged Exec

Usage Note that:

- The hardware does not record distinct counters for the number of Green or Yellow bytes, so the field marked Green/Yellow is the summation of bytes that have been marked Green or Yellow by the meter.
- The counters are based on metering performed on the specified class-map. Therefore, the 'Dropped Bytes' counter is the number of bytes dropped due to metering. This is different from packets dropped via a 'deny' action in the ACL. If a policer is configured to perform re-marking, bytes can be marked Red but are not dropped, and is shown with a value of 0 for the Dropped field and a non-0 value for the 'Red Bytes' field.

Example To show the counters for all class-maps attached to port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 policer-counters
```

Output Figure 46-5: Example output from **show mls qos interface policer-counters** on a port

```
awplus#show mls qos interface port1.0.1 policer-counters
Interface:               port1.0.1
  Class-map:             default
    Green/Yellow Bytes:  0
    Red Bytes:           0
    Dropped Bytes:       0
    Non-dropped Bytes:   0
  Class-map:             cmap1
    Green/Yellow Bytes:  1290
    Red Bytes:           0
    Dropped Bytes:       0
    Non-dropped Bytes:   1290
```

show mls qos interface queue-counters

Overview This command displays an interface's egress queue counters. This can either be for a specific queue or for all queues on the interface. If no queue is specified all queue counters on the interface will be displayed.

The counters show the number of frames currently in the queue and the maximum number of frames allowed in the queue, for individual egress queues and the port's queue (which will be a sum of all egress queues).

Syntax

```
show mls qos interface <port> queue-counters [queue <0-7>]
```

Parameter	Description
<port>	The switch port to display counters for.
queue *<0-7>*	The number of the queue to display counters for.

Mode User Exec and Privileged Exec

Example To show the counters for all queues on port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 queue-counters
```

Output Figure 46-6: Example output from **show mls qos interface queue-counters**

```
Interface port1.0.1 Queue Counters:
  Port queue length     1169
  Egress Queue length:
    Queue 0                0
    Queue 1                0
    Queue 2             1169
    Queue 3                0
    Queue 4                0
    Queue 5                0
    Queue 6                0
    Queue 7                0

Egress queue drop/transmit counters:
              Dropped Bytes    Dropped Pkts    Tx Bytes    Tx Pkts
    Queue 0               0               0           0          0
    Queue 1               0               0           0          0
    Queue 2               0               0           0          0
    Queue 3               0               0           0          0
    Queue 4               0               0         576          9
    Queue 5               0               0           0          0
    Queue 6               0               0    10489664      63901
    Queue 7               0               0           0          0
```

Table 46-3: Parameters in the output from **show mls qos interface queue-counters**

Parameter	Description
Interface	Port we are showing the counters for.
Port queue length	Number of frames in the port's queue. This will be the sum of all egress queues on the port.
Egress Queue length	Number of frames in a specific egress queue.
Egress queue drop/transmit counters	The number of bytes and packets dropped and transmitted on each egress queue.

Related commands clear mls qos interface queue-counters

show mls qos interface storm-status

Overview Show the current configuration and status of the QoS Storm Protection (QSP) on the given port.

Syntax

```
show mls qos interface <port> storm-status
```

Parameter	Description
<port>	Switch port.

Mode User Exec and Privileged Exec

Example To see the QSP status on port1.0.1, use the command:

```
awplus# show mls qos interface port1.0.1 storm-status
```

Output Figure 46-7: Example output from **show mls qos interface storm-status**

```
Interface:           port1.0.1
Storm-Protection:    Enabled
Port-status:         Enabled
Storm Action:        vlandisable
Storm Window:        5000 ms
Storm Downtime:      0 s
Timeout Remaining:   0 s
Last read data-rate: 0 kbps
Storm Rate:          1000 kbps
```

show mls qos maps cos-queue

Overview Show the current configuration of the cos-queue map.

Syntax

```
show mls qos maps cos-queue
```

Mode User Exec and Privileged Exec

Example To display the current configuration of the cos-queue map, use the command:

```
awplus# show mls qos maps cos-queue
```

Output Figure 46-8: Example output from **show mls qos maps cos-queue**

```
COS-TO-QUEUE-MAP:
      COS :                0 1 2 3 4 5 6 7
      ---------------------------------
      QUEUE:               2 0 1 3 4 5 6 7
```

Related commands mls qos map cos-queue

show mls qos maps premark-dscp

Overview This command displays the premark-dscp map. This map is used to replace the DSCP, CoS and/or bandwidth class of a packet matching the class-map, based on a lookup DSCP value.

Syntax

```
show mls qos maps premark-dscp [<0-63>]
```

Parameter	Description
<0-63>	DSCP table entry.

Mode User Exec and Privileged Exec

Example To display the premark-dscp map for DSCP 1, use the command:

```
awplus# show mls qos maps premark-dscp 1
```

Output Figure 46-9: Example output from the **show mls qos maps premark-dscp** command

```
PREMARK-DSCP-MAP:

    DSCP 1
    Bandwidth Class
    -------------------------
    New DSCP                2
    New CoS                 0
    New Bandwidth Class     green
```

Related commands

mls qos map premark-dscp

trust dscp

show platform classifier statistics utilization brief

Overview This command displays the number of used entries available for various platform functions, and the percentage that number of entries represents of the total available.

Syntax

```
show platform classifier statistics utilization brief
```

Mode Privileged Exec

Example To display the platform classifier utilization statistics, use the following command:

```
awplus# show platform classifier statistics utilization brief
```

Output Figure 46-10: Output from **show platform classifier statistics utilization brief**

```
awplus#show platform classifier statistics utilization brief

...[Instance 4]
Capacity: 2038
Number of Entries:
Policy Type Group ID Used / Allocated
-----------------------------------------------
ACL 1476395009 702 / 758 ( 92%)
DoS Inactive 0 / 0 ( 0%)
VLAN Counter
Group-Octet Inactive 0 / 0 ( 0%)
Group-Packet Inactive 0 / 0 ( 0%)
QoS 850 / 1024 ( 83%)
Group-0 1 250 / 256 ( 97%)
Group-1 2 250 / 256 ( 97%)
Group-2 3 250 / 256 ( 97%)
Group-3 4 100 / 256 ( 39%)
```

Note that QoS entries and ACLs share the same area of dedicated ASIC memory, so increasing the number of ACLs reduces the number of QoS class-maps and policy-maps available. ASIC memory is allocated in “groups” of 256 entries. The switch automatically allocates the correct number of groups to ACLs and QoS as you create more ACLs or QoS class-maps and policy-maps. The output example above is for a switch where:

- 758 entries are allocated to ACLs, of which 702 entries are used, and
- 1024 entries are allocated to QoS, of which 850 entries are used, and
- 256 entries are unallocated (2038 - 1024 - 758 = 256)

In the following example, there is one UFO VLAN and one upstream port consuming 3 FP entries.

```
#show platform classifier statistics utilization brief

[Instance 4]
  Number of Entries:
  Policy Type      Group ID   Used / Total
  ---------------------------------------------
  ACL              1476395010    0 /  117 (  0%)
   Interface                     0
   VACL                          0
  DoS              Inactive      0 /    0 (  0%
  VLAN Counter
   Group-Octet     Inactive      0 /    0 (  0%)
   Group-Packet    Inactive      0 /    0 (  0%)
  Flooding Nexthop Inactive      0 /    0 (  0%)
  Remote-Mirror    Inactive      0 /    0 (  0%)

```

Output parameters

Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

Parameter	Description
IPv6 Multicast	Reserved hardware space for use by IPv6 multicast, when the ipv6 multicast-routing command is used.
System	Fixed system entries. For example, resiliency links make use of system ACLs.
MLD Snooping	Entries to send various packets that MLD Snooping is interested in to the CPU.
DHCP Snooping	Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.
Loop Detection	Entries uses to send the special loop detection frame to the CPU.
EPSR	Entries used to send EPSR control traffic to the CPU.

Parameter	Description
CFM	Entries used by Connectivity Fault Management.
G8032	Entries used to send G.8032 control traffic to the CPU.
Global ACLs	Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.
ACL	Entries for ACL filters that have been applied directly to ports using the access-group command.
VACL	Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).
DOS	Entries used for Denial of Service protection.
UFO	Entries used by Upward Forwarding Only (UFO).
QoS	Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the service input command.
RA Guard	Entries used to block IPv6 router advertisements, configured with the **ipv6 nd raguard** command.
AMFAPPS	Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.
Pre-Ingress	Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).
Egress	Entries used for VLAN ID Translation.
UDB	User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only.

show platform

ipv6 access-list (named IPv6 hardware ACL)

show policy-map

Overview Displays the policy-maps configured on the switch. The output also shows whether or not they are connected to a port (attached / detached) and shows their associated class-maps.

Syntax

```
show policy-map [<name>]
```

Parameter	Description
<name>	The name of a specific policy-map.

Mode User Exec and Privileged Exec

Example To display a listing of the policy-maps configured on the switch, use the command:

```
awplus# show policy-map
```

Output Figure 46-11: Example output from the **show policy-map** command

```
POLICY-MAP-NAME: example
  Interfaces:
  Default class-map action: permit

  CLASS-MAP-NAME: default
    Policer counters enabled
```

Related commands

service-policy input

storm-action

Overview Sets the action to be taken when triggered by QoS Storm Protection (QSP). There are three available options:

- **portdisable** will disable the port in software.
- **vlandisable** will disable the port from the VLAN matched by the class-map in class-map. This option requires the match vlan class-map to be present in the class-map
- **linkdown** will physically bring the port down. .

The **no** variant of this command will negate the action set by the **storm-action** command.

Syntax

```
storm-action {portdisable|vlandisable|linkdown}
no storm-action
```

Parameter	Description
`portdisable`	Disable the port in software.
`vlandisable`	Disable the VLAN.
`linkdown`	Shutdown the port physically.

Mode Policy Map Class Configuration

Examples To apply the storm protection of **vlandisable** to the policy-map named “pmap2” and the class-map named “cmap1”, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# storm-action vlandisable
```

To negate the storm protection set on the policy-map named “pmap2” and the class-map named “cmap1”, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c# no storm-action
```

Related commands

storm-downtime

storm-protection

storm-rate

storm-window

storm-downtime

Overview Sets the time to re-enable a port that has been disabled by QoS Storm Protection (QSP). The time is given in seconds, from a minimum of one second to maximum of 86400 seconds (i.e. one day).

The **no** variant of this command resets the time to the default value of 10 seconds.

Syntax

```
storm-downtime <1-86400>
no storm-downtime
```

Parameter	Description
<1-86400>	Seconds.

Default 10 seconds

Mode Policy Map Class Configuration

Examples To re-enable the port in 1 minute, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# storm-downtime 60
```

To re-set the port to the default (10 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap1
awplus(config-pmap-c)# no storm-downtime
```

Related commands

storm-action

storm-protection

storm-rate

storm-window

storm-protection

Overview Use this command to enable policy-based Storm Protection (such as QSP - QoS Storm Protection). Storm protection is activated as soon as a port is enabled. However, it will only be functional after storm-rate and storm-window have been set.

The **no** variant of this command disables policy-based Storm Protection.

Syntax

```
storm-protection
no storm-protection
```

Default By default, storm protection is disabled.

Mode Policy Map Class Configuration

Examples To enable QSP on cmap2 in pmap2, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-protection
```

To disable QSP on cmap2 in pmap2, use the following commands:

```
awplus# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-protection
```

Related commands

storm-action

storm-downtime

storm-rate

storm-window

storm-rate

Overview Sets the data rate that triggers the storm-action. The rate is in kbps and the range is from 1kbps to 40Gbps.

Note that this setting is made in conjunction with the storm-window command.

Use the **no** variant of this command to negate the **storm-rate** command.

Syntax

```
storm-rate <1-40000000>
no storm-rate
```

Parameter	Description
<1-40000000>	The range of the storm-rate.

Default No default

Mode Policy Map Class Configuration

Usage This setting is made in conjunction with the storm-window command.

Examples To limit the data rate to 100Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-rate 100000
```

To negate the limit set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-rate
```

Related commands

storm-action

storm-downtime

storm-protection

storm-window

storm-window

Overview Sets the window size of QoS Storm Protection (QSP). This sets the time to poll the data-rate every given milliseconds. Minimum window size is 100 ms and the maximum size is 60 sec.

Use the **no** variant of this command to negate the **storm-window** command.

Syntax

```
storm-window <100-60000>
no storm-window
```

Parameter	Description
<100-60000>	The window size, measured in milliseconds.

Default No default

Mode Policy Map Class Configuration

Usage This command should be set in conjunction with the storm-rate command.

Examples To set the QSP window size to 5000 ms, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# storm-window 5000
```

To negate the QSP window size set previously, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap2
awplus(config-pmap)# class cmap2
awplus(config-pmap-c)# no storm-window
```

Related commands

storm-downtime

storm-protection

storm-rate

strict-priority-queue egress-rate-limit queues

Overview Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to WRR queues too. Setting the limit with this command is the same as setting it with wrr-queue egress-rate-limit queues.

Syntax

```
strict-priority-queue egress-rate-limit <bandwidth> queues
[0][1][2][3][4][5][6][7]
```

```
no strict-priority-queue egress-rate-limit <bandwidth> queues
[0][1][2][3][4][5][6][7]
```

Parameter	Description
<bandwidth>	Bandwidth <1-100000000 kbits> (usable units: k, m, g).
[0][2]...[7]	Selects one or more queues numbered 0 to 7.

Mode Interface Configuration

Example To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# strict-priority-queue egress-rate-limit
500M queues 0 1 2
```

Related commands show mls qos interface

wrr-queue egress-rate-limit queues

trust dscp

Overview This command enables the premark-dscp map to replace the DSCP, bandwidth-class and/or CoS of classified traffic based on a lookup DSCP value.

With the **no** variant of this command, no premark-dscp mapping function will be applied for the selected class-map. QoS components of the packet existing either at ingress, or applied by the class-map, will pass unchanged.

Syntax

```
trust dscp
no trust
```

Mode Policy-Map Configuration

Examples To enable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# trust dscp
```

To disable the premark-dscp map lookup for policy-map pmap1, use the commands:

```
awplus# configure terminal
awplus(config)# policy-map pmap1
awplus(config-pmap)# no trust
```

Related commands mls qos map premark-dscp

wrr-queue disable queues

Overview Use this command to disable an egress queue from transmitting traffic.

The **no** variant of this command enables an egress queue to transmit traffic.

Syntax

```
wrr-queue disable queues [0][1][2][3][4][5][6][7]
no wrr-queue disable queues [0][1][2][3][4][5][6][7]
```

Parameter	Description
`[0][2]...[7]`	Selects one or more queues numbered 0 to 7.

Mode Interface Configuration

Examples To disable queue 1 on port1.0.1 from transmitting traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue disable queues 1
```

To enable queue 1 on port1.0.1 to transmit traffic, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue disable queues 1
```

Related commands show mls qos interface

wrr-queue egress-rate-limit queues

Overview Sets a limit on the amount of traffic that can be transmitted per second from these queues. The default unit is in Kb, but Mb or Gb can also be specified. The minimum is 651 Kb.

This limit applies to strict priority queues too. Setting the limit with this command is the same as setting it with strict-priority-queue egress-rate-limit queues.

Syntax

```
wrr-queue egress-rate-limit <bandwidth> queues
[0][1][2][3][4][5][6][7]
```

```
no wrr-queue egress-rate-limit <bandwidth> queues
[0][1][2][3][4][5][6][7]
```

Parameter	Description
<bandwidth>	Bandwidth <1-100000000 kbits> (usable units: k, m, g).
[0][2]...[7]	Selects one or more queues numbered 0 to 7.

Mode Interface Configuration

Example To limit the egress rate of queues 0, 1 and 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue egress-rate-limit 500M queues 0 1
2
```

Related commands show mls qos interface

strict-priority-queue egress-rate-limit queues

wrr-queue weight queues

Overview This command configures weighted round-robin based scheduling on the specified egress queues on switch port interfaces only. The weights are specified as ratios relative to each other.

Use the **no wrr-queue** command to remove weighted round-robin based scheduling from the specified egress queue. The queue then reverts to its normal priority-based scheduling.

Syntax

```
wrr-queue weight <1-15> queues [0][1][2][3][4][5][6][7]
no wrr-queue <queue-number>
```

Parameter	Description
<1-15>	Weight (the higher the number the greater will be the queue servicing).
`[0][2]...[7]`	Selects one or more queues numbered 0 to 7.
<queue-number>	Egress queue to revert to priority-based scheduling.

Mode Interface Configuration for switch port interfaces only (not for static aggregated interfaces).

Usage notes You cannot apply weighted round-robin based scheduling to static aggregated interfaces (for example, sa2).

Example To apply a WRR weight of 6 to queues 0 and 1 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# wrr-queue weight 6 queues 0 1
```

To remove weighted round-robin scheduling from egress queue 2 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no wrr-queue 2
```

show mls qos interface

47 802.1X Commands

Introduction

Overview

802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control. For more information, see the AAA and Port Authentication_Feature Overview and Configuration Guide.

Command List

dot1x accounting

Overview This command overrides the **default** RADIUS accounting method for IEEE 802.1X-based authentication on an interface by allowing you to apply a user-defined named method list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method list.

Syntax

```
dot1x accounting {default|<list-name>}
no dot1x accounting
```

Parameter	Description
`default`	Apply the default accounting method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x accounting
```

Related commands aaa accounting dot1x

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x authentication

Overview This command overrides the **default** 802.1X-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax

```
dot1x authentication {default|<list-name>}
no dot1x authentication
```

Parameter	Description
default	Apply the default authentication method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x authentication
```

Related commands aaa authentication dot1x

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

debug dot1x

Overview Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

Syntax

```
debug dot1x [all|auth-web|event|nsm|packet|timer]
no debug all dot1x
no debug dot1x [all|auth-web|event|nsm|packet|timer]
```

Parameter	Description
`all`	Used with the **no** variant of this command exclusively; turns off all debugging for 802.1X.
`auth-web`	Specifies debugging for 802.1X auth-web information.
`events`	Specifies debugging for 802.1X events.
`nsm`	Specifies debugging for NSM messages.
`packet`	Specifies debugging for 802.1X packets.
`timer`	Specifies debugging for 802.1X timers.

Mode Privileged Exec and Global Configuration

Usage notes This command turns on a mode where trace-level information is output during authentication conversations. Be aware that this is a very verbose output. It is mostly useful to capture this as part of escalating an issue to ATI support.

Examples Use this command without any parameters to turn on normal 802.1X debug information.

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
  802.1X events debugging is
  802.1X timer debugging is on
  802.1X packets debugging is on
  802.1X NSM debugging is on
```

Related commands show debugging dot1x

undebug dot1x

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x control-direction

Overview This command sets the direction of the filter for the unauthorized interface.

If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.

If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.

The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

Syntax

```
dot1x control-direction {in|both}
no dot1x control-direction
```

Parameter	Description
`in`	Discard received packets from the supplicant (ingress packets).
`both`	Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets).

Default The authentication port direction is set to **both** by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the port direction to the default (**both**) for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x control-direction in
```

To set the port direction to **in** for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x control-direction in
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x eap

Overview This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

Syntax

```
dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}
```

Parameter	Description
`discard`	Discard.
`forward`	Forward to all ports on the switch.
`forward-untagged-vlan`	Forward to ports with the same untagged VLAN.
`forward-vlan`	Forward to ports with the same VLAN.

Default The transmit mode is set to `discard` EAP packets by default.

Mode Global Configuration

Examples To set the transmit mode of EAP packet to **forward**, to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to **discard**, to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to **forward-untagged-vlan**, to forward EAP packets to ports with the same untagged VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to **forward-vlan**, to forward EAP packets to ports with the same VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x eapol-version

Overview This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

Syntax

```
dot1x eapol-version {1|2}
no dot1x eapol-version
```

Parameter	Description
1|2	EAPOL protocol version 1 or 2.

Default The EAP version for 802.1X authentication is set to 1 by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the EAPOL protocol version to 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x eapol-version
```

To set the EAPOL protocol version to 2 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x eapol-version 2
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x initialize interface

Overview This command removes authorization for a specified connected interface. The connection will attempt to re-authorize when the specified port attempts to make use of the network connection.

NOTE: *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.*

Syntax

```
dot1x initialize interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list. The specified interfaces must exist.

Mode Privileged Exec

Examples To initialize 802.1X port authentication on the interface port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize switch port1.0.2 and attempt reauthentication on switch port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize all switch ports for a 18-port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.0.1-port1.0.18
```

Related commands dot1x initialize supplicant

show dot1x

show dot1x interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x initialize supplicant

Overview This command removes authorization for a connected supplicant with the specified MAC address or username. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

NOTE: *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.*

Syntax

```
dot1x initialize supplicant {<macadd>|username}
```

Parameter	Description
`dot1x`	IEEE 802.1X Port-Based Access Control.
`initialize`	Initialize the port to attempt reauthentication.
`supplicant`	Specify the supplicant to initialize.
<macadd>	MAC (hardware address of the supplicant.
`username`	The name of the supplicant entry.

Mode Privileged Exec

Example To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant 0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

Related commands

show dot1x supplicant

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x keytransmit

Overview Use this command to enable key transmission on the interface specified previously in Interface mode.

This command enables key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant.

The **no** variant of this command disables key transmission on the interface specified.

Syntax

```
dot1x keytransmit
no dot1x keytransmit
```

Default Key transmission for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x keytransmit
```

Related commands show dot1x

show dot1x interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x max-auth-fail

Overview Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

Syntax

```
dot1x max-auth-fail <0-10>
no dot1x max-auth-fail
```

Parameter	Description
<0-10>	Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is 3 login attempts.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- the auth-fail VLAN feature, and
- restrictions regarding combinations of authentication enhancements working together

Examples To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to the default number of 3 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-auth-fail
```

To configure the maximum number of login attempts for a supplicant on authentication profile 'student' to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-auth-fail 1
```

dot1x max-reauth-req

Overview Use this command to set the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

Syntax

```
dot1x max-reauth-req <1-10>
no dot1x max-reauth-req
```

Parameter	Description
<1-10>	Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use this command to set the maximum reauthentication attempts after failure.

Examples To configure the maximum number of reauthentication attempts for interface port1.0.2 to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface port1.0.2 to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-reauth-req
```

To configure the maximum number of reauthentication attempts for authentication profile 'student' to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-reauth-req 1
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x port-control

Overview This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port.

The **no** variant of this command disables the port authentication on the interface specified.

Syntax

```
dot1x port-control {force-unauthorized|force-authorized|auto}
no dot1x port-control
```

Parameter	Description
`force-unauthorized`	Force the port state to unauthorized. Specify this to force a port to always be in an unauthorized state.
`force-authorized`	Force the port state to authorized. Specify this to force a port to always be in an authorized state.
`auto`	Allow the port client to negotiate authentication. Specify this to enable authentication on the port.

Default 802.1X port control is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use this command to force a port state.

When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be
removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable port authentication on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.0.2 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x port-control
```

To enable port authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x port-control auto
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x timeout tx-period

Overview This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

Syntax

```
dot1x timeout tx-period <1-65535>
no dot1x timeout tx-period
```

Parameter	Description
<1-65535>	Seconds.

Default The default transmit period for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use this command to set the interval between successive attempts to request an ID.

Examples To set the transmit timeout period to 5 seconds on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x timeout tx-period
```

To set the transmit timeout period to 5 seconds on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x timeout tx-period 5
```

show debugging dot1x

Overview Use this command to see what debugging is turned on for 802.1X.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show debugging dot1x
```

Mode User Exec and Privileged Exec

Example To enable 802.1X debugging and display the debugging option set, use the following commands:

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
  802.1X events debugging is on
  802.1X timer debugging is on
  802.1X packets debugging is on
  802.1X NSM debugging is on
```

Related commands debug dot1x

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x

Overview Use this command to show authentication information for 802.1X port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x [all]
```

Parameter	Description
`all`	Displays all authentication information for each port available on the switch.

Mode Privileged Exec

Example

```
awplus# show dot1x all
```

Table 1: Example output from the **show dot1x all** command

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x diagnostics

Overview This command shows 802.1X authentication diagnostics for the specified interface (optional).

If no interface is specified then authentication diagnostics are shown for all interfaces.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x diagnostics [interface <interface-list>]
```

Parameter	Description
`interface`	Specify a port to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list. The specified interfaces must exist.

Mode Privileged Exec

Example See the sample output below showing 802.1X authentication diagnostics for port1.0.2:

```
awplus# show dot1x diagnostics interface port1.0.2
```

Output Figure 47-1: Example output from the **show dot1x diagnostics** command

```
Authentication Diagnostics for interface port1.0.2
   Supplicant address: 00d0.59ab.7037
      authEnterConnecting: 2
      authEaplogoffWhileConnecting: 1

      BackendAuthSuccess: 1
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x interface

Overview Use this command to show the status of 802.1X port-based authentication on the specified interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Examples See the sample output below showing 802.1X authentication status for port1.0.2:

```
awplus# show dot1x interface port1.0.2
```

Table 2: Example output from the **show dot1x interface** command for a port

```
awplus#show dot1x interface port1.0.2

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x sessionstatistics

Overview This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x sessionstatistics [interface <interface-list>]
```

Parameter	Description
`interface`	Specify a port to show.
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example See sample output below showing 802.1X authentication session statistics for port1.0.2:

```
awplus# show dot1x sessionstatistics interface port1.0.2
```

```
Authentication session statistics for interface port1.0.2
   session user name: manager
      session authentication method: Remote server
      session time: 19440 secs
      session terminat cause: Not terminated yet
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x statistics interface

Overview Use this command to show the authentication statistics for the specified interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

The output from this command is the same as the output from the show auth statistics interface command.

Syntax

```
show dot1x statistics interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display 802.1X authentication statistics for port1.0.2, use the command:

```
awplus# show dot1x statistics interface port1.0.2
```

Output Figure 47-2: Example output from **show dot1x statistics interface** for a port

```
awplus# show dot1x statistics interface port1.0.2
802.1X statistics for interface port1.0.2

```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x supplicant

Overview This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x supplicant [<macadd>] [brief]
```

Parameter	Description
<macadd>	MAC (hardware) address of the Supplicant.
`brief`	Brief summary of the Supplicant state.

Mode Privileged Exec

Example See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
   authenticationMethod: dot1x
    Two-Step Authentication:
      firstAuthentication: Pass - Method: mac
      secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
RADIUS server group (auth): radius
RADIUS server (auth): 192.168.1.40
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.0.2
   authenticationMethod: dot1x
   totalSupplicantNum: 1
   authorizedSupplicantNum: 1
      macBasedAuthenticationSupplicantNum: 0
      dot1xAuthenticationSupplicantNum: 1
      webBasedAuthenticationSupplicantNum: 0
Interface   VID Mode MAC Address       Status          IP Address      Username
==========  === ==== ===============  =============  ==============  ========
port1.0.2   2   D    00d0.59ab.7037   Authenticated  192.168.2.201   manager
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.0.2  authenticationMethod: dot1x/web
  Two-Step Authentication
    firstMethod: dot1x
    secondMethod: web
  totalSupplicantNum: 1
  authorizedSupplicantNum: 1
    macBasedAuthenticationSupplicantNum: 0
    dot1xAuthenticationSupplicantNum: 0
    webBasedAuthenticationSupplicantNum: 1
    otherAuthenticationSupplicantNum: 0

Interface   VID  Mode MAC Address    Status            IP Address      Username
=========== ==== ==== ============== ================= =============== ========
port1.0.2   5    W    0008.0d5e.c216 Authenticated     192.168.1.200   web
```

Related commands show dot1x supplicant interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x supplicant interface

Overview Use this command to show the supplicant state of the authentication mode set for the interface.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x supplicant interface <interface-list> [brief]
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.
`brief`	Brief summary of the Supplicant state.

Mode Privileged Exec

Examples See sample output below showing the supplicant on the interface port1.0.2:

```
awplus# show dot1x supplicant interface port1.0.2
```

```
Interface port1.0.2
 authenticationMethod: dot1x
  totalSupplicantNum: 1

undebug dot1x

Overview This command applies the functionality of the **no** variant of the debug dot1x command.

48 Authentication Commands

Introduction

Overview

Port authentication commands enable you to specify three different types of device authentication: 802.1X authentication, web authentication, and MAC authentication.

- 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device.
- Web authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested.
- MAC authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

This chapter provides an alphabetical reference for MAC and web authentication commands. For a list of 802.1X commands see the 802.1X Commands chapter.

For more information on configuring and using port authentication, see the AAA and Port Authentication Feature Overview and Configuration Guide.

Command List

auth auth-fail vlan

Overview Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices) to the specified VLAN if they fail port authentication.

Use the **no** variant of this command to disable the auth-fail vlan feature for a specified VLAN interface.

Syntax

```
auth auth-fail vlan <1-4094>
no auth auth-fail vlan
```

Parameter	Description
<1-4094>	Assigns the VLAN ID to any supplicants that have failed port authentication.

Default The auth-fail vlan feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use the auth-fail vlan feature when using web authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web-Authentication feature is shorter, and the auth-fail vlan feature enables assignment to a different VLAN if a supplicant fails authentication.

To enable the auth-fail vlan feature with web authentication, you need to set the web authentication server virtual IP address by using the auth-web-server ipaddress command or the auth-web-server dhcp ipaddress command.

When using 802.1X port authentication, use a dot1x max-auth-fail command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the dot1x max-auth-fail on page 2542 for command information.

See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication, and
- restrictions regarding combinations of authentication enhancements working together

Use appropriate ACLs (Access Control Lists) on interfaces for extra security if a supplicant allocated to the designated auth-fail vlan can access the same network

as a supplicant on the Guest VLAN. For more information about ACL concepts, and configuring ACLs see the ACL Feature Overview and Configuration Guide. For more information about ACL commands see:

- IPv4 Hardware Access Control List (ACL) Commands
- IPv4 Software Access Control List (ACL) Commands
- IPv6 Hardware Access Control List (ACL) Commands
- IPv6 Software Access Control List (ACL) Commands

Examples To enable the auth-fail vlan feature for port1.0.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the auth-fail vlan feature for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth auth-fail vlan
```

auth critical

Overview Use this command to enable the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables the critical port feature on the interface.

Syntax

```
auth critical
no auth critical
```

Default The critical port of port authentication is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth critical
```

To disable the critical port feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

Related commands

show running-config

auth dhcp-framed-ip-lease

Overview Use this command to enable DHCP Framed IP Lease on an interface.

When the DHCP Framed IP Lease feature is enabled on an interface, supplicants authenticated using 802.1x or MAC authentication will be assigned a specific IP address, and other network settings, gathered from the RADIUS server during the authentication process.

Use the **no** variant of this command to disable DHCP Framed IP Lease.

Syntax

```
auth dhcp-framed-ip-lease
no auth dhcp-framed-ip-lease
```

Default DHCP Framed IP Lease is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes You need to complete the following steps to configure the DHCP Framed IP Lease feature on your network.

On the RADIUS server:

- Configure the RADIUS server with the username and password for 802.1x or MAC authentication
- Configure the following 'framed' RADIUS attributes on the RADIUS server for the that user:
  - Framed-IP-Address (8): the IPv4 address for the supplicant
  - Framed-IP-Netmask (9): the netmask for the supplicant
  - Framed-Route (22): the default gateway IPv4 address for the supplicant
  - Session-Timeout (27): IP address lease time for the supplicant

NOTE: *The Frame-IP-Address (8) attribute must be configured for this feature to work. All other attributes are optional.*

On the DHCP server:

- Configure the RADIUS client
- Enable 802.1x or MAC authentication on the required interface/s
- Enable DHCP Framed IP Lease feature on the required interface/s
- Setup a DHCP pool with the network range for the IP address/es registered on the RADIUS server
- Enable DHCP server

For more information, see the AAA and Port Authentication Feature Overview and Configuration Guide.

Example

To enable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# auth dhcp-framed-ip-lease
```

To disable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth dhcp-framed-ip-lease
```

Related commands

show dot1x supplicant

Command changes

Version 5.4.8-2.1: command added

auth dynamic-acl enable

Overview Use this command to enable Dynamic Access Control Lists (ACLs). This lets you configure port authentication to dynamically apply ACLs when a supplicant is authorized. These ACLs are automatically removed when the supplicant disconnects.

Use the **no** variant of this command to disable Dynamic ACLs.

Syntax

```
auth dynamic-acl enable
no auth dynamic-acl enable
```

Default Disabled.

Mode Interface configuration for switch port or static aggregator.

Usage notes Dynamic ACLs are created and attached to a switchport in the following way:

- A RADIUS server holds the ACL rules for a supplicant, along with that supplicants user name and password.
- These ACL rules can be either:
  - a complete IPv4 or IPv6 hardware rule (stored as a RADIUS NAS-Filter-Rule attribute), or
  - name or number reference to an existing ACL rule (stored as a RADIUS Filter-Id attribute)
- When the first packet from a supplicant arrives on a switchport the authenticator starts the authentication process with the RADIUS server.
- The RADIUS server returns Access-Accept packet to the authenticator with the configured ACL rules.
- The authenticator creates and installs these ACLs dynamically on the switchport and authorizes the supplicant.
- These Dynamic ACLs are named IPv4 and IPv6 hardware access-lists. They are internally maintained and cannot be removed or modified from the CLI.
- All traffic on the switchport is filtered using these ACLs.
- When the supplicant is unauthorized, dynamically installed ACLs are removed and detached from the switchport.

For more information, see the AAA and Port Authentication Feature Overview and Configuration Guide.

Examples This example uses the local RADIUS server to define two ACL rules that are applied to MAC authenticated supplicants on port1.0.2.

Define the local RADIUS server as the RADIUS server to use:

```
awplus# configure terminal
awplus(config)# radius-server host 127.0.0.1 key
awplus-local-radius-server
```

Define the authentication method list:

```
awplus(config)# aaa authentication auth-mac default group
radius
```

Enable MAC authentication and dynamic ACLs on port1.0.2:

```
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# auth dynamic-acl enable
awplus(config-if)# exit
```

Configure the local RADIUS server with the required ACL rules:

```
awplus(config)# radius-server local
awplus(config-radsrv)# group dacl-rule
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "ip:permit ip 192.168.1.0/24 192.168.2.0/24"
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "ip:deny ip 192.168.1.0/24 any"
awplus(config-radsrv-group)# exit
```

Add a user with the Dynamic ACL rules and enable the local RADIUS server:

```
awplus(config-radsrv)# user xx-xx-xx-xx-xx-xx password
xx-xx-xx-xx-xx-x group dacl-rule
awplus(config-radsrv)# server enable
awplus(config-radsrv)# exit
```

These ACL rules will reject IP traffic from 192.168.1.x to any destination except 192.168.2.x for supplicants on port1.0.2.

Command changes

Version 5.5.0-1.1: command added

auth dynamic-vlan-creation

Overview Use this command to enable and disable the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

Syntax

```
auth dynamic-vlan-creation [rule {deny|permit}] [type
{multi|single}]
no auth dynamic-vlan-creation
```

Parameter	Description
`rule`	VLAN assignment rule.
`deny`	Deny a differently assigned VLAN ID. This is the default rule.
`permit`	Permit a differently assigned VLAN ID.
`type`	Specifies whether multiple different VLANs can be assigned to supplicants (client devices) attached to the port, or whether only a single VLAN can be assigned to supplicants on the port.
`multi`	Multiple Dynamic VLAN.
`single`	Single Dynamic VLAN.

Default By default, the Dynamic VLAN assignment feature is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes If the Dynamic VLAN assignment feature is enabled, VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports. Dynamic VLANs may be associated with authenticated MAC addresses if the **type** parameter is applied with the **rule** parameter.

The **rule** parameter deals with the case where there are multiple supplicants attached to a port, and the type parameter has been set to **single-vlan**. The parameter specifies how the switch should act if different VLAN IDs end up being assigned to different supplicants. The keyword value **deny** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is rejected. The keyword value **permit** means that once a given VID has been assigned to the first supplicant, then if any subsequent supplicant is assigned a different VID, that supplicant is accepted, but it is actually assigned the same VID as the first supplicant.

If you issue an **auth dynamic-vlan-creation** command without a **rule** parameter then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without a **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VIDs.

The **type** parameter specifies whether multiple different VLANs can be assigned to supplicants attached to the port, or whether only a single VLAN can be assigned to supplicants on the port. The **type** parameter can select the port base VLAN or the MAC base VLAN from the RADIUS VLAN ID. This can be used when the host-mode is set to multi-supplicant. For **single**-host ports, the VLAN ID will be assigned to the port. It is not supported with the Guest VLAN feature. Display the ID assigned using a **show vlan** command. For **multi**-host ports, the VLAN ID will be assigned to the MAC address of the authenticated supplicant. The VLAN ID assigned for the MAC Base VLAN is displayed using the **show platform table vlan** command.

To configure Dynamic VLAN with Web Authentication, you need to set the Web Authentication Server virtual IP address by using the auth-web-server ipaddress command or the auth-web-server dhcp ipaddress command. You also need to create a hardware access-list that can be applied to the switch port interface.

You need to configure an IPv4 address for the VLAN interface on which Web Authentication is running.

Examples To enable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 10
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# interface vlan10
awplus(config-if)# ip address 10.1.1.1/24
```

To enable the Dynamic VLAN assignment feature with Web Authentication on interface port1.0.2 when Web Authentication is needed, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 1.2.3.4
awplus(config)# access-list hardware acl-web send-to-cpu ip any
1.2.3.4
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# access-group acl-web
awplus(config-if)# interface vlan1
awplus(config-if)# ip address 10.1.1.1/24
```

To disable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth dynamic-vlan-creation
```

To enable the Dynamic VLAN assignment feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth dynamic-vlan-creation
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth guest-vlan

Overview Use this command to enable and configure the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface unless it is already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest VLAN feature on the interface specified.

Syntax

```
auth guest-vlan <1-4094> [routing]
no auth guest-vlan [routing]
```

Parameter	Description
<1-4094>	VLAN ID (VID).
`routing`	Enables routing from the Guest VLAN to other VLANs.

Default The Guest VLAN authentication feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must enable 802.1X on the port and define a VLAN using the vlan command before you can configure it as a guest VLAN.

Roaming Authentication cannot be enabled if DHCP snooping is enabled (service dhcp-snooping command), and vice versa.

Note that Guest VLAN can use only untagged ports.

See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- Guest VLAN, and

- restrictions regarding combinations of authentication enhancements working together

Examples

To define vlan100 and assign the guest VLAN feature to vlan100 on interface port1.0.2, and enable routing from the guest VLAN to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest VLAN feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan
```

To define vlan100 and assign the guest VLAN feature to vlan100 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan 100
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth guest-vlan forward

Overview Use this command to enable packet forwarding from the guest VLAN to a destination IP address or subnet. If this command is configured, the device can lease DHCP addresses and accept access to a limited part of your network. Also, when using NAP authentication, the supplicant can log on to a domain controller to gain certification.

Use the **no** variant of this command to disable packet forwarding from the Guest VLAN to a destination IP address or subnet.

Syntax

```
auth guest-vlan forward {<ip-address>|<ip-address/mask>}
[dns|tcp <1-65535>|udp <1-65535>]
```

```
no auth guest-vlan forward {<ip-address>|<ip-address/mask>}
[dns|tcp <1-65535>|udp <1-65535>]
```

Parameter	Description
<ip-address> <ip-address/mask>	The IP address or subnet to which the guest VLAN can forward packets, in dotted decimal notation
`dns`	Enable forwarding of DNS packets
`tcp <1-65535>`	Enable forwarding of packets for the specified TCP port number
`udp <1-65535>`	Enable forwarding of packets for the specified UDP port number

Default Forwarding is disabled by default.

Mode Interface Configuration mode for a specified switch port, or Authentication Profile mode

Usage Before using this command, you must configure the guest VLAN with the auth guest-vlan command.

Example To enable packet forwarding from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan forward 10.0.0.1
```

To enable forwarding of DNS packets from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface
awplus(config-if)# auth guest-vlan forward 10.0.0.1 dns
```

To disable forwarding of DNS packets from the guest VLAN to the destination IP address on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan forward 10.0.0.1 dns
```

To enable the TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan forward 10.0.0.1
tcp 137
```

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth guest-vlan hw-forwarding

Overview Use this command to enable hardware forwarding on the guest VLAN. By default, hardware forwarding is disabled and all traffic on the VLAN is forwarded by the CPU.

Use the **no** variant of this command to disable hardware forwarding on the guest VLAN.

Syntax
```
auth guest-vlan hw-forwarding
no auth guest-vlan hw-forwarding
```

Default Disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To enable guest VLAN hardware forwarding on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan hw-forwarding
```

To disable guest VLAN hardware forwarding on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan hw-forwarding
```

To enable guest VLAN hardware forwarding authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan hw-forwarding
```

Related commands
auth profile (global)

auth guest-vlan

auth guest-vlan forward

Command changes Version 5.5.0-1.1: command added to x230, GS970M, IE210 series switches.

Version 5.5.1-0.1: command added to all other AlliedWare Plus switches.

auth host-mode

Overview Use this command to select the host mode on the specified interface.

Use the **no** variant of this command to set host mode to the default setting (single host).

Syntax

```
auth host-mode
{host-plus-voice|single-host|multi-host|multi-supplicant}
```

```
no auth host-mode
```

Parameter	Description
`host-plus-voice`	In this mode, only one voice device (IP phone) and one host device can join the network. You use the RADIUS attribute 'Cisco-AVPair device-traffic-class=voice' to identify the IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the AAA and Port Authentication Feature Overview and Configuration Guide.
`single-host`	In this mode, only one supplicant is allowed per port. This is the default mode.
`multi-host`	In this mode, once the first host on a port is authenticated, all other downstream hosts are allowed without being authenticated (piggy-back mode).
`multi-supplicant`	In this mode, multiple separate supplicants are individually authenticated on one port.

Default The default host mode for port authentication is for a single host.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes

Single-host mode

With this mode, only one supplicant may be authenticated on the port. Once that host has been authenticated, no other supplicants may be authenticated until the first supplicant's session has closed. This means, of course, that none of the other hosts downstream of the port will be able to send or receive traffic on that port.

This option is recommended when you know that there should only be one host connected to a port. By limiting the port to a single authenticated host, you guard against the consequences of someone accidentally or maliciously connecting a downstream switch to the port.

Multi-host mode

With this mode, once the first host has been authenticated on the port, all other downstream hosts are allowed without being authenticated. This is sometimes known as piggy-back mode. It is useful when the downstream switch attached to

the authenticating port is an intelligent switch that can act as an authentication supplicant.

If you trust that malicious users cannot be connected to that switch but you do not know the identity of those users, then you can simply authenticate the switch and then allow its attached users to have network access. If the valid switch is disconnected and an invalid one is connected which is not configured with the correct authentication credentials, then the devices connected to the invalid switch will be blocked from accessing the network.

Examples To set the host mode to multi-supplicant on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-supplicant on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-supplicant
```

To set the host mode to the default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

auth log

Overview Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

Syntax

```
auth log {dot1x|auth-mac|auth-web}
{success|failure|logoff|all}
```

```
no auth log {dot1x|auth-mac|auth-web}
{success|failure|logoff|all}
```

Parameter	Description
`dot1x`	Specify only 802.1X-Authentication log messages are output to the log file.
`auth-mac`	Specify only MAC-Authentication log messages are output to the log file.
`auth-web`	Specify only Web-Authentication log messages are output to the log file.
`success`	Specify only successful authentication log messages are output to the log file.
`failure`	Specify only authentication failure log messages are output to the log file.
`logoff`	Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.
`all`	Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature.

Default All types of authentication log messages are output to the log file by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To configure the logging of MAC authentication failures to the log file for supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth log auth-mac failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth log auth-mac all
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log auth-mac all
```

auth max-supplicant

Overview Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

Syntax

```
auth max-supplicant <2-1024>
no auth max-supplicant
```

Parameter	Description
<2-1024>	Limit number.

Default 1024

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the maximum number of supplicants to 10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-supplicant 10
```

To reset the maximum number of supplicants to the default value on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-supplicant
```

To set the maximum number of supplicants to 10 on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-supplicant 10
```

To reset the maximum number of supplicants to the default value on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-supplicant
```

auth max-supplicant tagged-vlan

Overview Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on tagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on tagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the AAA and Port Authentication Feature Overview and Configuration Guide.

Use the **no** variant of this command to reset the maximum number of supplicants on tagged VLANs to the default.

Syntax

```
auth max-supplicant tagged-vlan <0-1024>
no auth max-supplicant tagged-vlan <0-1024>
```

Default 1024

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Examples To set the maximum number of supplicants on tagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-supplicant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-supplicant tagged-vlan
```

To set the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-supplicant tagged-vlan 1
```

To reset the maximum number of supplicants on tagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-supplicant tagged-vlan
```

Command changes

Version 5.5.2-1.1: command added

auth max-supplicant untagged-vlan

Overview Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port on untagged VLANs. Once this value is exceeded, further supplicants will not be authenticated on untagged VLANs on that port.

This command is useful for preventing unwanted supplicants from connecting to the network when a host (e.g. a PC) connects to an AlliedWare Plus NAS via an IP phone. For more information and a step-by-step configuration example, see the "Limit the number of supplicants when connecting via an IP phone" section of the AAA and Port Authentication Feature Overview and Configuration Guide.

Use the **no** variant of this command to reset the maximum number of supplicants on untagged VLANs to the default.

Syntax

```
auth max-supplicant untagged-vlan <0-1024>
no auth max-supplicant untagged-vlan <0-1024>
```

Default 1024

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Examples To set the maximum number of supplicants on untagged VLANs on interface port1.0.2 to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth max-supplicant untagged-vlan 1
```

To reset the maximum number of supplicants on untagged VLANs on interface port1.0.2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth max-supplicant untagged-vlan
```

To set the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to 1, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# auth max-supplicant untagged-vlan
1
```

To reset the maximum number of supplicants on untagged VLANs on authentication profile 'accounts' to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile accounts
awplus(config-auth-profile)# no auth max-supplicant
untagged-vlan
```

Command changes

Version 5.5.2-1.1: command added

auth multi-vlan-session

Overview Use this command to enable packet forwarding on multiple VLANs for an authenticated supplicant attached to a trunked (tagged VLAN) port.

By default, AlliedWare Plus only allows packet forwarding on the VLAN that a device was authenticated on. This command enables packet forwarding to the attached device on any VLAN configured on the switchport. After the device authenticates it will have access to all VLANs configured on the switchport.

Use the **no** variant of this command to disable packet forwarding on multiple VLANs for an authenticated supplicant.

Syntax

```
auth multi-vlan-session
no auth multi-vlan-session
```

Default By default, **multi-vlan-session** is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To allow a client attached to port1.0.2 to access all VLANs configured on the AlliedWare Plus device, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan all
awplus(config-if)# auth host-mode multi-supplicant
awplus(config-if)# auth multi-vlan-session
```

To disable **multi-vlan-session** on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth multi-vlan-session
```

Command changes Version 5.4.8-1.1: command added

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth priority

Overview Use this command to enable authentication priority on an interface. This sets the tri-authentication order of priority for MAC, 802.1X, and web-based authentication. If tri-authentication is not configured on the interface then this command has no effect.

You specify the authentication methods in order of priority. The first method in the list has the highest priority, the second method has the second highest priority, and the third method has the lowest priority. Any methods not specified will have the lowest priority.

Use the **no** variant of this command to disable authentication priority.

Syntax

```
auth priority {[auth-mac] [dot1x] [auth-web]}
no auth priority
```

Parameter	Description
`auth-mac`	Set MAC authentication priority.
`dot1x`	Set 802.1X authentication priority.
`auth-web`	Set web-based authentication priority.

Default Authentication priority is not set.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Before using this command you must correctly configure tri-authentication on the interface. Tri-authentication is when multiple authentication methods (MAC, 802.1X, and/or web-based) are configured on the same interface. With tri-authentication, a supplicant is authorized to use the network as soon as they are successfully authenticated by any of the configured authentication methods.

When authentication priority is not set, once a supplicant is authenticated any future attempts to authenticate are ignored. When, however, authentication priority is set, and a higher priority authentication attempt is made by the supplicant, a new authentication process starts. The supplicant will then be authorized, or unauthorized, based on the result of this new authentication attempt.

Example To configure 802.1X authentication to have a higher priority than MAC authentication on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

To disable authentication priority on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth priority
```

To configure 802.1X authentication to have a higher priority than MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

Related commands auth profile (interface)

Command changes Version 5.5.0-2.1: command added

auth profile (global)

Overview Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

Syntax

```
auth profile <profile-name>
no auth profile <profile-name>
```

Parameter	Description
<profile-name>	Name of the profile to create or configure.

Default No port authentication profiles are created by default.

Mode Global Configuration

Usage A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the auth profile (interface) command.

Example To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

Related commands auth profile (interface)

description (auth-profile)

auth profile (interface)

Overview Use this command to attach a port authentication profile to the current interface.

Use the **no** variant of this command to detach a port authentication profile from the current interface.

Syntax

```
auth profile <profile-name>
no auth profile <profile-name>
```

Parameter	Description
<profile-name>	The name of the profile to attach to the current interface.

Default No profile is attached by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage This command attaches an authentication profile, that was created using the auth profile (global) command, to a static channel, a dynamic (LACP) channel group, or a switch port.

You can only attach one profile to an interface at a time. Use the **no** variant of the command to detach a profile before attempting to attach another one.

Example To attach the authentication profile 'student' to port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth profile student
```

Related commands auth profile (global)

auth reauthentication

Overview Use this command to enable re-authentication on the interface specified in the Interface mode, which may be a static channel group (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Use the **no** variant of this command to disable reauthentication on the interface.

Syntax

```
auth reauthentication
no auth reauthentication
```

Default Reauthentication of port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

Related commands

auth profile (global)

show dot1x

show dot1x interface

auth roaming disconnected

Overview This command allows a supplicant to move to another authenticating interface without reauthentication, even if the link is down for the interface that the supplicant is currently connected to.

You must enter the auth roaming enable command on both interfaces before using this command.

The **no** variant of this command disables roaming authentication on interfaces that are link-down, and forces a supplicant to be reauthenticated when moving between interfaces.

See the AAA and Port Authentication Feature Overview and Configuration Guide for further information about this feature.

Syntax

```
auth roaming disconnected
no auth roaming disconnected
```

Default By default, the authentication status for a roaming supplicant is deleted when an interface goes down, so supplicants must reauthenticate.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Note that 802.1X port authentication, MAC-authentication, or Web-authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Roaming Authentication cannot be enabled if DHCP snooping is enabled (service dhcp-snooping command), and vice versa.

Examples To allow supplicants to move from port1.0.2 without reauthentication even when the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To require supplicants to reauthenticate when moving from port1.0.2 if the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth roaming disconnected
```

To allow supplicants using authentication profile 'student' to move between ports without reauthentication even when the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming disconnected
```

To require supplicants using authentication profile 'student' to reauthenticate when moving between ports if the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth roaming disconnected
```

auth roaming enable

Overview Use this command to allow a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is currently connected to.

The **no** variant of this command disables roaming authentication on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See the AAA and Port Authentication Feature Overview and Configuration Guide for further information about this feature.

Syntax

```
auth roaming enable
no auth roaming enable
```

Default Roaming authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Note that 802.1X port authentication, MAC authentication, or web-based authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

This command only enables roaming authentication for links that are up. If you want roaming authentication on links that are down, you must also use the command auth roaming disconnected.

Roaming Authentication cannot be enabled if DHCP snooping is enabled (service dhcp-snooping command), and vice versa.

Examples To enable roaming authentication for port1.0.4, when using auth-mac authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# auth-mac enable
awplus(config-if)# auth roaming enable
```

To disable roaming authentication for port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no auth roaming enable
```

To enable roaming authentication for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming enable
```

auth supplicant-ip

Overview Use this command to add a supplicant (client device) IP address on a given interface and provides parameters for its configuration.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for auth-web clients only.

Syntax

```
auth supplicant-ip <ip-addr> [max-reauth-req <1-10>]
[port-control {auto|force-authorized|force-unauthorized|
skip-second-auth}] [quiet-period <1-65535>] [reauth-period
<1-4294967295>] [supp-timeout <1-65535>] [server-timeout
<1-65535>] [reauthentication]
```

```
no auth supplicant-ip <ip-addr> [reauthentication]
```

Parameter	Description
<ip-addr>	IP address of the supplicant entry in A.B.C.D/P format.
`max-reauth-req`	The number of reauthentication attempts before becoming unauthorized.
<1-10>	Count of reauthentication attempts (default 2).
`port-control`	Port control commands.
`auto`	A port control parameter that allows port clients to negotiate authentication.
`force-authorized`	A port control parameter that forces the port state to authorized.
`force-unauthorized`	A port control parameter that forces the port state to unauthorized.
`skip-second-auth`	Skip the second authentication.
`quiet-period`	Quiet period during which the port remains in the HELD state (default 60 seconds).
<1-65535>	Seconds for quiet period.
`reauth-period`	Seconds between reauthorization attempts (default 3600 seconds).
<1-4294967295>	Seconds for reauthorization attempts (reauth-period).
`supp-timeout`	Supplicant response timeout.
<1-65535>	Seconds for supplicant response timeout (default 30 seconds).
`server-timeout`	The period, in seconds, before the authentication server response times out.

Parameter	Description
<1-65535>	The server-timeout period, in seconds, default 3600 seconds.
`reauthentication`	Enable reauthentication on a port.

Default No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The defaults for parameters applied are as shown in the table above.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip
192.168.10.0/24 port-control force-authorized
```

Related commands

show auth

show dot1x

show dot1x interface

auth supplicant-mac

Overview This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

Syntax

```
auth supplicant-mac <mac-addr> [mask <mac-addr-mask>]
[max-reauth-req <1-10>] [port-control {auto|force-authorized|
force-unauthorized|skip-second-auth}] [quiet-period <1-65535>]
[reauth-period <1-4294967295>] [supp-timeout <1-65535>]
[server-timeout <1-65535>] [reauthentication]
```

```
no auth supplicant-mac <mac-addr> [reauthentication]
```

Parameter	Description
<mac-addr>	MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.
`mask`	A mask applied to MAC addresses in order to select only those addresses containing a specific string.
<mac-addr-mask>	The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored. In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored.
`port-control`	Port control commands.
`auto`	Allow port client to negotiate authentication.
`force-authorized`	Force port state to authorized.
`force-unauthorized`	Force port state to unauthorized.
`skip-second-auth`	Skip the second authentication.
`quiet-period`	Quiet period in the HELD state (default 60 seconds).
<1-65535>	Seconds for quiet period.
`reauth-period`	Seconds between reauthorization attempts (default 3600 seconds).
<1-4294967295>	Seconds for reauthorization attempts (reauth-period).
`supp-timeout`	Supplicant response timeout (default 30 seconds).

Parameter	Description
<1-65535>	Seconds for supplicant response timeout.
`server-timeout`	Authentication server response timeout (default 30 seconds).
<1-65535>	Seconds for authentication server response timeout.
`reauthentication`	Enable reauthentication on a port.
`max-reauth-req`	No of reauthentication attempts before becoming unauthorized (default 2).
<1-10>	Count of reauthentication attempts.

Default No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac
0000.5E00.5343 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

auth timeout connect-timeout

Overview Use this command to set the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default.

Syntax

```
auth timeout connect-timeout <1-65535>
no auth timeout connect-timeout
```

Parameter	Description
<1-65535>	Specifies the connect-timeout period (in seconds).

Default The connect-timeout default is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes This command is used for MAC and web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When auth-web-server session-keep or auth two-step enable is enabled, we recommend you configure a longer connect-timeout period.

Examples To set the connect-timeout period to 3600 seconds for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

Related commands auth profile (global)

auth timeout quiet-period

Overview Use this command to set a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

Syntax

```
auth timeout quiet-period <1-65535>
no auth timeout quiet-period
```

Parameter	Description
<1-65535>	Specifies the quiet period (in seconds).

Default The quiet period for port authentication is 60 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the quiet period to 10 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

Related commands auth profile (global)

auth timeout reauth-period

Overview Use this command to set the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

Syntax

```
auth timeout reauth-period <1-4294967295>
no auth timeout reauth-period
```

Parameter	Description
<1-4294967295>	The reauthentication timeout period (in seconds).

Default The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the reauthentication period to 1 day for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

auth timeout server-timeout

Overview Use this command to set the timeout for the waiting response from the RADIUS server on a given interface.

Use the **no** variant of this command to reset the server-timeout to the default (30 seconds).

Syntax

```
auth timeout server-timeout <1-65535>
no auth timeout server-timeout
```

Parameter	Description
<1-65535>	Server timeout period (in seconds).

Default The server timeout for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the server timeout to 120 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface port1.0.2 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

auth timeout supp-timeout

Overview This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

Syntax

```
auth timeout supp-timeout <1-65535>
no auth timeout supp-timeout
```

Parameter	Description
<1-65535>	The supplicant timeout period (in seconds).

Default The supplicant timeout for port authentication is 30 seconds.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the supplicant timeout to 2 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the supplicant timeout to the default (30 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout supp-timeout
```

To set the supplicant timeout to 2 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout supp-timeout 2
```

auth vlan-restriction

Overview Use this command to restrict port authenticated supplicants on an interface to one per VLAN. This is useful, for example, if you have configured multiple supplicants on an interface but you want to restrict network access to a single IP phone and a single authorized workstation.

Use the **no** variant of this command to remove the single supplicant per VLAN restriction.

Syntax

```
auth vlan-restriction
no auth vlan-restriction
```

Default Not configured

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes This is a port authentication command, so you should first configure 802.1X, MAC, or web authentication. In addition, configure multi-supplicants on the interface using the **auth host-mode multi-supplicant** command.

This command works with both dynamic VLANs and static voice VLAN configurations.

Examples To restrict supplicants to a one per VLAN on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth vlan-restriction
```

To remove the one per VLAN supplicant restriction on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth vlan-restriction
```

Command changes Version 5.5.1-2.1: command added

auth two-step enable

Overview Use this command to enable a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated.

Use this command to apply the two-step authentication method based on 802.1X, MAC or web authentication.

Use the **no** variant of this command to disable the two-step authentication feature.

Syntax

```
auth two-step enable
no auth two-step enable
```

Default Two step authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

Examples To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable MAC authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable 802.1X authentication followed by web authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable the two step authentication feature for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth two-step enable
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth two-step order

Overview Use this command to configure the order for two-step authentication. Two-step authentication and the relevant authentication methods must be enabled on the interface.

Use the **no** variant of this command to reset the authentication order to the default.

Syntax

```
auth two-step order auth-mac {dot1x|auth-web}
auth two-step order dot1x {auth-mac|auth-web}
no auth two-step order
```

Parameter	Description
`auth-mac`	MAC authentication
`dot1x`	802.1X authentication
`auth-web`	Web authentication

Default Order is determined by the authentication methods configured on the interface (see **Usage notes**).

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes The default authentication order depends on the combination of the authentication methods configured on the interface:

- If auth-mac is configured then auth-mac will be the first method.
- If auth-mac is **not** configured then dot1x will become the first method.
- If only two methods are configured then the remaining method becomes the second method.
- If all three methods are configured then the second method is chosen based on the packet type received (dot1x for an EAPOL packet and auth-web for an HTTP packet).

Examples

To set the two-step authentication order on port1.0.1 for 802.1X authentication and then MAC authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth two-step enable
awplus(config-if)# auth two-step order dot1x auth-mac
```

To reset the two-step authentication order back to the default, which would be MAC authentication then 802.1X authentication if configured as above, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth two-step order
```

Command changes

Version 5.5.0-0.3: command added

auth-mac accounting

Overview Use this command to override the **default** RADIUS accounting method for MAC-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax

```
auth-mac accounting {default|<list-name>}
no auth-mac accounting
```

Parameter	Description
`default`	Apply the default accounting method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac accounting
```

Related commands aaa accounting auth-mac

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac authentication

Overview This command overrides the **default** MAC authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax

```
auth-mac authentication {default|<list-name>}
no auth-mac authentication
```

Parameter	Description
`default`	Apply the default authentication method list
`<list-name>`	Apply a user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac authentication
```

Related commands aaa authentication auth-mac

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac enable

Overview This command enables MAC authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC authentication on an interface.

Syntax

```
auth-mac enable
no auth-mac enable
```

Default MAC-Authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Enabling **spanning-tree edgeport** on ports after enabling MAC authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be
removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable MAC authentication on interface port1.0.2 and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac enable
```

To enable MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac enable
```

Command changes

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac method

Overview This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

Syntax

```
auth-mac method [eap-md5|pap]
no auth-mac method
```

Parameter	Description
eap-md5	Enable EAP-MD5 as the authentication method.
pap	Enable PAP as the authentication method.

Default The MAC authentication method is PAP.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the MAC authentication method to PAP on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac method
```

To set the MAC authentication method to EAP-MD5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac method eap-md5
```

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac password

Overview This command changes the password for MAC-based authentication.

Use the **no** variant of this command to return the password to its default.

Syntax

```
auth-mac [encrypted] password <password>
no auth-mac password
```

Parameter	Description
`auth-mac`	MAC-based authentication
`encrypted`	Specify an encrypted password
`password`	Configure the password
<password>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except: • ? • " (double quotes) • space

Default By default, the password is the MAC address of the supplicant.

Mode Global Configuration

Usage notes Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers, and/or
- you are using two-step authentication (see the "Ensuring Authentication Methods Require Different Usernames and Passwords" section of the AAA and Port Authentication Feature_Overview_and_Configuration_Guide).

Examples To change the password to verySecurePassword, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

Related commands auth two-step enable

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac reauth-relearning

Overview This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

Syntax

```
auth-mac reauth-relearning
no auth-mac reauth-relearning
```

Default Re-learning for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac reauth-relearning
```

To enable the re-authentication re-learning feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac reauth-relearning
```

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac static

Overview This command configures MAC authentication to use static entries in the FDB. Static entries persist in the FDB, even if there is no traffic flow from the supplicant.

When static FDB entries are configured, the auth roaming disconnected command is supported for MAC authentication. This command allows a supplicant to move to another authenticating interface without re-authentication.

Use the **no** variant of this command to revert to dynamic FDB entries.

Syntax

```
auth-mac static
no auth-mac static
```

Default By default MAC authentication supplicants are added to the FDB dynamically.

Mode Global Configuration

Example To configure MAC authentication to use static FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac static
```

To configure MAC authentication to use dynamic FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-mac static
```

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac username

Overview Use this command to specify the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Syntax

```
auth-mac username {ietf|unformatted} {lower-case|upper-case}
```

Parameter	Description
`ietf`	The MAC address includes a hyphen between each 2 bytes. (Example: xx-xx-xx-xx-xx-xx)
`unformatted`	The MAC address does not include hyphens. (Example: xxxxxxxxxxxx)
`lower-case`	The MAC address uses lower-case characters (a-f)
`upper-case`	The MAC address uses upper-case characters (A-F)

Default

```
auth-mac username ietf lower-case
```

Mode Global Configuration

Usage This command is provided to allow other vendors', AlliedWare, and AlliedWare Plus switches to share the same format on the RADIUS server.

Example To configure the format of the MAC address in the username and password field to be changed to IETF and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac username ietf upper-case
```

Related commands auth-mac username

show running-config

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-web accounting

Overview This command overrides the default RADIUS accounting method for web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

Syntax

```
auth-web accounting {default|<list-name>}
no auth-web accounting
```

Parameter	Description
`default`	Apply the default accounting method list
`<list-name>`	Apply a named accounting method list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web accounting
```

Related commands aaa accounting auth-web

auth-web authentication

Overview Use this command to override the default web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

Syntax

```
auth-web authentication {default|<list-name>}
no auth-web authentication
```

Parameter	Description
`default`	Apply the default authentication method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-web authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-web authentication
```

Related commands aaa authentication auth-web

auth-web enable

Overview Use this command to enable web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

Syntax

```
auth-web enable
no auth-web enable
```

Default Web authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Web-based authentication cannot be enabled if DHCP snooping is enabled by using the service dhcp-snooping command, and vice versa. You need to configure an IPv4 address for the VLAN interface on which web authentication is running.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be
removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
awplus(config-if)# exit
awplus(config)# interface sa2
awplus(config-if)# auth-web enable
```

To disable web authentication on static-channel-group 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)# no auth-web enable
```

To enable web authentication on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable web authentication on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

auth-web forward

Overview Use this command to enable the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

Use the **no** variant of this command to disable the specified packet forwarding feature on the interface.

Syntax

```
auth-web forward [<ip-address>|<ip-address/prefix-length>]
{dns|tcp <1-65535>|udp <1-65535>}
```

or

```
auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}
```

The **no** variants of this command are:

```
no auth-web forward [<ip-address>|<ip-address/prefix-length>]
{dns|tcp <1-65535>|udp <1-65535>}
```

or

```
no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}
```

Parameter	Description
<ip-address> *<ip-address/prefix-length>*	The IP address or subnet on which the web authentication is to be enabled.
`arp`	Enable forwarding of ARP.
`dhcp`	Enable forwarding of DHCP (67/udp).
`dns`	Enable forwarding of DNS (53/udp).
`tcp`	Enable forwarding of TCP specified port number.
`<1-65535>`	TCP Port number.
`udp`	Enable forwarding of UDP specified port number.
`<1-65535>`	UDP Port number.

Default Packet forwarding for port authentication is enabled by default for “arp”, “dhcp” and “dns”.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes For more information about the *<ip-address>* parameter, and an example, see the “auth-web forward” section in the Alliedware Plus Technical Tips and Tricks.

Examples To enable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward arp
```

To add TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web forward tcp 137
```

To add the DNS Server IP address 192.168.1.10 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth-web forward 192.168.1.10 dns
```

To disable the ARP forwarding feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward arp
```

To delete TCP forwarding port 137 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp 137
```

To delete all TCP forwarding on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web forward tcp
```

To enable the ARP forwarding feature on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward arp
```

To add TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward arp
```

To delete TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp 137
```

To delete all TCP forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp
```

Related commands

show auth

show auth interface

auth-web idle-timeout enable

Overview Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

Syntax

```
auth-web idle-timeout enable
no auth-web idle-timeout enable
```

Default The idle-timeout is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

Related commands auth-web enable

auth-web idle-timeout timeout

auth-web idle-timeout timeout

Overview Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

Syntax

```
auth-web idle-timeout timeout <420-86400>
no auth-web idle-timeout timeout
```

Parameter	Description
<420-86400>	Time in seconds.

Default The timeout is 3600 seconds by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

Related commands auth-web enable

auth-web idle-timeout enable

auth-web max-auth-fail

Overview Use this command to set the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

Use the **no** variant of this command to reset the maximum number of authentication failures to the default.

Syntax

```
auth-web max-auth-fail <0-10>
no auth-web max-auth-fail
```

Parameter	Description
<0-10>	The maximum number of authentication failures allowed before login requests are refused.

Default The maximum number of authentication failures is set to 3.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the lock count to 5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

auth-web method

Overview Use this command to set the web authentication access method that is used with RADIUS on the interface specified.

Use the **no** variant of this command to set the authentication method to PAP for the interface specified when web authentication is also used with the RADIUS authentication method.

Syntax

```
auth-web method {eap-md5|pap}
no auth-web method
```

Parameter	Description
eap-md5	Enable EAP-MD5 as the authentication method.
pap	Enable PAP as the authentication method.

Default The web authentication method is set to PAP by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To set the web authentication method to EAP-MD5 on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to EAP-MD5 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

auth-web-server blocking-mode

Overview Use this command to enable blocking mode for the Web-Authentication server. The blocking mode displays an authentication success or failure screen immediately from the response result from a RADIUS server.

Use the **no** variant of this command to disable blocking mode for the Web-Authentication server.

Syntax

```
auth-web-server blocking-mode
no auth-web-server blocking-mode
```

Default By default, blocking mode is disabled for the Web-Authentication server.

Mode Global Configuration

Example To enable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server blocking-mode
```

To disable blocking mode for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server blocking-mode
```

Related commands auth-web-server redirect-delay-time

show auth-web-server

show running-config

auth-web-server dhcp ipaddress

Overview Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

Syntax

```
auth-web-server dhcp ipaddress <ip-address/prefix-length>
no auth-web-server dhcp ipaddress
```

Parameter	Description
<ip-address/prefix-length>	The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants.

Default No IP address for the Web-Authentication server is set by default.

Mode Global Configuration

Usage notes See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Note that this Web Authentication virtual DHCP server is a limited implementation of the DHCP protocol. Separation of IP addresses depends on allocating addresses incrementally and a short lease time. In a situation where a supplicant remains permanently connected but does not authenticate, there is a risk of re-allocation of the same IP address once the server has rolled through the entire address range.

Examples To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

Related commands

auth-web-server dhcp lease

show auth-web-server

show running-config

auth-web-server dhcp lease

Overview Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

Syntax

```
auth-web-server dhcp lease <20-60>
no auth-web-server dhcp lease
```

Parameter	Description
<20-60>	DHCP lease time for supplicants using the DHCP service on the Web-Authentication server in seconds.

Default The default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server is set to 30 seconds.

Mode Global Configuration

Usage notes See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

Examples To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

Validation Commands show running-config

Related commands show auth-web-server

auth-web-server dhcp ipaddress

auth-web-server dhcp-wpad-option

Overview This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the "Web Auth Proxy" section in the Alliedware Plus Technical Tips and Tricks.

Use the **no** variant of this command to disable the DHCP WPAD function.

Syntax

```
auth-web-server dhcp wpad-option <url>
no auth-web-server dhcp wpad-option
```

Parameter	Description
<url>	URL to the server which gets a .pac file.

Default The Web-Authentication server DHCP WPAD option is not set.

Mode Global Configuration

Usage notes If the supplicant is configured to use WPAD, the supplicant's web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

Example To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

Related commands show auth-web-server

auth-web-server host-name

Overview This command assigns a hostname to the web authentication server.

Use the **no** variant of this command to remove the hostname from the web authentication server.

Syntax

```
auth-web-server host-name <hostname>
no auth-web-server host-name
```

Parameter	Description
<hostname>	URL string of the hostname

Default The web authentication server has no hostname.

Mode Global Configuration

Usage notes When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

Examples To set the auth.example.com as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname auth.example.com from the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server host-name
```

Related commands aaa authentication auth-web

auth-web enable

auth-web-server intercept-port

Overview This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

Syntax

```
auth-web-server intercept-port {<1-65535>|any}
no auth-web-server intercept-port {<1-65535>|any}
```

Parameter	Description
<1-65535>	TCP port number.
`any`	Intercept all TCP packets

Default No additional TCP port numbers are intercepted by default.

Mode Global Configuration

Usage notes If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the Alliedware Plus Technical Tips and Tricks.

Example To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

Related commands show auth-web-server

auth-web-server ip-conflict-prefer-newer-supplicant

Overview Use this command to alter the behavior of a Network Access Server (NAS) when it detects a supplicant with a duplicate IP address.

The default behavior is for the NAS to not authorize the newer supplicant. This command allows it to authorize the newer supplicant and unauthorize the original supplicant.

This command applies to Web-based authentication supplicants only.

Use the **no** variant of this command to set the behavior back to default.

Syntax

```
auth-web-server ip-conflict-prefer-newer-supplicant
no auth-web-server ip-conflict-prefer-newer-supplicant
```

Default The default behavior is to not authorize the newer supplicant if the NAS detects a duplicate IP address.

Mode Global Configuration

Usage notes Allied Telesis recommends you investigate and resolve the root cause of the conflicting IP addresses.

Example To configure a NAS to authorize the newer supplicant, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server
ip-conflict-prefer-newer-supplicant
```

Related commands auth-web enable

show auth

Command changes Version 5.5.2-0.1: command added

auth-web-server ipaddress

Overview This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Syntax

```
auth-web-server ipaddress <ip-address>
no auth-web-server ipaddress
```

Parameter	Description
<ip-address>	Web-Authentication server dotted decimal IP address in A.B.C.D format.

Default The Web-Authentication server address on the system is not set by default.

Mode Global Configuration

Examples To set the IP address `10.0.0.1` to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server page language

Overview Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

Syntax

```
auth-web-server page language {english|japanese}
no auth-web-server page language
```

Parameter	Description
english	Web authentication pages are presented in English.
japanese	Web authentication pages are presented in Japanese.

Default Web authentication pages are presented in English by default.

Mode Global Configuration

Examples To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

Related commands

auth-web-server page title

auth-web-server page sub-title

auth-web-server login-url

Overview This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide for details.

Use the **no** variant of this command to delete the URL.

Syntax

```
auth-web-server login-url <URL>
no auth-web-server login-url
```

Parameter	Description
<URL>	Set login page URL

Default The built-in login page is set by default.

Mode Global Configuration

Examples To set http://example.com/login.html as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url
http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

Related commands show running-config

auth-web-server page logo

Overview This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page logo {auto|default|hidden}
no auth-web-server page logo
```

Parameter	Description
`auto`	Display the custom logo if installed; otherwise display the default logo
`default`	Display the default logo
`hidden`	Hide the logo

Default Logo type is **auto** by default.

Mode Global Configuration

Examples To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

Validation Commands show auth-web-server page

auth-web-server page sub-title

Overview This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page sub-title {hidden|text <sub-title>}
no auth-web-server page sub-title
```

Parameter	Description
`hidden`	Hide the sub-title
<sub-title>	Text string of the sub-title

Default "Allied-Telesis" is displayed by default.

Mode Global Configuration

Examples To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

Validation Commands show auth-web-server page

auth-web-server page success-message

Overview This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page success-message text <success-message>
no auth-web-server page success-message
```

Parameter	Description
<success-message>	Text string of the success message

Default No success message is set by default.

Mode Global Configuration

Examples To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page success-message text Your success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page success-message
```

Validation Commands show auth-web-server page

auth-web-server page title

Overview This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page title {hidden|text <title>}
no auth-web-server page title
```

Parameter	Description
`hidden`	Hide the title
`<title>`	Text string of the title

Default "Web Access Authentication Gateway" is displayed by default.

Mode Global Configuration

Examples To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

Validation Commands show auth-web-server page

auth-web-server page welcome-message

Overview This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page welcome-message text <welcome-message>
no auth-web-server page welcome-message
```

Parameter	Description
<welcome-message>	Text string of the welcome message

Default No welcome message is set by default.

Mode Global Configuration

Examples To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page welcome-message text Your welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page welcome-message
```

Validation Commands show auth-web-server page

auth-web-server ping-poll enable

Overview This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

Syntax

```
auth-web-server ping-poll enable
no auth-web-server ping-poll enable
```

Default The ping polling feature for Web-Authentication is disabled by default.

Mode Global Configuration

Examples To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server ping-poll failcount

Overview This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

Syntax

```
auth-web-server ping-poll failcount <1-100>
no auth-web-server ping-poll failcount
```

Parameter	Description
<1-100>	Count.

Default The default failcount for ping polling is 5 pings.

Mode Global Configuration

Examples To set the failcount of ping polling to `10` pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server ping-poll interval

Overview This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

Syntax

```
auth-web-server ping-poll interval <1-65535>
no auth-web-server ping-poll interval
```

Parameter	Description
<1-65535>	Seconds.

Default The interval for ping polling is 30 seconds by default.

Mode Global Configuration

Examples To set the interval of ping polling to `60` seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server ping-poll reauth-timer-refresh

Overview This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

Syntax

```
auth-web-server ping-poll reauth-timer-refresh
no auth-web-server ping-poll reauth-timer-refresh
```

Default The `reauth-timer-refresh` parameter is disabled by default.

Mode Global Configuration

Examples To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll
reauth-timer-refresh
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server ping-poll timeout

Overview This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

Syntax

```
auth-web-server ping-poll timeout <1-30>
no auth-web-server ping-poll timeout
```

Parameter	Description
<1-30>	Seconds.

Default The default timeout for ping polling is 1 second.

Mode Global Configuration

Examples To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server ping-poll type

Overview Use this command to set the type of polling used to check that a web authenticated supplicant is still connected. The polling can be done using either ICMP (ping), or ARP messages.

If there is a firewall between an authenticating server and a supplicant, it may block ICMP traffic. If this occurs try changing to ARP polling.

Polling only starts when ping-polling is enabled and the supplicant has been authorized.

Use the **no** variant of this command to set the default polling type of ICMP (ping).

Syntax

```
auth-web-server ping-poll type {arp|ping}
no auth-web-server ping-poll type
```

Parameter	Description
`auth-web-server`	Web authentication server configuration commands
`arp`	Enable polling via ARP
`ping`	Enable polling via ICMP (ping)

Default ICMP

Mode Global Configuration

Examples To set the polling type to ARP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type arp
```

To set the polling type to ICMP, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
awplus(config)# auth-web-server ping-poll type ping
```

To set the polling type to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll type
```

auth-web-server port

Overview This command sets the HTTP port number for the Web-Authentication server.

Use the **no** variant of this command to reset the HTTP port number to the default (80).

Syntax

```
auth-web-server port <port-number>
no auth-web-server port
```

Parameter	Description
<port-number>	Set the local Web-Authentication server port within the TCP port number range 1 to 65535.

Default The Web-Authentication server HTTP port number is set to 80 by default.

Mode Global Configuration

Examples To set the HTTP port number `8080` for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number `80` for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server redirect-delay-time

Overview Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

Syntax

```
auth-web-server redirect-delay-time <5-60>
no auth-web-server redirect-delay-time
```

Parameter	Description
`redirect-delay-time`	Set the delay time before jumping to a specified URL after the supplicant is authorized.
<5-60>	The time in seconds.

Default The default redirect delay time is `5` seconds.

Mode Global Configuration

Examples To set the delay time to `60` seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

Related commands

auth-web-server blocking-mode

auth-web-server redirect-url

show auth-web-server

show running-config

auth-web-server redirect-url

Overview This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

Syntax

```
auth-web-server redirect-url <url>
no auth-web-server redirect-url
```

Parameter	Description
<url>	URL (hostname or dotted IP notation).

Default The redirect URL for the Web-Authentication server feature is not set by default (null).

Mode Global Configuration

Examples To enable and set redirect a URL string www.alliedtelesis.com for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

Related commands

auth-web-server redirect-delay-time

show auth

show auth-web-server

show running-config

auth-web-server session-keep

Overview This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

Syntax
```
auth-web-server session-keep
no auth-web-server session-keep
```

Default The session-keep feature is disabled by default.

Mode Global Configuration

Usage notes This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

Examples To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server ssl

Overview This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

Syntax

```
auth-web-server ssl
no auth-web-server ssl
```

Default HTTPS functionality for the Web-Authentication server feature is disabled by default.

Mode Global Configuration

Examples To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server ssl intercept-port

Overview Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

Syntax

```
auth-web-server ssl intercept-port <1-65535>
no auth-web-server ssl intercept-port <1-65535>
```

Parameter	Description
<1-65535>	TCP port number in the range from 1 through 65535

Default 443/TCP is registered by default.

Mode Global Configuration

Examples To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

Validation Commands show auth-web-server

Related commands auth-web-server intercept-port

auth-web-server trustpoint

Overview Use this command to set the PKI trustpoint to use for secure web authentication communication to an AlliedWare Plus device.

Use the **no** variant of this command to revert to using the default trustpoint 'default-selfsigned'.

Syntax

```
auth-web-server trustpoint <trustpoint-name>
no auth-web-server trustpoint
```

Parameter	Description
<trustpoint-name>	Name of trustpoint

Default By default, web authentication uses the 'default-selfsigned' trustpoint.

Mode Global Configuration

Usage notes Before using the **auth-web-server trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'web-trust' with keypair 'web_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint web-trust
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair web_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate web-trust
awplus# crypto pki enroll web-trust
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the Public Key Infrastructure (PKI) Feature Overview and Configuration Guide

Example To configure web authentication to use the trustpoint 'web-trust', use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server trustpoint web-trust
```

To configure web authentication to use the default trustpoint 'default-selfsigned', use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server trustpoint
```

Command changes

Version 5.5.1-2.1: command added

copy proxy-autoconfig-file

Overview Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

Syntax

```
copy <filename> proxy-autoconfig-file
```

Parameter	Description
<filename>	The URL of the PAC file.

Mode Privileged Exec

Example To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

Related commands

show proxy-autoconfig-file

erase proxy-autoconfig-file

copy web-auth-https-file

Overview Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

Syntax

```
copy <filename> web-auth-https-file
```

Parameter	Description
<filename>	The URL of the server certificate file.

Mode Privileged Exec

Example To download the server certificate file `veriSign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/veriSign_cert.pem
web-auth-https-file
```

Related commands

auth-web-server ssl

erase web-auth-https-file

description (auth-profile)

Overview Use this command to add a description to an authentication profile in Authentication Profile mode.

Use the **no** variant of this command to remove the current description.

Syntax

```
description <description>
```

Parameter	Description
<description>	Text describing the selected authentication profile.

Default No description configured by default.

Mode Authentication Profile

Example To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

Related commands auth profile (global)

erase proxy-autoconfig-file

Overview Use this command to remove the proxy auto configuration file.

Syntax

```
erase proxy-autoconfig-file
```

Mode Privileged Exec

Example To remove the proxy auto configuration file, use the command:

```
awplus# erase proxy-autoconfig-file
```

Related commands

show proxy-autoconfig-file

copy proxy-autoconfig-file

erase web-auth-https-file

Overview Use this command to remove the SSL server certificate for web-based authentication.

Syntax

```
erase web-auth-https-file
```

Mode Privileged Exec

Example To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

platform l3-hashing-algorithm

Overview This command enables you to change the L3 VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of crc32l.

Syntax

```
platform l3-hashing-algorithm {crc16l|crc16u|crc32l|crc32u}
no platform l3-hashing-algorithm
```

Parameter	Description
`crc16l`	The algorithm that will apply to the lower bits of CRC-16
`crc16u`	The algorithm that will apply to the upper bits of CRC-16
`crc32l`	The algorithm that will apply to the lower bits of CRC-32
`crc32u`	The algorithm that will apply to the upper bits of CRC-32

Default The hash-key algorithm is crc32l by default.

Mode Global configuration

Usage notes Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN L3 table. This can happen when more than four different IP addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of crc32l. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

Example To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform l3-hashing-algorithm crc16l
```

Related commands platform mac-vlan-hashing-algorithm

show platform

platform mac-vlan-hashing-algorithm

Overview This command enables you to change the MAC VLAN hash-key-generating algorithm.

The **no** variant of this command returns the hash-key algorithm to the default of crc32l.

Syntax

```
platform mac-vlan-hashing-algorithm
{crc16l|crc16u|crc32l|crc32u}
```

```
no platform mac-vlan-hashing-algorithm
```

Parameter	Description
`crc16l`	The algorithm that will apply to the lower bits of CRC-16
`crc16u`	The algorithm that will apply to the upper bits of CRC-16
`crc32l`	The algorithm that will apply to the lower bits of CRC-32
`crc32u`	The algorithm that will apply to the upper bits of CRC-32

Default The hash-key algorithm is crc32l by default.

Mode Global configuration

Usage notes Occasionally, when using the Multiple Dynamic VLAN feature, a supplicant cannot be authenticated because a collision occurs within the VLAN MAC table. This can happen when more than four different MAC addresses produce the same hash-key.

When this situation occurs, collisions can sometimes be avoided by changing the hashing algorithm from its default of crc32l. Several different algorithms may need to be tried to rectify the problem.

You must restart the switch for this command to take effect.

Note that this command is intended for technical support staff, or advanced end users.

Example To change the hash-key generating algorithm applying to the lower bits of CRC-16, use the command:

```
awplus# configure terminal
awplus(config)# platform mac-vlan-hashing-algorithm crc16l
```

Related commands platform l3-hashing-algorithm

show auth diagnostics

Overview This command shows authentication diagnostics, optionally for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

Syntax

```
show auth diagnostics [interface <interface-list>]
```

Parameter	Description
`interface`	Specify ports to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.6`), a static channel group (e.g. `sa2`) or a dynamic (LACP) channel group (e.g. `po2`) • a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.4`, or `sa1-2`, or `po1-2` • a comma-separated list of the above; e.g. `port1.0.1,port1.0.4-1.0.6`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display authentication diagnostics for port1.0.6, enter the command:

```
awplus# show auth diagnostics interface port1.0.6
```

Output Figure 48-2: Example output from the **show auth diagnostics** command

```
Authentication Diagnostics for interface port1.0.6
     Supplicant address: 00d0.59ab.7037
         authEnterConnecting: 2
         authEaplogoffWhileConnecting: 1

         BackendAuthSuccess: 1
```

Related commands show dot1x interface

show auth interface

Overview This command shows the status of port authentication on the specified interface.

Syntax

```
show auth interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display the web-based authentication status for port1.0.4, enter the command:

```
awplus# show auth interface port1.0.4
```

If port-based authentication is not configured, the output will be

```
% Port-Control not configured on port1.0.4
```

To display the port-based authentication status for port1.0.4, enter the command:

```
awplus# show auth interface port1.0.4
```

```
awplus# show auth interface port1.0.4
Authentication Info for interface port1.0.4

show auth sessionstatistics

Overview This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

Syntax `show auth sessionstatistics [interface <interface-list>]`

Parameter	Description
`interface`	Specify ports to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.6`), a static channel group (e.g. `sa2`) or a dynamic (LACP) channel group (e.g. `po2`) • a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.4`, or `sa1-2`, or `po1-2` • a comma-separated list of the above; e.g. `port1.0.1,port1.0.4-1.0.6`. Do not mix interface types in a list The specified interfaces must exist.

Mode Privileged Exec

Example To display authentication statistics for port1.0.6, enter the command:

```
awplus# show auth sessionstatistics interface port1.0.6
```

Output Figure 48-3: Example output from the **show auth sessionstatistics** command

```
Authentication session statistics for interface port1.0.6
     session user name: manager
         session authentication method: Remote server
         session time: 19440 secs

```

show auth statistics interface

Overview Use this command to show the authentication statistics for the specified interface.

Syntax

```
show auth statistics interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display authentication statistics for port1.0.2, enter the command:

```
awplus# show auth statistics interface port1.0.2
```

Output Figure 48-4: Example output from **show auth statistics interface** for a port

```
awplus# show auth statistics interface port1.0.2

show auth supplicant

Overview Use this command to show the supplicant (client device) state when authentication is configured for the switch. Use the optional **brief** parameter to show a summary of the supplicant state.

Syntax

```
show auth supplicant [<macadd>] [brief]
```

Parameter	Description
<macadd>	Mac (hardware) address of the supplicant. Entry format is HHHH.HHHH.HHHH (hexadecimal).
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display a summary of authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant brief
```

To display authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant
```

To display authenticated supplicant information for the device with MAC address 0000.5E00.5301, enter the command:

```
awplus# show auth supplicant 0000.5E00.5301
```

Output Figure 48-5: Example output from **show auth supplicant brief**

```
awplus#show auth supplicant brief
Interface port1.0.3

show auth supplicant interface

Overview This command shows the supplicant (client device) state for the authentication mode set for the interface. Use the optional **brief** parameter to show a summary of the supplicant state.

Syntax `show auth-web supplicant interface <interface-list> [brief]`

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. `vlan2`), a switch port (e.g. `port1.0.6`), a static channel group (e.g. `sa2`) or a dynamic (LACP) channel group (e.g. `po2`) • a continuous range of interfaces, ports, static channel groups or dynamic (LACP) channel groups separated by a hyphen; e.g. `vlan2-8`, or `port1.0.1-1.0.4`, or `sa1-2`, or `po1-2` • a comma-separated list of the above; e.g. `port1.0.1,port1.0.4-1.0.6`. Do not mix interface types in a list The specified interfaces must exist.
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display the authenticated supplicant on the interface port1.0.2, enter the command:

```
awplus# show auth supplicant interface port1.0.2
```

To display brief summary output for the authenticated supplicant on the interface port1.0.2, enter the command:

```
awplus# show auth supplicant interface port1.0.2 brief
```

show auth two-step supplicant brief

Overview This command displays the supplicant state of the two-step authentication feature on the interface.

Syntax

```
show auth two-step supplicant [interface <interface-list>]
brief
```

Parameter	Description
`interface`	The interface selected for display.
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Usage notes Do not mix interface types in a list. The specified interfaces must exist.

Example To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface port1.0.2 brief
```

Output Figure 48-8: Example output from **show auth two-step supplicant brief**

```
interface port1.0.2

  authenticationMethod: dot1x/mac

  Two-Step Authentication:

49 AAA Commands

Introduction

Overview

AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These functions can be applied in a variety of methods with a variety of servers.

The purpose of the AAA commands is to map instances of the AAA functions to sets of servers. The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1X-Authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see the AAA and Port_Authentication Feature Overview and Configuration Guide.

Command List

aaa accounting auth-mac

Overview This command configures an accounting method list for MAC-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with MAC-based authentication enabled, or a named method list, which can be applied to an interface with the auth-mac accounting command.

Use the **no** variant of this command to disable either the default or a named accounting method list for MAC-based authentication. Once all method lists are disabled, AAA accounting for MAC-based authentication is disabled globally.

Syntax

```
aaa accounting auth-mac {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
```

```
no aaa accounting auth-mac {default|<list-name>}
```

Parameter	Description
`default`	Configure the default accounting method list
`<list-name>`	Configure a named accounting method list
`start-stop`	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
`stop-only`	Only sends a stop accounting message at the end of the session.
`none`	No accounting record sent.
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default RADIUS accounting for MAC-based Authentication is disabled by default

Mode Global Configuration

Usage notes This command can be used to configure either the default accounting method list or a named accounting method list:

- **default**: the default accounting method list which is automatically applied to all interfaces with MAC-based authentication enabled.
- *<list-name>*: a user named list which can be applied to an interface using the auth-mac accounting command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command

- **group** <*group-name*>: use the specified RADIUS server group configured with the aaa group server command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

Examples

To enable the default RADIUS accounting for MAC-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

To enable a named RADIUS accounting method list 'vlan10_acct' for MAC-based authentication, with the RADIUS server group 'rad_group_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10_acct' for MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac vlan10_acct
```

Related commands

aaa accounting auth-web

Overview This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the auth-web accounting command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

Syntax

```
aaa accounting auth-web {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
no aaa accounting auth-web {default|<list-name>}
```

Parameter	Description
`default`	Configure the default accounting method list
`<list-name>`	Configure a named accounting method list
`start-stop`	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
`stop-only`	Only sends a stop accounting message at the end of the session.
`none`	No accounting record sent.
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default RADIUS accounting for Web-based authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default accounting method list or a named accounting method list:

- **default**: the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- *<list-name>*: a user named list which can be applied to an interface using the auth-web accounting command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command

- **group** <*group-name*>: use the specified RADIUS server group configured with the aaa group server command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop**: sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
- **stop-only**: sends a stop accounting message at the end of a session.
- **none**: disables accounting.

Examples To enable the default RADIUS accounting method for Web-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable the default RADIUS accounting method for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

To enable a named RADIUS accounting method list 'vlan10_acct' for Web-based authentication, with the RADIUS server group 'rad_group_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10_acct' for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web vlan10_acct
```

aaa accounting commands

Overview This command configures and enables TACACS+ accounting on commands entered at a specified privilege level. Once enabled for a privilege level, accounting messages for commands entered at that privilege level will be sent to a TACACS+ server.

In order to account for all commands entered on a device, configure command accounting for each privilege level separately.

The command accounting message includes, the command as entered, the date and time the command finished executing, and the user-name of the user who executed the command.

Use the **no** variant of this command to disable command accounting for a specified privilege level.

TACACS+ is not available in Secure Mode (see the crypto secure-mode command).

Syntax

```
aaa accounting commands <1-15> default stop-only group tacacs+
no aaa accounting commands <1-15> default
```

Parameter	Description
<1-15>	The privilege level being configured, in the range 1 to 15.
`default`	Use the default method list, this means the command is applied globally to all user exec sessions.
`stop-only`	Send accounting message when the commands have stopped executing.
`group`	Specify the server group where accounting messages are sent. Only the tacacs+ group is available for this command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.

Default TACACS+ command accounting is disabled by default.

Mode Global Configuration

Usage notes This command only supports a **default** method list, this means that it is applied to every console and VTY line.

The **stop-only** parameter indicates that the command accounting messages are sent to the TACACS+ server when the commands have stopped executing.

The **group tacacs+** parameters signifies that the command accounting messages are sent to the TACACS+ servers configured by the tacacs-server host command.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured with only the

first reachable server being used. If no server is found, the accounting message is dropped.

Command accounting cannot coexist with triggers. An error message is displayed if you attempt to enable command accounting while a trigger is configured. Likewise, an error message is displayed if you attempt to configure a trigger while command accounting is configured.

Examples To configure command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 1 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 7 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 1 default
awplus(config)# no aaa accounting commands 7 default
awplus(config)# no aaa accounting commands 15 default
```

Related commands

aaa accounting dot1x

Overview Use this command to configure an accounting method list for IEEE 802.1X-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with IEEE 802.1X-based authentication enabled, or a named method list, which can be applied to an interface with the dot1x accounting command.

Use the **no** variant of this command to disable either the default or a named accounting method list for 802.1X-based authentication. Once all method lists are disabled, AAA accounting for 802.1x-based authentication is disabled globally.

Syntax

```
aaa accounting dot1x {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
no aaa accounting dot1x {default|<list-name>}
```

Parameter	Description
`default`	Configure the default accounting method list
`<list-name>`	Configure a named accounting method list
`start-stop`	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
`stop-only`	Only sends a stop accounting message at the end of the session.
`none`	No accounting record sent.
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default RADIUS accounting for 802.1X-based authentication is disabled by default (there is no default server set by default).

Mode Global Configuration

Usage notes This command can be used to configure either the default accounting method list or a named accounting method list:

- **default**: the default accounting method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- *<list-name>*: a user named list which can be applied to an interface using the dot1x accounting command.

There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius**: use all RADIUS servers configured by radius-server host command.
- **group** <*group-name*>: use the specified RADIUS server group configured with the aaa group server command.

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

Examples

To enable RADIUS accounting for 802.1X-based authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group radius
```

To disable RADIUS accounting for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

To enable a named RADIUS accounting method list 'vlan10_acct' for 802.1X-based authentication, with the RADIUS server group 'rad_group_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x vlan10_acct start-stop group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10_acct' for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x vlan10_acct
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

aaa accounting login

Overview This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and VTY line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

TACACS+ is not available in Secure Mode (see the crypto secure-mode command).

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or VTY line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

Syntax

```
aaa accounting login
{default|<list-name>}{start-stop|stop-only|none} {group
{radius|tacacs+|<group-name>}}
```

```
no aaa accounting login {default|<list-name>}
```

Parameter	Description
`default`	Default accounting method list.
`<list-name>`	Named accounting method list.
`start-stop`	Start and stop records to be sent.
`stop-only`	Stop records to be sent.
`none`	No accounting record to be sent.
`group`	Specify the servers or server group where accounting packets are sent.
`radius`	Use all RADIUS servers configured by the radius-server host command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.
`<group-name>`	Use the specified RADIUS server group, as configured by the aaa group server command.

Default Accounting for login shell sessions is disabled by default.

Mode Global Configuration

Usage notes

This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name **default** and any number of other named method lists. The name of any method list that you define can then be used as the *<list-name>* parameter in the accounting login command.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by radius-server host command
- **group** *<group-name>* : use the specified RADIUS server group configured with the aaa group server command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by tacacs-server host command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Examples

To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)#  no aaa accounting login default
```

Related commands

aaa accounting commands

aaa accounting login

aaa accounting update

accounting login

radius-server host

tacacs-server host

aaa accounting update

Overview This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

Syntax

```
aaa accounting update [periodic <1-65535>]
no aaa accounting update
```

Parameter	Description
`periodic`	Send accounting records periodically.
<1-65535>	The interval to send accounting updates (in minutes). The default is 30 minutes.

Default Disabled

Mode Global Configuration

Usage notes Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting reporting is enabled, interim accounting records are sent at the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is re-enabled, unless this interval is specified.

Examples To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting updates wherever accounting has been configured, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting update
```

radius-server host

aaa authentication auth-mac

Overview This command enables MAC-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running MAC-based authentication, or a user named authentication method list, which is applied to an interface with the auth-mac authentication command.

Use the **no** variant of this command to disable either the default or a named method list for MAC-based authentication. Once all method lists are disabled MAC-based authentication is disabled globally.

Syntax

```
aaa authentication auth-mac {default|<list-name>} group
{<group-name>|radius}
```

```
no aaa authentication auth-mac {default|<list-name>}
```

Parameter	Description
`default`	Configure the default authentication method list
`<list-name>`	Configure a named authentication method list
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default MAC-based Port Authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default authentication method list or a named authentication method list:

- **default**: the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<***list-name***>**: a user named list which can be applied to an interface using the auth-web authentication command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command
- **group** <*group-name*>: use the specified RADIUS server group configured with the aaa group server command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group <*group-name*>, it also remains a member of the group **radius**.

Examples

To enable MAC-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group radius
```

To disable MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

To enable MAC-based authentication for named list 'vlan10_auth', with RADIUS server group 'rad_group_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac vlan10_auth group rad_group_vlan10
```

To disable MAC-based authentication for named list 'vlan10_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac vlan10_acct
```

Related commands

aaa authentication auth-web

Overview This command enables Web-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running Web-based authentication, or a user named authentication method list, which is applied to an interface with the auth-web authentication command.

Use the **no** variant of this command to disable either the default or a named method list for Web-based authentication. Once all method lists are disabled Web-based authentication is disabled globally.

Syntax

```
aaa authentication auth-web {default|<list-name>} group
{<group-name>|radius}
```

```
no aaa authentication auth-web {default|<list-name>}
```

Parameter	Description
`default`	Configure the default authentication method list
`<list-name>`	Configure a named authentication method list
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default Web-based authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default authentication method list or a named authentication method list:

- **default**: the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- *<list-name>*: a user named list which can be applied to an interface using the auth-web authentication command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command
- **group** *<group-name>*: use the specified RADIUS server group configured with the aaa group server command

Note that you need to configure an IPv4 address for the VLAN interface on which Web authentication is running.

Examples

To enable Web-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group radius
```

To disable Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

To enable Web-based authentication for named list 'vlan10_auth', with RADIUS server group 'rad_group_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web vlan10_auth group rad_group_vlan10
```

To disable Web-based authentication for named list 'vlan10_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication vlan10_auth
```

radius-server host

aaa authentication dot1x

Overview Use this command to enable IEEE 802.1X-based authentication globally and to allow you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running IEEE 802.1X-based authentication, or a user named authentication method list, which is applied to an interface with the dot1x authentication command.

Use the **no** variant of this command to disable either the default or a named method list for 802.1X-based authentication. Once all method lists are disabled 802.1x-based authentication is disabled globally.

Syntax

```
aaa authentication dot1x {default|<list-name>} group
{<group-name>|radius}
```

```
no aaa authentication dot1x {default|<list-name>}
```

Parameter	Description
`default`	Configure the default authentication method list
`<list-name>`	Configure a named authentication method list
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default 802.1X-based Port Authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default authentication method list or a named authentication method list:

- **default**: the default authentication method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- *<list-name>*: a user named list which can be applied to an interface using the aaa authentication dot1x command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command
- **group** *<group-name>*: use the specified RADIUS server group configured with the aaa group server command

Examples To enable 802.1X-based authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal
```

```
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

To enable 802.1X-based authentication for named list 'vlan10_auth', with RADIUS server group 'rad_group_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x vlan10_auth group
rad_group_vlan10
```

To disable 802.1X-based authentication for named list 'vlan10_auth' use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x vlan10_acct
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

aaa authentication enable default group tacacs+

Overview This command enables privilege level authentication against a TACACS+ server.

Use the **no** variant of this command to disable privilege level authentication.

TACACS+ is not available in Secure Mode (see the crypto secure-mode command).

Syntax

```
aaa authentication enable default group tacacs+ [local] [none]
no aaa authentication enable default
```

Parameter	Description
`local`	Use the locally configured enable password (**enable password** command) for authentication.
`none`	No authentication.

Default Local privilege level authentication is enabled by default (aaa authentication enable default local command).

Mode Global Configuration

Usage notes A user is configured on a TACACS+ server with a maximum privilege level. When they enter the enable (Privileged Exec mode) command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

NOTE: *If both **local** and **none** are specified, you must always specify **local** first.*

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**

  then the user is never granted access to Privileged Exec mode.

- **aaa authentication enable default group tacacs+ local**

  then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.

- **aaa authentication enable default group tacacs+ none**

  then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.

- **aaa authentication enable default group tacacs+ local none**

  then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

Examples

To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

Related commands

tacacs-server host

aaa authentication enable default local

Overview This command enables local privilege level authentication.

Use the **no** variant of this command to disable local privilege level authentication.

Syntax

```
aaa authentication enable default local
no aaa authentication enable default
```

Default Local privilege level authentication is enabled by default.

Mode Global Configuration

Usage notes The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an enable (Privileged Exec mode) command.

Examples To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

Related commands

aaa authentication login

enable (Privileged Exec mode)

enable password

enable secret (deprecated)

aaa authentication login

Overview Use this command to create an ordered list of methods for authenticating user logins. It can also be used to replace an existing method list with a list of the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the login authentication command. To apply a non-default method list, you must also use the login authentication command.

TACACS+ is not available in Secure Mode (see the crypto secure-mode command).

Use the **no** variant of this command to remove a method list from user login authentication. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

Syntax

```
aaa authentication login {default|<list-name>} {[local] [group
{radius|ldap|tacacs+|<group-name>}]}
```

```
no aaa authentication login {default|<list-name>}
```

Parameter	Description
`default`	Set the default authentication server for user login.
`<list-name>`	Name of authentication server.
`local`	Use the local username database.
`group`	Use server group.
`radius`	Use all RADIUS servers configured by the radius-server host command.
`ldap`	Use all LDAP servers configured by the ldap-server command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.
`<group-name>`	Use the specified RADIUS or LDAP server group.

Default If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **login authentication** command.

local is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. You can reset it to the default method list using the **no aaa authentication login default** command.

Mode Global Configuration

Usage notes When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies **group tacacs+ local**, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers nor the local user database; the user login fails.

Examples To configure the default authentication method list for user login to first use all available RADIUS servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure the default authentication method list for user login to first use all available LDAP servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group ldap
local
```

To configure a user login authentication method list called 'USERS' to first use the RADIUS server group 'RAD_GROUP1' for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group RAD_GROUP1
local
```

To configure a user login authentication method list called 'USERS' to first use the TACACS+ servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list 'USERS' created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

Command changes

Version 5.5.2-1.1: **ldap** parameter added

aaa authorization commands

Overview This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

Syntax

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]
```

```
no aaa authorization commands <privilege-level>
{default|<list-name>}
```

Parameter	Description
<privilege-level>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: **Level = 1**: All commands that can be accessed by a user with privilege level between 1 and 6 inclusive **Level = 7:** All commands that can be accessed by a user with privilege level between 7 and 14 inclusive **Level = 15**: All commands that can be accessed by a user with privilege level 15
`group`	Specify the server group where authorization messages are sent. Only the `tacacs+` group is available for this command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.
`default`	Configure the default authorization commands method list.
<list-name>	Configure a named authorization commands method list
`none`	If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.

Mode Global Configuration

Usage notes TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

Example To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

Related commands

Command changes Version 5.4.6-2.1: command added

aaa authorization config-commands

Overview Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

Syntax

```
aaa authorization config-commands
no aaa authorization config-commands
```

Default By default, command authorization is disabled on configuration mode commands.

Mode Global Configuration

Usage notes If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

NOTE: *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

Example To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

Command changes Version 5.4.6-2.1: command added

aaa group server

Overview Use this command to create an AAA group of RADIUS or LDAP servers, and to enter Server Group Configuration mode.

A server group is used to specify a subset of RADIUS or LDAP servers in AAA commands. Once in Server Group Configuration mode you can add servers to the group.

Use the **no** variant of this command to remove an existing server group.

Syntax

```
aaa group server {radius|ldap} <group-name>
no aaa group server {radius|ldap} <group-name>
```

Parameter	Description
`radius`	Create or configure a RADIUS server group.
`ldap`	Create or configure an LDAP server group.
<group-name>	Server group name.

Mode Global Configuration

Usage notes To add servers to a RADIUS or LDAP server group, use the **server** command. Each RADIUS server in a server group must be configured using the radius-server host command. Similarly, each LDAP server in a server group must be configured using the ldap-server command.

Server groups named 'radius' and 'ldap' are predefined and include all RADIUS and LDAP servers configured using the radius-server host or ldap-server commands.

Examples To create a RADIUS server group named 'GROUP1' with hosts 192.168.1.1, 192.168.2.1 and 192.168.3.1, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port 1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port 1813
```

To remove a RADIUS server group named 'GROUP1' from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

To create an LDAP server group named 'GROUP2' with servers named 'SERVER1', 'SERVER2' and 'SERVER3', use the commands:

```
awplus(config)# aaa group server ldap GROUP2
awplus(config-ldap-group)# server SERVER1
awplus(config-ldap-group)# server SERVER2
awplus(config-ldap-group)# server SERVER3
```

To remove an LDAP server group named 'GROUP2' from the configuration, use the command:

```
awplus(config)# no aaa group server ldap GROUP2
```

Command changes

Version 5.5.2-1.1: **ldap** parameter added

aaa local authentication attempts lockout-time

Overview This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

Syntax

```
aaa local authentication attempts lockout-time <lockout-time>
no aaa local authentication attempts lockout-time
```

Parameter	Description
<lockout-time>	<0-10000>. Time in seconds to lockout the user.

Mode Global Configuration

Default The default for the lockout-time is 300 seconds (5 minutes).

Usage notes While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the clear aaa local user lockout command.

Examples To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

Related commands aaa local authentication attempts max-fail

aaa local authentication attempts max-fail

Overview This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

Syntax

```
aaa local authentication attempts max-fail <failed-logins>
no aaa local authentication attempts max-fail
```

Parameter	Description
<failed-logins>	<1-32>. Number of login failures allowed before locking out a user.

Mode Global Configuration

Default The default for the maximum number of failed login attempts is five failed login attempts.

Usage When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the aaa local authentication attempts lockout-time command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

Examples To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

Related commands aaa local authentication attempts lockout-time

clear aaa local user lockout

aaa login fail-delay

Overview Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet.

Use the **no** variant of this command to reset the minimum time period to its default value.

Syntax

```
aaa login fail-delay <1-10>
no aaa login fail-delay
```

Parameter	Description
<1-10>	The minimum number of seconds required between login attempts

Default 1 second

Mode Global configuration

Example To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

Related commands

aaa authentication login

aaa local authentication attempts lockout-time

clear aaa local user lockout

accounting login

Overview This command applies a login accounting method list to console or VTY lines for user login. When login accounting is enabled using this command, logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA Accounting applied to console or VTY lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

Syntax

```
accounting login {default|<list-name>}
no accounting login
```

Parameter	Description
`default`	Default accounting method list.
`<list-name>`	Named accounting method list.

Default By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command.

Mode Line Configuration

Examples To apply the accounting server `USERS` to all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

To reset accounting for login sessions on the console, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no accounting login
```

Related commands aaa accounting commands

aaa accounting login

authorization commands

Overview This command applies a command authorization method list, defined using the aaa authorization commands command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

Syntax

```
authorization commands <privilege-level> {default|<list-name>}
no authorization commands <privilege-level>
```

Parameter	Description
<privilege-level>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: **Level = 1**: All commands that can be accessed by a user with privilege level between 1 and 6 inclusive **Level = 7:** All commands that can be accessed by a user with privilege level between 7 and 14 inclusive **Level = 15**: All commands that can be accessed by a user with privilege level 15
`default`	Configure the default authorization commands method list.
<list-name>	Configure a named authorization commands method list

Default The **default** method list is applied to each console and VTY line by default.

Mode Line Configuration

Usage notes If the specified method list does not exist users will not be enable to execute any commands in the specified method list on the specified VTY lines.

Example To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

aaa authorization config-commands

tacacs-server host

Command changes Version 5.4.6-2.1: command added

clear aaa local user lockout

Overview Use this command to clear the lockout on a specific user account or all user accounts.

Syntax

```
clear aaa local user lockout {username <username>|all}
```

Parameter	Description
`username`	Clear lockout for the specified user.
`<username>`	Specifies the user account.
`all`	Clear lockout for all user accounts.

Mode Privileged Exec

Examples To unlock the user account '`bob`' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

Related commands aaa local authentication attempts lockout-time

debug aaa

Overview This command enables AAA debugging.

Use the **no** variant of this command to disable AAA debugging.

Syntax

```
debug aaa [accounting|all|authentication|authorization]
no debug aaa [accounting|all|authentication|authorization]
```

Parameter	Description
`accounting`	Accounting debugging.
`all`	All debugging options are enabled.
`authentication`	Authentication debugging.
`authorization`	Authorization debugging.

Default AAA debugging is disabled by default.

Mode Privileged Exec

Examples To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

Related commands show debugging aaa

undebug aaa

login authentication

Overview Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

Command Syntax

```
login authentication {default|<list-name>}
no login authentication
```

Parameter	Description
`default`	The default authentication method list. If the default method list has not been configured by the aaa authentication login command, the local user database is used for user login authentication.
<list-name>	Named authentication server.

Default The default login authentication method list, as specified by the aaa authentication login command, is used to authenticate user login. If this has not been specified, the default is to use the local user database.

Mode Line Configuration

Examples To apply the authentication method list called `CONSOLE` to the console port terminal line (asyn 0), use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication CONSOLE
```

To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

Related commands aaa authentication login

line

proxy-port

Overview Use this command to change the local UDP port used for communication between local RADIUS client applications and the RadSecProxy AAA application. Any unused UDP port may be selected. The default port is 1645.

Use the **no** variant of this command to change the UDP port back to the default of 1645.

Syntax

```
proxy-port <port>
no proxy-port
```

Parameter	Description
<port>	UDP Port Number, 1-65536.

Default The default port is 1645.

Mode RadSecProxy AAA Configuration Mode

Usage notes It is not necessary to change the value from the default unless UDP port 1645 is required for another purpose.RADIUS requests received on this port from external devices will be ignored. The port is only used for local (intra-device) communication.

Example To configure change the UDP port to 7001, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# proxy-port 7001
```

Related commands

radius-secure-proxy aaa

server (radsecproxy-aaa)

server name-check

server trustpoint

radius-secure-proxy aaa

Overview Use this command to enter the RadSecProxy AAA (authentication, authorization, and accounting) application configuration mode. This application allows local RADIUS-based clients on system to communicate with remote RadSec servers via a secure (TLS) proxy.

Syntax

```
radius-secure-proxy aaa
```

Mode Global Configuration Mode

Example To change mode from User Exec mode to the RadSecProxy AAA configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)#
```

Related commands

proxy-port

server (radsecproxy-aaa)

server name-check

server trustpoint

server (radsecproxy-aaa)

Overview Use this command to add a server to the RadSecProxy AAA application. Local RADIUS client applications will attempt, via the proxy, to communicate with any RadSec servers that are operational (in addition to any non-TLS RADIUS servers that are configured).

Use the **no** variant of this command to delete a previously-configured server from the RadSecProxy AAA application.

Syntax

```
server {<hostname>|<ip-addr>} [timeout <1-1000>] [name-check
{on|off}]
no server {<hostname>|<ip-addr>}
```

Parameter	Description	
<hostname>	Hostname of RadSec server	
<ip-addr>	Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).	
timeout	Specify the amount of time that the RadSecProxy AAA application should wait for replies from this server. RADIUS server timeout (which defaults to 5 seconds).	
<1-1000>	Time in seconds to wait for a server reply.	
name-check	Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to **on**, is used.	
	on	Enable name checking for this client.
	off	Disable name checking for this client.

Mode RadSecProxy AAA Configuration Mode

Usage notes The server may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each server may be configured with a timeout; if not specified, the global timeout value for RADIUS servers will be used. The global timeout may be changed using the **radius-server timeout** command. The default global timeout is 5 seconds.

Each server may be configured to use certificate name-checking; if not specified, the global behavior defined by **server name-check** or **no server name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the server's X.509 certificate must match the domain name or IP address specified in this command.

Example To add a server 'mynas.local' with a timeout of 3 seconds, and name checking off, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server mynas.local name-check
off
```

Related commands

proxy-port

radius-secure-proxy aaa

server name-check

server trustpoint

server mutual-authentication

Overview This command enables or disables mutual certificate authentication for all RadSecProxy servers. When enabled, the RadSecProxy AAA application will send a local X.509 certificate to the server when establishing a TLS connection.

Use the **no** variant of this command to disable mutual certificate validation causing the RadSecProxy AAA application to not transmit a certificate to the server.

NOTE: *If mutual authentication is disabled on the client (AAA) application but enabled on the server, a connection will not be established.*

Syntax

```
server mutual-authentication
no server mutual-authentication
```

Default Mutual authentication is enabled by default.

Mode RadSecProxy AAA Configuration Mode

Example Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server
mutual-authentication
```

Related commands

radius-secure-proxy aaa

server name-check

server (radsecproxy-aaa)

Command changes Version 5.4.6-2.1: command added

server name-check

Overview This command sets the global behavior for certificate name-checking for the RadSecProxy AAA application to **on**. This behavior will be used for all servers associated with the application that do not specify a behavior on a per-server basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **server (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

Syntax

```
server name-check
no server name-check
```

Default Certificate name checking is on by default.

Mode RadSecProxy AAA Configuration Mode

Example Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server name-check
```

Related commands

proxy-port

radius-secure-proxy aaa

server (radsecproxy-aaa)

server trustpoint

server trustpoint

Overview This command adds one or more trustpoints to be used with the RadSecProxy AAA application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

Syntax

```
server trustpoint [<trustpoint-list>]
no server trustpoint [<trustpoint-list>]
```

Parameter	Description
<trustpoint-list>	Specify one or more trustpoints to be added or deleted.

Default By default, no trustpoints are associated with the application.

Mode RadSecProxy AAA Configuration Mode

Usage notes The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no server trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

Example You can add multiple trustpoints to the RadSecProxy AAA application by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server trustpoint example_1
awplus(config-radsecproxy-aaa)# server trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-aaa)# server trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy AAA application using the command:

```
awplus(config-radsecproxy-aaa)# no server trustpoint
```

Related commands proxy-port

radius-secure-proxy aaa

show aaa local user locked

Overview This command displays the failed attempts against each user account attempting to login into the device, along with the failure times and locations.

Use this command's output to see if a user is currently locked out or not. You can check:

- the number of login attempts that have a 'V' in the 'Valid' column, and
- if the last attempt happened within the lockout time. If the number of 'V' attempts exceeds the maximum allowed number of attempts, and the last attempt is within the lockout time, then the user is locked out.

The maximum number of attempts is 5 by default. You can change it using the command **aaa local authentication attempts max-fail**. The lockout time is 5 minutes by default. You can change it using the command **aaa local authentication attempts lockout-time**.

Once a user's lockout status is cleared, this command will no longer display any failed attempts for that user. The status gets cleared by:

- being manually cleared by another privileged user, using the clear aaa local user lockout command, or
- the locked out user successfully logs into the system after waiting for the lockout time to pass.

In the Valid column:

- 'V' means this login attempt counts towards the maximum allowed number of attempts
- 'I' means this login attempt does not count towards the maximum allowed number of attempts, because it was more than 15 minutes ago.

Syntax
```
show aaa local user locked
```

Mode User Exec and Privileged Exec

Example To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

Output Figure 49-1: Example output from the **show aaa local user locked** command

```
awplus#show aaa local user locked
manager:

2023-02-09 11:22:51 RHOST 192.168.5.1                             I
2023-02-09 11:22:54 TTY   /dev/ttyS0                              I
user3:
When                Type  Source                                Valid
2023-02-09 11:38:58 TTY   /dev/ttyS0                              V
2023-02-09 11:39:04 RHOST 192.168.5.1                             V
2023-02-09 11:39:06 TTY   /dev/ttyS0                              V
2023-02-09 11:39:22 RHOST 192.168.5.1                             V
2023-02-09 11:39:26 TTY   /dev/ttyS0                              V
```

This output example was run at 11:49. The lockout-time and max-fail settings are set to their defaults:

- manager: is not locked out because they only have 2 valid attempts.
- user1: is locked out because they have 7 valid attempts and the most recent was within the lockout time.
- user2: is not locked out because only 4 attempts are valid.
- user3: is not locked out. Even though they have 5 valid attempts, the most recent attempt is older than the lockout time of 5 minutes.

```

show radius server group

Overview Use this command to show the RADIUS server group configuration.

Syntax

```
show radius server group [<group-name>]
```

Parameter	Description
<group-name>	RADIUS server group name.

Default Command name is set to something by default.

Mode Privileged Exec

Usage Use this command with the *<group-name>* parameter to display information for a specific RADIUS server group, or without the parameter to display information for all RADIUS server groups.

Example To display information for all RADIUS server groups, use the command:

```
awplus# show radius server group
```

To display a information for a RADIUS server group named 'rad_group_list1', use the command:

```
awplus# show radius server group rad_group_list1
```

Output Figure 49-4: Example output from **show radius server group**

```
awplus#show radius server group

50 Lightweight Directory Access Protocol (LDAP) Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Lightweight Directory Access Protocol (LDAP).

LDAP is an authentication protocol that facilitates user access to various IT resources e.g. applications, servers, networking equipment, and file servers.

It can be used to connect to internal networks over OpenVPN. Although both LDAP and RADIUS are interchangeable on AlliedWare Plus devices as an authentication protocol, LDAP is added because of its ability to interact with directory services such as Microsoft's Active Directory (AD).

For more information, see the LDAP Feature Overview and Configuration Guide.

Command List

authentication (ldap-server)

Overview Use this command to set the authentication method used to authenticate users against the Lightweight Directory Access Protocol (LDAP) server.

Use the **no** variant of this command to reset the authentication method to **search**.

Syntax

```
authentication {search|bind-only}
no authentication
```

Parameter	Description
`search`	The **search** method initially binds to the LDAP server, then searches for the user, then binds to the user using the DN found with the search. The initial bind is either anonymous, or using the user specified with the bind authenticate root-dn command.
`bind-only`	The **bind-only** method attempts to bind to the LDAP server using a predicted DN based on the username, the user attribute (set with the login-attribute command) and the base DN (set with the base-dn command). The format of this user DN is as follows: '<username>=<login-attribute>,<base-dn>'.

Default Search

Mode LDAP Server Configuration

Example To set the authentication method to bind-only for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# authentication bind-only
```

To reset the authentication method to the default (search) for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no authentication
```

Related commands

base-dn

bind authenticate root-dn

ldap-server

login-attribute

search-filter

Command changes Version 5.5.2-1.1: command added

base-dn

Overview Use this command to set the base DN (Distinguished Name) of the LDAP server.

When using 'search' authentication, the base DN is the LDAP server's starting point to search for the user within the directory.

If 'bind-only' authentication is enabled, then the base DN is the suffix of the DN that is used to bind to the user.

Use the **no** variant of this command to remove the configured base DN.

Syntax

```
base-dn <base-dn>
no base-dn
```

Parameter	Description
<base-dn>	The base DN of the LDAP server.

Default Not set

Mode LDAP Server Configuration

Example To set the base DN for the LDAP server called 'Server1' to 'dc=example, dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# base-dn dc=example,dc=com
```

To clear the base DN for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no base-dn
```

Related commands

authentication (ldap-server)

bind authenticate root-dn

group-attribute

group-dn

ldap-server

login-attribute

search-filter

Command changes Version 5.5.2-1.1: command added

bind authenticate root-dn

Overview Use this command to set the authenticated user to bind to when searching for a user on an LDAP server. Do not set this option if you wish to use anonymous binding with the 'search' method.

This option is ignored with the 'bind-only' authentication method.

Use the **no** variant of this command to unset the authenticated user.

Syntax

```
bind authenticate root-dn <user-dn> password <password>
no bind authenticate root-dn
```

Parameter	Description
<user-dn>	The DN of the authenticated user to bind to.
<password>	The password of the authenticated user.

Default Not set

Mode LDAP Server Configuration

Example To set the authenticated user to 'cn=admin,dc=example,dc=com' with the password '12345678' for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# bind authenticate root-dn
cn=admin,dc=example,dc=com password 12345678
```

Command changes Version 5.5.2-1.1: command added

deadtime (ldap-server)

Overview Use this command to configure the deadtime for an LDAP server. The configured deadtime is how long in seconds before an unresponsive LDAP server is considered dead.

Use the **no** variant of this command to remove the deadtime configured on an LDAP server. When you remove the deadtime, the server will never be considered dead.

Syntax

```
deadtime <0-1440>
no deadtime
```

Parameter	Description
<0-1440>	The number of seconds that the server can be unresponsive for before it is considered dead.

Default 0 seconds (the LDAP server is never considered dead)

Mode LDAP Server Configuration

Example To set the deadtime to 20 seconds for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# deadtime 20
```

To reset the deadtime to the default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no deadtime
```

Command changes Version 5.5.2-1.1: command added

debug ldap client

Overview Use this command to enable LDAP debugging.

Use the **no** variant of this command to disable all LDAP debugging.

Syntax

```
debug ldap client all
debug ldap client {[acl] [args] [ber] [config] [conns] [filter]
[packets] [parse] [shell] [stats] [stats2] [sync] [trace]}
no debug ldap client
```

Parameter	Enable or disable debugging for ...
`all`	All LDAP debugging options
`acl`	Access Control List processing
`args`	Heavy trace debugging (args, arguments)
`ber`	Print out packets sent and received (ber, Bit Error Rate)
`config`	Configuration processing
`conns`	Connection management
`filter`	Search filter processing
`packets`	Debug packet handling
`parse`	Parsing processing
`shell`	Print communication with shell backends
`stats`	Stats from connections, operations and results
`stats2`	Stats from log entries sent
`sync`	Syncrepl consumer processing (LDAP Sync replication)
`trace`	Trace function calls

Default By default, all LDAP debugging is disabled.

Mode Global Configuration

Example To turn on all LDAP debugging, use the command:

```
awplus# debug ldap client all
```

To turn on filter and packet LDAP debugging, use the command:

```
awplus# debug ldap client filter packets
```

To disable all LDAP debugging, use the command:

```
awplus# no debug ldap client
```

group-attribute

Overview Use this command to configure the name of the attribute that group members are stored in.

It is only necessary to set this option if group-dn is used and you don't want to use the default attribute, which is 'uniquemember'.

Use the **no** variant of this command to revert to the default group attribute.

Syntax

```
group-attribute <attribute>
no group-attribute
```

Parameter	Description
<attribute>	The attribute that group members are stored in.

Default The default group attribute is 'uniquemember'.

Mode LDAP Server Configuration

Example To set the group attribute for the LDAP server called 'Server1' to 'member', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-attribute member
```

To reset the group attribute to default for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-attribute
```

Related commands

Command changes Version 5.5.2-1.1: command added

group-dn

Overview Use this command to configure the group DN (Distinguished Name) of the group that users should be a member of.

By default the device will determine this by checking the 'uniquemember' attribute of the group to see if it contains the user's DN string. This can be changed with the group-attribute command.

Use the **no** variant of this command to remove the configured group DN.

Syntax

```
group-dn <group-dn>
no group-dn
```

Parameter	Description
<group-dn>	The DN of the group that users should be a member of.

Default Not set

Mode LDAP Server Configuration

Example To set the group DN for the LDAP server called 'Server1' to 'cn=Users,dc=example, dc=com', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# group-dn cn=Users,dc=example,
dc=com
```

To clear the group DN for 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no group-dn
```

Related commands

host (ldap-server)

Overview Use this command to configure the address of the remote LDAP server you want to connect to.

Use the **no** variant of this command to remove the remote LDAP server.

Syntax

```
host {<host-name>|<ip-address>|<ipv6-address>}
no host
```

Parameter	Description
<hostname>	The hostname of the LDAP server.
<ip-address>	The IPv4 address of the LDAP server. Uses the format A.B.C.D.
<ipv6-address>	The IPv6 address of the LDAP server. Uses the format x:x::x:x.

Default Not set

Mode LDAP Server Configuration

Example To set the host for the LDAP server called 'Server1' to the IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 10.0.0.1
```

To set the host for Server1 to the IPv6 address 2001:0db8::a2, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host 2001:db8::a2
```

To set the host for Server1 to the hostname www.ldapserver.com, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# host www.ldapserver.com
```

To unset the host for Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no host
```

Command changes

Version 5.5.2-1.1: command added

ldap-server

Overview Use this command to configure an LDAP server and enter LDAP server configuration mode.

Use the **no** variant of this command to remove the specified server.

Syntax

```
ldap-server <server-name>
no ldap-server <server-name>
```

Parameter	Description
<server-name>	The name of the LDAP server.

Default Not set

Mode Global Configuration

Example To create and configure an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To configure the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)#
```

To remove an LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# no ldap-server Server1
```

Command changes Version 5.5.2-1.1: command added

login-attribute

Overview Use this command to set the name of the attribute user names are stored in. The device will search this attribute for the user's DN (Distinguished Name).

It is only necessary to set this option if you don't want to use the default attribute, which is 'uid'.

If the authentication method is 'bind-only', then this attribute is used as the first component of the user DN, with the base DN added to complete the user DN.

Use the **no** variant of this command to reset the login attribute to the default of 'uid'.

Syntax

```
login-attribute <attribute>
no login-attribute
```

Parameter	Description
<attribute>	The LDAP attribute to use for the username of connecting users.

Default uid

Mode LDAP Server Configuration

Example To set the login attribute for the LDAP server called 'Server1' to 'sAMAccountName', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# login-attribute sAMAccountName
```

To reset the login attribute for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no login-attribute
```

port (ldap-server)

Overview Use this command to configure the port you are using to connect to the remote LDAP server.

Note that if secure ciphers are enabled, then the secure port is used instead. Secure ciphers are configured with the secure mode (ldap-server) command.

Use the **no** variant of this command to reset the port number to the default (389).

Syntax

```
port <1-65535>
no port
```

Parameter	Description
<1-65535>	Port number from 1 through 65535.

Default 389

Mode LDAP Server Configuration

Example To set the port for the LDAP server called 'Server1' to 1579, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# port 1579
```

To reset the port for 'Server1' to the default of 389, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no port
```

Related commands

Command changes Version 5.5.2-1.1: command added

retransmit (ldap-server)

Overview Use this command to configure the number of times a device will attempt to reconnect to the LDAP server before aborting.

Use the **no** variant of this command to reset the reconnect attempts to the default value of 3.

Syntax

```
retransmit <0-100>
no retransmit
```

Parameter	Description
<0-100>	The number of times the device will attempt to reconnect to the LDAP server.

Default 3 times

Mode LDAP Server Configuration

Example To set the number of reconnect attempts for the LDAP server called 'Server1' to 5 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# retransmit 5
```

To reset the number of reconnect attempts for 'Server1' to 3 attempts, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no retransmit
```

Related commands

deadtime (ldap-server)

Command changes Version 5.5.2-1.1: command added

search-filter

Overview Use this command to add a filter to use when searching for a user on the LDAP server.

The filter should be a form similar to 'attribute=value' or '&(attribute1=value1)(attribute2=value2)

Use the **no** variant of this command to remove the search filter.

Syntax

```
search-filter <filter>
no search-filter
```

Parameter	Description
<filter>	The filter to use when searching for a user.

Default Not set

Mode LDAP Server Configuration

Usage notes If the 'bind-only' authentication method is used, then this value is unused.

For the search authentication method, a search operation is used to search the LDAP server. The client specifies the starting point (base DN) of the search, the search scope (either the object, its children, or the subtree rooted at the object), and a search filter.

Example To set a search filter on the LDAP server called 'Server1' to 'building=block1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# search-filter building=block1
```

To unset the search filter of 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no search-filter
```

secure cipher (ldap-server)

Overview Use this command to configure the OpenSSL ciphers used in LDAP secure mode. You can choose groups of ciphers from a number of Mozilla TLS configs, or specify multiple individual ciphers in OpenSSL format.

Use the **no** variant of this command to remove the configured ciphers on a server.

Syntax

```
secure cipher {old|intermediate|modern}
secure cipher <cipher-list>
no secure cipher
```

Parameter	Description
`old`	Ciphers in Mozilla's old TLS config. Alongside the modern and intermediate ciphers, this includes the following ciphers: DHE-RSA-CHACHA20-POLY1305,ECDHE-ECDSA-AES128SHA256, ECDHE-RSA-AES128-SHA256,ECDHE-ECDSA-AES128-SHA, ECDHE-RSA-AES128-SHA,ECDHE-ECDSA-AES256-SHA384, ECDHE-RSA-AES256-SHA384, ECDHE-ECDSA-AES256-SHA, ECDHE-RSA-AES256-SHA,DHE-RSA-AES128-SHA256, DHE-RSA-AES256-SHA256, AES128-GCM-SHA256, AES256-GCM-SHA384,AES128-SHA256, AES256-SHA256, AES128-SHA, AES256-SHA, DES-CBC3-SHA
`intermediate`	Ciphers in Mozilla's intermediate TLS config. Alongside the modern ciphers, this includes the following ciphers: ECDHE-ECDSA-AES128-GCM-SHA256,ECDHE-RSA-AES128-CM-SHA256, ECDHE-ECDSA-AES256-GCM-SHA384,ECDHE-RSA-AES256-CM-SHA384, ECDHE-ECDSA-CHACHA20-POLY1305,ECDHE-RSA-CHACHA20-POLY1305, DHE-RSA-AES128-GCM-SHA256,DHE-RSA-AES256-GCM-SHA384
`modern`	Ciphers in Mozilla's modern TLS config. Includes the following ciphers: TLS_AES_128_GCM_SHA256, TLS_AES_256_GCM_SHA384, TLS_CHACHA20_POLY1305_SHA256
<cipher-list>	The name (or names) of a cipher in OpenSSL format. This is a **space** separated list of cipher names, for example: DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384

Default Not set

Mode LDAP Server Configuration

Example To use the Intermediate Mozilla cipher suite on the LDAP server called Server1, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher intermediate
```

To remove the configured ciphers on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure cipher
```

To use the ciphers DHE-DSS-AES256-GCM-SHA384 and TLS_AES_256_GCM_SHA384 on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure cipher
DHE-DSS-AES256-GCM-SHA384 TLS_AES_256_GCM_SHA384
```

Related commands

Command changes

Version 5.5.2-1.1: command added

secure mode (ldap-server)

Overview Use this command to configure the LDAP server to use secure mode. Secure mode encrypts communications with the LDAP server using TLS (Transport Layer Security). If you don't specify a port number, the default port (636) is used.

For secure mode, you should also set the CA certificate using the secure trustpoint (ldap-server) command.

Use **no secure mode** to disable secure mode for communicating with this LDAP server.

Use **no secure mode secure-port** to reset the secure mode port to the default.

Syntax

```
secure mode [secure-port <port>]
no secure mode
no secure mode secure-port
```

Parameter	Description
<port>	The secure port for communicating with the LDAP server

Default Secure mode is disabled, and the default port is 636

Mode LDAP Server Configuration

Example To enable secure mode for communicating with the LDAP server called 'Server1', with the default port, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode
```

To disable secure mode for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode
```

To enable secure mode with the port 1234 for communicating with 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# secure mode secure-port 1234
```

To reset the secure mode port to the default on 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no secure mode secure-port
```

Related commands

host (ldap-server)

ldap-server

port (ldap-server)

secure cipher (ldap-server)

secure trustpoint (ldap-server)

Command changes

Version 5.5.2-1.1: command added

secure trustpoint (ldap-server)

Overview Use this command to link a preconfigured trustpoint to the LDAP server configuration. The trustpoint must be the LDAP server certificate and is required to successfully connect to the LDAP server when secure mode is enabled.

Use the **no** variant of this command to remove a trustpoint from an LDAP server.

Syntax

```
secure trustpoint <trustpoint>
no secure trustpoint
```

Parameter	Description
<trustpoint>	The name of the trustpoint used for LDAP secure mode

Default Not set

Mode LDAP Server Configuration

Example To set the trustpoint to Trustpoint1 for the LDAP server called 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# secure trustpoint Trustpoint1
```

To remove the trustpoint from 'Server1', use the commands:

```
awplus# configure terminal
awplus(config)# ldap server Server1
awplus(config-ldap-server)# no secure trustpoint
```

Related commands

port (ldap-server)

secure cipher (ldap-server)

secure mode (ldap-server)

Command changes Version 5.5.2-1.1: command added

server (ldap-group)

Overview Use this command to add an LDAP server to an LDAP server group.

The server is identified by the name of the server, which is created using the ldap-server command.

Use the **no** variant of this command to remove an LDAP server from an LDAP server group.

Syntax

```
server <server-name>
no server <server-name>
```

Parameter	Description
<server-name>	The name of the LDAP server group, specified when creating the LDAP server.

Default By default, LDAP servers are only added to the default 'ldap' server group.

Mode LDAP Server Group Configuration

Usage notes The server is appended to the server list of the group, and the order of configuration determines the precedence of servers.

Example To add the LDAP server called 'Server1' to the LDAP server group called 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# server Server1
```

To remove 'Server1' from 'Group1', use the commands:

```
awplus# configure terminal
awplus(config)# aaa group server ldap Group1
awplus(config-ldap-group)# no server Server1
```

Related commands

aaa authentication login

aaa group server

ldap-server

show ldap server group

Command changes Version 5.5.2-1.1: command added

show ldap server group

Overview Use this command to display information about LDAP server groups, their servers and the status of those servers.

Syntax

```
show ldap server group [<group-name>]
```

Parameter	Description
<group-name>	The name of the LDAP server group.

Mode Global Configuration

Usage notes If you specify a single group name, you will only see information relating to that specific server group. Otherwise, all LDAP server groups are shown, including the 'ldap' group that contains every LDAP server.

Example To show all server groups, use the command:

```
awplus# show ldap server group
```

To show the default LDAP group that includes all the LDAP servers, use the command:

```
awplus# show ldap server group ldap
```

To show a server group named 'CustomGroup1', use the command:

```
awplus# show ldap server group CustomGroup1
```

Output Figure 50-1: Example output from **show ldap server group**

```
LDAP Group Configuration
 Group Name : ldap
  LDAP server name    Server Host/IP Address      Port  Status
-------------------------------------------------------------------
 server_one           10.1.1.1                   N/A   Alive
 server_two           10.2.1.1                   N/A   Dead (1 hour)

Group Name : CustomGroup1
  LDAP server name    Server Host/IP Address      Port  Status
-------------------------------------------------------------------
 server_one           10.1.1.1                   N/A   Alive

Group Name : CustomGroup2
  LDAP server name    Server Host/IP Address      Port  Status
-------------------------------------------------------------------
  No LDAP servers currently defined
```

timeout (ldap-server)

Overview Use this command to set the time to wait for a connection before reattempting to connect to the LDAP server.

Use the **no** variant of this command to reset the timeout back to the default value.

Syntax

```
timeout <1-1000>
no timeout
```

Parameter	Description
<1-1000>	The number of seconds to wait for a connection before reattempting to connect to the LDAP server.

Default 5 seconds

Mode LDAP Server Configuration

Example To set the server timeout for the LDAP server called 'Server1' to 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# timeout 10
```

To set the server timeout for 'Server1' to the default, use the commands:

```
awplus# configure terminal
awplus(config)# ldap-server Server1
awplus(config-ldap-server)# no timeout
```

51 RADIUS Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure the device to use RADIUS servers. For more information, see the RADIUS Feature Overview and Configuration Guide.

Command List

auth radius send nas-identifier

Overview Use this command to enable the device to include the NAS-Identifier(32) attribute in RADIUS authentication requests.

Use the **no** variant of this command to stop including the NAS-Identifier attribute.

Syntax

```
auth radius send nas-identifier {<name>|vlan-id}
no auth radius send nas-identifier
```

Parameter	Description
<name>	Send this user-defined text as the NAS-Identifier. You can specify up to 253 characters.
vlan-id	Send the VLAN ID of the authentication port as the NAS-Identifier. This is the configured VLAN ID, not the dynamic VLAN ID or guest VLAN ID.

Mode Global Configuration

Example To use a user-defined identifier of NASID100 as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier NASID100
```

To use the VLAN ID as the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send nas-identifier vlan-id
```

To stop sending the NAS-Identifier attribute, use the commands:

```
awplus# configure terminal
awplus(config)# no auth radius send nas-identifier
```

Related commands auth radius send service-type

auth radius send service-type

Overview Use this command to enable the device to include the Service-Type(6) attribute in RADIUS authentication requests. The Service-Type attribute has a value of:

- Framed(2) for 802.1x
- Call-Check(10) for MAC authentication
- Unbound(5) for Web authentication.

Use the **no** variant of this command to stop including the Service-Type attribute.

Syntax

```
auth radius send service-type
no auth radius send service-type
```

Mode Global Configuration

Example To send the Service-Type attribute, use the commands:

```
awplus# configure terminal
awplus(config)# auth radius send service-type
```

Related commands auth radius send nas-identifier

clear radius dynamic-authorization counters

Overview Use this command to set the Dynamic Authorization message counters to zero.

Syntax
```
clear radius dynamic-authorization counters
```

Mode Privileged Exec

Example To set the Dynamic Authorization message counters to zero, use the command:
```
awplus# clear radius dynamic-authorization counters
```

Related commands radius dynamic-authorization-client

show radius dynamic-authorization counters

Command changes Version 5.5.1-1.1: command added

deadtime (RADIUS server group)

Overview Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the radius-server deadtime command. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is 'dead'. Note that a RADIUS server is considered 'dead' if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

Syntax

```
deadtime <0-1440>
no deadtime
```

Parameter	Description
<0-1440>	Amount of time in minutes.

Default The deadtime is set to 0 minutes by default.

Mode RADIUS Server Group Configuration

Usage If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked 'dead', and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

Examples To configure the deadtime for 5 minutes for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group 'GROUP1', use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

Related commands aaa group server

radius-server deadtime

debug radius

Overview This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

Syntax

```
debug radius [packet|event|all]
no debug radius [packet|event|all]
```

Parameter	Description
`packet`	Debugging for RADIUS packets is enabled or disabled.
`event`	Debugging for RADIUS events is enabled or disabled.
`all`	Enable or disable all debugging options.

Default RADIUS debugging is disabled by default.

Mode Privileged Exec

Examples To enable debugging for RADIUS packets, use the command:

```
awplus#  debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus#  debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

Related commands show debugging radius

undebug radius

group (radproxy)

Overview Use this command create a RADIUS proxy server group. This command also takes you to the RADIUS proxy server group configuration mode.

Use the **no** variant of this command to delete a RADIUS proxy server group.

Syntax

```
group <groupname>
no group <groupname>
```

Parameter	Description
<groupname>	The name of the group to either create or configure.

Mode RADIUS Proxy Server Configuration

Example To create a RADIUS proxy server group named 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)#
```

To remove a RADIUS proxy server group named 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no group group1
```

help radius-attribute

Overview Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

Syntax

```
help radius-attribute [<attribute-name>|<attribute-ID>]
```

Parameter	Description
<attribute-name>	List the details and predefined values for the named attribute.
<attribute-ID>	List the details and predefined values for the given attribute ID.

Mode Privileged Exec

Usage notes When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

Example To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
  1      User-Name
  2      User-Password
  3      CHAP-Password
  4      NAS-IP-Address
  5      NAS-Port
  6      Service-Type
...
```

To display the details for the RADIUS attribute Frag-Status, use the following command:

```
awplus# help radius-attribute frag-status
```

```
awplus#help radius-attribute frag-status
Frag-Status : integer (Integer number)

Pre-defined values :
    Fragmentation-Supported (1)
    More-Data-Pending (2)
    More-Data-Request (3)
    Reserved (0)
```

Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

ip radius source-interface

Overview This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

Syntax

```
ip radius source-interface {<interface>|<ip-address>}
no ip radius source-interface
```

Parameter	Description
<interface>	Interface name.
<ip-address>	IP address in the dotted decimal format A.B.C.D.

Default Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Mode Global Configuration

Examples To configure all outgoing RADIUS packets to use the IP address of the interface “vlan1” for the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip radius source-interface
```

Related commands radius-server host

nas (radproxy)

Overview Use this command to add a NAS (Network Access Server) client to the list of devices able to send authentication requests to a RADIUS proxy server.

The NAS is identified by its IP address. In addition, a shared secret (also referred to as a shared key) must be defined. The NAS will use this key to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the RADIUS proxy server.

Syntax

```
nas <ip-address> key <nas-keystring>
no nas <ip-address>
```

Parameter	Description
<ip-address>	NAS IP address
key	Specify a shared key
<nas-keystring>	NAS shared key string

Mode RADIUS Proxy Server Configuration

Example To add a NAS with IP address '192.168.1.2' and the shared key 'nas_password', use the following commands.

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# nas 192.168.1.2 key nas_password
```

To remove the NAS with IP address '192.168.1.2', use the following commands.

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no nas 192.168.1.2
```

Related commands proxy enable

radius-server proxy-server

Command changes Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

proxy (radproxy)

Overview Use this command to set the UDP port numbers the RADIUS proxy service will implement for authentication and accounting.This only needs to be done if you do not want to use the default authentication (1812) and/or accounting (1813) ports.

Use the **no** variant of this command to set the UDP port numbers back to the default.

Syntax

```
proxy [auth-port <port-number>] [acct-port <port-number>]
no proxy [auth-port] [acct-port]
```

Parameter	Description
`auth-port`	Set the UDP port the RADIUS proxy server uses to listen for authentication requests.This only needs to be set if you don't wish to use the standard port (1812).
`<port-number>`	1-65535: Authentication port number.
`acct-port`	Set the UDP port the RADIUS proxy server uses to listen for accounting requests.This only needs to be set if you don't wish to use the standard port (1813).
`<port-number>`	1-65535: Accounting port number.

Default By default UDP port 1812 is used for authentication and port 1813 is used for accounting.

Mode RADIUS Proxy Server Configuration

Example To configure a RADIUS proxy server to listen on UDP ports '2044' for authentication and '2055' for accounting, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# proxy auth-port 2044 acct-port 2055
```

To reset the RADIUS proxy server's accounting port to default, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no proxy acct-port
```

Command changes

Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

proxy enable

Overview Use this command to enable the RADIUS proxy server.

Use the **no** variant of this command to disable the RADIUS proxy server

Syntax

```
proxy enable
no proxy enable
```

Default RADIUS proxy is disabled by default.

Usage notes You configure a RADIUS proxy server so that remote RADIUS servers hold the RADIUS user database and validate NAS RADIUS requests.

- The NAS sends a RADIUS request to the RADIUS proxy server.
- The proxy server forwards the request to the first available RADIUS server.
- The RADIUS server processes the request and sends the response back to the proxy server.
- The proxy server then forwards the response to the NAS with an accept or reject.

There are a variety of situations where a RADIUS proxy is useful. For example, multiple RADIUS servers could be configured to each hold a different user database for a specific purpose e.g. one for authenticating switch management sessions, one for authenticating VPN connections, and one for authenticating 802.1X sessions. In this situation it is convenient to use a single IP address on all the NASs to point to the RADIUS proxy server. This server then forwards the request to the correct RADIUS server holding the relevant user database.

For more information on configuring RADIUS proxy server, see the RADIUS Feature Overview and Configuration Guide..

Mode RADIUS Proxy Server Configuration

Example To enable RADIUS proxy server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# proxy enable
```

To disable RADIUS proxy server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no proxy enable
```

Command changes

Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

radius dynamic-authorization-client

Overview Use this command to add a Dynamic Authorization Client (DAC). A Network Access Server (NAS) will only accept Dynamic Authorization (DA) messages from DACs that have been authorized using this command.

Use the **no** variant of this command to remove a DAC from the list of authorized clients.

Syntax

```
radius dynamic-authorization-client <ip-address> key
<key-string>
```

```
no radius dynamic-authorization-client <ip-address>
```

When in secure mode (see the crypto secure-mode command), the syntax in config files will be:

```
radius dynamic-authorization-client <ip-address> key-encrypted
<encrypted-key-string>
```

Parameter	Description
<ip-address>	IP address of the DAC, entered in the form A.B.C.D
key	Sets the shared-key of the client.
key-encrypted	Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.

Mode Global Configuration

Usage notes The RADIUS protocol does not support unsolicited messages sent from the RADIUS server to the NAS. This means that the network access configuration a supplicant receives from a RADIUS server cannot be updated until the supplicant re-authenticates with the RADIUS server.

In some situations it is desirable to either update a supplicant's configuration, or even disconnect their session.

This command allows a Dynamic Authentication Client to send a message that will either update or terminate a supplicant's session.

Example To add a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# radius dynamic-authorization-client 10.0.0.1
key secret-key
```

To remove the configuration for a DAC with IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no radius dynamic-authorization-client 10.0.0.1
```

Related commands

Command changes

Version 5.5.1-1.1: command added

radius-server deadtime

Overview Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

Syntax

```
radius-server deadtime <minutes>
no radius-server deadtime
```

Parameter	Description
<minutes>	RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours).

Default The default RADIUS deadtime configured on the system is 0 seconds.

Mode Global Configuration

Usage The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the radius-server retransmit command or for the server by the radius-server host command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

Examples To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

Related commands

deadtime (RADIUS server group)

radius-server host

radius-server retransmit

radius-server host

Overview Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

Syntax

```
radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit
<0-100>] [timeout <1-1000>]

radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>] [key-encrypted
<encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>]

no radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>]
```

Syntax (VRF-lite)

```
radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit
<0-100>] [timeout <1-1000>] [vrf <vrf-name>]

radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>] [key-encrypted
<encrypted-key-string>] [retransmit <0-100>] [timeout <1-1000>]
[vrf <vrf-name>]

no radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>] [vrf <vrf-name>]
```

Parameter	Description
<host-name>	Server host name. The DNS name of the RADIUS server host.
<ip-address>	The IP address of the RADIUS server host.
acct-port	Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.
<0-65535>	UDP port number. (Accounting port number is set to (accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting.

Parameter	Description
`auth-port`	Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.
<0-65535>	UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.
`timeout`	Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the **radius-server timeout** command is used.
<1-1000>	Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the **radius-server timeout** command. If no timeout value is specified for this server, the global value is used.
`retransmit`	Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the **radius-server retransmit** command is used.
<0-100>	Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the **radius-server retransmit** command. If no retransmit value is specified, the global value is used.
`key`	Set shared secret key with RADIUS servers.
<key-string>	Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used. If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the **radius-server key** command. If no key value is specified, the global value is used.
`key-encrypted`	Set an encrypted shared secret key. When secure mode is enabled, the running configuration contains this parameter instead of the key parameter. It indicates that the device stores keys in the running configuration in encrypted form instead of in plain text.

Parameter	Description
<encrypted-key -string>	Encrypted shared key string.
vrf *<vrf-name>*	The name of a VRF instance. Use this to specify the VRF that the RADIUS server is accessible by. Servers are uniquely identified by their address and VRF, so multiple servers can have the same address or host-name as long as the VRF is different. The default is the global VRF.

Default The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

Mode Global Configuration

Usage Multiple **radius -server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the auth-port parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group radius, which may be used by AAA authentication, authorization and accounting commands. The client transmits (and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

Examples To add the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret
```

To delete the RADIUS server 10.0.0.20, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure rad1.company.com for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server rad1.company.com configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure rad2.company.com for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

Examples (VRF-lite)

To add the RADIUS server 10.0.0.20 in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 vrf red
```

To set the secret key to 'mySecret' on the RADIUS server 10.0.0.20 in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key mySecret vrf
red
```

Command changes

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

Version 5.4.9-2.1: **key-encrypted** parameter added

radius-server key

Overview This command sets a global secret key for RADIUS authentication on the device. The shared secret text string is used for RADIUS authentication between the device and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

Syntax

```
radius-server key <key-string>
no radius-server key
```

When in secure mode, the syntax in config files will be:

```
radius-server key-encrypted <encrypted-key-string>
```

Parameter	Description
`key <key-string>`	Shared secret among RADIUS server and 802.1X client.
`key-encrypted <encrypted-key-string>`	This parameter indicates that the key is in its encrypted form. You would not normally enter this command. Instead, if you enter key and secure mode is enabled, the running config contains this parameter instead of the key parameter. This indicates that in secure mode the device stores keys in the running config in encrypted form instead of in plain text.

Default The RADIUS server secret key on the system is not set by default (null).

Mode Global Configuration

Usage Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

Examples To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

Related commands

radius-server host

radius-server proxy-server

Overview Use this command to enter RADIUS proxy server configuration mode.

Syntax

```
radius-server proxy-server
```

Mode Global Configuration

Usage notes You configure a RADIUS proxy server so that remote RADIUS servers hold the RADIUS user database and validate NAS RADIUS requests.

- The NAS sends a RADIUS request to the RADIUS proxy server.
- The proxy server forwards the request to the first available RADIUS server.
- The RADIUS server processes the request and sends the response back to the proxy server.
- The proxy server then forwards the response to the NAS with an accept or reject.

There are a variety of situations where a RADIUS proxy is useful. For example, multiple RADIUS servers could be configured to each hold a different user database for a specific purpose e.g. one for authenticating switch management sessions, one for authenticating VPN connections, and one for authenticating 802.1X sessions. In this situation it is convenient to use a single IP address on all the NASs to point to the RADIUS proxy server. This server then forwards the request to the correct RADIUS server holding the relevant user database.

For more information on configuring RADIUS proxy server, see the RADIUS Feature Overview and Configuration Guide..

Example To enter RADIUS proxy server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)#
```

Related commands proxy enable

source-interface (radproxy)

Command changes Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

radius-server retransmit

Overview This command sets the retransmit counter to use RADIUS authentication on the device. This command specifies how many times the device transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

Syntax

```
radius-server retransmit <retries>
no radius-server retransmit
```

Parameter	Description
<retries>	RADIUS server retries in the range <0-100>. The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the **radius-server host** command, this global value is used.

Default The default RADIUS retransmit count on the device is 3.

Mode Global Configuration

Examples To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

Related commands

radius-server deadtime

radius-server host

show radius statistics

radius-server timeout

Overview Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

Syntax

```
radius-server timeout <seconds>
no radius-server timeout
```

Parameter	Description
<seconds>	RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the **radius-server retransmit** command).

Default The default RADIUS transmit timeout on the system is 5 seconds.

Mode Global Configuration

Examples To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

rule attribute (radproxy)

Overview Use this command to configure a rule to match a RADIUS request based on a RADIUS packet attribute. If a match is found then the request will be sent to the server or group defined in the rule.

Use the **no** variant of this command to remove a rule.

Syntax

```
rule <rule-id> attribute <attribute-name> <match-pattern>
server <ip-address> [auth-port <port-number>] [acct-port
<port-number>]
```

```
rule <rule-id> attribute <attribute-name> <match-pattern> group
<group-name>
```

```
no rule <rule-id>
```

Parameter	Description	
<rule-id>	Unique rule id.	
<attribute-name>	Attribute name to match. Commonly used names are:	
	`called-station-id`	Match for called-station-id: the phone number that the user called, uses Dialed Number Identification (DNIS) or similar technology.
	`calling-station-id`	Match for calling-station-id: the phone number that the call came from, uses Automatic Number Identification (ANI) or similar technology.
	`nas-identifier`	Match for NAS-Identifier: this attribute contains a string identifying the NAS originating the Access-Request
	`nas-ip-address`	NAS IP address to match for.
	`user-name`	Match for user-name: the name of the user to be authenticated.
	Use the help radius-attribute command to get a list of all RADIUS attributes.	
<match-pattern>	Attribute pattern to match. See the Usage section below for more information.	
`server`	Specify the upstream server to send the request to.	
<ip-address>	IP address of the upstream RADIUS server.	
`auth-port`	Set the authentication port used by the upstream server.This only needs to be set if the upstream server is not using the standard port (1812)for authentication.	

Parameter	Description
<port-number>	1-65535: Authentication port number.
acct-port	Set the accounting port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1813) for accounting.
<port-number>	1-65535: Accounting port number.
group	Specify a group of RADIUS servers to send the request to.
<group-name>	Name of the RADIUS server group.

Default By default a RADIUS request is sent to the first available server.

Mode RADIUS Proxy Server Configuration

Usage notes An asterisk acts as a wildcard character in the **match-pattern**. It matches any string of characters. For example using 'test*' as a match pattern for the user-name attribute will match all user-names beginning with 'test'.

If you wish to include an asterisk in the match pattern then escape it with the backslash character. For example using 'SSID: AP**X' as a match pattern for the Called-Station-Id attribute will match the call station with SSID 'SSID:AP**X'.

Example To configure a rule with id 20, that uses the RADIUS attribute user-name to send all requests from user 'myuser' to the upstream server 192.168.2.2, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# rule 20 attribute user-name myuser
server 192.168.2.2
```

To configure a rule with id 30, that uses the RADIUS attribute user-name to send all traffic from user-names that start with 'test' to the group of upstream servers 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# rule 30 attribute user-name test*
group group1
```

To remove a rule with id 20, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no rule 20
```

rule realm (radproxy)

Overview Use this command to configure a rule to match a RADIUS request based on a realm. If a match is found then the request will be sent to the server or group defined in the rule.

A realm can be any of the following formats:

- username@domain.com
- username%domain.com
- domain/username
- domain\username

Use the **no** variant of this command to remove a rule.

Syntax

```
rule <rule-id> realm <match-pattern> [nostrip] server
<ip-address> [auth-port <port-number>] [acct-port
<port-number>]
```

```
rule <rule-id> realm <match-pattern> [nostrip] group
<group-name>
```

```
no rule <rule-id>
```

Parameter	Description
<rule-id>	Unique rule id.
<match-pattern>	Attribute pattern to match. See the Usage section below for more information.
server	Specify the upstream server to send the request to.
nostrip	Do not strip the realm name when the request is sent to the upstream server. By default the realm name is stripped from the request.
<ip-address>	IP address of the upstream RADIUS server.
auth-port	Set the authentication port used by the upstream server.This only needs to be set if the upstream server is not using the standard port (1812)for authentication.
<port-number>	1-65535: Authentication port number.
acct-port	Set the accounting port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1813) for accounting.
<port-number>	1-65535: Accounting port number.
group	Specify a group of RADIUS servers to send the request to.
<group-name>	Name of the RADIUS server group.

Default By default a RADIUS request is sent to the first available server.

Mode RADIUS Proxy Server Configuration

Usage notes An asterisk acts as a wildcard character in the **match-pattern**. It matches any string of characters. For example using 'myuser@* ' as a match pattern will match the realms myuser@abcd.com, myuser@xyz.com, myuser@xyz.ac.nz, etc.

If you wish to include an asterisk in the match pattern then escape it with the backslash character.

Example To configure a rule with id 10, that matches a realm myuser@abcd.com, myuser@xyz.com, myuser@xyz.ac.nz to use the upstream server 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# rule 10 realm myuser@* server
192.168.1.1
```

To configure the same rule as in the previous example, where the upstream server is listening on ports 2044 and 2055, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# rule 10 realm myuser@* server
192.168.1.1 auth-port 2044 acct-port 2055
```

To remove a rule with id 10, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no rule 10
```

server (radproxy-group)

Overview Use this command to add and configure an upstream RADIUS proxy server in a RADIUS proxy group.

Use the **no** variant of this command to remove an upstream RADIUS proxy server from a group.

Syntax

```
server <ip-address> [auth-port <port-number>] [acct-port <port-number>]
```

```
no server <ip-address> [auth-port <port-number>] [acct-port <port-number>]
```

Parameter	Description
<ip-address>	IP address of the upstream RADIUS server.
auth-port	Set the authentication port used by the upstream server.This only needs to be set if the upstream server is not using the standard port (1812)for authentication.
<port-number>	1-65535: Authentication port number.
acct-port	Set the accounting port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1813) for accounting.
<port-number>	1-65535: Accounting port number.

Mode RADIUS Proxy Group Configuration

Usage notes You can configure more than one RADIUS server on the same IP address as long as each server has unique authentication and accounting ports.

Example To configure an upstream RADIUS server, '192.168.1.1', with authentication port '4050' and accounting port '4051', for the group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)# server 192.168.1.1 auth-port 4050 acct-port 4051
```

To remove the RADIUS server, '192.168.1.1', with authentication port '4050' and accounting port '4051', from the group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)# no server 192.168.1.1 auth-port
4050 acct-port 4051
```

If the RADIUS server uses the default authentication and accounting ports then to configure an upstream RADIUS server, '192.168.1.1' for the group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)# server 192.168.1.1
```

If the RADIUS server uses the default authentication and accounting ports then to remove an upstream RADIUS server, '192.168.1.1' from the group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# group group1
awplus(config-radproxy-group)# no server 192.168.1.1
```

Related commands

Command changes

Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

server (radproxy)

Overview Use this command to add and configure a RADIUS proxy upstream server.

Use the **no** variant of this command to remove a RADIUS proxy upstream server.

Syntax

```
server <ip-address> [auth-port <port-number>] [acct-port
<port-number>] key <key-string> [status-check]
```

```
no server <ip-address> [auth-port <port-number>] [acct-port
<port-number>]
```

Parameter	Description
<ip-address>	IP address of the upstream RADIUS server.
auth-port	Set the authentication port used by the upstream server.This only needs to be set if the upstream server is not using the standard port (1812)for authentication.
<port-number>	1-65535: Authentication port number.
acct-port	Set the accounting port used by the upstream server. This only needs to be set if the upstream server is not using the standard port (1813) for accounting.
<port-number>	1-65535: Accounting port number.
key	Set the secret key for the upstream RADIUS server.
<key-string>	Secret key string.
status-check	Send a status check to a dead upstream server.

Mode RADIUS Proxy Server Configuration

Usage notes You can configure more than one upstream server. RADIUS requests will be sent to the first available server. If the first one is not available, the request will be sent to the second one.

The authentication and accounting port parameters only need to be used if the upstream RADIUS server is not using the default authentication (1812) and/or accounting (1813) ports.

The status-check parameter is only valid if the upstream server supports status check.

- If status check is set then a dead server's status will change to 'Alive' if it responds favorably to a status check.
- If status check is not set, a dead server's status changes to 'Alive' after the specified deadtime, irrespective of the actual state of the server.

Example

To configure an upstream RADIUS server, '192.168.2.1', with authentication port '4050', accounting port '4051', and secret key 'secret', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# server 192.168.2.1 auth-port 4050 acct-port 4051 key secret
```

To remove an upstream RADIUS server, '192.168.2.1', with authentication port '4050' and accounting port '4051', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no server 192.168.2.1 auth-port 4050 acct-port 4051
```

Command changes

Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

server deadtime (radproxy)

Overview Use this command to configure RADIUS proxy upstream server deadtime. An upstream RADIUS server is considered "dead" if it does not respond to a RADIUS request within a specified timeout period.

The deadtime period is the amount of time a server is considered “dead” before:

- its status is changed to “alive” if status-check is disabled or
- a check status is initiated if status-check is enabled.

Use the **no** variant of this command to reset the deadtime period.

Syntax

```
server deadtime <seconds>
no server deadtime
```

Parameter	Description
`deadtime`	Specify the amount of time to consider an unavailable RADIUS server ‘dead’.
`<seconds>`	The time, in seconds, before a ‘dead’ RADIUS server is considered ‘alive’, or a check status is initiated.

Default The deadtime is set to 300 seconds by default.

Mode RADIUS Proxy Server Configuration

Example To configure the RADIUS server deadtime to 100 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config)# server deadtime 100
```

To reset to the default deadtime, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config)# no server deadtime
```

Related commands radius-server proxy-server

Command changes Version 5.4.8-0.2: command added

Version 5.4.9-0.1: added to x530 Series products

server (RADIUS server group)

Overview This command adds a RADIUS server to a server group in RADIUS Server Group Configuration mode. The RADIUS server should be configured by the radius-server host command.

The device adds each server to the end of the group's list of servers, so add the servers in order of priority. If you add a server and it is already in the list, it will be removed and then re-added to the end of the list.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set **auth-port** to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set **acct-port** to 0. If the accounting port is missing, the default port number is 1813.

Use the **no** variant of this command to remove a RADIUS server from the server group.

Syntax

```
server {<hostname>|<ip-address>} [auth-port <0-65535>]
[acct-port <0-65535>]
```

```
no server {<hostname>|<ip-address>} [auth-port <0-65535>]
[acct-port <0-65535>]
```

Parameter	Description
<hostname>	Server host name
<ip-address>	Server IP address The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.
auth-port	Authentication port The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set **auth-port** to 0. If the authentication port is missing, the default port number is 1812.
<0-65535>	UDP port number (default: 1812)
acct-port	Accounting port The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set **acct-port** to 0. If the accounting port is missing, the default port number is 1813.
<0-65535>	UDP port number (default: 1813)

Default The default Authentication port number is 1812 and the default Accounting port number is 1813.

Mode RADIUS Server Group Configuration

Usage notes The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

Examples To create a RADIUS server group 'RAD_AUTH1' for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000 acct-port
0
```

To create a RADIUS server group 'RAD_ACCT1' for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0 acct-port
1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group 'GROUP1', use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

server timeout (radproxy)

Overview Use this command to configure RADIUS proxy upstream server timeout. An upstream RADIUS server is considered "dead" if it does not respond to a RADIUS request within a specified timeout period.

Use the **no** variant of this command to reset the timeout period.

Syntax

```
server timeout <seconds>
no server timeout
```

Parameter	Description
`timeout`	Specify the time to wait for an upstream RADIUS server to respond.
`<seconds>`	The time, in seconds, to wait for the server to respond to a RADIUS request.

Default The timeout is set to 30 seconds by default.

Mode RADIUS Proxy Server Configuration

Example To configure the RADIUS server timeout to 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config)# server timeout 10
```

To reset to the default timeout, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config)# no server timeout
```

Related commands radius-server proxy-server

show debugging radius

Overview This command displays the current debugging status for the RADIUS servers.

Syntax

```
show debugging radius
```

Mode User Exec and Privileged Exec

Example To display the current debugging status of RADIUS servers, use the command:

```
awplus# show debugging radius
```

Output Figure 51-1: Example output from the **show debugging radius** command

```
RADIUS debugging status:
 RADIUS event debugging is off
 RADIUS packet debugging is off
```

show radius

Overview This command displays the current RADIUS server configuration and status.

Syntax

```
show radius
```

Mode User Exec and Privileged Exec

Example To display the current status of RADIUS servers, use the command:

```
awplus# show radius
```

Output Figure 51-2: Example output from the **show radius** command showing RADIUS servers

```
RADIUS Global Configuration
 Source Interface : not configured
 Secret Key : secret
 Timeout : 5 sec
 Retransmit Count : 3
 Deadtime : 20 min
Server Host : 192.168.1.10
 Authentication Port : 1812
 Accounting Port : 1813
 Secret Key : secret
 Timeout : 3 sec
 Retransmit Count : 2
Server Host : 192.168.1.11
 Authentication Port : 1812
 Accounting Port : not configured

Server Name/   Auth   Acct   Auth     Acct
IP Address     Port   Port   Status   Status
-----------------------------------------------------------
192.168.1.10   1812   1813   Alive    Alive
192.168.1.11   1812   N/A    Alive    N/A
```

Example See the sample output below showing RADIUS client status and RADIUS configuration:

```
awplus# show radius
```

Output Figure 51-3: Example output from the **show radius** command showing RADIUS client status

```
RADIUS global interface name: awplus
 Secret key:
 Timeout: 5
 Retransmit count: 3
 Deadtime: 0

Server Address: 150.87.18.89
 Auth destination port: 1812
 Accounting port: 1813
 Secret key: swg
 Timeout: 5
 Retransmit count: 3
 Deadtime: 0
```

Output Parameter	Meaning
Source Interface	The interface name or IP address to be used for the source address of all outgoing RADIUS packets.
Secret Key	A shared secret key to a radius server.
Timeout	A time interval in seconds.
Retransmit Count	The number of retry count if a RADIUS server does not response.
Deadtime	A time interval in minutes to mark a RADIUS server as “dead”.
Interim-Update	A time interval in minutes to send Interim-Update Accounting report.
Group Deadtime	The deadtime configured for RADIUS servers within a server group.
Server Host	The RADIUS server hostname or IP address.
Authentication Port	The destination UDP port for RADIUS authentication requests.
Accounting Port	The destination UDP port for RADIUS accounting requests.

Output Parameter	Meaning	
`Auth Status`	The status of the authentication port. The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for.	
	`Alive`	The server is alive.
	`Error`	The server is not responding.
	`Dead`	The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time.
	`Unknown`	The server is never used or the status is unknown.
`Acct Status`	The status of the accounting port. The status ("dead", "error", or "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.	

show radius dynamic-authorization counters

Overview Use this command to display the Dynamic Authorization message counters. It shows the count of sent and received messages, as well as a count of any error messages.

Syntax

```
show radius dynamic-authorization counters
```

Mode Privileged Exec

Example To display the Dynamic Authorization message counters, use the following command:

```
awplus# show radius dynamic-authorization counters
```

Output Figure 51-4: Example output from **show radius dynamic-authorization counters**

```
awplus#show radius dynamic-authorization counters

RADIUS Dynamic Authorization packet counters
--------------------------------------------

show radius proxy-server

Overview Use this command to see the status of the upstream RADIUS servers.

Syntax

```
show radius proxy-server
```

Mode Privileged Exec

Example To see the status of the upstream RADIUS servers, use the following command:

```
awplus# show radius proxy-server
```

Output Figure 51-5: Example output from **show radius proxy-server**

```
awplus#show radius proxy-server

                              Auth  Acct  Auth         Acct
Server Host/IP Address        Port  Port  Status       Status
-------------------------------------------------------------------
192.168.1.1                   1812  1813  Alive        Unknown
192.168.2.1                   1812  1813  Unknown      Unknown
192.168.1.2                   1812  1813  Unknown      Unknown
192.168.10.1                  1812  1813  Unknown      Unknown
192.168.11.1                  1812  1813  Unknown      Unknown
192.168.12.1                  1812  1813  Unknown      Unknown
```

Each upstream RADIUS server will be in one of the following states:

- Unknown - each server starts out as 'unknown' until an attempt is made to contact it.
- Alive - the server responded to a RADIUS request.
- Unreachable - the server did not respond to a RADIUS request.

show radius proxy-server statistics

Overview Use this command to show RADIUS proxy server statistics for the upstream servers.

Syntax

```
show radius proxy-server statistics
```

Mode Privileged Exec

Example Use the following command to see the status of the upstream RADIUS servers.

```
awplus# show radius proxy-server statistics
```

Output Figure 51-7: Example output from **show radius proxy-server statistics**

```
awplus#show radius proxy-server statistics
RADIUS Proxy Statistics for Server 192.168.1.1:1812,1813:
                     Auth                 Acct
---------------------------------------------------------------
Requests             5                    -
Responses            5                    -
Accepts              4                    -
Rejects              1                    -
Challenges           -                    -
Dup                  -                    -
Invalid              -                    -
Malformed            -                    -
Bad_Authenticator    -                    -

Dup                  -                    -
Invalid              -                    -
Malformed            -                    -
Bad_Authenticator    -                    -
Dropped              -                    -
Unknown_Types        -                    -
Timeouts             -                    -
Last_Packet          -                    -
```

Table 51-1: Parameters in the output from **show radius proxy-server statistics**

Parameter	Description
Requests	Number of request packets sent to the server.
Responses	Number of response packets received from the server.
Accepts	(auth-only): Number of Access-Accept packets received from the server.
Rejects	(auth-only): Number of Access-Reject packets received from the server.
Challenges	(auth-only): Number of Access-Challenge packets received from the server.
Dup	Duplicated requests.
Invalid	Invalid requests (e.g. requests from an unknown NAS).
Malformed	Malformed requests (e.g. requests packets with an invalid length).
Bad_Authenticator	Bad authenticators (wrong secret key).
Dropped	Packets dropped for other reasons.
Unknown_Types	Packets types not allowed on this proxy.
Timeouts	No response from the server.
Last_Packet	Last time a packet was sent to the server.

show radius statistics

Overview This command shows the RADIUS client statistics for the device.

Syntax

```
show radius statistics
```

Mode User Exec and Privileged Exec

Example See the sample output below showing RADIUS client statistics and RADIUS configuration:

```
awplus# show radius statistics
```

Output Figure 51-8: Example output from the **show radius statistics** command:

```
RADIUS statistics for Server: 150.87.18.89
 Access-Request Tx  : 5 - Retransmit  : 0
 Access-Accept Rx  : 1 - Access-Reject Rx  : 2
 Access-Challenge Rx  : 2
 Unknown Type  : 0 - Bad Authenticator : 0
 Malformed Access-Resp : 0 - Wrong Identifier : 0
 Bad Attribute  : 0 - Packet Dropped  : 0
 TimeOut  : 0 - Dead count  : 0
 Pending Request : 0
```

source-interface (radproxy)

Overview Use this command to configure the source IP address of each outgoing RADIUS packet. The RADIUS packets will use the specified IP address or the IP address of the specified interface. If the interface is down, or there is no IP address on the interface, then the source IP address will be the IP address of the interface the packets leave on.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing proxy RADIUS packets will then be the IP address of the interface from which the packets are sent.

Syntax

```
source-interface [<ip-address>|<interface-name>]
no source-interface
```

Parameter	Description
<ip-address>	The IP address to be used as the source IP address.
<interface-name>	The name of the interface whose IP address is to be used as the source IP address.

Default The source IP in outgoing proxy RADIUS packets is the IP address of the interface from which the packets are sent.

Mode RADIUS Proxy Server Configuration

Example To set the source IP address to '192.168.1.1' for all outgoing RADIUS packets from the proxy server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# source-interface 192.168.1.1
```

To remove the source interface configuration., use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server proxy-server
awplus(config-radproxy)# no source-interface
```

52 Local RADIUS Server Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see the Local RADIUS Server Feature Overview and Configuration Guide.

The local RADIUS server is not available in Secure Mode (see the crypto secure-mode command.

Command List

attribute (radsrv-grp)

Overview Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see the Local RADIUS Server Feature Overview and Configuration Guide.

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

Syntax

```
attribute [repeated] {<attribute-name>|<attribute-id>} <value>
no attribute {<attribute-name>|<attribute-id>}
```

Parameter	Description
`repeated`	This optional parameter allows you to set multiple instances of the same attribute name or attribute ID.
<attribute-name>	RADIUS attribute name for standard attributes or Vendor-Specific attributes (see the Local RADIUS Server Feature Overview and Configuration Guide for tables of attributes).
<attribute-id>	RADIUS attribute numeric identifier for standard attributes.
<value>	RADIUS attribute value.

Default By default, no attributes are configured.

Mode Local RADIUS Server User Group Configuration

Usage notes For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

In the same way, where the specific attribute has a pre-defined value, the parameter *<value>* may be substituted with the Value Name or with its numeric value, for example the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
user-request
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

You can define more than one instance of an attribute name (or id) by using the **repeated** parameter. For example:

```
awplus(config-radsrv-group)# attribute repeated
Nas-filter-Rule "deny in tcp from any to 0.0.0.0/0 23”
awplus(config-radsrv-group)# attribute repeated
Nas-filter-Rule "deny in tcp from any to fe80::b1 23"
```

Examples To define the attribute name ‘Service-Type’ with Administrative User (6) to the RADIUS User Group ‘Admin’, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute ‘Service-Type’ from the RADIUS User Group ‘Admin’, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# no attribute Service-Type
```

To define multiple values for attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "deny in tcp from any to 0.0.0.0/0 23"
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "deny in tcp from any to fe80::b1 23"
```

To delete a specific value from the attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# no attribute NAS-Filter-Rule "deny
in tcp from any to 0.0.0.0/0 23"
```

help radius-attribute

Command changes Version 5.5.0-1.1: **repeated** parameter added

authentication

Overview Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

Syntax

```
authentication {mac|eapmd5|eaptls|peap}
no authentication {mac|eapmd5|eaptls|peap}
```

Parameter	Description
`mac`	Enable MAC authentication method.
`eapmd5`	Enable EAP-MD5 authentication method.
`eaptls`	Enable EAP-TLS authentication method.
`peap`	Enable EAP-PEAP authentication method.

Default All authentication methods are enabled by default.

Mode RADIUS Server Configuration

Examples The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

Related commands server enable

show radius local-server statistics

client (radsecproxy-srv)

Overview Use this command to add a RadSec client (for example, a NAS device) to the RadSecProxy local-server application. The application will accept RADIUS requests from all configured clients.

Use the **no** variant of this command to delete a previously-configured client from the RadSecProxy local-server application.

Syntax

```
client {<hostname>|<ip-addr>} [name-check {on|off}]
no client {<hostname>|<ip-addr>}
```

Parameter	Description	
<hostname>	Hostname of client.	
<ip-addr>	Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).	
name-check	Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to **on**, is used.	
	on	Enable name checking for this client.
	off	Disable name checking for this client.

Mode RadSecProxy Local Server Configuration

Usage notes The client may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each client may be configured to use certificate name-checking; if not specified, the global behavior defined by **client name-check** or **no client name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in this command.

NOTE: *If mutual authentication is disabled then this parameter has no effect, see the client mutual-authentication command.*

Example To add a client called 'mynas.local' with certificate name checking **off**, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client mynas.local name-check
off
```

Related commands

client mutual-authentication

client name-check

client trustpoint

radius-secure-proxy local-server

client mutual-authentication

Overview This command enables or disables mutual certificate authentication for all RadSecProxy clients. When enabled, the RadSecProxy local-server application will request and validate an X.509 certificate from the client when establishing a connection.

The **no** variant of this command disables mutual certificate validation. The local-server application will still transmit the local server certificate to the client, but will not expect or validate a certificate from the client.

Syntax

```
client mutual-authentication
no client mutual-authentication
```

Default Mutual authentication is enabled by default.

Mode RadSecProxy Local Server Configuration

Example Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client
mutual-authentication
```

Related commands

client (radsecproxy-srv)

client name-check

radius-secure-proxy local-server

Command changes Version 5.4.6-2.1: command added

client name-check

Overview This command sets the global behavior for certificate name-checking for the RadSecProxy localserver application to **on**. This behavior will be used for all clients associated with the application that do not specify a behavior on a per-client basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **client (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

Syntax

```
client name-check
no client name-check
```

Default Certificate name checking is on by default.

Mode RadSecProxy Local Server Configuration

Example Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client name-check
```

Related commands

client (radsecproxy-srv)

client trustpoint

radius-secure-proxy local-server

client trustpoint

Overview This command adds one or more trustpoints to be used with the RadSecProxy local-server application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

Syntax

```
client trustpoint [<trustpoint-list>]
no client trustpoint [<trustpoint-list>]
```

Parameter	Description
<trustpoint-list>	Specify one or more trustpoints to be added or deleted.

Mode RadSecProxy Local Server Configuration

Usage notes The device certificate associated with the first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If you enter **client trustpoint** without specifying a trustpoint, the trustpoint list will be unchanged.

If you enter **no client trustpoint** without specifying a trustpoint, all trustpoints will be disassociated from the application.

Example You can add multiple trustpoints to the RadSecProxy local-server by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client trustpoint example_1
awplus(config-radsecproxy-srv)# client trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-srv)# client trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy local-server application using the command:

```
awplus(config-radsecproxy-srv)# no client trustpoint
```

Related commands

client (radsecproxy-srv)

client name-check

radius-secure-proxy local-server

clear radius local-server statistics

Overview Use this command to clear the statistics stored on the device for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

Syntax

```
clear radius local-server statistics [nas|server|user]
```

Parameter	Description
`nas`	Clear the NAS (Network Access Server) statistics on the device. For example, clearing statistics stored for NAS server invalid passwords.
`server`	Clear the Local RADIUS Server statistics on the device. For example, clearing Local RADIUS Servers statistics for all failed login attempts.
`user`	Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.

Mode Privileged Exec

Usage Refer to the sample output for the show radius local-server statistics for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the `user` parameter clears the number of successful and failed logins for each local RADIUS server user.

Examples To clear the NAS (Network Access Server) statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics user
```

Related commands show radius local-server statistics

copy fdb-radius-users (to file)

Overview Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

Syntax

```
copy fdb-radius-users
{local-radius-user-db|nvs|flash|usb|debug|tftp|scp|
fserver|<url>} [interface <port>] [vlan <vid>] [group <name>]
[export-vlan [<radius-group-name>]]
```

Parameter	Description
`local-radius-user-db`	Copy the local RADIUS server users created to the local RADIUS server.
`nvs`	Copy the local RADIUS server users created to NVS memory.
`flash`	Copy the local RADIUS server users created to Flash memory.
`usb`	Copy the local RADIUS server users created to USB storage device.
`debug`	Copy the local RADIUS server users created to debug.
`tftp`	Copy the local RADIUS server users created to the TFTP destination.
`scp`	Copy the local RADIUS server users created to the SCP destination.
`fserver`	Copy the local RADIUS server users created to the remote file server.
`<url>`	Copy the local RADIUS server users created to the specified URL.
`interface <port>`	Copy only MAC addresses learned on a specified device port. Wildcards may be used when specifying an interface name. For example, if you specify interface port2.* in a stacked environment, then this command generates RADIUS server users for MAC addresses learned on stack member 2.
`vlan <vid>`	Copy only MAC addresses learned on a specified VLAN.
`group <name>`	Assign a group name to the local RADIUS server users created.
`export-vlan`	Export VLAN ID assigned to exported FDB entry.
`<radius-group-name>`	Prefix for Radius group name storing VLAN ID

Mode Privileged Exec

Usage notes The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server

users can then be imported to a local RADIUS server using the copy local-radius-user-db (from file) command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

Examples To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface port1.0.1 to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface
port1.0.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to the file radius-user.csv, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface
port1.0.1 vlan10
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to a file on the remote file server, use the command:

```
awplus# copy fdb-radius-users fserver interface port1.0.1
vlan10
```

Related commands copy local-radius-user-db (to file)

copy local-radius-user-db (from file)

copy local-radius-user-db (from file)

Overview Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

Syntax

```
copy <source-url> local-radius-user-db [add|replace]
```

Parameter	Description
<source-url>	URL of the source file.
`add`	Add file contents to local RADIUS server user database.
`replace`	Replace current local RADIUS server user database with file contents.

Default When no copy method is specified with this command the **replace** option is applied.

Mode Privileged Exec

Examples To replace the current local RADIUS server user data to the contents of http://datahost/ user.csv, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of http://datahost/user.csv to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

Related commands copy fdb-radius-users (to file)

copy local-radius-user-db (to file)

copy local-radius-user-db (to file)

Overview Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

Syntax

```
copy local-radius-user-db
{nvs|flash|usb|tftp|scp|<destination-url>}
```

Parameter	Description
`nvs`	Copy to NVS memory.
`flash`	Copy to Flash memory.
`usb`	Copy to USB storage device.
`tftp`	Copy to TFTP destination.
`scp`	Copy to SCP destination.
<destination-url>	URL of the Destination file.

Mode Privileged Exec

Example Copy the current local RADIUS server user data to http://datahost/user.csv.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

crypto pki enroll local local-radius-all-users (deleted)

Overview This command is no longer available. Please use the following command instead:

```
crypto pki enroll <trustpoint> local-radius-all-users
```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

crypto pki enroll local user (deleted)

Overview This command is no longer available. Please use the following command instead:

```
crypto pki enroll <trustpoint> user <username>
```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

crypto pki export local pem (deleted)

Overview This command is no longer available. Please use the crypto pki export pem command instead:

```
crypto pki export <trustpoint> pem [terminal|<url>]
```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

crypto pki export local pkcs12 (deleted)

Overview This command is no longer available. Please use the crypto pki export pkcs12 command instead:

```
crypto pki export <trustpoint> pkcs12 {ca|server|<username>}
<url>
```

Note that "local" is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

crypto pki trustpoint local (deleted)

Overview This command is no longer available. Please use the following command instead:

```
crypto pki trustpoint <trustpoint>
```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

debug crypto pki (deleted)

Overview This command is no longer available.

domain-style

Overview Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

Syntax

```
domain-style {suffix-atsign|ntdomain}
no domain-style {suffix-atsign|ntdomain}
```

Parameter	Description
`suffix-atsign`	Enable at sign "@" delimited suffix style, i.e. "user@domain".
`ntdomain`	Enable NT domain style, i.e. "domain\user".

Default This feature is disabled by default.

Mode RADIUS Server Configuration

Usage notes When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

Examples To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

Related commands server enable

egress-vlan-id (radsrv-grp)

Overview Use this command to configure the standard RADIUS attribute 'Egress-VLANID (56)' for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

Syntax

```
egress-vlan-id <vid> [tagged|untagged]
no egress-vlan-id
```

Parameter	Description
`<vid>`	The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.
`tagged`	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
`untagged`	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

Default By default, no Egress-VLANID attributes are configured.

Mode Local RADIUS Server User Group Configuration

Usage When a Voice VLAN is configured for dynamic VLAN allocation (switchport voice vlan command), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the egress-vlan-id (radsrv-grp) command or the egress-vlan-name (radsrv-grp) command, and specify the **tagged** parameter.

Examples To set the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the 'Egress-VLANID' attribute for the 'NormalUsers' local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

Related commands

attribute (radsrv-grp)

egress-vlan-name (radsrv-grp)

switchport voice vlan

egress-vlan-name (radsrv-grp)

Overview Use this command to configure the standard RADIUS attribute 'Egress-VLAN-Name (58)' for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

Syntax

```
egress-vlan-name <vlan-name> [tagged|untagged]
no egress-vlan-name
```

Parameter	Description
`<vlan-name>`	The VLAN name to be configured as the Egress-VLAN-Name attribute.
`tagged`	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
`untagged`	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

Default By default, no Egress-VLAN-Name attributes are configured.

Mode Local RADIUS Server User Group Configuration

Usage When a Voice VLAN is configured for dynamic VLAN allocation (switchport voice vlan command), the RADIUS server must be configured to send the VLAN information when an IP phone is successfully authenticated. Use either the egress-vlan-id (radsrv-grp) command or the egress-vlan-name (radsrv-grp) command, and specify the **tagged** parameter.

Examples To configure the 'Egress-VLAN-Name' attribute for the RADIUS server user group 'NormalUsers' with the VLAN name vlan2 and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the 'Egress-VLAN-Name' attribute for the 'NormalUsers' group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

Related commands

attribute (radsrv-grp)

egress-vlan-id (radsrv-grp)

switchport voice vlan

group (radsrv)

Overview Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

Syntax

```
group <user-group-name>
no group <user-group-name>
```

Parameter	Description
<user-group-name>	User group name string.

Mode RADIUS Server Configuration

Examples The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

Related commands

user (radsrv)

show radius local-server user

vlan (radsrv-grp)

nas

Overview This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

Syntax

```
nas <ip-address> key <nas-keystring>
no nas <ip-address>
```

Parameter	Description
<ip-address>	RADIUS NAS IP address.
<nas-keystring>	NAS shared keystring.

Mode RADIUS Server Configuration

Examples The following commands add the NAS with an IP address of `192.168.1.2` to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identify is `NAS_PASSWORD`.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of `192.168.1.2` from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

Related commands show radius local-server nas

help radius-attribute

Overview Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

Syntax

```
help radius-attribute [<attribute-name>|<attribute-ID>]
```

Parameter	Description
<attribute-name>	List the details and predefined values for the named attribute.
<attribute-ID>	List the details and predefined values for the given attribute ID.

Mode Privileged Exec

Usage notes When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

Example To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
  1      User-Name
  2      User-Password
  3      CHAP-Password
  4      NAS-IP-Address
  5      NAS-Port
  6      Service-Type
...
```

To display the details for the RADIUS attribute Frag-Status, use the following command:

```
awplus# help radius-attribute frag-status
```

```
awplus#help radius-attribute frag-status
Frag-Status : integer (Integer number)

Pre-defined values :
    Fragmentation-Supported (1)
    More-Data-Pending (2)
    More-Data-Request (3)
    Reserved (0)
```

radius-secure-proxy local-server

Overview Use this command to enter the RadSecProxy local-server application configuration mode. This application allows remote RadSec clients to communicate with the local RADIUS server process via a secure (TLS) proxy.

Syntax
```
radius-secure-proxy local-server
```

Mode Global Configuration Mode

Example To change mode from User Exec mode to the RadSecProxy local-server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)#
```

Related commands
client (radsecproxy-srv)

client name-check

client trustpoint

radius-server local

Overview Use this command to navigate to the Local RADIUS server configuration mode `(config-radsrv)` from the Global Configuration mode `(config)`.

Syntax
```
radius-server local
```

Mode Global Configuration

Example Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (config- radsrv), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

server auth-port

Overview Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

Syntax

```
server auth-port <1-65535>
no server auth-port
```

Parameter	Description
<1-65535>	UDP port number.

Default The default local RADIUS server UDP authentication port number is 1812.

Mode RADIUS Server Configuration

Examples The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server auth-port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server auth-port
```

Related commands server enable

show radius local-server statistics

server enable

Overview This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

Syntax

```
server enable
no server enable
```

Default The local RADIUS server is disabled by default and must be enabled for use with this command.

Mode RADIUS Server Configuration

Examples To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

Related commands server auth-port

show radius local-server statistics

show radius local-server group

Overview Use this command to display information about the local RADIUS server user group.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show radius local-server group [<user-group-name>]
```

Parameter	Description
<user-group-name>	User group name string.

Mode User Exec and Privileged Exec

Example The following command displays Local RADIUS server user group information.

```
awplus# show radius local-server group
```

Output

Table 1: Example output from the **show radius local-server group** command

```
Group-Name          Vlan
-------------------------------------------------------------
NetworkOperators    ManagementNet
NormalUsers         CommonNet
```

Table 2: Parameters in the output of the **show radius local-server group** command

Parameter	Description
Group-Name	Group name.
Vlan	VLAN name assigned to the group.

Related commands group (radsrv)

show radius local-server nas

Overview Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show radius local-server nas [<ip-address>]
```

Parameter	Description
<ip-address>	Specify NAS IP address for show output.

Mode User Exec and Privileged Exec

Example The following command displays NAS information.

```
awplus# show radius local-server nas
```

Output

Table 3: Example output from the **show radius local-server nas** command

```
NAS-Address      Shared-Key
-----------------------------------------------------
127.0.0.1       awplus-local-radius-server
```

Table 4: Parameters in the output of the **show radius local-server nas** command

Parameter	Description
NAS-Address	IP address of NAS.
Shared-Key	Shared key used for RADIUS connection.

Related commands nas

show radius local-server statistics

Overview Use this command to display statistics about the local RADIUS server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show radius local-server statistics
```

Mode User Exec and Privileged Exec

Usage notes Both unknown usernames and invalid passwords will display as failed logins in the show output.

Example The following command displays Local RADIUS server statistics.

```
awplus# show radius local-server statistics
```

Output

Table 5: Example output from the **show radius local-server statistics** command

```
Server status       : Run (administrative status is enable)

server enable

server auth-port

show radius local-server user

Overview Use this command to display information about the local RADIUS server user.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show radius local-server user [<user-name>]
show radius local-server user [<user-name>] format csv
show radius local-server user [<user-name>] detail
```

Parameter	Description
`<user-name>`	RADIUS user name. If no user name is specified, information for all users is displayed.
`format csv`	Format output as CSV. This parameter is only available in Privileged Exec mode.
`detail`	Display detailed information about the user.

Mode User Exec and Privileged Exec

Examples The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

Table 6: Example output from the **show radius local-server user** command

```
User-Name            Group               Vlan
-----------------------------------------------------------------
Tom                  NetworkOperators    ManagementNet
```

The following command displays all Local RADIUS server information for all users.

```
awplus# show radius local-server user
```

The following command displays Local RADIUS server user information for Tom in CSV format (only available in Privileged Exec mode).

```
awplus# show radius local-server user Tom format csv
```

Table 7: Example output from the **show radius local-server user Tom format csv** command

```
true,"NetworkOperators","Tom","abcd",0,2099/01/01,1,"","","Managem
entNet"false,3600,false,0,"",false,"",false,false,"","","",false,f
alse,false,,false,0,0,"",true
```

The following command displays detailed Local RADIUS server user information for all users.

```
awplus# show radius local-server user detail
```

Table 8: Example output from the **show radius local-server user detail** command

```
awplus# show radius local-server user detail
Total users: 1
Maximum users allowed by license: 3
----------------------------------------------------------------
    Username  : Tom
      Group   : NetworkOperators
      Vlan    : VlanName
```

Table 9: Parameters in the output from the **show radius local-server user** command

Parameter	Description
`User-Name`	User name.
`Group`	Group name assigned to the user.
`Vlan`	VLAN name assigned to the user.

Related commands

group (radsrv)

user (radsrv)

Command changes

Version 5.4.9-0.1: **detail** parameter added

user (radsrv)

Overview Use this command to register a user to the local RADIUS server.

Use the **no** variant of this command to delete a user from the local RADIUS server.

Syntax

```
user <radius-user-name> [encrypted] password <user-password>
[group <user-group>]
```

```
no user <radius-user-name>
```

Parameter	Description
<radius-user-name>	RADIUS user name. This can also be a MAC address in the IEEE standard format of `HH-HH-HH-HH-HH-HH` if you are configuring MAC authentication to use local RADIUS server.
`encrypted`	Specifies that the password is being entered in its encrypted form, so that it is not further encrypted. When creating a new user, enter the password in plaintext, and do not use the **encrypted** parameter. Use the **encrypted** parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the **encrypted** parameter, and enter the encrypted version of the password that appears in the output of **show** commands for the user.
<user-password>	User password. This can also be a MAC address in the IEEE standard format of `HH-HH-HH-HH-HH-HH` if you are configuring MAC authentication to use local RADIUS server.
`group`	Specify the group for the user.
<user-group>	User group name.

Mode RADIUS Server Configuration

Usage notes RADIUS user names cannot contain question mark (`?`), space ( ), or quote (" ") characters. RADIUS user names containing the below characters cannot use certificate authentication:

```
/ \ '$ &()*;< > '|
```

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (`HH-HH-HH-HH-HH-HH`) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the AAA and Port_Authentication Feature Overview and Configuration_Guide for a sample MAC configuration. See also the command **user**

00-db-59-ab-70-37 password 00-db-59-ab-70-37 as shown in the command examples.

Examples The following commands add user 'Tom' to the local RADIUS server and sets his password to 'QwerSD'.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user 'Tom' to the local RADIUS server user group 'NormalUsers' and sets his password 'QwerSD'.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user 'Tom' from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password
00-db-59-ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

Related commands group (radsrv)

show radius local-server user

vlan (radsrv-grp)

Overview Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

Syntax

```
vlan {<vid>|<vlan-name>}
no vlan
```

Parameter	Description
<vid>	VLAN ID.
<vlan-name>	VLAN name.

Default VLAN information is not set by default.

Mode Local RADIUS Server User Group Configuration

Examples The following commands set VLAN ID 200 to the group named 'NormalUsers':

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named 'NormalUsers':

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no vlan
```

Related commands group (radsrv)

show radius local-server user

53 Public Key Infrastructure and Crypto Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure the Public Key Infrastructure (PKI) capabilities on an AlliedWare Plus device. For more information about PKI, see the Public Key Infrastructure (PKI) Feature Overview and Configuration Guide.

Command List

crypto key generate rsa

Overview Use this command to generate a cryptographic public/private key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.

Syntax

```
crypto key generate rsa [label <keylabel>] [<1024-4096>]
```

Parameter	Description
<keylabel>	The name of the key to be created. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. If no label is specified the default value “server-default” is used.
<1024-4096>	The bit length for the key. If no bit length is specified the default of 2048 is used.

Mode Privileged Exec

Usage notes The generated key may be used for multiple server certificates in the system. A key is referenced by its label. A bit length between 1024 and 4096 bits may be specified. Larger bit lengths are more secure, but require more computation time.

The specified key must not already exist.

Example To create a key with the label "example-server-key" and a bit length of 2048, use the commands:

```
awplus> enable
awplus# crypto key generate rsa label example-server-key 2048
```

Related commands

crypto key zeroize

rsakeypair (ca-trustpoint)

show crypto key mypubkey rsa

crypto key zeroize

Overview Use this command to delete one or all cryptographic public/private key pairs.

Syntax

```
crypto key zeroize rsa <keylabel>
crypto key zeroize all
```

Parameter	Description
`rsa <keylabel>`	Delete a single key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.
`all`	Delete all keys.

Mode Privileged Exec

Usage notes When the system is in secure mode, this command will securely delete the file (the file's sectors in NVS will be overwritten with random data three times before deletion). When the device is not in secure mode, this command has the same effect as using the **delete** command (it deletes the file from Flash memory but does not overwrite it with zeros).

The specified key must exist but must not be in use for any existing server certificates.

A key may not be deleted if it is associated with the server certificate or server certificate signing request for an existing trustpoint. To remove a server certificate so that the key may be deleted, use the **no crypto pki enroll** command to de-enroll the server.

Example To delete an RSA key named "example-server-key", use the following command:

```
awplus# crypto key zeroize rsa example-server-key
```

Related commands

crypto key generate rsa

show crypto key mypubkey rsa

crypto secure-mode

Command changes

Version 5.4.6-1.1: zeroize functionality added to x930 Series

Version 5.4.8-1.2: zeroize functionality added to x220, XS900MX, x550 Series

Version 5.4.8-2.1: zeroize functionality added to SBx908 GEN2, x950 Series

crypto pki authenticate

Overview Use this command to authenticate a trustpoint by generating or importing the root CA certificate. This must be done before the server can be enrolled to the trustpoint.

Syntax

```
crypto pki authenticate <trustpoint>
```

Parameter	Description
<trustpoint>	The name of the trustpoint to be authenticated.

Mode Privileged Exec

Usage notes If the trustpoint's **enrollment** setting is "selfsigned", then this command causes a private key to be generated for the root CA, and a self-signed certificate to be generated based on that key.

If the trustpoint's **enrollment** setting is "terminal", then this command prompts the user to paste a certificate Privacy Enhanced Mail (PEM) file at the CLI terminal. If the certificate is a valid selfsigned CA certificate, then it will be stored as the trustpoint's root CA certificate.

The specified trustpoint must already exist, and its enrollment mode must have been defined.

Example To show the **enrollment** setting of a trustpoint named "example" and then generate a certificate from it, use the commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
awplus(config)# exit
awplus# exit
awplus# crypto pki authenticate example
```

Related commands

crypto pki import pem

crypto pki trustpoint

enrollment (ca-trustpoint)

crypto pki enroll

Overview Use this command to enroll the local server to the specified trustpoint.

Use the **no** variant of this command to de-enroll the server by removing its certificate

Syntax

```
crypto pki enroll <trustpoint>
no crypto pki enroll <trustpoint>
```

Parameter	Description
<trustpoint>	The name of the trustpoint to be enrolled

Mode Privileged Exec

Usage notes For the local server, "enrollment" is the process of creating of a certificate for the server that has been signed by a CA associated with the trustpoint. The public portion of the RSA key pair specified using the rsakeypair parameter for the trustpoint will be included in the server certificate.

If the trustpoint represents a locally self-signed certificate authority, then this command results in the direct generation of the server certificate, signed by the root CA for the trustpoint.

If the trustpoint represents an external certificate authority, then this command results in the generation of a Certificate Signing Request (CSR) file, which is displayed at the terminal in Privacy-Enhanced Mail (PEM) format, suitable for copying and pasting into a file or message. The CSR must be sent to the external CA for processing. When the CA replies with the signed certificate, that certificate should be imported using the crypto pki import pem command, to complete the enrollment process.

The specified trustpoint must already exist, and it must already be authenticated.

Example To enroll the local server with the trustpoint "example", use the following commands:

```
awplus> enable
awplus# crypto pki enroll example
```

Related commands

crypto pki enroll user

crypto pki import pem

crypto pki trustpoint

enrollment (ca-trustpoint)

crypto pki enroll user

Overview Use this command to enroll a single RADIUS user or all RADIUS users to the specified trustpoint.

Use the **no** variant of this command to remove the PKCS#12 file from the system. Note that the PKCS#12 files are generated in a temporary (volatile) file system, so a system restart also results in removal of all of the files.

Syntax

```
crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}
```

```
no crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}
```

Parameter	Description
<trustpoint>	The name of the trustpoint to which users are to be enrolled.
<username>	The name of the user to enroll to the trustpoint.

Mode Privileged Exec

Usage notes For RADIUS users, “enrollment” is the process of generating a private key and a corresponding client certificate for each user, with the certificate signed by the root CA for the trustpoint. The resulting certificates may be exported to client devices, for use with PEAP or EAP-TLS authentication with the local RADIUS server.

The specified trustpoint must represent a locally self-signed certificate authority.

The private key and certificate are packaged into a PKCS#12-formatted file, suitable for export using the **crypto pki export pkcs12** command. The private key is encrypted for security, with a passphrase that is entered at the command line. The passphrase is required when the PKCS#12 file is imported on the client system. The passphrase is not stored anywhere on the device, so users are responsible for remembering it until the export-import process is complete.

If **local-radius-all-users** is specified instead of an individual user, then keys and certificates for all RADIUS users will be generated at once. All the keys will be encrypted using the same passphrase.

The specified trustpoint must already exist, it must represent a locally self-signed CA, and it must already have been authenticated.

Example To enroll the user “example-user” with the trustpoint “example”, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki enroll example user example-user
```

To enroll all local RADIUS users with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example local-radius-all-users
```

Related commands

crypto pki export pkcs12

crypto pki trustpoint

crypto pki export pem

Overview Use this command to export the root CA certificate for the given trustpoint to a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred to the specified destination URL, or displayed at the terminal.

Syntax

```
crypto pki export <trustpoint> pem [terminal|<url>]
```

Parameter	Description
<trustpoint>	The name of the trustpoint for which the root CA certificate is to be exported.
terminal	Display the PEM file to the terminal.
<url>	Transfer the PEM file to the specified URL.

Default The PEM will be displayed to the terminal by default.

Mode Privileged Exec

Usage notes The specified trustpoint must already exist, and it must already be authenticated.

Example To display the PEM file for the trustpoint “example” to the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki export example pem terminal
```

To export the PEM file “example.pem” for the trustpoint “example” to the URL “tftp://server_a/”, use the following commands:

```
awplus> enable
awplus# crypto pki export example pem
tftp://server_a/example.pem
```

Related commands

crypto pki authenticate

crypto pki import pem

crypto pki trustpoint

crypto pki export pkcs12

Overview Use this command to export a certificate and private key for an entity in a trustpoint to a file in PKCS#12 format at the specified URL. The private key is encrypted with a passphrase for security.

Syntax

```
crypto pki export <trustpoint> pkcs12 {ca|server|<username>}
<url>
```

Parameter	Description
<trustpoint>	The name of the trustpoint for which the certificate and key are tobe exported.
`ca`	If this option is specified, the command exports the root CA certificate and corresponding key.
`server`	If this option is specified, the command exports the server certificate and corresponding key.
<username>	If a RADIUS username is specified, the command exports the PKCS#12 file that was previously generated using the crypto pki enroll user command. To avoid ambiguity with keywords, the username may be prefixed by the string “user:”.
<url>	The destination URL for the PKCS#12 file. The format of the URLis the same as any valid destination for a file copy command.

Mode Privileged Exec

Usage notes If the **ca** option is specified, this command exports the root CA certificate and the corresponding private key, if the trustpoint has been authenticated as a locally selfsigned CA. (If the trustpoint represents an external CA, then there is no private key on the system corresponding to the root CA certificate. Use the **crypto pki export pem** file to export the certificate by itself.) The command prompts for a passphrase to encrypt the private key.

If the **server** option is specified, this command exports the server certificate and the corresponding private key, if the server has been enrolled to the trustpoint. The command prompts for a passphrase to encrypt the private key.

If a RADIUS username is specified, this command exports the PKCS#12 file that was generated using the **crypto pki enroll user** command. (The key within the file was already encrypted as part of the user enrollment process.)

In the event that there is a RADIUS user named “ca” or “server”, enter “user:ca” or “user:server” as the username.

The key and certificate must already exist.

Example To export the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable

awplus# crypto pki export example pkcs12 ca
tftp://backup/example.pk12
```

Related commands

crypto pki enroll user

crypto pki export pem

crypto pki import pkcs12

crypto pki import pem

Overview This command imports a certificate for the given trustpoint from a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred from the specified destination URL, or entered at the terminal.

Syntax

```
crypto pki import <trustpoint> pem [terminal|<url>]
```

Parameter	Description
<trustpoint>	The name of the trustpoint for which the root CA certificate is to be imported.
terminal	Optional parameter, If specified, the command prompts the user to enter (or paste) the PEM file at the terminal. If parameter is specified terminal is assumed by default.
<url>	Optional parameter, If specified, the PEM file is transferred from the specified URL

Default The PEM will be imported from the terminal by default.

Mode Privileged Exec

Usage notes The command is generally used for trustpoints representing external certificate authorities. It accepts root CA certificates, intermediate CA certificates, and server certificates. The system automatically detects the certificate type upon import.

Using this command to import root CA certificates at the terminal is identical to the functionality provided by the crypto pki authenticate command, for external certificate authorities. The imported certificate is validated to ensure it is a proper CA certificate.

Intermediate CA certificates are validated to ensure they are proper CA certificates, and that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then intermediate CA certificates may not be imported.

Server certificates are validated to ensure that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then server certificates may not be imported.

The specified trustpoint must already exist. If the imported certificate is self-signed, then no certificates may exist for the trustpoint. Otherwise, the issuer's certificate must already be present for the trustpoint.

Example To import the PEM file for the trustpoint "example" from the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
```

To import the PEM file for the trustpoint "example" from the URL "tftp://server_a/", use the following commands:

```
awplus> enable

awplus# crypto pki import example pem
tftp://server_a/example.pem
```

Related commands

crypto pki authenticate

crypto pki export pem

crypto pki trustpoint

crypto pki import pkcs12

Overview This command imports a certificate and private key for an entity in a trustpoint from a file in PKCS#12 format at the specified URL. The command prompts for a passphrase to decrypt the private key within the file.

Syntax

```
crypto pki import <trustpoint> pkcs12 {ca|server} <url>
```

Parameter	Description
<trustpoint>	The name of the trustpoint for which the certificate and key are to be imported.
ca	If this option is specified, the command imports the root CA certificate and corresponding key.
server	If this option is specified, the command imports the server certificate and corresponding key.
<url>	The source URL for the PKCS#12 file. The format of the URLis the same as any valid destination for a file copy command.

Mode Privileged Exec

Usage notes If the **ca** option is specified, this command imports the root CA certificate and the corresponding private key. This is only valid if the root CA certificate does not already exist for the trustpoint (i.e., if the trustpoint is unauthenticated).

If the **server** option is specified, this command imports the server certificate and the corresponding private key. The imported private key is given a new unique label of the form "localN", where N is a non-negative integer. This operation is only valid if the server certificate does not already exist for the trustpoint (i.e., if the server is not enrolled to the trustpoint).

PKCS#12 files for RADIUS users may not be imported with this command. (There is no value in doing so, as the files are not needed on the local system.)

The specified trustpoint must already exist. The key and certificate must not already exist.

Example To import the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pkcs12 ca
tftp://backup/example.pk12
```

Related commands

crypto pki export pkcs12

crypto pki import pem

crypto pki trustpoint

Overview Use this command to declare the named trustpoint and enter trustpoint configuration mode.

Use the **no** variant of this command to destroy the trustpoint.

Syntax

```
crypto pki trustpoint <trustpoint>
no crypto pki trustpoint <trustpoint>
```

Parameter	Description
<trustpoint>	The name of the trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters.

Mode Global Configuration

Usage notes If the trustpoint did not previously exist, it is created as a new trustpoint. The trustpoint will be empty (unauthenticated) unless the name "local" is selected, in which case the system will automatically authenticate the trustpoint as a local self-signed certificate authority.

The **no** variant of this command destroys the trustpoint by removing all CA and server certificates associated with the trustpoint, as well as the private key associated with the root certificate (if the root certificate was locally self-signed). This is a destructive and irreversible operation, so this command should be used with caution.

Example To configure a trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
```

crypto secure-mode

Overview

Before enabling Secure Mode, make sure that your device is running bootloader version 3.1.3 or later. You can see the bootloader version by running the command show system. If your bootloader version is earlier than 3.1.3, please contact Allied Telesis technical support for assistance.

Use this command to put the device into Secure Mode. When in Secure Mode, the following are disabled:

- Telnet
- SSHv1
- SNMPv1/v2
- All privilege levels except 1 and 15
- Algorithms that are not supported under FIPS, including MD5, RSA-1 and DSA
- The ability to store passwords in cleartext and to specify an **enable** password.

In Secure Mode, the web server on the device (used by the Device GUI) only accepts AES128-SHA ciphers.

Note: Stacking is not supported in Secure Mode.

Use the **no** variant of this command to leave Secure Mode. You should delete all sensitive information first; see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
crypto secure-mode
no crypto secure-mode
```

Default

By default, the device is not in Secure Mode.

Mode

Global Configuration

Example

For step-by-step instructions about how to enter and leave Secure Mode, see “How to Enable Secure Mode” in the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

crypto secure-mode delete hostkey

Overview Use this command to delete the encryption key used for securing configuration secrets in secure mode. Note that doing this will make these secrets impossible to decrypt, potentially impacting the device configuration.

Syntax

```
crypto secure-mode delete hostkey
```

Default Not set.

Mode Privileged Exec

Example To delete the encrypted key, use the command:

```
awplus# crypto secure-mode delete hostkey
```

Related commands

radius-server host

radius-server key

ntp authentication-key

crypto secure-mode

Command changes Version 5.4.9-2.1: command added

crypto verify

Overview Use this command to compare the SHA256 checksum of a file with its correct checksum. This confirms that the file has not been corrupted or interfered with during download. You can verify any kind of file, but you cannot specify a file path, so the file must be stored in the top level of the device's flash memory.

CAUTION: *If a file fails to verify and you believe the file may have been interfered with, we recommend immediately performing a security audit of your network.*

Once the device has verified the file, you can use the **copy running-config startup-config** command to save the file/hash pair in the running configuration. If you do this, the device will verify the file every time it boots up and will take action if the verification fails.

The action taken when verification fails on boot-up depends on the type of file and whether the device is in Secure Mode:

- If the device is in Secure Mode and the boot-up firmware file fails verification, the device will not boot. Contact Allied Telesis support if this happens.
- If the device is not in Secure Mode and the boot-up firmware file fails verification, the device will display the following warning message after booting: "% Verification Failed". If this occurs because the saved hash is incorrect, use this command to replace the hash. If this occurs because the firmware file is corrupted or may have been interfered with, ensure that your device is secure, then replace the failed file with a known good file and reboot.
- If you use the **gui** parameter and the GUI fails verification, the device will boot up but the GUI will be disabled (the **service http** command will be disabled).
- If any other file fails verification, the device will display the following warning message after booting: "% Verification Failed"

You can use the show hash command to see the current hash of a file.

Use the **no** variant of this command to remove a verified filename/hash combination from the running configuration.

Syntax

```
crypto verify <filename> <hash-value>
crypto verify gui <hash-value>
no crypto verify <filename>
```

Parameter	Description
<filename>	The AlliedWare Plus file that you want to verify
gui	Verify the current Device GUI file
<hash-value>	The known correct checksum of the file. For firmware and GUI files, the correct checksum is listed in thesha256sum file that is available from the Allied Telesis Download Center.

Default No default

Mode Global Configuration

Usage notes All models of a particular series run the same firmware file and therefore have the same checksum for that firmware file. For example, all x930 Series switches have the same checksum.

If your network has extremely strict security requirements, such as FIPS compliance, you may need to verify the bootloader on boot-up and use signature verification for the firmware file. To configure these, use the commands crypto verify bootrom and crypto verify signed. These commands make it difficult to upgrade the bootloader or firmware, so only use them if necessary.

Examples To verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify x930-5.5.3-0.1.rel
7f22d8a30c991a4ddc0a2aed47246282b23b4e4a865e07f79795c0959c47de
78
```

Related commands crypto secure-mode

crypto verify bootrom

crypto verify signed

show hash

show secure-mode

Command changes Version 5.5.3-0.1: **gui** parameter added; **<filename>** parameter expanded to cover all file types

crypto verify bootrom

Overview Use this command to compare the SHA256 checksum hash value of a bootloader with its correct checksum. This confirms that the bootloader has not been corrupted or interfered with.

If the verification fails, contact Allied Telesis customer support.

If the device is in Secure Mode, running **crypto verify bootrom** also stores the hash value permanently. When in Secure Mode, we recommend only using this command in networks with extremely strict security requirements, such as in FIPS-compliant networks. This is because you can only remove the hash value by erasing flash memory (for example, by using the erase factory-default command).

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

When not in Secure Mode, you can use the **no** variant of this command to remove the bootrom/hash combination from the running configuration.

Syntax

```
crypto verify bootrom <hash-value>
no crypto verify <filename>
```

Parameter	Description
<hash-value>	The known correct checksum of the bootloader. To see the correct hash value, run the command **show hash bootrom** straight after you first boot the device up, or check the Deployment Guide for the device.

Default No default

Mode Global Configuration

Usage notes All models of a particular series run the same bootloader file and therefore have the same checksum. For example, all x930 Series switches have the same boatloader checksum.

Examples To verify the bootrom file, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify bootrom
5e80e70b6a2200965abf5f62f72af1bdc1654f3726bdff554afcbd76270c91
```

Note that the hash in this example is an example only; it is not the hash of the device's bootloader.

Related commands

crypto secure-mode

crypto verify

crypto verify signed

show hash

show secure-mode

crypto verify signed

Overview Use this command to compare the HMAC-SHA checksum hash value of a firmware file with its correct checksum. This confirms that the firmware has not been corrupted or interfered with. When the device is in Secure Mode, this command also forces the device to check the hash whenever it boots up, and prevents the device from booting if the verification fails.

Caution:

If the device is in Secure Mode, this command makes it difficult to upgrade the device's firmware file. Therefore, only use this command if the device is in Secure Mode and you have extremely strict security requirements, such as in FIPS-compliant networks. Otherwise, use the crypto verify command. See the Usage Notes below for more detail.

If the verification fails, contact Allied Telesis customer support.

Syntax

```
crypto verify signed <filename> <hash-value>
```

Parameter	Description
<filename>	The AlliedWare Plus file that you want to verify
<hash-value>	The known correct checksum of the file. This is a keyed HMAC-SHA hash. This is available in a .sig file, which you can get from your Allied Telesis customer representative.

Default No default

Mode Global Configuration

Usage notes **Caution**:

If the device is in Secure Mode, and if the firmware file verified is the boot release and signed verification succeeds, then the device stores the signed hash and uses it to verify the firmware file on all subsequent reboots. This means that if you change the firmware version, the switch will not boot up. You can only change the firmware version if you reset the switch to the factory defaults **before** changing the firmware version, by using the command erase factory-default.

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

All models of a particular series run the same release file and therefore have the same checksum. For example, all x930 Series switches have the same checksum.

Examples

To use signature verification to verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify signed x930-5.5.3-0.1.rel
3f50420644aebd277dd48b3aee30639801348896fffce231fc5615995ecde5
d9
```

show secure-mode

enrollment (ca-trustpoint)

Overview Use this command to declare how certificates will be added to the system for the current trustpoint.

Syntax

```
enrollment {selfsigned|terminal}
```

Parameter	Description
`selfsigned`	Sets the enrollment mode for the current trustpoint to selfsigned.
`terminal`	Sets the enrollment mode for the current trustpoint to terminal.

Mode Trustpoint Configuration

Usage notes If the enrollment is set to **selfsigned**, then the system will generate a root CA certificate and its associated key when the **crypto pki authenticate** command is issued. It will generate a server certificate (signed by the root CA certificate) when the **crypto pki enroll** command is issued.

If the enrollment is set to **terminal**, then the system will prompt the user to paste the root CA certificate Privacy Enhanced Mail (PEM) file at the terminal, when the **crypto pki authenticate** command is issued. It will create a Certificate Signing Request (CSR) file for the local server when the **crypto pki enroll** command is issued. The server certificate received from the external CA should be imported using the **crypto pki import pem** command.

The trustpoint named “local” may only use the **selfsigned** enrollment setting.

If no enrollment mode is specified, the **crypto pki authenticate** command will fail for the trustpoint.

Example To configure the trustpoint named "example" and set its enrollment to **selfsigned**, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
```

Related commands crypto pki enroll

fingerprint (ca-trustpoint)

Overview Use this command to declare that certificates with the specified fingerprint should be automatically accepted, when importing certificates from an external certificate authority. This can affect the behavior of the **crypto pki authenticate** and **crypto pki import pem** commands.

Use the **no** variant of this command to remove the specified fingerprint from the pre-accepted list.

Syntax

```
fingerprint <word>
no fingerprint <word>
```

Parameter	Description
<word>	The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings.

Default By default, no fingerprints are pre-accepted for the trustpoint.

Mode Trustpoint Configuration

Usage notes Specifying a fingerprint adds it to a list of pre-accepted fingerprints for the trustpoint. When a certificate is imported, if it matches any of the pre-accepted values, then it will be saved in the system automatically. If the imported certificate's fingerprint does not match any pre-accepted value, then the user will be prompted to verify the certificate contents and fingerprint visually.

This command is useful when certificates from an external certificate authority are being transmitted over an insecure channel. If the certificate fingerprint is delivered via a separate messaging channel, then pre-entering the fingerprint value via cut-and-paste may be less errorprone than attempting to verify the fingerprint value visually.

The fingerprint is a series of 40 hexadecimal characters. It may be entered as a continuous string, or as a series of up to multiple strings separated by spaces. The input format is flexible because different certificate authorities may provide the fingerprint string in different formats.

Example To configure a fingerprint "5A81D34C 759CC4DA CFCA9F65 0303AD83 410B03AF" for the trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# fingerprint 5A81D34C 759CC4DA CFCA9F65
0303AD83 410B03AF
```

Related commands crypto pki authenticate

crypto pki import pem

no crypto pki certificate

Overview Use this command to delete a certificate with the specified fingerprint from the specified trustpoint.

Syntax

```
no crypto pki certificate <trustpoint> <word>
```

Parameter	Description
<trustpoint>	The name of the trustpoint.
<word>	The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings.

Default By default, no fingerprints are pre-accepted for the trustpoint.

Mode Privileged Exec

Usage notes The fingerprint can be found in the output of the **show crypto pki certificates** command. If there are dependent certificates in the trustpoint (i.e., if other certificates were signed by the specified certificate), the command will be rejected.

If the specified certificate is the root CA certificate and the trustpoint represents a locally selfsigned CA, then the corresponding private key is also deleted from the system. Deleting the root CA certificate effectively resets the trustpoint to an unauthenticated state.

Example To delete a certificate with the fingerprint "594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792" from the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# no crypto pki certificate example
594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

Related commands no crypto pki trustpoint

show crypto pki certificates

rsakeypair (ca-trustpoint)

Overview Use this command to declare which RSA key pair should be used to enroll the local server with the trustpoint. Note that this defines the key pair used with the server certificate, not the key pair used with the root CA certificate.

Use the **no** variant of this command to restore the default value, “server-default”.

Syntax

```
rsakeypair <keylabel> [<1024-4096>]
no rsakeypair
```

Parameter	Description
<keylabel>	The key to be used with the server certificate for this trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters.
<1024-4096>	The bit length for the key, to be used if the key is implicitly generated during server enrollment.

Default The default value for **keylabel** is “server-default”.

The default value for the key bit length is 2048.

Mode Trustpoint Configuration

Usage notes If the label specified does not refer to an existing key created by the **crypto key generate rsa** command, the key will be implicitly generated when the **crypto pki enroll** command is issued to generate the server certificate or the server certificate signing request. The optional numeric parameter defines the bit length for the key, and is only applicable for keys that are implicitly created during enrollment.

This command does not affect server certificates or server certificate signing requests that have already been generated. The trustpoint’s server certificate is set to use whatever key pair was specified for the trustpoint at the time the **crypto pki enroll** command is issued.

The default key pair is “server-default”. The default bit length is 2048 bits.

Example To configure trustpoint "example" to use the key pair "example-server-key" with a bit length of 2048, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# rsakeypair example-server-key 2048
```

Related commands crypto key generate rsa

show crypto key mypubkey rsa

Overview Use this command to display information about the specified Rivest-Shamir-Adleman encryption key.

Syntax

```
show crypto key mypubkey rsa [<keylabel>]
```

Parameter	Description
<keylabel>	The name of the key to be shown, if specified.

Default By default, all keys will be shown.

Mode Privileged Exec

Usage notes If no key label is specified, information about all keys is shown. The command displays the bit length of the key, a key fingerprint (a hash of the key contents to help uniquely identify a key), and a list of trustpoints in which the server certificate is using the key.

The specified keys must exist.

Example To show all keys, use the following commands:

```
awplus> enable
awplus# show crypto key mypubkey rsa
```

Output Figure 53-1: Example output from **show crypto key mypubkey rsa**

```
awplus#show crypto key mypubkey rsa
--------------------
RSA Key Pair "example-server-key":
   Key size    : 2048 bits
   Fingerprint : 1A605D73 C2274CB7 853886B3 1C802FC6 7CDE45FB
   Trustpoints : example
--------------------
RSA Key Pair "server-default":
   Key size    : 2048 bits
   Fingerprint : 34AC4D2D 5249A168 29D426A3 434FFC59 C4A19901
   Trustpoints : local
```

Related commands crypto key generate rsa

show crypto pki certificates

Overview Use this command to display information about existing certificates for the specified trustpoint.

Syntax

```
show crypto pki certificates [<trustpoint>]
```

Parameter	Description
<trustpoint>	The trustpoint for which the certificates are to be shown.

Default By default, the certificates for all trustpoints are shown.

Mode Privileged Exec

Usage notes If no trustpoint is specified, certificates for all trustpoints are shown. The command displays the certificates organized into certificate chains. It starts with the server certificate and then displays its issuer, and continues up the issuer chain until the root CA certificate is reached.

For each certificate, the command displays the certificate type, the subject's distinguished name (the entity identified by the certificate), the issuer's distinguished name (the entity that signed the certificate), the validity dates for the certificate, and the fingerprint of the certificate. The fingerprint is a cryptographic hash of the certificate contents that uniquely identifies the certificate.

The specified trustpoints must already exist.

Example To show the certificates for the trustpoint "example", use the following command:

```
awplus> enable
awplus# show crypto pki certificates example
```

Output Figure 53-2: Example output from **show crypto pki certificates**

```
awplus>enable
awplus#show crypto pki certificates example
--------------------
Trustpoint "example" Certificate Chain
--------------------
Server certificate
   Subject     : /O=local/CN=local.loc.lc

Related commands crypto pki trustpoint

show crypto pki enrollment user

Overview Use this command to display a list of trustpoints for which RADIUS user enrollments have been performed, using the **crypto pki enroll user** command. This indicates that PKCS#12 files for the user are available for export for the given trustpoints, using the **crypto pki export pkcs12** command.

Syntax

```
crypto pki enrollment user <username>
```

Parameter	Description
<username>	The user for which enrollments are to be shown.

Mode Privileged Exec

Example To show the list of trustpoints to which user "exampleuser1" is enrolled, use the following commands:

```
awplus> enable
awplus(config)# show crypto pki enrollment user exampleuser1
```

Output Figure 53-3: Example output from **show crypto pki enrollment user**

```
awplus> enable
awplus# show crypto pki enrollment user exampleuser1
User "exampleuser1" is enrolled to the following trustpoints:
local,example
```

Related commands

crypto pki enroll user

crypto pki export pkcs12

show crypto pki trustpoint

Overview Use this command to display information about the specified trustpoint.

Syntax

```
show crypto pki trustpoint [<trustpoint>]
```

Parameter	Description
<trustpoint>	The name of the trustpoint to be shown

Default By default, all trustpoints are shown.

Mode Privileged Exec

Usage notes If no trustpoint is specified, information about all trustpoints is shown. The command displays the authentication status of the trustpoint, the fingerprint of the root CA certificate (if it exists), the enrollment status of the local server with the trustpoint, a list of any applications that are configured to use the trustpoint, and the trustpoint parameters that were configured from trustpoint-configuration mode.

The specified trustpoints must already exist.

Example To show the details of the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# show crypto pki trustpoint example
```

Output Figure 53-4: Example output from **show crypto pki trustpoint**

```
awplus> enable
awplus# show crypto pki trustpoint example
--------------------
Trustpoint "example"
   Type             : Self-signed certificate authority
   Root Certificate: 50C1856B EEC7555A 0F3A61F6 690D9463 67DF74D1
   Local Server     : The server is enrolled to this trustpoint.
   Server Key       : example-server-key
   Applications     : RADIUS

Authentication and Enrollment Parameters:
   Enrollment       : selfsigned
   RSA Key Pair     : example-server-key (2048 bits)
--------------------
```

Related commands

crypto pki trustpoint

show crypto pki certificates

show hash

Overview Use this command to display the hash for a specified file on the device, or for the device's current bootloader.

Syntax

```
show hash <filename>
show hash bootrom
```

Parameter	Description
<filename>	The name of the file to display the hash for.
bootrom	Display the hash for the current bootloader.

Mode Privileged Exec

Examples To show the hash for the GUI file named awplus-gui_552_27.gui, use the command:

```
awplus# show hash awplus-gui_552_27.gui
```

To show the hash for a file named 'example.txt', which is in the folder named 'example' in flash memory, use the command:

```
awplus# show hash flash://example/example.txt
```

To show the hash for the bootloader, use the command:

```
awplus# show hash bootrom
```

Output Figure 53-5: Example output from **show hash**

```
awplus#show hash awplus-gui_552_27.gui
b793e2c7fc5580513472017f964316f3bb0e79fbf1ddfd6f3844a2a8311c5c64
```

Related commands

crypto verify bootrom

Command changes Version 5.5.3-0.1: command added

show secure-mode

Overview Use this command to see whether secure mode is enabled or not. Secure mode disables a number of insecure features, such as Telnet.

Syntax

```
show secure-mode
```

Mode User Exec/Privileged Exec

Example To see if secure mode is enabled, use the command:

```
awplus# show secure-mode
```

Output Figure 53-6: Example output from **show secure-mode**

```
awplus#show secure-mode
Secure mode is enabled
```

Related commands crypto secure-mode

subject-name (ca-trustpoint)

Overview Use this command to specify the distinguished name string that should be used for the subject field in the server certificate, when enrolling the server (generating the server certificate or server certificate signing request).

Syntax

```
subject-name <word>
```

Parameter	Description
<word>	Specify the subject name as a distinguished name string. Complex strings (e.g., strings containing spaces) should be surrounded with double-quote characters.

Default If no subject name is specified for the trustpoint, then the system automatically builds a name of the form "/O=AlliedWare Plus/CN=xxxx.yyyy.zzz", where "xxxx" is the hostname of the system and "yyyy.zzz" is the default search domain for the system.

Mode Trustpoint Configuration

Usage notes The subject name is specified as a variable number of fields, where each field begins with a forward-slash character ("/"). Each field is of the form "XX=value", where "XX" is the abbreviation of the node type in the tree.

Common values include:

- "C" (country),
- "ST" (state),
- "L" (locality),
- "O" (organization),
- "OU" (organizational unit), and
- "CN" (common name).

Of these fields, "CN" is usually the most important.

NOTE: *For a server certificate, many applications require that the network name of the server matches the common name in the server's certificate.*

Example To configure the trustpoint named "example" and set its subject name, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# subject-name "/O=My
Company/CN=192.168.1.1
```

54 TACACS+ Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure the device to use TACACS+ servers. For more information about TACACS+, see the TACACS+ Feature Overview and Configuration Guide.

TACACS+ is not available in Secure Mode (see the crypto secure-mode command).

Command List

aaa authorization commands

Overview This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

Syntax

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]
```

```
no aaa authorization commands <privilege-level>
{default|<list-name>}
```

Parameter	Description
<privilege-level>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: **Level = 1**: All commands that can be accessed by a user with privilege level between 1 and 6 inclusive **Level = 7:** All commands that can be accessed by a user with privilege level between 7 and 14 inclusive **Level = 15**: All commands that can be accessed by a user with privilege level 15
`group`	Specify the server group where authorization messages are sent. Only the `tacacs+` group is available for this command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.
`default`	Configure the default authorization commands method list.
<list-name>	Configure a named authorization commands method list
`none`	If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.

Mode Global Configuration

Usage notes TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

Example To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

Related commands

aaa authorization config-commands

authorization commands

tacacs-server host

Command changes Version 5.4.6-2.1: command added

aaa authorization config-commands

Overview Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

Syntax

```
aaa authorization config-commands
no aaa authorization config-commands
```

Default By default, command authorization is disabled on configuration mode commands.

Mode Global Configuration

Usage notes If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

NOTE: *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

Example To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

Related commands aaa authorization commands

authorization commands

tacacs-server host

Command changes Version 5.4.6-2.1: command added

authorization commands

Overview This command applies a command authorization method list, defined using the aaa authorization commands command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

Syntax

```
authorization commands <privilege-level> {default|<list-name>}
no authorization commands <privilege-level>
```

Parameter	Description
<privilege-level>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: **Level = 1**: All commands that can be accessed by a user with privilege level between 1 and 6 inclusive **Level = 7:** All commands that can be accessed by a user with privilege level between 7 and 14 inclusive **Level = 15**: All commands that can be accessed by a user with privilege level 15
`default`	Configure the default authorization commands method list.
<list-name>	Configure a named authorization commands method list

Default The **default** method list is applied to each console and VTY line by default.

Mode Line Configuration

Usage notes If the specified method list does not exist users will not be enable to execute any commands in the specified method list on the specified VTY lines.

Example To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

Related commands aaa authorization commands

aaa authorization config-commands

tacacs-server host

Command changes

Version 5.4.6-2.1: command added

ip tacacs source-interface

Overview This command sets the source interface, or IP address, to use for all TACACS+ packets sent from the device. By default, TACACS+ packets use the source IP address of the egress interface.

Use the **no** variant of this command to remove the source interface configuration and use the source IP address of the egress interface.

Syntax

```
ip tacacs source-interface {<interface>|<ip-address>}
no ip tacacs source-interface
```

Parameter	Description
<interface>	Interface name.
<ip-address>	IP address in the dotted decimal format A.B.C.D.

Default The source IP address of outgoing TACACS+ packets default to the IP address of the egress interface.

Mode Global Configuration

Usage notes Setting the source interface ensures that all TACACS+ packets sent from the device will have the same source IP address. Once configured this affects all TACACS+ packets, namely accounting, authentication, and authorization.

If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing TACACS+ packets will default to the IP address of the egress interface.

Example To configure all outgoing TACACS+ packets to use the IP address of the loop-back "lo" interface as the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tacacs source-interface lo
```

To reset the source interface configuration for all TACACS+ packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip tacacs source-interface
```

Related commands tacacs-server host

show tacacs+

Command changes Version 5.4.6-2.1: command added

show tacacs+

Overview This command displays the current TACACS+ server configuration and status.

Syntax `show tacacs+`

Mode User Exec and Privileged Exec

Example To display the current status of TACACS+ servers, use the command:

```
awplus# show tacacs+
```

Output Figure 54-1: Example output from the **show tacacs+** command

```
TACACS+ Global Configuration
  Source Interface    : not configured
  Timeout             : 5 sec

Server Host/      Server
IP Address        Status
------------------------------------------------------------
192.168.1.10      Alive
192.168.1.11      Unknown
```

Table 1: Parameters in the output of the **show tacacs+** command

Output Parameter	Meaning	
`Source Interface`	IP address of source interface if set with ip tacacs source-interface.	
`Timeout`	A time interval in seconds.	
`Server Host/IP Address`	TACACS+ server hostname or IP address.	
`Server Status`	The status of the authentication port.	
	`Alive`	The server is alive.
	`Dead`	The server has timed out.
	`Error`	The server is not responding or there is an error in the key string entered.
	`Unknown`	The server is never used or the status is unkown.
	`Unreachable`	The server is unreachable.
	`Unresolved`	The server name can not be resolved.

Command changes Version 5.4.6-2.1: **Source Interface** parameter added

tacacs-server host

Overview Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

Syntax

```
tacacs-server host {<host-name>|<ip-address>} [key [8]
<key-string>]
```

```
no tacacs-server host {<host-name>|<ip-address>}
```

Syntax (VRF-lite)

```
tacacs-server host {<host-name>|<ip-address>} [vrf <vrf-name>]
[key [8] <key-string>]
```

```
no tacacs-server host {<host-name>|<ip-address>} [vrf
<vrf-name>]
```

Parameter	Description
<host-name>	Server host name. The DNS name of the TACACS+ server host.
<ip-address>	The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.
vrf *<vrf-name>*	The name of a VRF instance. Use this to specify the VRF that the TACACS+ server is accessible by. Servers are uniquely identified by their address and VRF, so multiple servers can have the same address or host-name as long as the VRF is different. The default is the global VRF.
key	Set shared secret key with TACACS+ servers.
8	Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the tacacs-server key command. If no key value is specified, the global value is used.

Default No TACACS+ server is configured by default.

Mode Global Configuration

Usage A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable
- it cannot communicate with the switch properly due to the switch and the server having different secret keys

Examples

To add the server tac1.company.com as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to 'secret' on the TACACS+ server 192.168.1.1, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server tac1.company.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

Examples (VRF-lite)

To add the server tac1.company.com as the TACACS+ server host in the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com vrf red
```

To remove the TACACS+ server 192.168.1.1 from the VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host 192.168.1.1 vrf red
```

Related commands

show tacacs+

Command changes

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

tacacs-server key

Overview This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the tacacs-server host command, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

Syntax

```
tacacs-server key [8] <key-string>
no tacacs-server key
```

Parameter	Description
8	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server.

Mode Global Configuration

Usage notes Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the tacacs-server host command, this global key is used.

Examples To set the global secret key to `secret` for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server key
```

Related commands tacacs-server host

show tacacs+

tacacs-server timeout

Overview Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.

Note that this command configures the **timeout** parameter for TACACS+ servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

Syntax

```
tacacs-server timeout <seconds>
no tacacs-server timeout
```

Parameter	Description
<seconds>	TACACS+ server timeout in seconds, in the range 1 to 1000.

Default The default timeout value is 5 seconds.

Mode Global Configuration

Examples To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server timeout
```

Related commands tacacs-server host

show tacacs+

55 DHCP Snooping Commands

Introduction

Overview

This chapter gives detailed information about the commands used to configure DHCP snooping. For detailed descriptions of related ACL commands, see IPv4 Hardware Access Control List (ACL) Commands. For more information about DHCP snooping, see the DHCP Snooping Feature Overview and Configuration Guide.

DHCP snooping can operate on static link aggregators (e.g. sa2) and dynamic link aggregators (e.g. po2), as well as on switch ports (e.g. port1.0.2).

Command List

arp security

Overview Use this command to enable ARP security on untrusted ports in the VLANs, so that the switch only responds to/forwards ARP packets if they have recognized IP and MAC source addresses.

Use the **no** variant of this command to disable ARP security on the VLANs.

Syntax

```
arp security
no arp security
```

Default Disabled

Mode Interface Configuration (VLANs)

Usage Enable ARP security to provide protection against ARP spoofing. DHCP snooping must also be enabled on the switch (service dhcp-snooping command), and on the VLANs (ip dhcp snooping command).

Example To enable ARP security on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# arp security
```

Related commands

arp security violation

show arp security

show arp security interface

show arp security statistics

arp security drop link-local-arps

Overview Use this command to enable ARP security on a per-port basis. This means that IPv4 link-local ARPs will be dropped without causing an ARP security violation when received.

Use the **no** variant of this command to return to the default setting of disabled.

Syntax

```
arp security drop link-local-arps
no arp security drop link-local-arps
```

Default Disabled by default.

Mode Interface Configuration

Usage notes Hosts that implement RFC 3927 may automatically assign themselves link-local IPv4 addresses in the subnet 169.254.0.0/16, if they are configured to learn their IP addresses via DHCP but are unable to contact a DHCP server. This is common behavior for all versions of Microsoft Windows since Windows XP. In an attempt to avoid IP address collision with other devices on the local network, the host will broadcast ARP probes for its randomly selected link-local IP address.

By default, ARP security will treat these ARP probes as violations and carry out the configured violation action on the port they are received on. If the violation action is configured as link-down, this will result in the host being disconnected from the network, which will interrupt any DHCP IP address discovery that was in progress.

Use this command to configure ARP Security to drop these ARP probes, and any other ARPs that contain link-local IP addresses, without raising a violation on the affected port. The count of ARPs dropped in this manner can be seen in the output of **show arp security statistics detail**.

Example To configure ARP security to drop IPv4 link local ARPs on port1.0.1 to port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# arp security drop link-local-arps
```

Related commands

arp security

arp security violation

show arp security statistics

Command changes Version 5.4.9-1.1: command added.

arp security violation

Overview Use this command to specify an additional action to perform if an ARP security violation is detected on the ports. ARP security must also be enabled (arp security command).

Use the **no** variant of this command to remove the specified action, or all actions. Traffic violating ARP security will be dropped, but no other action will be taken.

Syntax

```
arp security violation {log|trap|link-down} ...
no arp security violation [log|trap|link-down] ...
```

Parameter	Description
`log`	Generate a log message. To display these messages, use the show log command.
`trap`	Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the snmp-server enable trap command. Notifications are limited to one per second and to one per source MAC and violation reason. Additional violations within a second of a notification being sent will not result in further notifications. Default: disabled.
`link-down`	Shut down the port that received the packet. Default: disabled.

Default When the switch detects an ARP security violation, it drops the packet. By default, it does not perform any other violation actions.

Mode Interface Configuration (switch ports, static or dynamic aggregated links)

Usage notes When the switch detects an ARP security violation on an untrusted port in a VLAN that has ARP security enabled, it drops the packet. This command sets the switch to perform additional actions in response to ARP violations.

If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the shutdown command.

Example To send SNMP notifications for ARP security violations on ports 1.0.1 to 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.6
awplus(config-if)# arp security violation trap
```

Related commands

arp security

show arp security interface

show arp security statistics

show log

snmp-server enable trap

clear arp security statistics

Overview Use this command to clear ARP security statistics for the specified ports, or for all ports.

Syntax

```
clear arp security statistics [interface <port-list>]
```

Parameter	Description
<port-list>	The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The ports may be switch ports, or static or dynamic link aggregators.

Mode Privileged Exec

Example To clear statistics for ARP security on interface port1.0.1, use the command:

```
awplus# clear arp security statistics interface port1.0.1
```

Related commands

arp security violation

show arp security

show arp security statistics

clear ip dhcp snooping binding

Overview Use this command to remove one or more DHCP Snooping dynamic entries from the DHCP Snooping binding database. If no options are specified, all entries are removed from the database.

CAUTION: If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.

Syntax

```
clear ip dhcp snooping binding [<ipaddr>] [interface
<port-list>] [vlan <vid-list>]
```

Parameter	Description
<ipaddr>	Remove the entry for this client IP address.
<port-list>	Remove all entries for these ports. The port list may contain switch ports, and static or dynamic link aggregators (channel groups).
<vid-list>	Remove all entries associated with these VLANs.

Mode Privileged Exec

Usage This command removes dynamic entries from the database. Note that dynamic entries can also be deleted by using the **no** variant of the ip dhcp snooping binding command.

Dynamic entries can individually restored by using the ip dhcp snooping binding command.

To remove static entries, use the **no** variant of the ip source binding command.

Example To remove a dynamic lease entry from the DHCP snooping database for a client with the IP address 192.168.1.2, use the command:

```
awplus# clear ip dhcp snooping binding 192.168.1.2
```

Related commands

ip dhcp snooping binding

ip source binding

show ip dhcp snooping binding

clear ip dhcp snooping statistics

Overview Use this command to clear DHCP snooping statistics for the specified ports, or for all ports.

Syntax

```
clear ip dhcp snooping statistics [interface <port-list>]
```

Parameter	Description
<port-list>	The ports to clear statistics for. If no ports are specified, statistics are cleared for all ports. The port list can contain switch ports, or static or dynamic link aggregators.

Mode Privileged Exec

Example To clear statistics for the DHCP snooping on interface port1.0.1, use the command:

```
awplus# clear ip dhcp snooping statistics interface port1.0.1
```

Related commands

clear arp security statistics

show ip dhcp snooping

show ip dhcp snooping statistics

debug arp security

Overview Use this command to enable ARP security debugging.

Use the **no** variant of this command to disable debugging for ARP security.

Syntax

```
debug arp security
no debug arp security
```

Default Disabled

Mode Privileged Exec

Example To enable ARP security debugging, use the commands:

```
awplus# debug arp security
```

Related commands show debugging arp security

show log

terminal monitor

debug ip dhcp snooping

Overview Use this command to enable the specified types of debugging for DHCP snooping.

Use the **no** variant of this command to disable the specified types of debugging.

Syntax

```
debug ip dhcp snooping {all|acl|db|packet [detail]}
no debug ip dhcp snooping {all|acl|db|packet [detail]}
```

Parameter	Description
`all`	All DHCP snooping debug.
`acl`	DHCP snooping access list debug.
`db`	DHCP snooping binding database debug.
`packet`	DHCP snooping packet debug. For the **no** variant of this command, this option also disables detailed packet debug, if it was enabled.
`detail`	Detailed packet debug.

Default Disabled

Mode Privileged Exec

Example To enable access list debugging for DHCP snooping, use the commands:

```
awplus# debug ip dhcp snooping acl
```

Related commands

debug arp security

show debugging ip dhcp snooping

show log

terminal monitor

ip dhcp snooping

Overview Use this command to enable DHCP snooping on one or more VLANs.

Use the **no** variant of this command to disable DHCP snooping on the VLANs.

Syntax

```
ip dhcp snooping
no ip dhcp snooping
```

Default DHCP snooping is disabled on VLANs by default.

Mode Interface Configuration (VLANs)

Usage notes

Enabling DHCP snooping

For DHCP snooping to operate on a VLAN, you must:

- enable the service on the switch by using the service dhcp-snooping command, and
- enable DHCP snooping on the particular VLAN by using the ip dhcp snooping command, and
- if there is an external DHCP server, configure the port connected to the server as a trusted port, by using the ip dhcp snooping trust command

Disabling DHCP snooping

Use **no service dhcp-snooping** to disable DHCP snooping.

Disabling DHCP snooping removes all DHCP snooping configuration from the running configuration, except for:

- any DHCP snooping maximum bindings settings (ip dhcp snooping max-bindings), and
- any additional DHCP snooping-based ACLs you have created for filtering on untrusted ports.

You must remove any such additional DHCP snooping-based ACLs, using the **no access-group** command. This is because these ACLs block all traffic except for traffic that matches DHCP snooping entries. Once you have disabled DHCP snooping, these ACLs will block all traffic. Note that if you disable DHCP snooping on particular VLANs (using the **no ip dhcp snooping** command), you need to make sure you remove any such additional ACLs that apply to those VLANs.

If you re-enable the service, the switch repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (see the ip dhcp snooping database command). It also updates the lease expiry times.

Examples To enable DHCP snooping on VLANs 2 to 4, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ip dhcp snooping
```

To disable DHCP snooping on the switch, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ip dhcp snooping
```

Related commands

ip dhcp snooping trust

service dhcp-snooping

show ip dhcp snooping

ip dhcp snooping agent-option

Overview Use this command to enable DHCP Relay Agent Option 82 information insertion on the switch. When this is enabled, the switch:

- inserts DHCP Relay Agent Option 82 information into DHCP packets that it receives on untrusted ports
- removes DHCP Relay Agent Option 82 information from DHCP packets that it sends to untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 insertion.

Syntax

```
ip dhcp snooping agent-option
no ip dhcp snooping agent-option
```

Default DHCP Relay Agent Option 82 insertion is enabled by default when DHCP snooping is enabled.

Mode Global Configuration

Usage notes DHCP snooping must also be enabled on the switch (service dhcp-snooping command), and on the VLANs (ip dhcp snooping command).

If a subscriber ID is configured for the port (ip dhcp snooping subscriber-id command), the switch includes this in the DHCP Relay Agent Option 82 information it inserts into DHCP packets received on the port.

Example To disable DHCP Relay Agent Option 82 on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping agent-option
```

Related commands

ip dhcp snooping

ip dhcp snooping agent-option allow-untrusted

ip dhcp snooping subscriber-id

service dhcp-snooping

show ip dhcp snooping

ip dhcp snooping agent-option allow-untrusted

Overview Use this command to enable DHCP Relay Agent Option 82 information reception on untrusted ports. When this is enabled, the switch accepts incoming DHCP packets that contain DHCP Relay Agent Option 82 information on untrusted ports.

Use the **no** variant of this command to disable DHCP Relay Agent Option 82 information reception on untrusted ports.

Syntax

```
ip dhcp snooping agent-option allow-untrusted
no ip dhcp snooping agent-option allow-untrusted
```

Default Disabled

Mode Global Configuration

Usage notes If the switch is connected via untrusted ports to edge switches that insert DHCP Relay Agent Option 82 information into DHCP packets, you may need to allow these DHCP packets through the untrusted ports, by using this command.

When this is disabled (default), the switch treats incoming DHCP packets on untrusted ports that contain DHCP Relay Agent Option 82 information as DHCP snooping violations: it drops them and applies any violation action specified by the ip dhcp snooping violation command. The switch stores statistics for packets dropped; to display these statistics, use the show ip dhcp snooping statistics command.

Example To enable DHCP snooping Option 82 information reception on untrusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping agent-option allow-untrusted
```

Related commands

ip dhcp snooping agent-option

ip dhcp snooping violation

show ip dhcp snooping

show ip dhcp snooping statistics

ip dhcp snooping agent-option circuit-id vlantriplet

Overview Use this command to specify the Circuit ID sub-option of the DHCP Relay Agent Option 82 field as the VLAN ID and port number. The Circuit ID specifies the switch port and VLAN ID that the client-originated DHCP packet was received on.

Use the **no** variant of this command to set the Circuit ID to the default, the VLAN ID and Ifindex (interface number).

Syntax

```
ip dhcp snooping agent-option circuit-id vlantriplet
no ip dhcp snooping agent-option circuit-id
```

Default By default, the Circuit ID is the VLAN ID and Ifindex (interface number).

Mode Interface Configuration for a VLAN interface.

Usage The Circuit ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled (ip dhcp snooping agent-option command; enabled by default), and
- DHCP snooping is enabled on the switch (service dhcp-snooping) and on the VLAN to which the port belongs (ip dhcp snooping)

Examples To set the Circuit ID to `vlantriplet` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option circuit-id
vlantriplet
```

To return the Circuit ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option circuit-id
```

Related commands

ip dhcp snooping agent-option

ip dhcp snooping agent-option remote-id

show ip dhcp snooping

show ip dhcp snooping agent-option

ip dhcp snooping agent-option remote-id

Overview Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field. The Remote ID identifies the device that inserted the Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the switch's MAC address.

Use the **no** variant of this command to set the Remote ID to the default, the switch's MAC address.

Syntax

```
ip dhcp snooping agent-option remote-id <remote-id>
no ip dhcp snooping agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. If the Remote ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed.

Default The Remote ID is set to the switch's MAC address by default.

Mode Interface Configuration for a VLAN interface.

Usage The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of forwarded client DHCP packets:

- DHCP snooping Option 82 information insertion is enabled (ip dhcp snooping agent-option command; enabled by default), and
- DHCP snooping is enabled on the switch (service dhcp-snooping) and on the VLAN to which the port belongs (ip dhcp snooping)

Examples To set the Remote ID to `myid` for client DHCP packets received on `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp snooping agent-option remote-id myid
```

To return the Remote ID format to the default for `vlan1`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp snooping agent-option remote-id
```

Related commands

ip dhcp snooping agent-option

ip dhcp snooping agent-option circuit-id vlantriplet

show ip dhcp snooping

show ip dhcp snooping agent-option

ip dhcp snooping binding

Overview Use this command to manually add a dynamic-like entry (with an expiry time) to the DHCP snooping database. Once added to the database, this entry is treated as a dynamic entry, and is stored in the DHCP snooping database backup file. This command is not stored in the switch's running configuration.

Use the **no** variant of this command to delete a dynamic entry for an IP address from the DHCP snooping database, or to delete all dynamic entries from the database.

CAUTION: If you remove entries from the database for current clients, they will lose IP connectivity until they request and receive a new DHCP lease. If you clear all entries, all clients connected to untrusted ports will lose connectivity.

Syntax

```
ip dhcp snooping binding <ipaddr> [<macaddr>] vlan <vid>
interface <port> expiry <expiry-time>
```

```
no ip dhcp snooping binding [<ipaddr>]
```

Parameter	Description
<ipaddr>	Client's IP address.
<macaddr>	Client's MAC address in HHHH.HHHH.HHHH format.
<vid>	The VLAN ID for the entry, in the range 1 to 4094.
<port>	The port the client is connected to. The port can be a switch port, or a static or dynamic link aggregation (channel group).
<expiry-time>	The expiry time for the entry, in the range 5 to 2147483647 seconds.

Mode Privileged Exec

Usage notes Note that dynamic entries can also be deleted from the DHCP snooping database by using the clear ip dhcp snooping binding command.

To add or remove static entries from the database, use the ip source binding command.

Example To restore an entry in the DHCP snooping database for a DHCP client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, and with an expiry time of 1 hour, use the commands:

```
awplus# ip dhcp snooping binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.0.6 expiry 3600
```

Related commands

clear ip dhcp snooping binding

ip source binding

show ip dhcp snooping binding

ip dhcp snooping database

Overview Use this command to set the location of the file to which the dynamic entries in the DHCP snooping database are written. This file provides a backup for the DHCP snooping database.

Use the **no** variant of this command to set the database location back to the default, **nvs**.

Syntax

```
ip dhcp snooping database {nvs|flash|usb}
no ip dhcp snooping database
```

Parameter	Description
`nvs`	The switch checks the database and writes the file to non-volatile storage (NVS) on the switch at 2 second intervals if it has changed.
`flash`	The switch checks the database and writes the file to Flash memory on the switch at 60 second intervals if it has changed.
`usb`	The switch checks the database and writes the file to a USB storage device installed in the switch at 2 second intervals if it has changed.

Default nvs

Mode Global Configuration

Usage notes In a stack, the backup file is automatically synchronized across all stack members to the location configured. If the backup file is stored on a USB storage device on the stack master, it is only synchronized across stack members that also have USB storage devices installed.

If the location of the backup file is changed by using this command, a new file is created in the new location, and the old version of the file remains in the old location. This can be removed if necessary (hidden file: **.dhcp.dsn.gz**).

Example To set the location of the DHCP snooping database to Flash memory, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping database flash
```

Related commands show ip dhcp snooping

ip dhcp snooping delete-by-client

Overview Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when it receives a valid DHCP release message with matching IP address, VLAN ID, and client hardware address on an untrusted port, and to discard release messages that do not match an entry in the database.

Use the **no** variant of this command to set the switch to forward DHCP release messages received on untrusted ports without removing any entries from the database.

Syntax

```
ip dhcp snooping delete-by-client
no ip dhcp snooping delete-by-client
```

Default Enabled: by default, DHCP lease entries are deleted from the DHCP snooping database when matching DHCP release messages are received.

Mode Global Configuration

Usage DHCP clients send a release message when they no longer wish to use the IP address they have been allocated by a DHCP server. Use this command to enable DHCP snooping to use the information in these messages to remove entries from its database immediately. Use the **no** variant of this command to ignore these release messages. Lease entries corresponding to ignored DHCP release messages eventually time out when the lease expires.

Examples To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when a matching release message is received, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-client
```

To set the switch to forward and ignore the content of any DHCP release messages it receives, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-client
```

Related commands show ip dhcp snooping

ip dhcp snooping delete-by-linkdown

Overview Use this command to set the switch to remove a dynamic entry from the DHCP snooping database when its port goes down. If the port is part of an aggregated link, the entries in the database are only deleted if all the ports in the aggregated link are down.

Use the **no** variant of this command to set the switch not to delete entries when ports go down.

Syntax

```
ip dhcp snooping delete-by-linkdown
no ip dhcp snooping delete-by-linkdown
```

Default Disabled: by default DHCP Snooping bindings are not deleted when an interface goes down.

Mode Global Configuration

Usage notes If this command is enabled in a stack, and the master goes down and is replaced by a new master, entries in the DHCP snooping database for ports on the master are removed, unless they are part of link aggregators that are still up.

Examples To set the switch to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp snooping delete-by-linkdown
```

To set the switch not to delete DHCP snooping lease entries from the DHCP snooping database when links go down, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping delete-by-linkdown
```

Related commands show ip dhcp snooping

ip dhcp snooping disable-l2-flooding

Overview Use this command to disable Layer 2 flooding of DHCP packets on the specified VLANs. These should be VLANs that you have **not** enabled DHCP snooping on.

You need to do this if you have enabled DHCP snooping on a subset of your VLANs and you are using Q-in-Q (VLAN stacking or VLAN double-tagging). Otherwise, the switch may forward two copies of some DHCP packets on the non-snooping VLANs, with one copy being single-tagged instead of double-tagged.

Use the **no** variant of this command to enable Layer 2 flooding of DHCP packets again.

Syntax

```
ip dhcp snooping disable-l2-flooding
no ip dhcp snooping disable-l2-flooding
```

Default The **no** variant, so Layer 2 flooding of DHCP packets is enabled

Mode Interface Configuration for a VLAN interface.

Example To disable Layer 2 flooding on VLANs 10-20, which DHCP snooping is **not** enabled on, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10-vlan20
awplus(config-if)# ip dhcp snooping disable-l2-flooding
```

Related commands service dhcp-snooping

ip dhcp snooping max-bindings

Overview Use this command to set the maximum number of DHCP lease entries that can be stored in the DHCP snooping database for each of the ports. Once this limit has been reached, no further DHCP lease allocations made to devices on the port are stored in the database.

Use the **no** variant of this command to reset the maximum to the default, 1.

Syntax

```
ip dhcp snooping max-bindings <0-520>
no ip dhcp snooping max-bindings
```

Parameter	Description
<0-520>	The maximum number of bindings that will be stored for the port in the DHCP snooping binding database. If 0 is specified, no entries will be stored in the database for the port.

Default The default for maximum bindings is 1.

Mode Interface Configuration (port)

Usage notes The maximum number of leases cannot be changed for a port while there are DHCP snooping Access Control Lists (ACL) associated with the port. Before using this command, remove any DHCP snooping ACLs associated with the ports. To display ACLs used for DHCP snooping, use the show ip dhcp snooping acl command.

In general, the default (1) will work well on an edge port with a single directly connected DHCP client. If the port is on an aggregation switch that is connected to an edge switch with multiple DHCP clients connected through it, then use this command to increase the number of lease entries for the port.

If there are multiple VLANs configured on the port, the limit is shared between all the VLANs on this port. For example, the default only allows one lease to be stored for one VLAN. To allow connectivity for the other VLANs, use this command to increase the number of lease entries for the port.

Example To set the maximum number of bindings to be stored in the DHCP snooping database to 10 per port for ports 1.0.1 to 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.6
awplus(config-if)# ip dhcp snooping max-bindings 10
```

Related commands

access-group

show ip dhcp snooping acl

show ip dhcp snooping interface

ip dhcp snooping subscriber-id

Overview Use this command to set a Subscriber ID for the ports.

Use the **no** variant of this command to remove Subscriber IDs from the ports.

Syntax

```
ip dhcp snooping subscriber-id [<sub-id>]
no ip dhcp snooping subscriber-id
```

Parameter	Description
<sub-id>	The Subscriber ID; an alphanumeric (ASCII) string 1 to 50 characters in length. If the Subscriber ID contains spaces, it must be enclosed in double quotes. Wildcards are not allowed.

Default No Subscriber ID.

Mode Interface Configuration (port)

Usage notes The Subscriber ID sub-option is included in the DHCP Relay Agent Option 82 field of client DHCP packets forwarded from a port if:

- a Subscriber ID is specified for the port using this command, and
- DHCP snooping Option 82 information insertion is enabled (ip dhcp snooping agent-option command; enabled by default), and
- DHCP snooping is enabled on the switch (service dhcp-snooping) and on the VLAN to which the port belongs (ip dhcp snooping)

Examples To set the Subscriber ID for port 1.0.3 to **room_534**, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# ip dhcp snooping subscriber-id room_534
```

To remove the Subscriber ID from port 1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no ip dhcp snooping subscriber-id
```

Related commands ip dhcp snooping agent-option

show ip dhcp snooping interface

ip dhcp snooping trust

Overview Use this command to set the ports to be DHCP snooping trusted ports.

Use the **no** variant of this command to return the ports to their default as untrusted ports.

Syntax

```
ip dhcp snooping trust
no ip dhcp snooping trust
```

Default All ports are untrusted by default.

Mode Interface Configuration (port)

Usage notes Typically, ports connecting the switch to trusted elements in the network (towards the core) are set as trusted ports, while ports connecting untrusted network elements are set as untrusted. Configure ports connected to DHCP servers as trusted ports.

Example To set switch ports 1.0.1 and 1.0.2 to be trusted ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# ip dhcp snooping trust
```

Related commands show ip dhcp snooping interface

ip dhcp snooping verify mac-address

Overview Use this command to verify that the source MAC address and client hardware address match in DHCP packets received on untrusted ports.

Use the **no** variant of this command to disable MAC address verification.

Syntax

```
ip dhcp snooping verify mac-address
no ip dhcp snooping verify mac-address
```

Default Enabled—source MAC addresses are verified by default.

Mode Global Configuration

Usage When MAC address verification is enabled, the switch treats DHCP packets with source MAC address and client hardware address that do not match as DHCP snooping violations: it drops them and applies any other violation action specified by the ip dhcp snooping violation command. To bring the port back up again after any issues have been resolved, use the shutdown command.

Example To disable MAC address verification on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp snooping verify mac-address
```

Related commands

ip dhcp snooping violation

show ip dhcp snooping

show ip dhcp snooping statistics

ip dhcp snooping violation

Overview Use this command to specify the action the switch will take when it detects a DHCP snooping violation by a DHCP packet on the ports.

Use the **no** variant of this command to disable the specified violation actions, or all violation actions.

Syntax

```
ip dhcp snooping violation {log|trap|link-down} ...
no ip dhcp snooping violation [{log|trap|link-down} ...]
```

Parameter	Description
`log`	Generate a log message. To display these messages, use the show log command. Default: disabled.
`trap`	Generate an SNMP notification (trap). To send SNMP notifications, SNMP must also be configured, and DHCP snooping notifications must be enabled using the snmp-server enable trap command. Notifications are limited to one per second and to one per source MAC and violation reason. Default: disabled.
`link-down`	Set the port status to link-down. Default: disabled.

Default By default, DHCP packets that violate DHCP snooping are dropped, but no other violation action is taken.

Mode Interface Configuration (port)

Usage notes If a port has been shut down in response to a violation, to bring it back up again after any issues have been resolved, use the shutdown command.

IP packets dropped by DHCP snooping filters do not result in other DHCP snooping violation actions.

Example To set the switch to send an SNMP notification and set the link status to link-down if it detects a DHCP snooping violation on switch ports 1.0.1 to 1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap dhcpsnooping
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# ip dhcp snooping violation trap link-down
```

Related commands

show ip dhcp snooping interface

show log

snmp-server enable trap

ip source binding

Overview Use this command to add or replace a static entry in the DHCP snooping database.

Use the **no** variant of this command to delete the specified static entry or all static entries from the database.

Syntax

```
ip source binding <ipaddr> [<macaddr>] vlan <vid> interface
<port>
no ip source binding [<ipaddr>]
```

Parameter	Description
<ipaddr>	Client's IP address. If there is already an entry in the DHCP snooping database for this IP address, then this command replaces it with the new entry.
<macaddr>	Client's MAC address in HHHH.HHHH.HHHH format.
<vid>	The VLAN ID associated with the entry.
<port>	The port the client is connected to.

Mode Global Configuration

Usage notes This command removes static entries from the database.

To remove dynamic entries, use the clear ip dhcp snooping binding command or the **no** variant of the ip dhcp snooping binding command.

Examples To add a static entry to the DHCP snooping database for a client with the IP address 192.168.1.2, MAC address 0001.0002.0003, on port1.0.6 of vlan6, use the command:

```
awplus# configure terminal
awplus(config)# ip source binding 192.168.1.2 0001.0002.0003
vlan 6 interface port1.0.6
```

To remove the static entry for IP address 192.168.1.2 from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding 192.168.1.2
```

To remove all static entries from the database, use the commands:

```
awplus# configure terminal
awplus(config)# no ip source binding
```

Related commands

clear ip dhcp snooping binding

ip dhcp snooping binding

show ip source binding

service dhcp-snooping

Overview Use the **service dhcp-snooping** command to enable the DHCP snooping service globally on the switch. As well, you need to enable it on the desired VLANs, using the ip dhcp snooping command. The switch creates a global DHCP snooping Access Control list (ACL) the first time you use the ip dhcp snooping command, to send DHCP packets to the CPU for processing. Note that the switch will forward all DHCP traffic to the CPU, no matter what VLAN it belongs to.

Alternatively, you can use the **service dhcp-snooping per-vlan** command instead of the **service dhcp-snooping** command. This option only creates ACLs for the VLANs that you configure with the ip dhcp snooping command. This limits the amount of DHCP traffic that is forwarded to the CPU. However, using this option creates 2 ACLs for each VLAN that DHCP snooping is enabled on, so it is most suitable if you have a small number of VLANs. Use the **show platform classifier statistics utilization brief** command to see the number of ACLs available for your switch.

Use the **no** variant of this command to disable the DHCP snooping service on the switch.

Syntax

```
service dhcp-snooping
service dhcp-snooping per-vlan
no service dhcp-snooping
```

Parameter	Description
`per-vlan`	This optional parameter only enables DHCP snooping for the VLANs configured using the command ip dhcp snooping. Using this option creates ACL entries for only the VLANs that DHCP snooping is enabled on. This limits the DHCP traffic forwarded to the CPU.

Default Disabled

Mode Global Configuration

Usage notes

Enabling DHCP snooping

For DHCP snooping to operate on a VLAN, you must:

- enable the service on the switch by using this command, and
- enable DHCP snooping on the particular VLAN by using the ip dhcp snooping command, and
- if there is an external DHCP server, configure the port connected to the server as a trusted port, by using the ip dhcp snooping trust command

Disabling DHCP snooping

Use **no service dhcp-snooping** to disable DHCP snooping.

Disabling DHCP snooping removes all DHCP snooping configuration from the running configuration, except for:

- any DHCP snooping maximum bindings settings (ip dhcp snooping max-bindings), and
- any additional DHCP snooping-based ACLs you have created for filtering on untrusted ports.

You must remove any such additional DHCP snooping-based ACLs, using the **no access-group** command. This is because these ACLs block all traffic except for traffic that matches DHCP snooping entries. Once you have disabled DHCP snooping, these ACLs will block all traffic. Note that if you disable DHCP snooping on particular VLANs (using the **no ip dhcp snooping** command), you need to make sure you remove any such additional ACLs that apply to those VLANs.

If you re-enable the service, the switch repopulates the DHCP snooping database from the dynamic lease entries in the database backup file (see the ip dhcp snooping database command). It also updates the lease expiry times.

Per-VLAN DHCP snooping

This mode only enables DHCP snooping for the VLANs configured using the command ip dhcp snooping. It minimizes the amount of DHCP traffic forwarded to the CPU. However, it creates 2 ACL entries for each VLAN that DHCP snooping is enabled on, so it is most suitable if you have a small number of VLANs. Use the show platform classifier statistics utilization brief command to see the number of ACLs available for your switch.

If you use this mode and you are also using Q-in-Q (VLAN stacking or VLAN double-tagging), then you need to disable Layer 2 flooding on VLANs that do not have DHCP snooping configured. Otherwise, the switch may forward two copies of some DHCP packets on the non-snooping VLANs, with one copy being single-tagged instead of double-tagged. To turn off L2 flooding, use the ip dhcp snooping disable-l2-flooding command.

Examples

To enable the DHCP snooping service on only the VLANs that have DHCP snooping enabled, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-snooping
```

To disable the DHCP snooping service on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-snooping
```

Command changes

Version 5.4.9-2.1: **per-vlan** parameter added for SBx8100, x530, and x320 series.

Version 5.4.9-2.1: **per-vlan** parameter added for IE510, IE340, IE300, SBx908 GEN2, x950, x930, and x510 series.

show arp security

Overview Use this command to display ARP security configuration.

Syntax

```
show arp security
```

Mode User Exec and Privileged Exec

Example To display ARP security configuration on the switch use the command:

```
awplus# show arp security
```

Table 1: Example output from the **show arp security** command

```
awplus# show arp security

ARP Security Information:
  Total VLANs enabled ..... 2
  Total VLANs disabled ..... 11
  vlan1 ..... Disabled
  vlan2 ..... Disabled
  vlan3 ..... Disabled
  vlan4 ..... Disabled
  vlan5 ..... Disabled
  vlan100 ..... Disabled
  vlan101 ..... Disabled
  vlan102 ..... Disabled
  vlan103 ..... Disabled
  vlan104 ..... Disabled
  vlan105 ..... Enabled
  vlan1000 ..... Disabled
  vlan1001 ..... Enabled
```

Table 2: Parameters in the output from the **show arp security** command

Parameter	Description
`Total VLANs enabled`	The number of VLANs that have ARP security enabled.
`Total VLANs disabled`	The number of VLANs that have ARP security disabled.

Related commands

arp security

show arp security interface

show arp security statistics

show arp security interface

Overview Use this command to display ARP security configuration for the specified ports or all ports.

Syntax `show arp security interface [<port-list>]`

Parameter	Description
<port-list>	The ports to display ARP security information about. The port list can include switch ports, and static or dynamic aggregated links.

Mode User Exec and Privileged Exec

Example To display ARP security configuration for ports, use the command:

```
awplus# show arp security interface
```

Table 3: Example output from the **show arp security interface** command

```
awplus#show arp security interface

Arp Security Port Status and Configuration:

  Port: Provisioned ports marked with brackets, e.g. (portx.y.z)
  KEY:  LG = Log
        TR = Trap
        LD = Link down

Port         Action
------------------------------
port1.0.1    -- -- --
port1.0.2    -- -- --
port1.0.3    LG TR LD
port1.0.4    LG -- --
port1.0.5    LG -- --
port1.0.6    LG TR --
port1.0.7    LG -- LD
...
```

Table 4: Parameters in the output from the **show arp security interface** command

Parameter	Description
`Action`	The action the switch takes when it detects an ARP security violation on the port.
`Port`	The port. Parentheses indicate that ports are configured for provisioning.
`LG, Log`	Generate a log message
`TR, Trap`	Generate an SNMP notification (trap).
`LD, Link down`	Shut down the link.

Related commands

show arp security statistics

Overview Use this command to display ARP security statistics for the specified ports or all ports.

Syntax `show arp security statistics [detail] [interface <port-list>]`

Parameter	Description
`detail`	Display detailed statistics.
`interface <port-list>`	Display statistics for the specified ports. The port list can include switch ports, and static or dynamic aggregated links

Mode User Exec and Privileged Exec

Example To display the brief statistics for the ARP security, use the command:

```
awplus# show arp security statistics
```

Table 5: Example output from the **show arp security statistics** command

```
awplus# show arp security statistics

DHCP Snooping ARP Security Statistics:
              In          In
 Interface    Packets     Discards
---------------------------------
 port1.0.3    20          20
 port1.0.4    30          30
 port1.0.12   120         0
```

Table 6: Parameters in the output from the **show arp security statistics** command

Parameter	Description
`Interface`	A port name. Parentheses indicate that ports are configured for provisioning.
`In Packets`	The total number of incoming ARP packets that are processed by DHCP Snooping ARP Security
`In Discards`	The total number of ARP packets that are dropped by DHCP Snooping ARP Security.

Table 7: Example output from the **show arp security statistics detail** command

```
awplus#show arp security statistics detail

DHCP Snooping ARP Security Statistics:
Interface ..................... port1.0.3
  In Packets .................. 20
  In Discards ................. 20
    No Lease .................. 20
    Bad Vlan .................. 0

```

Table 60: Parameters in the output from the **show ip dhcp snooping binding** command

Parameter	Description
Client IPAddress	The IP address of the DHCP client.
MAC Address	The MAC address of the DHCP client.
Server IPAddress	The IP address of the DHCP server.
VLAN	The VLAN associated with this entry.
Port	The port the client is connected to.
Expires (sec)	The time in seconds until the lease expires.

Table 60: Parameters in the output from the **show ip dhcp snooping binding** command (cont.)

Parameter	Description
`Type`	The source of the entry: • Dyna: dynamically entered by snooping DHCP traffic, configured by the ip dhcp snooping binding command, or loaded from the database backup file. • Stat: added statically by the ip source binding command
`Total number of bindings in database`	The total number of dynamic and static lease entries in the DHCP snooping database.

```

Table 62: Parameters in the output from the **show ip dhcp snooping interface** command

Parameter	Description
`Port`	The port interface name.
`Status`	The port status: untrusted (default) or trusted.
`Full Leases`	The number of entries in the DHCP snooping database for the port.
`Max Leases`	The maximum number of entries that can be stored in the database for the port.
`Action`	The DHCP snooping violation actions for the port.
`Subscriber ID`	The subscriber ID for the port. If the subscriber ID is longer than 34 characters, only the first 34 characters are displayed. To display the whole subscriber ID, use the command **show running-config dhcp**.

Related commands

show ip dhcp snooping

show ip dhcp snooping statistics

show running-config dhcp

show ip dhcp snooping statistics

Overview Use this command to display DHCP snooping statistics.

Syntax

```
show ip dhcp snooping statistics [detail] [interface
<interface-list>]
```

Parameter	Description
`detail`	Display detailed statistics.
`interface <interface-list>`	Display statistics for the specified interfaces. The interface list can contain switch ports, static or dynamic link aggregators (channel groups), or VLANs.

Mode User Exec and Privileged Exec

Example To show the current DHCP snooping statistics for all interfaces, use the command:

```
awplus# show ip dhcp snooping statistics
```

Table 63: Example output from the **show ip dhcp snooping statistics** command

```
awplus# show ip dhcp snooping statistics

DHCP Snooping Statistics:

Table 65: Parameters in the output from the **show ip dhcp snooping statistics** command

Parameter	Description
`Interface`	The interface name.
`In Packets`	The total number of incoming packets that are processed by DHCP Snooping.
`In BOOTP Requests`	The total number of incoming BOOTP Requests.
`In BOOTP Replies`	The total number of incoming BOOTP Replies.
`In Discards`	The total number of incoming packets that have been discarded.
`Invalid BOOTP Information`	Packet contained invalid BOOTP information, such as an invalid BOOTP.OPCode.
`Invalid DHCP ACK`	A DHCP ACK message was discarded, for reasons such as missing Server Option or Lease Option.

Table 65: Parameters in the output from the **show ip dhcp snooping statistics** command (cont.)

Parameter	Description
`Invalid DHCP Release or Decline`	A DHCP Release or Decline message was discarded, for reasons such as mismatch between received interface and current binding information.
`Invalid IP/UDP Header`	A problem was detected in the IP or UDP header of the packet.
`Max Bindings Exceeded`	Accepting the packet would cause the maximum number of bindings on a port to be exceeded.
`Option 82 Insert Error`	An error occurred while trying to insert DHCP Relay Agent Option 82 information.
`Option 82 Received Invalid`	The DHCP Relay Agent Option 82 information received did not match the information inserted by DHCP Snooping.
`Option 82 Received On Untrusted Port`	A packet containing DHCP Relay Agent Option 82 information was received on an untrusted port.
`Option 82 Transmit On Untrusted Port`	A packet containing DHCP Relay Agent Option 82 information was to be sent on an untrusted port.
`Reply Received On Untrusted Port`	A BOOTP reply was received on an untrusted port.
`Source MAC/CHADDR Mismatch`	The L2 Source MAC address of the packet did not match the client hardware address field (BOOTP.CHADDR).
`Static Entry Already Exists`	An entry could not be added as a static entry already exists.

ip dhcp snooping

ip dhcp snooping violation

show ip source binding

Overview Use this command to display static entries in the DHCP snooping database. These are the entries that have been added by using the ip source binding command.

Syntax

```
show ip source binding
```

Mode User Exec and Privileged Exec

Example To display static entries in the DHCP snooping database information, use the command:

```
awplus# show ip source binding
```

Table 66: Example output from the **show ip source binding** command

```
awplus# show ip source binding

IP Source Bindings:

Client       MAC                                Expires
IP Address   Address         VLAN  Port         (sec)      Type
-------------------------------------------------------------------
 1.1.1.1     0000.1111.2222  1     port1.0.1    Infinite   Static
```

Table 67: Parameters in the output from the **show ip source binding** command

Parameter	Description
Client IP Address	The IP address of the DHCP client.
MAC Address	The MAC address of the DHCP client.
VLAN	The VLAN ID the packet is received on.
Port	The Layer 2 port name the packet is received on.
Expires (sec)	Always infinite for static bindings, or when the leave time in the DHCP message was 0xffffffff (infinite).
Type	DHCP Snooping binding type: Static

56 OpenFlow Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure the OpenFlow protocol.

Command List

openflow

Overview Use this command to specify a port or static aggregator as a data plane port. The ingress and egress traffic on the data plane port become controlled by the OpenFlow Controller. A data plane port number is assigned to the port automatically.

Use the **no** variant of this command to cancel the setting of a port as a data plane port.

Syntax

```
openflow
no openflow
```

Default All the ports are non-data plane ports by default.

Mode Interface mode for a switch port (e.g. port1.0.1) or static aggregator (e.g. sa1)

Example To specify port1.0.1 as a data plane port:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# openflow
```

Related commands show openflow config

Command changes Version 5.4.6-1.1: command added

Version 5.4.7-1.1: command added to GS900MX, XS900MX, x550 series products

Version 5.4.7-2.1: command added to IE300, IE500 series products

Version 5.4.8-0.2: added to SBx908 GEN2

Version 5.4.8-1.1: added to IE210L series products

openflow controller

Overview Use this command to specify the controller name, address, and port number of the OpenFlow Controller. If you do not specify a controller name, a name will automatically be created using the following format: 'ocxx', where 'xx' is the sequential number starting from 1.

You can specify one or more OpenFlow Controllers to the switch.

Use the **no** variant of this command to delete one or more OpenFlow Controllers specified to the switch.

You can delete a controller by specifying only the controller name. If you do not know the controller name, you can identify it from the **show openflow config** command output.

Syntax

```
openflow controller <protocol> <address> <port>
openflow controller <controller-name> <protocol> <address>
<port>
no openflow controller <controller-name>
```

Parameter	Description
<controller-name>	The user specified or auto-generated (in the case of legacy syntax) controller name that can contain alphanumeric and/or special characters other than the following set of characters: ':', '=', ',', '[', ']', '{', '}', '!', '<', '>'
<protocol>	The protocol type to communicate with the OpenFlow Controller. There are two options: TCP and SSL. Use TCP for an insecure connection. Use SSL for a connection protected by TLS. OpenFlow switches support TLSv1.0, TLSv1.1 and TLSv1.2. The TLS version used between an OpenFlow switch and OpenFlow Controller is determined by peer negotiation.
<address>	The IPv4 address of the Controller.
<port>	Port number used to communicate with the Controller. The IANA has assigned the number 6653 for this purpose, but a different number can be used for local reasons.

Default No OpenFlow Controller is configured by default.

Mode Global Configuration

Usage notes The older version of this command is supported. If you enter the legacy CLI syntax (without the controller name), it will automatically adapt and display in the running configuration as the newer syntax.

For example, entering the legacy command:

```
awplus(config)# openflow controller tcp 192.168.1.2 6653
```

Displays as following in the running-config:

```
awplus(config)# openflow controller oc1 tcp 192.168.1.2 6653
```

Examples To add an OpenFlow Controller with the address 10.1.1.1 using the TCP protocol and the IANA assigned port number of 6653, use the commands:

```
awplus# configure terminal
awplus(config)# openflow controller tcp 10.1.1.1 6653
```

To add an OpenFlow Controller for the switch whose name is controller1, with the address 10.1.2.1 using the TCP protocol on port number 6653, use the commands:

```
awplus# configure terminal
awplus(config)# openflow controller controller1 tcp 10.1.2.1
6653
```

To delete an OpenFlow Controller whose name is controller1, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow controller controller1
```

Related commands show openflow config

Command changes Version 5.4.7-1.1: command added

Version 5.4.7-2.1: command added to IE300, IE500 series products

Version 5.4.8-0.2: added to SBx908 GEN2

Version 5.4.8-1.1: added to IE210L series products

Version 5.4.8-2.1: <*controller-name*> parameter added

openflow datapath-id

Overview Use this command to change the Datapath Identifier (DPID) of the OpenFlow switch.

Use the **no** variant of this command to revert back to the default DPID.

Syntax

```
openflow datapath-id <dpid>
no openflow datapath-id
```

Parameter	Description
<dpid>	The DPID field consists of 16 Hex digits. If you specify a DPID less than 16 Hex digits, then the upper bits are padded out with zeros.

Default Each OpenFlow instance on a switch is identified by a Datapath Identifier. This is a 64 bit number. By default, the lower 48 bits are configured based on the switch MAC address. The top 16 bits are padded with zeros.

Mode Global Configuration

Usage notes This command changes the DPID, which is used as the OpenFlow switch ID in OpenFlow Controller(s).

Example To change the DPID to "0000000000000001", use the commands:

```
awplus# configure terminal
awplus(config)# openflow datapath-id 1
```

To revert back to the default DPID, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow datapath-id
```

Related commands show openflow status

Command changes Version 5.4.7-1.1: command added

Version 5.4.7-2.1: command added to IE300, IE500 series products

Version 5.4.8-0.2: added to SBx908 GEN2

Version 5.4.8-1.1: added to IE210L series products

openflow failmode

Overview Use this command to set the operation mode for the switch when the Controller connection fails or no Controllers are defined.

Use the **no** variant of this command to return to the default mode.

Syntax

```
openflow failmode secure non-rule-expired
openflow failmode standalone
no openflow failmode
```

Parameter	Description
`secure non-rule-expired`	Set the mode to secure non-rule-expired. See the Usage section for details.
`standalone`	Set the mode to standalone. See the Usage section for details.

Default Secure mode, without the **non-rule-expired** option

Mode Global Configuration

Usage notes If an OpenFlow switch loses contact with all Controllers as a result of echo request timeouts, then the OpenFlow switch goes into **fail mode**. There are three fail modes available:

- In **standalone** mode, if no message is received from the OpenFlow Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows. OpenFlow will cause the switch to act like an ordinary MAC-learning switch, but continue to retry connecting to the Controller in the background. When the connection succeeds, it will discontinue its standalone behavior.

  NOTE: *If the OpenFlow switch is in fail mode, and you change the configured fail mode to or from standalone mode, OpenFlow will flush all existing rules.*

- In **secure** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever, unless a rule timeout causes it to expire.

  This mode is the default, and you can also set it by using the command **no openflow failmode**.

- In **secure non-rule-expired** mode, OpenFlow will not set up new flows on its own when the Controller connection fails or when no Controllers are defined, but all existing flows are left in place. The switch will continue to retry connecting to any defined Controllers forever. The **non-rule-expired** parameter means that existing rules won't be expired regardless of their timeouts while under fail mode. In other words, the OpenFlow switch will

ignore timeout values of both idle timeout and hard timeout in existing rules.

Example To set the fail mode to **standalone** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode standalone
```

To set the fail mode to **secure non-rule-expired** mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow failmode secure non-rule-expired mode
```

To revert the fail mode to the default mode, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow failmode
```

Related commands openflow controller

Command changes Version 5.4.7-1.1: command added

Version 5.4.7-2.1: command added to IE300, IE500 series products

Version 5.4.8-0.1: non-rule-expired parameter added

Version 5.4.8-0.2: added to SBx908 GEN2

Version 5.4.8-1.1: added to IE210L series products

openflow inactivity

Overview Use this command to set the value of the Controller inactivity timeout.

Use the **no** variant of this command to reset the inactivity timeout value to its default.

Syntax

```
openflow inactivity <5-2073600>
no openflow inactivity
```

Parameter	Description
<5-2073600>	Specifies the timeout value in seconds
inactivity	OpenFlow inactivity probe

Default 10 seconds.

Mode Global Configuration

Usage notes OpenFlow uses the inactivity probe timer to monitor its connection to Controller(s). If no message is received from any Controller for three times the inactivity probe interval, then OpenFlow will take over responsibility for setting up flows, if in standalone mode.

Example To configure the inactivity probe timeout to 20 seconds, enter the commands:

```
awplus# configure terminal
awplus(config)# openflow inactivity 20
```

To reset the inactivity probe timeout to its default value of 10 seconds, enter the commands:

```
awplus# configure terminal
awplus(config)# no openflow inactivity
```

Version 5.4.8-0.2: added to SBx908 GEN2

Version 5.4.8-1.1: added to IE210L series products

openflow native vlan

Overview Use this command to specify a VLAN as a native VLAN for the data plane ports. You must create a VLAN (using the vlan database command) before specifying the VLAN as a native VLAN.

The OpenFlow native VLAN **must** be different from the native VLAN of the control plane. This prevents the OpenFlow ports from receiving any broadcast or multicast traffic flooded on the control plane native VLAN.

The VLAN used as the OpenFlow native VLAN should not be used on non-OpenFlow ports.

Use the **no** variant of this command to change the native VLAN for the data plane ports back to the default VLAN 1.

Syntax

```
openflow native vlan <vlan-id>
no openflow native vlan
```

Parameter	Description
<vlan-id>	VLAN ID in the range <1-4090>

Default The native VLAN for the data plane ports is VLAN 1 by default.

Mode Global Configuration

Example To specify VLAN 100 as a native VLAN for the data plane ports:

```
awplus# configure terminal
awplus(config)# openflow native vlan 100
```

To change the native VLAN for the data plane ports back to the VLAN 1:

```
awplus# configure terminal
awplus(config)# no openflow native vlan
```

Version 5.4.8-1.1: added to IE210L series products

openflow ssl peer certificate

Overview Use this command to enable a peer certificate to be sent from the machine that the OpenFlow Controller is running.

Use the **no** variant of this command to disable a peer certificate from being sent from the machine that the OpenFlow Controller is running.

Syntax

```
openflow ssl peer certificate {<file>|bootstrap}
no openflow ssl peer certificate
```

Parameter	Description
<file>	The CA certificate of an OpenFlow Controller must be in PEM format and specified with an absolute path using the format flash:cacert.pem. You must copy the file from the machine on which the OpenFlow Controller is running beforehand to the OpenFlow switch.
bootstrap	In bootstrap mode, when the switch first connects to the OpenFlow Controller, it accepts and saves to RAM a self-signed CA certificate sent from the Controller. Thereafter, the OpenFlow switch will only connect to OpenFlow Controllers signed by the same CA certificate.

Default Peer certificate validation is disabled by default.

Mode Global Configuration

Usage notes This command enables or disables peer certification on an OpenFlow Controller.

Example To validate a peer certificate using the bootstrap mode, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl peer certificate bootstrap
```

To disable peer certificate validation, use the commands:

```
awplus# configure terminal
awplus(config)# no openflow ssl peer certificate
```

Related commands show openflow ssl

Version 5.4.7-2.1: command added to IE300, IE500 series products

Version 5.4.8-0.2: added to SBx908 GEN2

Version 5.4.8-1.1: added to IE210L series products

openflow ssl trustpoint

Overview Use this command to configure the local trustpoint to be used for authentication.

Use the **no** variant of this command to disable the local trustpoint.

Syntax

```
openflow ssl trustpoint local
no openflow ssl trustpoint local
```

Default There is no trustpoint configured by default.

Mode Global Configuration mode.

Usage notes Use this command to specify a local self-signed certificate authority trustpoint for authentication. You must first create the trustpoint using the **crypto pki trustpoint** command.

Example To configure a local trustpoint, use the commands:

```
awplus# configure terminal
awplus(config)# openflow ssl trustpoint local
```

To delete the local trustpoint, use the command:

```
awplus(config)# no openflow ssl trustpoint
```

Related commands openflow controller

Version 5.4.8-0.2: added to SBx908 GEN2

Version 5.4.8-1.1: added to IE210L series products

openflow version

Overview Use this command to change the supported OpenFlow version numbers on the switch. You can specify a list of version numbers.

Use the **no** variant of this command to change the version number of the OpenFlow protocol back to the default version 1.3.

Syntax

```
openflow version <version-list>
no openflow version
```

Parameter	Description
<version-list>	Specifies a list of version numbers separated by a space. The version numbers are 1.0 and 1.3.

Default The OpenFlow version is set to 1.3 by default.

Mode Global Configuration

Usage notes This command overwrites any previously configured OpenFlow versions with the default OpenFlow version 1.3.

Example To change the OpenFlow protocol version to 1.0 and 1.3:

```
awplus(config)# openflow version 1.0 1.3
```

To change the OpenFlow protocol version to the default 1.3:

```
awplus(config)# no openflow version
```

Related commands show openflow config

Command changes Version 5.4.6-1.1: command added

show openflow config

Overview Use this command to display the OpenFlow configuration database on the switch.

Syntax

```
show openflow config
```

Mode User Exec/Privileged Exec

Example To show the contents of the OpenFlow configuration database on the switch:

```
awplus# show openflow config
```

Output Figure 56-1: Example output from **show openflow config**

```
awplus# show openflow config
258a3d74-d349-4d18-9d75-09ab66e19d81
    Bridge of0
        Controller "tcp:192.168.1.2:6653"
            is_connected: true
        fail_mode: standalone
        Port of0
            Interface of0
                type: internal
        Port port1.0.4
           Interface port1.0.4
                type: system

            Interface port1.0.8
                type: system
                options: {ifindex="5008", mtu="1500", native_vlan="4090"}
...
```

Table 56-1: Parameters in the output from **show openflow config**

Parameter	Description
`First line`	The switch ID
`Bridge of0`	The configuration of the OpenFlow bridge.
`Controller`	The address of the OpenFlow Controller and SSL port number
`is_connected: true`	Indicates that the switch is connected to the OpenFlow Controller. If the switch is not connected to the Controller, "is_connected" is not displayed.

Table 56-1: Parameters in the output from **show openflow config** (cont.)

Parameter	Description
`fail_mode`	The fail mode. When the fail mode is "secure," OpenFlow on the switch does not set up flows when the OpenFlow Controller fails. When the fail mode is "standalone", OpenFlow on the switch sets up flows to work as a Layer 2 switch when the OpenFlow Controller fails.
`Port`	The port information
`Interface`	The interface of the port.
`type:`	The type of the port
`options:`	The options for the port

show openflow coverage

Overview Use this command to display the OpenFlow counters from the Open vSwitch.

Syntax

```
show openflow coverage
```

Mode User Exec/Privileged Exec

Usage The information displayed by this command is for troubleshooting. Contact Allied Telesis Technical Support for assistance.

Example To show OpenFlow counters:

```
awplus# show openflow coverage
```

Output Figure 56-2: Example output from **show openflow coverage**

```
awplus# show openflow coverage
Event coverage, avg rate over last: 5 seconds, last minute, last hour,
hash=86bbd699:
netlink_sent               0.0/sec     0.000/sec        0.0000/sec   total: 14
netlink_recv_jumbo         0.0/sec     0.000/sec        0.0000/sec   total: 4

72 events never hit
```

Table 56-2: Parameters in the output from

Parameter	Description
`Event coverage`	The name of a coverage event
`avg rate over last: 5 seconds`	The rate at which the event occurred for the last 5 seconds
`last minute`	The rate at which the event occurred for the last one minute
`last hour`	The rate at which the event occurred for the last one hour
`hash`	The name of the internal hash on the counter
`total:`	The total number of occurrences of the event
`events never hit`	The number of coverage events that have never occurred. When the value is 0, this information is not displayed.

show openflow flows

Overview Use this command to display all the entries in the switch's flow tables that resulted from receiving packets on OpenFlow ports.

Syntax

```
show openflow flows
```

Mode Privileged Exec

Usage notes The switch uses OpenFlow rules from the Controller to create a rule table that tells the switch what to do with packets. From the rules, the switch creates a software flow table to process packets. From the software flow table, the switch creates entries in its silicon hardware flow tables, when possible. When silicon table entries exist, the switch uses them to switch packets. When silicon table entries do not exist, the switch uses the software flow table to process packets.

See the "Communication and Packet Processing" section of the OpenFlow Feature Overview and Configuration Guide for a detailed explanation of how the switch puts entries into the software and silicon flow tables.

This command displays flows in both the software and silicon flow tables. A symbol at the start of each flow output indicates whether it is a silicon or software table entry:

- # indicates silicon flow table entries, and
- ~ indicates software flow table entries

Example To show the entries of the flow tables on the switch:

```
awplus# show openflow flows
```

Output Where possible, the switch uses OpenFlow rules from the Controller to create entries in its silicon hardware flow tables, and switches packets according to the silicon flow tables.

In the following example output, the OpenFlow ports are port1.0.14, port1.0.15, port1.0.16, port1.0.33 and sa3 (port1.0.27 and port1.0.38). As LOCAL and LAG ports are now supported, the first OpenFlow port number is used as the local port.

OpenFlow port numbering becomes:

- port1.0.14 is OpenFlow port number 2
- port1.0.15 is OpenFlow port number 3
- port1.0.33 is OpenFlow port number 5
- sa3 is OpenFlow port number 6

The clients are connected to port1.0.15 and port1.0.33 in this scenario and sa3 is used as OpenFlow ports for the uplink. The **show openflow flows** command shows the following:

Figure 56-3: Example output from **show openflow flows**

```
awplus# show openflow flows

~recirc_id(0),in_port(3),eth(src=08:00:27:9a:b6:7f,dst=08:00:27:4b:ef:3b),eth_type(0

```

NOTE: *This output includes added line spacing for readability purposes*

Table 56-3: Parameters in the output from **show openflow flows**

Parameter	Description
`recirc_id`	Used to select the next packet processing steps among multiple instances of recirculation. Packets initially enter the process with an ID of 0, which indicates no recirculation.
`in_port`	The OpenFlow port number
`eth`	The source and destination MAC address of the packet
`eth_type`	The Ethernet type
`ipv4`	The information in the IPv4 header
`packets`	The number of matched packets
`bytes`	The number of matched bytes
`actions`	A set of actions for the packets that match the key

Table 56-4: Parameters in the output from **show openflow rules**

Parameter	Description
duration	The duration of the flow entry in seconds
n_packets	The number of packets that match the flow entry
n_bytes	The number of bytes that match the flow entry
priority	The priority of the flow entry
in_port	The OpenFlow port number on which the packets are received
dl_src	The source address
dl_dst	The destination address
actions	A set of actions applied to a packet. The actions are: “drop”, “goto_table”, “pop_vlan”, or “push_vlan”
table_id	The table ID of the flow entry

show openflow ssl

Overview Use this command to display the current SSL configuration for OpenFlow.

Syntax

```
show openflow ssl
```

Mode Privileged Exec

Usage notes This command displays the current SSL configuration for OpenFlow.

Example To display the current SSL configuration for OpenFlow, use the command:

```
awplus# show openflow ssl
```

Output Figure 56-5: Example output from **show openflow ssl**

```
awplus#show openflow ssl
Private key: /flash/.certs/pki/local/cakey.pem
Certificate: /flash/.certs/pki/local/cacert.pem
CA Certificate: /etc/openvswitch/cacert.pem
Bootstrap: true

show openflow status

Overview Use this command to display the status of each data plane port and the OpenFlow protocol messages queried by the OpenFlow Controller.

Syntax

```
show openflow status
```

Mode Privileged Exec

Example To show the status of a switch with four OpenFlow ports, enter the command:

```
awplus# show openflow status
```

Output Figure 56-6: Example output from **show openflow status**

```
awplus#show openflow status
 OFPT_FEATURES_REPLY (OF1.3) (xid=0x2): dpid:0000eccd6dc421bd

OFPT_GET_CONFIG_REPLY (OF1.3) (xid=0x5): frags=normal
miss_send_len=0
```

Table 56-5: Parameters in the output from **show openflow status**

Parameter	Description
`OFPT_FEATURES_REPLY (OF1.3) (xid=0x2):`	Indicates that the following information is from the OpenFlow version 1.3 Feature reply.
`dpid:`	The datapath ID
`n_tables`	The number of tables supported by the switch
`n_buffers`	The maximum number of packets that the switch can buffer when sending packets to the OpenFlow controller
`capabilities`	A list of the OpenFlow capabilities: FLOW_STATS (flow statistics), TABLE_STATS (table statistics), PORT_STATS (port statistics), IP_REASM (IP fragments reassemble), QUEUE_STATS (queue statistics), and GROUP_STATS (group statistics
`OFPST_PORT_DESC replay (OF1.3) (xid=0x3):`	Indicates that the following information is from the OpenFlow version 1.3 Port Description Reply.
`1(port1.0.1): addr:ec:cd:6d:c4: 21:bd`	The port number and MAC address.
`config:`	The port status: 0 (the port is up) or PORT_DOWN (the port is down.)
`state:`	The link status: 0 (the link is up) or LINK_DOWN (the link is down.)
`current:`	The current feature status.
`supported:`	A list of the supported features: 1GB-FD, 10GB-FD, AUTO-NEG, etc. Not displayed from software release 5.4.7 onwards for interfaces that do not have this capability, i.e. static LAG interfaces or the of0 bridge interface.
`speed:`	The current port speed and maximum speed.
`OFPT_GET_CONFIG_REPLY (OF1.3) (xid=0x5):`	Indicates that the switch responds to a configuration request by an OFPT_GET_CONFIG_REPLY message with the following information.

Table 56-5: Parameters in the output from **show openflow status** (cont.)

Parameter	Description
`frags:`	The action for the IP fragments: normal, dropped, or reassembled. Normal means that an attempt should be made to pass the fragments through the OpenFlow tables.
`miss_send_len=0:`	The number of bytes of each packet that was sent to the OpenFlow controller when a flow table fails or reaches the controller

57 MACsec Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure MACsec (Media Access Control Security) and the MACsec Key Agreement protocol (MKA).

MACsec provides line-rate encryption and protection of traffic passing over a Layer 2 network or link. It protects all frames passing over the link, including Layer 2 protocols such as ARP.

For more information, see the MACsec Feature Overview and Configuration Guide.

Command List

clear macsec counters

Overview Use this command to clear MACsec packet counters for the given interface or for all interfaces.

These are the statistics displayed in the output from show macsec.

Syntax

```
clear macsec counters [interface <interface-list>]
```

Parameter	Description
`interface <interface-list>`	The interfaces to clear statistics for: • a switchport (e.g. port1.0.4) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4).

Mode Privileged Exec

Example To clear MACsec packet counters for port1.0.1, use the command:

```
awplus# clear macsec counters interface port1.0.1
```

To clear MACsec packet counters for all interfaces, use the command:

```
awplus# clear macsec counters
```

Related commands show macsec

Command changes Version 5.4.9-2.1: command added

Version 5.5.1-2.1: command added to x550 Series

clear mka sessions

Overview Use this command to restart MKA sessions. Note that this will cause a traffic disruption until the MKA sessions re-establish.

Syntax

```
clear mka sessions [interface <interface-list>]
```

Parameter	Description
`interface <interface-list>`	The interfaces to clear MKA sessions for: • a switchport (e.g. port1.0.4) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4).

Mode Privileged Exec

Example To clear the MKA session on port1.0.1, use the command:

```
awplus# clear mka sessions interface port1.0.1
```

To clear all MKA sessions for all interfaces, use the command:

```
awplus# clear mka sessions
```

Related commands

Command changes

Version 5.4.9-2.1: command added

Version 5.5.1-2.1: command added to x550 Series

crypto random bytes

Overview Use this command to generate a cryptographically secure random number in hexadecimal format and print it to the console.

Syntax

```
crypto random bytes <1-32>
```

Parameter	Description
`bytes <1-32>`	The length of the random number to generate in bytes. Each byte is represented by 2 hexadecimal digits in the output.

Mode Privileged Exec

Usage notes You can use this command to generate keys for symmetric encryption algorithms such as Advanced Encryption Standard (AES). You can also use this to generate strong passwords.

This command prints a random number to the console; it does not automatically store or configure anything. You can copy the command output into other configuration commands.

For example, the MACsec Key Agreement protocol requires a pre-shared key, known as the Secure Connectivity Association Key (CAK). You can use this command to generate a key and then copy it into the mka pre-shared-key command.

Example To generate a 128-bit (16-byte) key, use the command:

```
awplus# crypto random bytes 16
```

A 16 byte key will be printed to the console as a 32-digit hexadecimal number.

Related commands mka policy (interface)

mka pre-shared-key

Command changes Version 5.4.9-2.1: command added

Version 5.5.1-2.1: command added for x550 Series.

key-server priority

Overview Use this command to adjust the key server priority advertised in MKA.

Use the **no** variant of this command to reset the key server priority to the default.

Syntax

```
key-server priority <0-255>
no key-server priority
```

Parameter	Description
<0-255>	The priority for this device to become the key server, in the range 0 to 255. Lower values are higher priority.

Default 128

Mode MKA Policy Configuration

Usage notes If both peers are configured with the same key server priority value, the MKA peer transmitting on the channel with the lowest Secure Channel Identifier (SCI) will be chosen as the key server. The SCI is made up of the MAC address followed by a port identifier.

Example To configure this MKA peer to advertise the highest priority to become the key server for MKA policy 'office', use the commands:

```
awplus# config terminal
awplus(config)# mka policy office
awplus(config-mka-policy)# key-server priority 0
```

To reset the device to default key server priority of 128, use the commands:

```
awplus# config terminal
awplus(config)# mka policy office
awplus(config-mka-policy)# no key-server priority
```

Command changes

Version 5.4.9-2.1: command added

Version 5.5.1-2.1: command added to x550 Series

macsec replay-protection

Overview Use this command to enable replay protection and set the size of the replay protection window for the MKA policy. When replay protection is enabled, MACsec drops frames that are too far out of the expected order, as specified by the window size.

Use the **no** variant of this command to disable replay protection.

Syntax

```
macsec replay-protection window-size <0-4294967295>
no macsec replay-protection
```

Parameter	Description
`window-size <0-4294967295>`	The size of the MACsec replay protection window, in frames. A window-size of 0 (zero) means MACsec will not allow any frame re-ordering. That is, it drops any frames it receives with packet numbers earlier than the next expected packet number.

Default By default, replay protection is enabled and the window size is 0.

Mode MKA Policy Configuration

Usage notes We recommend using the default setting for replay protection unless you expect legitimate frame reordering on the link.

Example To enable MACsec replay protection with window size 0 for MKA policy 'office', use the following commands:

```
awplus# configure terminal
awplus(config)# mka policy office
awplus(config-mka-policy)# macsec replay-protection
window-size 0
```

To disable replay protection for MKA policy 'office', use the commands:

```
awplus# config terminal
awplus(config)# mka policy office
awplus(config-mka-policy)# no macsec replay-protection
```

Command changes Version 5.4.9-2.1: command added

Version 5.5.1-2.1: command added to x550 Series

macsec-cipher-suite

Overview Use this command to set the cipher suite MACsec uses to encrypt and decrypt MACsec-protected frames.

Syntax

```
macsec-cipher-suite gcm-aes-128
```

Parameter	Description
gcm-aes-128	Cipher suite GCM-AES-128.

Default GCM-AES-128

Mode MKA Policy Configuration

Usage notes After a device has been elected as key server, it chooses the settings to use for MACsec protection, including which cipher suite to use. Both devices use the settings chosen by the key server.

If this device is elected as key server, then it will choose the cipher suite specified by this command.

If this device is not elected as key server, then this command has no effect. This device will use the cipher suite that the key server has chosen, so long as it is supported. If the key server chooses a cipher suite that is not supported by this device's switchport then MACsec will not unblock the port.

You can use the key-server priority command to influence which device will be elected as key server.

Example To set the cipher suite for MKA policy 'our-policy' to GCM-AES-128, use the commands:

```
awplus# configure terminal
awplus(config)# mka policy our-policy
awplus(config-mka-policy)# macsec-cipher-suite gcm-aes-128
```

Command changes

Version 5.4.9-2.1: command added

Version 5.5.1-2.1: command added to x550 Series

Version 5.5.1-2.1: GCM-AES-256 option added for SBx908 GEN2 and x950 only.

mka policy (global)

Overview Use this command to create an MKA (MACsec Key Agreement protocol) policy and to enter MKA Policy Configuration mode to configure the policy.

Use the **no** variant of this command to delete the named MKA policy. The policy must first be removed from any interface that uses it. You cannot delete the default policy.

Syntax

```
mka policy <policy-name>
no mka policy <policy-name>
```

Parameter	Description
<policy-name>	The name of the MKA policy to be created or deleted. MKA policy names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Profile names can have only letters from a to z and A to Z, numbers from 0 to 9, - (dash), or _ (underscore).

Default By default, there is one MKA policy named 'default'. You can add this policy to a port; you cannot change its configuration or delete the policy.

Mode Global Configuration

Usage notes To protect the layer 2 traffic between the peers:

- Enable MACsec on the device (platform macsec enable) and restart the device before you can configure MACsec or MKA.
- First create and configure an MKA policy (**mka policy (global)**) or use the default policy and then set the interface to use this policy (mka policy (interface)). Optionally, configure macsec replay-protection and key-server priority.
- Create a pre-shared key and add it to the interface (mka pre-shared-key).
- Limit bandwidth to prevent loss of important control packets on the interface (for instance, egress-rate-limit).

For more information about MACsec and how to configure it, see the MACsec Feature Overview and Configuration Guide.

Example To create an MKA policy named 'office', and enter MKA Policy mode to configure it, use the commands:

```
awplus# configure terminal
awplus(config)# mka policy office
```

To delete the MKA policy from the device, use the commands:

```
awplus# configure terminal
awplus(config)# no mka policy our-policy
```

Command changes

Version 5.4.9-2.1: command added

Version 5.5.1-1.1: support added for XEM2-12XS v2 and XEM2-8XSTm

Version 5.5.1-2.1: command added to x550 Series

mka policy (interface)

Overview Use this command to set the MKA policy for the interface to use for MACsec, and to enable MACsec on the interface. All traffic except EAPOL traffic will be blocked and MKA will begin. The switch will create SCs and SAs from SAKs negotiated via MKA and traffic will then be forwarded and encrypted.

Use the **no** variant of this command to disable MACsec on the interface and remove an MKA policy from the interface. The policy name does not need to be given.

Syntax

```
mka policy <policy-name>
no mka policy
```

Parameter	Description
<policy-name>	The name of the MKA policy to be enabled or disabled. Only one MKA policy can be added to an interface.

Default By default, there is one MKA policy named 'default'. You can add this policy to a port; you cannot change its configuration or delete the policy.

Mode Interface Configuration

Usage notes To protect the Layer 2 traffic between the peers:

- Enable MACsec on the device (platform macsec enable) and restart the device before you can configure MACsec or MKA.
- Create and configure an MKA policy (mka policy (global) or use the default policy and then set the interface to use this policy (**mka policy (interface)**). Optionally, configure macsec replay-protection and key-server priority.
- Create a pre-shared key and add it to the interface (mka pre-shared-key).
- Limit bandwidth to prevent loss of important control packets on the interface (for instance, egress-rate-limit).

For more information about MACsec and how to configure it, see the MACsec Feature Overview and Configuration Guide.

Example To add the MKA policy 'office' to port1.0.1, use the commands:

```
awplus(config)# interface port1.0.1
awplus(config-if)# mka policy office
```

To remove the MKA policy from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mka policy
```

Version 5.5.1-2.1: command added to x550 Series

mka pre-shared-key

Overview Use this command to set the pre-shared Secure Connectivity Association Key (CAK) and CAK name (CKN) that MKA uses on the interface.

Use the **no** variant of this command to remove the pre-shared key from the interface.

Syntax

```
mka pre-shared-key ckn <cak-name> cak <key>
no mka pre-shared-key
```

Parameter	Description
`ckn <cak-name>`	The CAK name (CKN). Enter the CKN as a series of hexadecimal characters. • It can be from 2 to 64 hexadecimal characters long (inclusive). This represents 1 to 32 bytes. • There must be an even number of hexadecimal characters.
`cak <key>`	The Secure Connectivity Association Key (CAK). Enter this encryption key as a series of hexadecimal characters. • Enter a 128-bit (16 byte) key as 32 hexadecimal characters. • Enter a 256-bit (32 byte) key as 64 hexadecimal characters.

Default By default, there are no pre-shared keys configured.

Mode Interface Configuration

Usage notes The MACsec Key Agreement (MKA) protocol uses the pre-shared CAK to secure itself and to authenticate peers. MKA includes the CAK Name (CKN) in every message that it sends. You must configure the same CAK and CKN at both ends of a MACsec-protected link.

Selecting the CAK:

- The CAK should be a value from a cryptographically secure random number generator. We recommend you use the crypto random bytes command.
- Each MACsec-protected link in your network should use a different CAK.
- We recommend you always use a 256-bit CAK, regardless of which MACsec cipher suite you choose (macsec-cipher-suite command).

Selecting the CAK name (CKN):

- The CKN must not be derived from any part of the CAK because that would seriously undermine protection. The CKN is clearly visible in every MKA message (it is not encrypted).
- Each different CAK used in your network should have a unique name.

AlliedWare Plus uses the exact CKN and CAK that you have entered; it does not pad or truncate your input.

The running configuration will not display the CAK in plain text—it will show a different number. However, we recommend limiting access to authorized eyes only.

Example To configure a 256-bit pre-shared key with CAK name (CKN) '01' on port1.0.1, use the commands:

```
awplus# crypto random bytes 32
```

The output of this command is 64 hexadecimal characters that you can copy and paste as the CAK <cak>.

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mka pre-shared-key ckn 01 cak <cak>
```

To remove the preshared key from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mka pre-shared-key
```

Version 5.5.1-2.1: CAK parameter now accepts 256-bit keys

platform macsec enable

Overview Use this command to enable hardware support for MACsec.

Use the **no** variant of this command to disable hardware support for MACsec (default).

The device must be rebooted for either enabling or disabling to take effect.

Syntax

```
platform macsec enable
no platform macsec enable
```

Default Disabled

Mode Global Configuration

Usage notes To use MACsec, you must enable MACsec hardware support with this command (**platform macsec enable**) and then restart the device.

If you disable hardware support for MACsec (**no platform macsec enable**) and then reboot the device, no MACsec configuration can be entered manually or by configuration script.

Example To enable hardware support for MACsec, use the commands:

```
awplus# configure terminal
awplus(config)# platform macsec enable
awplus(config)# exit
awplus# copy running-config startup-config
awplus# reboot
reboot system? (y/n): y
```

To disable hardware support for MACsec, use the following commands. After the device has restarted, hardware support for MACsec will be disabled.

```
awplus# configure terminal
awplus(config)# no platform macsec enable
awplus(config)# exit
awplus# copy running-config startup-config
awplus# reboot
reboot system? (y/n): y
```

Version 5.5.1-1.1: support added for XEM2-12XS v2 and XEM2-8XSTm (ports 5-8)

Version 5.5.1-2.1: command added to the x550 Series

show macsec

Overview Use this command to display MKA and MACsec information and statistics for specified interfaces or for all interfaces.

Syntax

```
show macsec [interface <interface-list>]
```

Parameter	Description
`interface <interface-range>`	The interfaces or range of interfaces for which to display information: • a switchport (e.g. port1.0.4) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4).

Mode Privileged Exec

Example To display information about port1.0.1, use the command:

```
awplus# show macsec interface port1.0.1
```

To display information about all interfaces, use the command:

```
awplus# show macsec
```

Output Figure 57-1: Example output from **show macsec** when MACsec is working

```
awplus#show macsec interface port1.0.4

```

Table 57-1: Parameters in the output from **show macsec**

Parameter	Description
MKA	Information about the MACsec Key Agreement protocol.
Pre-shared CAK Size (Bits)	The size (in bits) of the Secure Connectivity Association Key (CAK) that has been configured with the mka pre-shared-key command. This will show "-" when the pre-shared key has not been configured.

Table 57-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
`Active`	This is "True" when MKA is active. Being active means that MKA is sending messages and listening for messages from peers. This doesn't indicate whether or not any peers have been discovered. When MKA is inactive this will be "False" and may display one of the following reasons: • "unlicensed"—Either the device does not have a MACsec license installed or the license is not currently valid according to its start and end dates. Check the **show license external** command to see which licenses are installed. • "incomplete configuration"— MKA is not fully configured. Check that bothmka policy (interface) and mka pre-shared-key are configured on the port. • "interface down"—The switchport is currently down. This will only show one reason at a time, even if there is more than one reason for MKA being inactive.
`Actor SCI`	The Secure Channel Identifier (SCI) of this device (automatically assigned, based on the MAC address).
`Actor Priority:`	This device's priority value for key server election, as set by the key-server priority command. This is compared with the peer's priority to decide which device will be the key server. Lower values represent higher priorities so the highest priority is zero and the lowest priority is 255.
`Key Server SCI`	The Secure Channel Identifier (SCI) of the device that has been elected to be the key server. This will display "-" when a key server has not been elected.
`Key Server Priority`	The priority of the device that has been elected to be the key server. This will display "-" when a key server has not been elected.
`Keys Distributed`	How many Secure Association Keys (SAKs) this device has transmitted to the peer.
`Keys Received`	How many Secure Association Keys (SAKs) this device has received from the peer.
`MACsec Settings Received`	Displays "True" when this device knows the protections settings chosen by the key server. That means either a message containing the settings has been received from the key server or, if this device is the key server, the decision has been made by this device. Otherwise, this displays "False" which means the chosen protection settings are not yet known to this device.

Table 57-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
MACsec Settings Accepted	Displays "True" when the protection settings, chosen by the key server, are supported on this switchport. When this is "False", at least one of the settings (cipher suite or protection mode) is not supported. When the settings are not yet known, this displays "-".
MACsec Cipher Suite	The MACsec cipher suite chosen by the key server, e.g. "GCM-AES-128". Displays "-" when the protection settings are not known or the key server has chosen to not use MACsec protection.
MACsec Protection Mode	The type of protection chosen by the key server. Displays one of the following values when the protection settings are known: • "No protection" - don't add any MACsec encapsulation • "Integrity only" • "Integrity and confidentiality" • "Integrity and offset-confidentiality" • Displays "-" when the protection settings are not known. The MACsec protection mode that the key server has chosen. Only 'Integrity and confidentiality' is supported by AlliedWare Plus. This will show 'Undecided' when a key server has not been elected.
General MACsec Info	General information about the MACsec processing of traffic.
Hardware Ready	This displays 'True' when the necessary settings have been applied to hardware. That is: • the channels and SAs have been added and • it is using the cipher suite and MACsec protection mode that this device and port and AlliedWare Plus version support. Otherwise, it displays 'False' and MACsec protection is not working.
Current Cipher Suite	The cipher suite that is being used for encryption/decryption and verification of MACsec frames. This will show "-" when the key server has not been elected or it has chosen settings that the device does not support.
Cipher Suite Protection	The cipher suite protection mode that is currently being used. AlliedWare Plus only supports "Integrity and confidentiality". That means frames are protected from modification and the payload is encrypted. This will show "-" when the key server has not been elected or it has chosen settings that the device doesn't support.

Table 57-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
`Input Data Pkts (Allowed)`	The number of ingress frames that have been allowed through the port. This does not include EAPOL frames that have bypassed MACsec verification; they are counted separately under "Input EAPOL Pkts".
`Input Data Pkts (Blocked)`	The number of ingress frames that have been discarded. This should not be going up during normal operation.
`Input EAPOL Pkts`	The number of ingress EAPOL frames (including MKA) that have bypassed MACsec verification. If this is not going up then the device is not receiving MKA messages from the peer. See the show auth statistics interface command for a counter that includes only MKA messages.
`Output Data Pkts (OK)`	The number of egress frames that have been allowed through the port. This does not include EAPOL frames sent by this device; they are counted separately under "Output EAPOL Pkts".
`Output Data Pkts (Error)`	This is the same value as "Frame Generation" -> "Pkts Too Long". This does not include frames discarded when MACsec is blocking the port or when the link is oversubscribed.
`Output EAPOL Pkts`	The number of egress EAPOL frames sent by this device. EAPOL frames sent by this device are never encapsulated in MACsec.
`Frame Generation`	Information about MACsec processing of egress frames.
`Protect Frames`	This will always be "True". It means that outgoing traffic will be encapsulated in MACsec frames.
`Always Include SCI`	This will always be "True" It means that the Secure Channel Identifier is always included in outgoing MACsec frames.
`Pkts Untagged`	This will always be '0' (zero). MACsec sends no unprotected frames.
`Pkts Too Long`	The number of egress frames that were discarded during MACsec processing because they were too big. This does not include frames that were discarded due to exceeding the MRU configured on the port because that happens before MACsec processing.
`Bytes Protected Only`	The number of bytes that have been included inside MACsec encapsulation without encryption. This will always be '0' (zero) because AlliedWare Plus only supports encrypted MACsec frames.
`Bytes Encrypted`	The number of bytes that have been encrypted for MACsec encapsulation.

Table 57-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Frame Verification	Information about MACsec processing of ingress frames.
Validate Frames	This is always "Strict".
Replay Protect	This is "True" if replay protection is enabled and "False" if replay protection is disabled. This will match what has been configured with the macsec replay-protection command.
Replay Window	The size of the replay protection window, as set by the macsec replay-protection command.
Pkts Untagged (Allowed)	The number of ingress frames that were allowed through the port even though they did not have MACsec encapsulation. This will always be zero because AlliedWare Plus only supports "Strict" validation. This does not include EAPOL frames that have bypassed MACsec verification.
Pkts Untagged (Blocked)	The number of ingress frames that were discarded because they did not have MACsec encapsulation. This does not include EAPOL frames that have bypassed MACsec verification.
Pkts Bad Tag	The number of ingress frames that were discarded because the MACSec tag (SecTAG) contained invalid information.
Pkts Unknown SCI (Allowed)	The number of ingress frames that were allowed through the port even though they could not be matched to a receive channel. This will always be zero because AlliedWare Plus only supports "Strict" validation.
Pkts Unknown SCI (Blocked)	The number of ingress frames that were discarded because they could not be matched to a receive channel. This could happen for one of the following reasons: • A Secure Channel Identifier (SCI) was not included in the MACsec tag (SecTAG). • The SCI in the SecTAG did not match the receive channel.
Pkts Overrun	The number of ingress frames that were discarded due to performance limitations of MACsec validation.
Bytes Validated Only	The number of non-encrypted bytes encapsulated inside MACsec frames that have gone through integrity checking. This includes frames that get discarded due to failing the integrity check or another check that is performed afterwards. This does not include the MAC addresses, SecTAG or ICV.

Table 57-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Bytes Decrypted	The number of encrypted bytes encapsulated inside MACsec frames that have gone through integrity checking and decryption. This includes frames that get discarded due to failing the integrity check or another check that is performed afterwards.
Transmit Channel <secure-channel-identifier>	Information about the Secure Channel used for transmitting frames to the peer. The peer device should have a receive channel with the same Secure Channel Identifier.
Created Time	When the transmit channel was created.
Pkts Protected Only	The number of MACsec-protected frames transmitted through this channel without encryption. This will always be zero.
Pkts Encrypted	The number of MACsec-protected frames transmitted through this channel with encryption.
Secure Association <association-number>	Information about a Secure Association (SA) that belongs to the transmit channel. The peer device should have an SA on its receive channel with the same association number and key identifier.
Key Identifier	An identifier for the Secure Association Key (SAK) that is part of this Secure Association. This is not the key itself.
Created Time	When this Secure Association was created. The SA will usually become operational (as indicated by "In Use") a few seconds after it has been created.
In Use	This is "True" if the Secure Association is installed in hardware and is operational.
Next Packet Number	This value, expressed in hexadecimal, will be used as the packet number in the next MACsec frame that's generated with this SA. This starts at 0x00000001 when the SA is first created and increases by one for each frame sent. The process of changing SAKs should start once this reaches 0xC0000000. The maximum possible value is 0xFFFFFFFF.
Pkts Protected Only	The number of MACsec-protected frames transmitted with this Secure Association without encryption. This will always be zero.
Pkts Encrypted	The number of MACsec-protected frames transmitted with this Secure Association with encryption.
Receive Channel <secure-channel-identifier>	Information about a Secure Channel used for receiving frames from a peer.

Table 57-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
Created Time	When the receive channel was created.
Pkts OK	The number of MACsec-protected frames that passed all validation checks and were allowed through the port. This counter only includes frames received through this channel.
Pkts Unchecked	This will always be zero because Alliedware Plus only supports "Strict" validation.
Pkts Invalid (Allowed)	The number of ingress frames that were allowed through the port even though they did not pass integrity protection checks. This will always be zero because Alliedware Plus only supports "Strict" validation.
Pkts Invalid (Blocked)	The number of MACsec-protected frames that were discarded because they did not pass integrity protection checks. This counter only includes frames received through this channel.
Pkts Late (Allowed)	The number of MACsec-protected frames that were allowed through the port even though they did not pass the replay protection check. This counter only includes frames received through this channel. This depends on the setting of the macsec replay-protection command.
Pkts Late (Blocked)	The number of MACsec-protected frames that were discarded because they did not pass the replay protection check. This counter only includes frames received through this channel. This depends on the setting of the macsec replay-protection command.
Secure Association <association-number>	Information about a Secure Association (SA) that belongs to the receive channel.
Key Identifier	An identifier for the Secure Association Key (SAK) that is part of this Secure Association. This is not the key itself.
Created Time	When this Secure Association was created. The SA will usually become operational (as indicated by "In Use") a few seconds after it has been created.
In Use	This is "True" if the Secure Association is installed in hardware and is operational.
Next Packet Number	The packet number that the device expects to receive next. This is one greater than highest packet number received so far.

Table 57-1: Parameters in the output from **show macsec** (cont.)

Parameter	Description
`Pkts OK`	The number of MACsec-protected frames that passed all validation checks and were allowed through the port. This counter only includes frames received with this Secure Association.
`Pkts Invalid (Allowed)`	The number of ingress frames that were allowed through the port even though they did not pass integrity protection checks. This will always be zero because AlliedWare Plus only supports “Strict” validation.
`Pkts Invalid (Blocked)`	The number of MACsec-protected frames that were discarded because they did not pass integrity protection checks. This counter only includes frames received with this Secure Association.

show mka policy

Overview Use this command to display information about the named MKA policy or all MKA policies.

Syntax

```
show mka policy [<policy-name>]
```

Parameter	Description
<policy-name>	The name of the MKA policy to display. If no policy name is specified, all MKA policies are displayed.

Mode Privileged Exec

Example To display settings for MKA policy 'office', use the command:

```
awplus# show mka policy office
```

To display all MKA policies, use the command:

```
awplus# show mka policy
```

Output Figure 57-2: Example output from **show mka policy**

```
awplus# show mka policy
MKA policy: default
  Key server priority: 128
  MACsec Cipher Suite: GCM-AES-128
  Replay protection: Enabled
  Replay window size: 0

MKA policy: office
  Key server priority: 100
  MACsec Cipher Suite: GCM-AES-128
  Replay protection: Enabled
  Replay window size: 20

MKA policy: test
  Key server priority: 200
  MACsec Cipher Suite: GCM-AES-128
  Replay protection: Disabled
```

Table 57-2: Parameters in the output from **show mka policy**

Parameter	Description
`MKA policy`	The name of the MKA policy; either 'default' or as named with the mka policy (interface) command.
`Key server priority`	The priority for this device to be the keyserver for the MACsec link; in the range 0 to 255, as specified by the key-server priority command. A lower number is a higher priority. The default is 128.
`MACsec Cipher Suite`	The cipher suite that MACsec uses for encapsulation and encryption of data, as specified by the macsec-cipher-suite command.
`Replay protection`	Whether replay protection is enabled or disabled, as set by the macsec replay-protection command. When enabled, MACsec drops frames that arrive outside this window.
`Replay window size`	The size of the replay protection window in frames, as set by the macsec replay-protection command. A value of 0 (zero) allows no frame reordering.

Part 6: Network Availability

58 Virtual Chassis Stacking (VCStack™) Commands

Introduction

Overview This chapter provides an alphabetical reference for Virtual Chassis Stacking (VCStack™) commands.

For information on stacking, see VCStack Feature Overview and Configuration Guide.

VCStack is not available in Secure Mode (see the crypto secure-mode command.

Also note the following stacking trigger commands that are documented in the Triggers chapter:

- type stack disabled-master
- type stack master-fail
- type stack member
- type stack link

In addition to the stacking commands shown in this chapter, stacking content also exists in the following commands:

- hostname
- reboot
- reload
- show cpu
- show cpu history
- show exception log
- show file systems
- show memory
- show memory history
- show process

- show system

CAUTION: *Stack operation is only supported if* ***stack virtual-mac*** *is enabled. For more information refer to stack virtual-mac.*

Command List

clear counter stack

Overview This command clears all stack counters for all stack members.

Syntax

```
clear counter stack
```

Mode Privileged Exec

Example To clear all stack counters:

```
awplus# clear counter stack
```

Related commands show counter stack

debug stack

Overview This command enables the stacking debugging facilities.

Syntax

```
debug stack [link|topology|trace]
no debug stack [link|topology|trace]
```

Parameter	Description
`link`	Stacking neighbor discovery events on stack links.
`topology`	Stacking topology discovery messages.
`trace`	Notable stacking events.

Default Stack trace debugging is enabled.

Mode Privileged Exec and Global Configuration

Usage notes The command displays debug information about the stacked devices. If no parameter is specified, all the stack debugging information will be displayed, including link events, topology discovery messages and all notable stacking events. If link parameter is specified, only the link events debugging information will be displayed.

Examples To enable debugging, enter the following command on the stack master:

```
awplus# debug stack
```

To enable link debugging, enter the following command on the stack master:

```
awplus# debug stack link
```

To enable topology discovery debugging, enter the following command on the stack master:

```
awplus# debug stack topology
```

To enable stack trace debugging, enter the following command on the stack master:

```
awplus# debug stack trace
```

Related commands undebug stack

delete stack-wide force

Overview Use this command to delete files from all members of a stack.

Syntax

```
delete stack-wide force [recursive] <name>
```

Parameter	Description
`recursive`	Delete directories that match the name, including their contents.
<name>	The name of the files or directories to delete. The filename can include the wildcard *. Use the wildcard with caution, because this command does not ask for confirmation before deleting files.

Mode Privileged Exec.

Usage notes This a non-interactive command, so if the specified file or files exist, they are deleted without question or warning. This is indicated by the mandatory **force** parameter.

You can use this command within an AMF working set.

Examples To delete a file "test.scp" that is located in flash memory on all stack members, use the following command:

```
awplus# delete stack-wide force test.scp
```

To remove directories "output1" and "output2" from an external USB memory device on all stack members, use the following command:

```
awplus# delete stack-wide force recursive usb:output*
```

Related commands cd

dir stack-wide

Command changes Version 5.4.7-0.1: command added.

dir stack-wide

Overview This command lists the files on all stack members at once. If you don't specify a directory or file, then this command lists the files in the current directory.

Syntax
```
dir stack-wide [recursive] [sort [reverse] [name|size|time]]
[<filename>|debug|flash|nvs|usb]
```

Parameter	Description
`recursive`	List the contents of directories recursively.
`sort`	Sort directory listing.
`reverse`	Sort using reverse order.
`name`	Sort by name.
`size`	Sort by size.
`time`	Sort by modification time (default).
<filename>	The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory.
`debug`	Debug root directory
`flash`	Flash memory root directory
`nvs`	NVS memory root directory
`usb`	USB storage device root directory

Mode Privileged Exec

Usage notes The **dir stack-wide** command behaves the same as the dir command, except for running on all stack members.

Examples To list the files in the current directory across all stack members, use the command:

```
awplus# dir stack-wide
```

To list files in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide flash
```

To list files recursively in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide recursive flash
```

To list the files in alphabetical order, use the command:

```
awplus# dir stack-wide sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir stack-wide sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir stack-wide sort reverse time
```

Output Figure 58-1: Example output from using the **dir stack-wide** command to list files that start with atmf

```
awplus#dir stack-wide atmf*

Stack member 1:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh

Stack member 2:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh
```

mkdir

delete stack-wide force

Command changes Version 5.4.8-0.2: command added.

mac address-table vcs-sync-mode

Overview Use this command to allow a MAC address learnt on one stack member to be used on any other stack member. Note that this command is only necessary in unusual circumstances, as described in the Usage section below.

Syntax

```
mac address-table vcs-sync-mode
no mac address-table vcs-sync-mode
```

Default Disabled

Mode Global configuration

Usage notes MAC addresses are automatically learnt by stack members when a packet is seen by that stack member. Normally this is sufficient to make sure that all stack members that need the MAC address learn it.

If aggregators are used, it is possible for the path taken by packets travelling from host A to B to traverse different stack members than packets travelling from host B to A. In this case, the MAC addresses may not be learnt and traffic could be flooded. Even in this case, a broadcast packet from each unit, such as an ARP packet, would be enough to cause all stack members to learn these MAC addresses.

However, in very unusual cases, the automatic learning can still lead to some flooding. This command resolves such situations by synchronising MAC address entries between stack members. This will prevent the flooding that would otherwise occur in these unusual cases.

Note that enabling this feature has a small impact on CPU performance, because it slightly increases the numbers of packets sent to the CPU.

Example To make a MAC address learned by one stack member available to all members in the stack, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table vcs-sync-mode
```

Related commands show mac address-table

reboot rolling

Overview This command reboots a stack in a rolling sequence to minimize downtime.

The stack master is rebooted, causing the remaining stack members to failover and elect a new master. The rebooted unit remains separate from the remaining stack and boots up as a stand-alone unit. Once the rebooted unit has finished running its configuration and has brought its ports up, it reboots all the remaining stack members at once.

Syntax

```
reboot rolling
```

Mode Privileged Exec

Usage notes When stacking is used with EPSR, the EPSR **failovertime** must be set to at least 5 seconds to avoid any broadcast storms during failover. Broadcast storms may occur if the switch cannot failover quickly enough before the EPSR **failovertime** expires. For further information about EPSR **failovertime**, see the epsr command.

Examples To rolling reboot the stack, use the commands:

```
awplus# reboot rolling
Continue the rolling reboot of the stack? (y/n):
```

After running this command, the stack master will reboot immediately with the configuration file settings. The remaining stack members will then reboot once the master has finished re-configuring.

```
Continue the rolling reboot of the stack? (y/n):
awplus# y
```

Related commands boot system

epsr

reload rolling

Overview This command performs the same function as the reboot rolling command.

remote-command (deleted)

Overview This command has been deleted in Software Version 5.4.4-1.1 and later. Instead, please use the remote-login command and then run the command you need to run remotely.

remote-login

Overview This command is used only on the master in order to log onto the CLI of another stack member. In most respects the result of this is similar to being logged into the stack master. Configuration commands are still applied to all stack members, but show commands and commands that access the file system are executed locally.

The specific output obtained will vary greatly depending on the show command chosen.

Syntax

```
remote-login <stack-ID>
```

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.

Mode Privileged Exec

Usage notes Note that some commands such as **ping** or **telnet** are not available when the remote-login is used.

Example To log onto stack member 2, use the following command:

```
awplus# remote-login 2
```

To return to the command prompt on the master stack member, type **exit**.

show counter stack

Overview Use this command to display stack related counter information.

Syntax

```
show counter stack
```

Default All counters are reset when the stack member is rebooted.

Mode User Exec and Privileged Exec

Usage notes This displays the stacking counter information for every stack member.

Examples To display the stacking counter information about the whole stack, use the following command:

```
awplus# show counter stack
```

Figure 58-2: Example output from the **show counter stack** command

Stack member 2:

-- Output repeated for other stack members - details not shown --
```

Table 1: Parameters in the output of the **show counter stack** command

Parameters	Description
Topology Event Counters	
`Units joined`	Number of times that the stack acquires a member.
`Units left`	Number of times that the stack loses a member.
`Links up`	Number of times that a stack link is up in the stack.
`Links down`	Number of times that a stack link is down in the stack.

Table 1: Parameters in the output of the **show counter stack** command (cont.)

Parameters	Description
ID conflict	Number of times that stack-ID conflicts.
Master conflict	Number of times that stack master conflict occurs.
Master failover	Number of times that stack master fails.
Master elected	Number of times that stack master is elected.
Master discovered	Number of times that stack master is discovered.
SW autoupgrades	Number of times that the software in the stack members are auto upgraded.
Stack port	
Link up	Number of times that this unit's physical stack link has come up.
Link down	Number of times that this unit's physical stack link has come down.
Nbr re-init	Number of times that the neighbor is detected as having reinitialized.
Nbr incompatible	Number of times that the neighbor is detected as incompatible.
Nbr 2way comms	Number of times that the neighbor is in two way communication status.
Nbr full comms	Number of times that the neighbor is in full communication status.
Topology message counters	
Total	Total number of topology messages.
Hellos	Number of hello messages.
Topology DB	Number of topology database messages.
Topology update	Number of topology database update messages.
Link event	Number of link event messages.
Reinitialise	Number of reinitialize messages.
1-hop transport	Number of 1-hop transport messages.
Layer-2 transport	Number of layer 2 transport messages.

Table 1: Parameters in the output of the **show counter stack** command (cont.)

Parameters	Description
`Link event`	Number of link event messages.
`Reinitialise`	Number of reinitialize messages.
`1-hop transport`	Number of 1-hop transport messages.
`Layer-2 transport`	Number of Layer 2 transport messages.
`Topology error counters`	Reasons why a neighboring unit could not join the stack.
`Version unsupported`	Number of stack software version unsupported errors.
`Product unsupported`	Number of product unsupported errors.
`XEM unsupported`	Number of XEM unsupported errors.
`Too many units`	Number of too many units errors.
`Invalid messages`	Number of invalid messages.
`Health status good`	The number of times that the resiliency link has successfully carried healthchecks following a failure at startup.
`Health status bad`	The number of times that the resiliency link healthcheck has timed out. A timeout occurs when a backup stack member detects a delay greater than two seconds between healthcheck messages received.
`Rx`	The total number of healthcheck messages that a stack member has received from the stack master.
`Rx Error`	The total number of invalid healthcheck messages that have been received from the master. This message is not applicable to the stack master.

Related commands

show stack

switch provision (stack)

show debugging stack

Overview This command shows which debugging modes are currently enabled for stacking.

Syntax

```
show debugging stack
```

Mode User Exec and Privileged Exec

Example To display the stack debugging mode status, use the command:

```
awplus# show debugging stack
```

Figure 58-3: Example output from the **show debugging stack** command

```
Virtual Chassis Stacking debugging status:
  VCS link debugging is on
  VCS topology debugging is on
  VCS trace debugging is on
```

Related commands debug stack

show running-config stack

Overview Use this command to display the running system information specific to the stack.

```
show running-config stack
```

Mode Privileged Exec and Global Configuration

Example To display the stacking running configuration information, use the command:

```
awplus# show running-config stack
```

Output Figure 58-4: Example output from the **show running-config stack** command

```
awplus#show running-config stack

stack virtual-mac
stack virtual-chassis-id 1982
stack management vlan 4000
stack management subnet 192.168.254.0
stack resiliencylink eth0
stack enable
stack 2 priority 20
```

Related commands show running-config

show provisioning (stack)

Overview Use this command to display the provisioning status of all installed or provisioned hardware. Provisioning is the preconfiguration necessary to accommodate future connection of hardware items such as a switch.

Syntax

```
show provisioning
```

Mode User Exec and Privileged Exec

Example To show provisioning, use the following command:

```
awplus# show provisioning
```

Output Figure 58-5: Example output from **show provisioning**

```
Switch provisioning summary information

ID  Board class  Status
1.0 x930-28      Hardware present
2.0 x930-52      Provisioned
```

Table 2: Parameters in the output of the **show provisioning** command

Parameter	Description
ID	The unit bay-location of the hardware provision.
Board class	The hardware type.
Status	The provisioned state: • Hardware Present means that the hardware is currently installed in the stack. • Provisioned means that although the hardware is not currently installed, the stack is preconfigured ready to accept the hardware installation.

Related commands

show stack

switch provision (stack)

show stack

Overview Use this command to display summary information about current stack members.

Syntax

```
show stack
```

Mode User Exec and Privileged Exec

Usage notes This command displays summary information about current stack members. See show stack detail to display detailed stack information.

Example To display summary information about the stack, use the command:

```
awplus# show stack
```

Output Figure 58-6: Example output from the **show stack** command

```
Virtual Chassis Stacking summary information

ID  Pending ID  MAC address      Priority  Status  Role
1   -           0000.cd28.07e1   128       Ready   Active Master
2   -           0015.77c2.4d44   128       Ready   Backup Member
3   -           0015.77c9.7464   128       Syncing Backup Member
4   -           -                -         -       Provisioned

Operational Status                Normal operation
Stack MAC address                 0000.cd28.07e1
```

Table 3: Parameters in the output from the **show stack** command

Parameter	Description
ID	Stack-ID.
Pending ID	The pending stack member ID. This displays if you have used the command stack renumber to change the stack ID and have not yet applied the change by rebooting the switch. If there is no pending ID, the "-" symbol will display.
MAC address	Stack member MAC address.

Table 3: Parameters in the output from the **show stack** command (cont.)

Parameter	Description
`Priority`	Stack member master election priority (between 0 and 255). Note that the lowest number has the highest priority.
`Role`	Stack member's role in the stack, this can be one of: • **Active Master** • **Disabled Master**— this is the temporary master when there is a communication break within the stack, but communication still exists across the resiliency link. In this state all switch ports within the stack are disabled by default, but a different configuration can be run by a 'type stack disabled-master' trigger. • **Backup Member**— a device other than the stack master. • **Provisioned**— indicates that the stack position is provisionally configured, i.e. ready to accept a particular switch type into the stack.

Related commands

show stack detail

show stack resiliencylink

stack disabled-master-monitoring

stack resiliencylink

stack software-auto-synchronize

show stack detail

Overview Use this command to display detailed information about current stack members.

Syntax

```
show stack detail
```

Mode User Exec and Privileged Exec

Usage notes This command displays detailed information about current stack members. See the command show stack to display summary stack information only.

Example To display the detailed stacking information about the stack's overall status, use the following command:

```
awplus# show stack detail
```

Figure 58-7: Example output from **show stack detail**

```

S/W version auto synchronization        On
Resiliency link status                  Not configured
Stack port2.1.1 status                  Learnt neighbor 3, connected port3.1.5
Stack port2.1.5 status                  Learnt neighbor 1, connected port1.1.1
...
```

Table 4: Parameters in the output from the **show stack detail** command

Parameter	Description
`S/W version auto synchronization`	Whether the software-auto-synchronization feature is turned on or off.
`Host name`	The host name of the stack member.
`ID`	Stack-ID .
`Pending ID`	The pending stack member ID. This displays if you have used the command stack renumber to change the stack ID and have not yet applied the change by rebooting the switch. If there is no pending ID, the "-" symbol will display.
`Last Role Change`	The date and time the stack member last changed its role in the stack.
`MAC address`	Stack member MAC address.
`Management VLAN ID`	The VLAN ID currently used for stack management: the default is 4094.
`Management VLAN subnet address`	The current stacking management VLAN subnet address.
`Virtual Chassis ID`	The Virtual Chassis ID determines the last 12 bits of the Virtual MAC address: `0000.cd37.0xxx`
`Virtual MAC Address`	The Virtual MAC address of the stack.
`Disabled Master Monitoring`	The current Disabled Master Monitoring status. This can be: • Enabled • Disabled • Inactive

Table 4: Parameters in the output from the **show stack detail** command (cont.)

Parameter	Description
`Operational Status`	The status of the stack. This can be: • **Normal operation**: If any other status is displayed, it may warrant further investigation. • **Stacking hardware disabled:** Use the **stack enable** command to activate the stacking feature. • **Operating in failover mode**: This stack member has become separated from the rest of the stack, or it failed to join the stack correctly. • **Standalone unit**: Stacking is enabled, but no other stack members are present. • **Not all stack ports are up**: One or more stacking ports may be down, or stacking discovery may not have detected the neighbor successfully.
`Stack Status`	The stack's overall status. Note that a warning is issued if the stack is not connected in a standard ring topology.
`Stack port status`	The status of the stack port. This can be: • Down • Neighbor incompatible • Discovering neighbor • Learned neighbor If the stack has learned a neighbor, the status also shows the neighbor's stacking number and the port the stack members are connected through.
`Priority`	Stack member master election priority (between 1 and 255) Note that the lowest number has the highest priority.
`Product Type`	The switch series that the stack member belongs to.
`Provisioned`	Indicates that the stack position is provisionally configured, i.e. ready to accept a particular switch type into the stack.

Table 4: Parameters in the output from the **show stack detail** command (cont.)

Parameter	Description
`Resiliency link status`	The current status of the resiliency link. The status can be one of: • **Not configured** (on a Master or Member). • **Configured** (on a Master only). • **Successful**: Successfully receiving healthchecks from the Active Master. • **Failed** (on a Member only): Not receiving any healthchecks from the Active Master. • **Stopped**: The resiliency link is configured, but is inactive. This may occur in a Disabled Master stack, for example if the Disabled Master Monitoring feature is not used.
`Role`	Stack member's role in the stack, this can be one of: • **Active Master**. • **Disabled Master**— The temporary master when there is a communication break within the stack, but communication still exists across the resiliency link. In this state all switch ports within the stack are disabled by default, but a different configuration can be run by a "" trigger command. • **Backup Member**— a device other than the stack master. • **Discovering**— joining the stack.
`Status`	Indicates how readily a stack member can take over as master if the current stack master were to fail. • **Init —** the stack member is completing the startup initialization. • **Syncing**— the stack member is synchronizing state information with the stack master following startup. • **Ready**— the stack member is fully synchronized with the current master and is ready to take over immediately.

Related commands

show stack

show counter stack

show stack resiliencylink

stack disabled-master-monitoring

stack resiliencylink

stack software-auto-synchronize

show stack indicator

Overview This command enables you to physically identify a specific stack member. This command will flash the Master Status LED for the stack member specified. The pattern will be a number of flashes in quick succession followed by a longer pause; where the number of flashes equals the stack member ID.

Syntax

```
show stack indicator [<stack-member>|all] [timeout
<timeout-period>]
```

Parameter	Description
<stack-member>	The ID of the stack member to be identified (1-8). Default is All.
`all`	Will flash the Master Status LED on each stack member with its own appropriate ID pattern.
<timeout-period>	The time period (in seconds) that the indication will display. Default is 30 seconds.

Mode User Exec and Privileged Exec

Examples To find stack member 2 by flashing its Master Status LED, use the command:

```
awplus# show stack indicator 2
```

To find stack member 2 by flashing its Master Status LED for 1 minute, use the command:

```
awplus# show stack indicator 2 timeout 60
```

show stack resiliencylink

Overview Use this command to display information about the current status of the resiliency-link across the members of the stack.

Syntax

```
show stack resiliencylink
```

Mode User Exec and Privileged Exec

Example To display information about the current status of the resiliency-link across the stack members, use the command:

```
awplus# show stack resiliencylink
```

Output Figure 58-8: Example output from the **show stack resiliencylink** command

```
awplus(config)# show stack resiliencylink
Stack member 1:
-------------------------------------------------------------
Status                          Configured
Interface                       vlan4093
Interface state                 UP
Resiliency-link port(s)         port1.0.11

Stack member 2:
-------------------------------------------------------------
Status                          Successful
Interface                       vlan4093
Interface state                 UP
Resiliency-link port(s)         port2.0.11
```

Table 5: Parameters in the output of the **show stack resiliencylink** command

Parameter	Description
`Status`	The current status of the stack member's resiliency link. Can be one of: • **Not configured** (Master or Member). • **Configured** (Master only). • **Successful**: Successfully receiving healthchecks from the Active Master. • **Failed** (Member only): Not receiving any healthchecks from the Active Master. • **Stopped**: The resiliency link is configured, but is inactive. This may occur in a Disabled Master stack, for example if the Disabled Master Monitoring feature is not used.
`Interface`	The name of the eth or VLAN interface that is connected to the resiliency link.
`Interface state`	The current status of the interface. Can be either up or down.
`Resiliency-link port(s)`	The switch port(s) the resiliency link is connected to.

Related commands

switch provision (stack)

show stack

stack resiliencylink

switchport resiliencylink

stack disabled-master-monitoring

Overview This command enables the Disabled Master Monitoring (DMM) feature. If a stack member becomes a disabled master, the DMM feature will use the stack resiliency link to continue monitoring the health of the separated stack master.

Use the **no** variant of this command to disable the DMM feature.

Syntax

```
stack disabled-master-monitoring
no stack disabled-master-monitoring
```

Default By default, Disabled Master Monitoring is enabled. However, it only operates if there is a resiliency link.

Mode Global Configuration

Usage This command enables additional stack resiliency link functionality, which is used if a stack separation occurs. For DMM to operate, a resiliency link must also be configured (see the stack resiliencylink command). A stack separation could result in a stack member becoming a disabled master, which has the configuration as a normal stack master except that all its switchports are shutdown.

For more information about the disabled master state, see the VCStack Feature Overview and Configuration Guide.

When the DMM feature is enabled, the disabled master will continue to monitor the health of the original stack master over the stack resiliency link connection. If the original stack master were to fail, when the DMM feature is enabled, then the disabled master will detect this and will automatically re-enable its switchports. This ensures that the stack will continue to pass network traffic, even if a catastrophic stack failure occurs.

For more information about the DMM feature when the stack member is a disabled master, see theVCStack Feature Overview and Configuration Guide.

Examples To enable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# stack disabled-master-monitoring
```

To disable the DMM feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no stack disabled-master-monitoring
```

type stack master-fail

stack enable

Overview This command enables stacking on either the built-in front-panel S1 & S2 ports, 1G copper ports and 1G SFP transceivers ports, or the ports of the AT-StackQS.

The **no** variant of this command removes a selected stack member switch, as specified by the <*stack-ID*> selection in the command syntax, from the virtual chassis stack. We recommend you uncable the stack member from the stack before issuing the **no** command.

Syntax

```
stack enable [builtin-ports|expansion-ports|front-panel-ports]
no stack <stack-ID> enable
```

Parameter	Description
`builtin-ports`	Enable stacking through the front-panel S1 & S2 ports
`expansion-ports`	Enable stacking through the ports of the AT-StackQS
`front-panel-ports`	Enable stacking through the 1G front-panel-ports
<*stack-ID*>	Stack member number, from 1 to 8.

Default The default is **expansion-ports** if there is a AT-StackQS inserted, or **builtin-ports** otherwise.

Mode Global Configuration

Example To turn on stacking on the front-panel S1 & S2 ports, use the commands:

```
awplus# configure terminal
awplus(config)# stack enable builtin-ports
```

To turn on stacking on the 1 Gigabit front-panel ports, use the commands:

```
awplus# configure terminal
awplus(config)# stack enable front-panel-ports
```

Command changes Version 5.5.1-2.1: parameter **front-panel-ports** added.

stack management subnet

Overview This command configures the subnet address used by the stack management VLAN.

Use the **no** variant of this command to reset the stack's VLAN subnet management address back to the default address and mask (192.168.255.0/27).

Syntax

```
stack management subnet <ip-address>
no stack management subnet
```

Parameter	Description
<ip-address>	The new subnet address for the stack management VLAN.

Default The default stacking management VLAN subnet address is 192.168.255.0 with a subnet mask 255.255.255.224 or /27.

Mode Global Configuration

Usage notes This command configures the stack management VLAN subnet address.

The management VLAN will be used for high speed communication between stacked units via the stacking ports. Although this command enables you to change the IP address command, the subnet mask must always remain as shown.

The stack management IP subnet is solely used internally to the stacked devices, and cannot be reached external to the stack. You should only change the stack management VLAN subnet address if it causes a conflict within your network.

Note that several separate stacks can use the same default management VLAN subnet address even though their user ports may share the same external network. If the stack subnet address is changed, then the configuration for any new units must also be updated before they are inserted into the stack.

If the management VLAN subnet address is changed by this command, you can use the **no** variant of this command to reset it to its default.

Example To set the management VLAN subnet address to 192.168.255.144:

```
awplus# configure terminal
awplus(config)# stack management subnet 192.168.255.144
```

Related commands stack management vlan

stack management vlan

Overview Use this command to configure the stack management VLAN ID.

Use the **no** variant of this command to change the stack management VLAN ID back to the default (VLAN ID 4094).

Syntax

```
stack management vlan <2-4094>
no stack management vlan
```

Parameter	Description
<2-4094>	Stack management VLAN ID.

Default VLAN ID 4094

Mode Global Configuration

Usage notes The management VLAN is used for high speed communication between stacked units. This command enables you to change the ID of this VLAN.

The default stacking management VLAN ID is 4094, which is the last configurable VLAN ID in the switch.

The stack management VLAN is created and configured automatically so that the stack VLAN cannot be used in the stack's VLAN configuration commands. This means you cannot enter commands such as:

```
awplus(config-vlan)# vlan <stack-management-VLAN-ID>
```

You should only change the management VLAN if the VLAN ID 4094 needs to be used in the stack's VLAN configuration.

If necessary, you can use the **no** variant of this command to change the management VLAN back to its default value.

Changes to the stacking management VLAN configuration will take effect once the stack is restarted.

Examples To set the management VLAN to 4000, enter the following commands:

```
awplus# configure terminal
awplus(config)# stack management vlan 4000
```

To reset the management VLAN back to the default (4094), enter the following commands:

```
awplus# configure terminal
awplus(config)# no stack management vlan
```

Related commands stack management subnet

stack priority

Overview When creating a stack, use this command to set the priority of the switch you want to be master for the stack.

Syntax

```
stack <stack-ID> priority <0-255>
no stack <stack-ID> priority
```

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.
priority	The stack member's election priority value.
<0-255>	The stack member's new priority value. The lowest value is assigned the highest priority. The default is 128.

Mode Global Configuration

Usage notes This command is used to change the value of a specific stack member's master-election priority. If the specified stack-ID is not used by any current stack member, the command will be rejected.

The election criteria selects the stack member with the lowest priority value to become the stack master. Where two stack members both have the same lowest priority value, then the stack member with the lowest MAC address will be elected as master.

NOTE: *Assigning a new priority value will not immediately change the current stack master. In order to force a master re-election after the new priority value is assigned, use reboot stack-member <master's ID> to reboot the current stack master, a new stack master will then be elected based on the new priority values.*

Example To change the priority of stack member 2 to be 3, use the command:

```
awplus# configure terminal
awplus(config)# stack 2 priority 3
```

Validation Command show stack

stack renumber

Overview Use this command to renumber a specific stack member.

Syntax

```
stack <existing stack-ID> renumber <new stack-ID>
```

Parameter	Description
<existing stack-ID>	Enter the existing stack-ID in the range 1 to 8.
renumber	Change the existing stack-ID.
<new stack-ID>	Enter the new stack-ID in the range 1 to 8.

Default Every stack unit will initially try to use a stack-ID of 1.

Mode Global Configuration

Usage notes This command is used to change the ID of a specific stack member, primarily when exchanging stack members. The changes made by this command will not take effect until the switch is rebooted.

You can see renumbering changes that have not yet taken effect by checking the Pending ID field in the output of the show stack command.

NOTE: *This command does not alter any of the stack's existing configuration, apart from the stack-ID specified. For example, if stack member 2 were removed from the stack and a new stack unit is assigned the member 2 stack-ID, then the interface configuration that existed for the removed stack member 2 will be applied to the new stack member 2.*

The existing stack-ID must already be assigned to an existing stack member. To avoid duplicating IDs, a warning message will appear if you assign a new stack-ID that is currently assigned to another stack member. However, you can continue to renumber the stack-IDs and remove ID duplications. If you do not remove the duplications, then one of the devices will be forced to automatically renumber to an unused ID. Once you have removed any duplicate IDs, you can reboot the switch to implement your changes.

Note that the configured stack-ID is saved immediately on the renumbered member, and so is not reliant on using the **copy running-config** command for it to take effect.

Example To renumber stack 1 to stack 2, use the commands:

```
awplus# configure terminal
awplus(config)# stack 1 renumber 2
```

Validation Command show stack

stack renumber cascade

Overview This command is used to renumber the members of a stack so that their IDs are ordered sequentially, relative to the member's physical position within the stack.

CAUTION: Changing the stack numbering will upset the existing stack member configurations such as port settings. This command is intended for use when the stack is either initially commissioned, or has undergone a major reconfiguration. In this situation you run the stack renumber command (which will automatically reboot the switch), then configure the stack members to meet the new requirements.

Syntax

```
stack <stack-ID> renumber cascade [<new-stack-ID>]
```

Parameter	Description
<stack-ID>	The ID of the stack member to start renumbering from, from 1 to 8.
`renumber`	Change the existing stack-ID.
`cascade`	Renumber the existing stack-ID in cascade order.
<new-stack-ID>	The new ID for the first member renumbered, from 1 to 8.

Default If no new-stack-ID is specified, the member will take the default ID of 1.

Mode Global Configuration

Usage notes This command is used to renumber the members of a stack so that their stack-IDs are ordered sequentially. This would normally be done either when the stack is initially configured or following a major reconfiguration.

The renumber will start on the specified stack member. If that stack-ID is not used by any of the existing stack members, the command will be rejected.

The starting stack member will be renumbered with the new stack-ID specified, or the default of member ID of 1. The stack-ID of the next physically will be the starting member's ID +1, for example member ID 2. This renumbering will continue in cascading order around the stack members.

The changes will take place immediately and reboot all stack members. For this reason a confirmation prompt follows this command entry, asking whether you are sure you want to renumber and reboot the entire stack.

Example

```
awplus(config)# stack 1 renumber cascade

Any existing interface configuration
may no longer be valid.
Are you sure you want to renumber and reboot the entire
stack?(y/n): y
```

Related commands

show stack

switch provision (stack)

stack renumber

stack resiliencylink

Overview This command configures the resiliency link used by the stack.

The interface used is a dedicated VLAN (resiliencylink VLAN) to which switch ports may become members. This VLAN is dedicated to the resiliency link function and must not be the stack management VLAN.

Alternatively, the interface may be a NET MGMT port (eth0).

Syntax

```
stack resiliencylink <interface>
no stack resiliencylink
```

Parameters	Description
<interface>	The name of the interface that is connected to the resiliency link. This may be either the eth port or the resiliencylink VLAN.

Mode Global Configuration

Usage notes The resiliency-link is only used when a backup member loses connectivity with the master via the stacking cables. Such a communication loss would occur if:

- a stacking link is removed or fails
- two or more stacking link cables are unplugged or fail
- the stack master itself fails due to a reboot or power failure

The resiliency-link allows the backup member to determine if the master is still present in the network by the reception of healthcheck messages sent by the master over the resiliency-link interface.

Reply healthcheck messages are received if the master is still online, but the stack will now split into two different “stubs”. The stub containing the existing master will continue operating as normal. The members in the masterless stub will now use a “type stack disabled-master” trigger to run a configuration to form a second temporary stack. This utilizes the remaining stack members' resources without conflicting directly with the master's configuration. If no “type stack disabled-master” trigger was configured on the switches, then the masterless stub members will disable their switch ports.

If no healthcheck messages are received, then the master is assumed to be completely offline, and so the other stack members can safely take over the master's configuration.

CAUTION: *The purpose of the resiliency link is to enable the stack members (particularly the backup master) to check the status of the master under fault conditions. If the resiliency link is not configured, and the master loses communication with its other stack members, then the stack will assume the master is NOT present in the network, which could cause network conflicts if the master is still online. Note that this is a change to the behavior of stacking in releases prior to version 5.3.1.*

Example

To set the resiliency link to be eth0, use the following commands:

```
awplus# configure terminal
awplus(config)# stack resiliencylink eth0
```

To set the resiliency link to be VLAN 4093, first create VLAN 4093 as the resiliencylink VLAN. You do not have to use **vlan database** to create the VLAN, because the **stack resiliencylink** command creates it:

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next assign VLAN 4093 to the interface port, in this case port1.0.1:

```
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

Related commands

show stack

switch provision (stack)

show stack resiliencylink

stack disabled-master-monitoring

switchport resiliencylink

stack software-auto-synchronize

Overview This command re-enables the software version auto-synchronization feature either on a specified stack member or all stack members.

Use the **no** variant of this command to turn the software version auto-synchronization feature off.

Syntax

```
stack {all|<stack-ID>} software-auto-synchronize
no stack {all|<stack-ID>} software-auto-synchronize
```

Parameter	Description
`all`	All stack members.
`<stack-ID>`	Stack member number, from 1 to 8.

Default Enabled on all stack members

Mode Global Configuration

Usage notes This command is used to enable the software version auto-synchronization feature for either a specific stack member or all stack members and candidates.

Note that if a device attempts to join a stack but is running a software release that is different to the other stack members, the software version auto-synchronization feature will copy the master's software release onto the new member. If the software version auto-synchronization feature is not enabled, then the device will be unable to join the stack.

Note that the software version auto-synchronization feature may also result in the stack member downgrading its software release if the master is running an older software version.

Examples To turn on the software-auto-synchronize feature on stack member 2, which was previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config# stack 2 software-auto-synchronize
```

To turn on the software-auto-synchronize feature for all stack members, which were previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack all software-auto-synchronize
```

Related commands show stack

stack virtual-chassis-id

Overview This command specifies the stack virtual chassis ID. The ID selected will determine which virtual MAC address the stack will use. The MAC address assigned to a stack must be unique within its network.

NOTE: *The command will not take effect until the switch has been rebooted.*

Syntax

```
stack virtual-chassis-id <id>
```

Parameter	Description
<id>	The value of the ID - enter a decimal number in the range 0 to 4095.

Mode Global Configuration

Usage notes The virtual-chassis-id entered will form the last 12 bits of a pre-selected MAC prefix component; that is, 0000.cd37.0xxx. If you enable the stack virtual MAC address feature (by using the stack virtual-mac command) without using the stack virtual-chassis-id command to select the virtual-chassis-id, then the stack will select a virtual- chassis-id from a number within the assigned range.

Example To set the stack virtual-chassis-id to 63 use the commands

```
awplus# configure terminal
awplus(config)# stack virtual-chassis-id 63
```

This will result in a virtual MAC address of 0000.cd37.003f.

Related commands

show running-config

show stack

switch provision (stack)

stack virtual-mac

stack virtual-mac

Overview This command enables the stack virtual MAC address feature. For more information on this topic, see the VCStack Feature Overview and Configuration Guide. With this command set, the value used as the virtual MAC address is determined by the setting of the command stack virtual-chassis-id.

You must enable **stack virtual-mac**, in order to minimize data loss if a new stack member is required to become the VCStack master.

Before enabling the virtual MAC address feature, you should check that the stack's virtual-chassis-id is not already used by another stack in the network. Otherwise the duplicate MAC addresses will cause problems for the network traffic.

Syntax

```
stack virtual-mac
no stack virtual-mac
```

Default The stack virtual MAC address feature is disabled by default. However, if you manually turn on stacking (by entering the **stack enable** command), then that enables the stack virtual MAC address feature as well.

Mode Global Configuration

Usage notes Note that this command will not take effect until the switch has been rebooted.

Example

```
awplus# configure terminal
awplus(config)# stack virtual-mac
```

Related commands

show running-config

show stack

switch provision (stack)

stack virtual-chassis-id

switch provision (stack)

Overview This command enables you to provide the configuration for a new stack member switch prior to physically connecting it to the stack. To run this command, the stack position must be vacant. The selected hardware type must be compatible with existing stack hardware.

Use the **no** variant of this command to remove an existing switch provision.

Syntax

```
switch <stack-ID> provision {x930-28|x930-52}
no switch <stack-ID> provision
```

Parameter	Description
<stack-ID>	Stack member number, from 1 to 8.
`provision`	Provides settings within the stack configuration ready for a specific switch type to become a stack member.
`x930-28`	Provision a 28-port x930 switch.
`x930-52`	Provision a 52-port x930 switch.

Mode Global Configuration

Examples To provision an x930-28GTX switch as stack member 3, use the following commands:

```
awplus# configure terminal
awplus(config)# switch 3 provision x930-28
```

To remove the provision of the x930-28GTX switch as stack member 3, use the following commands:

```
awplus# configure terminal
awplus(config)# no switch 3 provision
```

Related commands show provisioning (stack)

show stack

Command changes Version 5.4.8-1.1: SBx908 GEN2 syntax changed

switchport resiliencylink

Overview This command configures the switch port to be a member of the stack resiliency link VLAN. Note that this switchport will only be used for stack resiliency-link traffic and will not perform any other function, or carry any other traffic.

The **no** variant of this command removes the switchport from the resiliency link VLAN.

Syntax

```
switchport resiliencylink
no switchport resiliencylink
```

Mode Interface Configuration

Usage notes Note that a resiliency link cannot be part of a static or dynamic aggregator group.

Examples To set the resiliency link to be VLAN 4093:

First, use the **stack resiliencylink** command to create the resiliency-link vlan `vlan4093`

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next, use the **switchport resiliencylink** command to assign the resiliency-link vlan to the port, in this case `port1.0.1`.

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

Related commands stack resiliencylink

show stack resiliencylink

vlan mode stack-local-vlan

Overview This command enables you to create stack-local-VLANs and use ICMP to monitor and diagnose issues within specific members of the stack. When a VLAN is added using this method, all its traffic will be trapped to and processed by the CPU of the specific local stack member, rather than the CPU of the stack master.

The **no** variant of this command destroys the specified VLAN.

Syntax

```
vlan <vid> mode stack-local-vlan <member-id>
no vlan <vid>
```

Parameter	Description
`<vid>`	The VID of the VLAN to be created in the range 2-4094. We recommend that the first stack-local-vlan be assigned the number 4001 for the first stack member, then incremented by one for each stack member. For example, a stack of four members would be assigned the following VID numbers: • stack member one: VID 4001 • stack member two: VID 4002 • stack member three: VID 4003 • stack member four: VID 4004
`mode stack-local-vlan`	Specifies that the new VLAN will function as a stack-local-VLAN.
`<member-id>`	Specifies the stack member ID. Enter a decimal number in the range 1-8.

Default By default, VLANs are automatically enabled as they are added.

Mode VLAN Configuration

Usage notes If IGMP snooping is operating on a stack-local-VLAN, the device will try to process some multicast traffic via that VLAN, if it is connected to a Microsoft Windows PC.

To avoid this, we recommend disabling IGMP snooping on stack-local-VLANs, by using the command **no** ip igmp snooping.

Examples To add a stack-local-VLAN with the VID of 4002 and assign it to stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode stack-local-vlan 2
awplus(config-vlan)# exit
awplus(config)# interface vlan4002
awplus(config-if)# no ip igmp snooping
```

To remove VLAN 4002, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 4002
```

59 VRRP Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure the Virtual Router Redundancy Protocol (VRRP). For more information, see the VRRP Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

advertisement-interval

Overview Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

Syntax

```
advertisement-interval [<1-255>|csec <1-4095>]
no advertisement-interval
```

Parameter	Description
<1-255>	Specifies the advertisement interval in seconds.
csec	Use centiseconds instead of seconds for the advertisement interval.
<1-4095>	Specifies the advertisement interval in centiseconds.

Default The default advertisement interval is 1 second.

Mode Router Configuration

Usage notes Note when using VRRP with VCStacking, ensure the VRRP advertisement-interval is larger than the VCStacking failover time to avoid VCStacking failovers causing VRRP failovers.

See the VRRP Feature Overview and Configuration Guide for more information about:

- setting the advertisement-interval when configuring VRRP
- using seconds for VRRPv2 host compatibility whenever you use transition-mode to upgrade or transition from VRRPv2 to VRRPv3
- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details

NOTE: *When using VRRPv3 with VCStacking, ensure that the VRRPv3 advertisement-interval is configured to a longer time than the VCStacking failover time.*

If the VRRPv3 advertisement-interval is shorter than the VCStacking failover time, then a VRRPv3 failover will also occur whenever a VCStacking failover occurs. Use seconds not centiseconds to ensure interoperability with VRRPv2.

Examples

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

Command changes

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

alternate-checksum-mode

Overview Use this command to enable an alternate checksum mode for VRRPv3 to allow inter-operability with some other vendors' products. The IPv4 checksum for VRRPv3 advertisements will then use a pseudo header in the calculation.

This mode may be required if the other product indicates checksum errors on VRRP packets sent by AlliedWare Plus devices.

Use the **no** variant of this command to disable the alternate checksum mode.

Syntax

```
alternate-checksum-mode
no alternate-checksum-mode
```

Default Disabled

Mode Router Configuration

Example To turn on the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# alternate-checksum-mode
```

To turn off the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# no alternate-checksum-mode
```

Related commands show running-config

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

Version 5.4.7-1.1: command added

circuit-failover

Overview Use this command to enable the VRRP circuit failover feature.

Circuit failover enables the device to take action if the uplink interface goes down, so that the VRRP backup, whose uplink interface is still active, takes over as VRRP master. See the Usage section below and the VRRP Feature Overview and Configuration Guide for more information.

Use the **no** variant of this command to disable this feature.

Syntax

```
circuit-failover <interface> <1-253>
no circuit-failover [<interface> <1-253>]
```

Parameter	Description
<interface>	The interface of the router that is monitored. The interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface - generally the uplink interface.
<1-253>	Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.

Mode Router Configuration

Usage notes You can use Circuit Failover to monitor up to 32 interfaces per VRRP instance. If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because 100 - 10 = 90.
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because 100 - 20 = 80.
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because 100 - 10 - 20 = 70.

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

Examples To configure circuit failover on an IPv4 VRRP instance on interface VLAN2, so that if VLAN3 goes down, then the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

To configure circuit failover on a VRRPv3 IPv6 session with VR ID 1 on interface VLAN2, so that when interface VLAN3 goes down, the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

Related commands router vrrp (interface)

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

debug vrrp

Overview Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp [all]
no debug vrrp [all]
```

Mode Privileged Exec and Global Configuration

Usage notes See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 debugging details.

Examples The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

Related commands show debugging vrrp

undebug vrrp

debug vrrp events

Overview Use this command to specify debugging options for VRRP event troubleshooting.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp events
no debug vrrp events
```

Mode Privileged Exec and Global Configuration

Usage notes The **debug vrrp events** command enables the display of debug information related to VRRP internal events.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 debugging details.

Examples The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

Related commands show debugging vrrp

undebug vrrp events

debug vrrp packet

Overview Use this command to specify debugging options for VRRP packets.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp packet [send|recv]
no debug vrrp packet [send|recv]
```

Parameter	Description
`send`	Specifies the debug option set for sent packets.
`recv`	Specifies the debug option set for received packets.

Mode Privileged Exec and Global Configuration

Usage notes The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 debugging details.

Examples The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

Related commands show debugging vrrp

undebug vrrp packet

disable (VRRP)

Overview Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the enable (VRRP) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

Syntax

```
disable
```

Mode Router Configuration

Usage notes See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 and IPv6 configuration details.

Examples The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

Related commands

router ipv6 vrrp (interface)

show vrrp

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

enable (VRRP)

Overview Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make changes to the VRRP configuration, first disable the router from participating in virtual routing using the disable (VRRP) command.

Syntax

```
enable
```

Mode Router Configuration

Usage notes You must configure the virtual IP address and define the interface for the VRRP session (using the virtual-ip or virtual-ipv6 and the router vrrp (interface) or router ipv6 vrrp (interface) commands) before using this command.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 and IPv6 configuration details.

Examples To enable the VRRP session for VRRP VR ID 5 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

To enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

Related commands

virtual-ip

virtual-ipv6

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

preempt-mode

Overview Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

If preempt-mode is set to **true**, an extra parameter is available called **delay-time**. If the delay-time parameter is used, a VRRP router with a higher priority will wait the configured length of time before it preempts the lower priority VRRP router to take over as master.

Syntax

```
preempt-mode {true|false}[delay-time <0-3600>]
```

Parameter	Description
`true`	Preemption is enabled.
`false`	Preemption is disabled.
`delay-time`	Enable preempting but delay the preempt by the amount of seconds specified by the delay-time value. Note, a delay-time of 0 means delayed preempting is disabled.

Default The default is **true**.

Mode Router Configuration

Usage notes When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority back up router will take over the master role from a lower priority back up. Preempt mode set to **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over from the backup virtual router that was previously elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled on a backup virtual router that is starting up, and this router has a higher priority than the current master, the higher priority backup will not preempt the current master, and the lower priority master will stay in the master role.

See the VRRP Feature Overview and Configuration Guide for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- preempt mode and preempt delay-time

Examples

The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure delay-time as 20 seconds for VRRPv3 VR ID 5 on vlan5:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan5
awplus(config-router)# preempt-mode true delay-time 20
```

Command changes

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

priority

Overview Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless preempt-mode is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

Syntax

```
priority <1-255>
no priority
```

Parameter	Description
<1-255>	The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>.

Default On a master router default priority is 255; on a backup router, default priority is 100.

Mode Router Configuration

Usage notes Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a value of 1 through 254.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 and IPv6 configuration details.

Examples The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

Command changes

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

router ipv6 vrrp (interface)

Overview Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

Syntax

```
router ipv6 vrrp <vrid> <interface>
no router ipv6 vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	*<1-255>* The ID of the virtual router VRRPv3 IPv6 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

Mode Global Configuration

Usage notes Use the required *<interface>* placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

NOTE: *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv6 configuration details.

Examples The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
```

Related commands advertisement-interval

circuit-failover

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

router vrrp (interface)

Overview Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

Syntax

```
router vrrp <vrid> <interface>
no router vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	*<1-255>* The ID of the virtual router VRRP IPv4 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages.

Mode Global Configuration

Usage notes Use the required *<interface>* placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

NOTE: *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Examples To enable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
```

To disable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
```

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

show running-config router vrrp

Overview Use this command to show the running configuration for VRRP IPv4.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Syntax

```
show running-config router vrrp
```

Mode Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

Example The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

Output Figure 59-2: Example output from the **show running-config router vrrp** command

```
!
router vrrp 2 vlan2
 circuit-failover vlan2 2
 advertisement-interval 4
 preempt-mode true
!
```

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

show vrrp

Overview Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Syntax

```
show vrrp [brief]
```

Parameter	Description
brief	Brief summary of VRRP sessions.

Mode User Exec and Privileged Exec

Example To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

Output Figure 59-3: Example output from the **show vrrp** command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
 State: AdminUp    - Master
 Virtual IP address: 192.168.1.2 (Not-owner)
 Priority is 100
 Advertisement interval: 100 centiseconds
 Preempt mode: TRUE
 Multicast membership on IPv4 interface vlan2: JOINED
 Transition mode: FALSE
 Accept mode: FALSE
 Master address: 192.168.1.3
```

Figure 59-4: Example output from the **show vrrp brief** command

```
awplus#show vrrp brief

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

show vrrp counters

Overview This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show vrrp counters
```

Mode User Exec and Privileged Exec

Usage notes The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

NOTE: *Note that the counters displayed with this commands are the same counters as described in RFC 2787, except for the "Monitored Circuit Up" and "Monitored Circuit Down" counters, which are additions beyond the MIB.*

Example To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 59-5: Example output from the **show vrrp counters** command

```
awplus#show vrrp counters
VRRP Global Counters:
  Checksum Errors .... 230
  Version Errors ..... 0
  VRID Errors ........ 230

VRRP IPv4 counters for VR 10/vlan10:
  Master Transitions ........ 0
  Received Advertisements ... 0
  Internal Errors ........... 0
  TTL Errors ................ 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ....... 0
  Received Invalid Type ..... 0
  Address List Errors ....... 0
  Packet Length Errors ...... 0
  Monitored Circuit Up ...... 0
  Monitored Circuit Down..... 0
```

```
VRRP IPv4 counters for VR 100/vlan100:
  Master Transitions ........ 1
  Received Advertisements ... 1614
  Internal Errors ........... 0
  TTL Errors ................ 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ....... 0
  Received Invalid Type ..... 0
  Address List Errors ....... 0
  Packet Length Errors ...... 0
  Monitored Circuit Up ...... 0
  Monitored Circuit Down..... 2
```

Table 1: Global counters with descriptions for the **show vrrp counters** command:

Counter	Description
`Checksum Errors`	The total number of VRRP packets received with an invalid VRRP checksum value.
`Version Errors`	The total number of VRRP packets received with an unknown or unsupported version number.
`VRID Errors`	The total number of VRRP packets received with an invalid VRID for this virtual router.

Table 2: Per VR counters with descriptions for the **show vrrp counters** command:

Counter	Description
`Master Transitions`	The total number of times that this virtual router's state has transitioned to MASTER.
`Received Advertisements`	The total number of VRRP advertisements received by this virtual router.
`Internal Errors`	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
`TTL Errors`	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
`Received Priority 0 Pkt`	The total number of VRRP packets received by the virtual router with a priority of '`0`'.
`Sent Priority 0 Pkt`	The total number of VRRP packets sent by the virtual router with a priority of '`0`'.
`Received Invalid Type`	The number of VRRP packets received by the virtual router with an invalid value in the '`type`' field.
`Address List Errors`	The total number of packets received for which the address list does not match the locally configured list for the virtual router.

Table 2: Per VR counters with descriptions for the **show vrrp counters** command: (cont.)

Counter	Description
`Packet Length Errors`	The total number of packets received with a packet length less than the length of the VRRP header.
`Monitored Circuit Up`	The total number of times the monitored circuit has generated the UP event.
`Monitored Circuit Down`	The total number of times the monitored circuit has generated the down event.

Command changes

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

show vrrp ipv6

Overview Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv6 configuration details.

Syntax

```
show vrrp ipv6 [<interface>]
```

Parameter	Description
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

Mode User Exec and Privileged Exec

Example To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

Output Figure 59-6: Example output from the **show vrrp ipv6** command for a specific interface

```
awplus#show vrrp ipv6 vlan2
VrId <1>
 State is Master
 Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
 Interface is vlan2
 Priority is 255
 Advertisement interval is 4 sec
 Preempt mode is FALSE
```

Related commands enable (VRRP)

disable (VRRP)

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

show vrrp (session)

Overview Use this command to display information for a particular VRRP session.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Syntax

```
show vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	*<1-255>* The virtual router ID for which to display information. Session must already exist.
<interface>	The interface to display information about.

Mode User Exec and Privileged Exec

Example To display information about VRRP session 1 configured on vlan2, use the command:

```
awplus# show vrrp 1 vlan2
```

Output Figure 59-7: Example output from the **show vrrp** command for a specific interface

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
 Interface is vlan2
 State is Initialize
 Virtual IP address is 10.10.11.250 (Not IP owner)
 Priority is 100
 Advertisement interval is 1 sec
```

In this example, the output shows that a Virtual IP address has been set.

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

transition-mode

Overview Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the advertisement-interval should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

Syntax

```
transition-mode {true|false}
```

Parameter	Description
`true`	Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3.
`false`	Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.

Default The default is **false**.

Mode Router Configuration

Usage notes See the VRRP Feature Overview and Configuration Guide for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- configuring transition mode to upgrade from VRRPv2 to VRRPv3.

Examples The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

Related commands router vrrp (interface)

Command changes Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

undebug vrrp

Overview Use this command to disable all VRRP debugging.

Syntax

```
undebug vrrp all
```

Mode Privileged Exec

Example The example below shows you how to disable all VRRP debugging:

```
awplus# undebug vrrp all
```

Related commands debug vrrp

undebug vrrp events

Overview Use this command to disable debugging options for VRRP event troubleshooting.

Syntax

```
undebug vrrp events
```

Mode Privileged Exec

Example The example below shows you how to disable VRRP event debugging:

```
awplus# undebug vrrp events
```

Related commands debug vrrp events

undebug vrrp packet

Overview Use this command to disable debugging options for VRRP packets.

Syntax

```
undebug vrrp packet [send|recv]
```

Parameter	Description
`send`	Disable the debug option set for sent packets.
`recv`	Disable the debug option set for received packets.

Mode Privileged Exec

Examples The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebug vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebug vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebug vrrp packet
```

Related commands debug vrrp packet

virtual-ip

Overview Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

Syntax

```
virtual-ip <ip-address> [master|backup|owner]
no virtual-ip
```

Parameter	Description
<ip-address>	The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.
`master`	Sets the default state of the VRRP router within the Virtual Router as **master**. For master, the router must own the Virtual IP address. Specify the **owner** option before using **master** option.
`backup`	Sets the default state of the VRRP router within the Virtual Router as **backup**.
`owner`	Sets the IPv6 address of the VRRP router within the Virtual Router as the **owner**. Specify this before using the **master** option.

Mode Router Configuration

Usage notes The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv6 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the vrrp vmac command to enable and disable this feature.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Examples The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

Related commands

router vrrp (interface)

enable (VRRP)

vrrp vmac

Command changes

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

virtual-ipv6

Overview Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the primary IPv6 address specified is an IPv6 link-local address. See the Usage note below for further information.

Use the **no** variant of this command to disable this feature.

Syntax

```
virtual-ipv6 <ipv6-address> [master|backup]
[primary|secondary]
```

```
no virtual-ipv6
```

Parameter	Description
<ipv6-address>	The IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X.
`master`	Sets **master** to be the default state of the VRRPv3 router within the Virtual Router. For **master**, we recommend using a Virtual IP address that is not owned by any of the VRRP routers in the same grouping (that share the same VRID).
`backup`	Sets **backup** to be the default state of the VRRPv3 router within the Virtual Router.
`primary`	Sets the specified address as the primary IPv6 address. The primary address must be a link-local IPv6 address.
`secondary`	Sets the specified address as the secondary IPv6 address. Normally this would be a globally-routable IPv6 address. This enables you to specify a globally-routable address as the default gateway address for all the hosts on an interface.

Mode Router Configuration

Usage notes The virtual router will reply to ping, telnet, and SSH requests to the virtual IP address. The virtual router will reply even if it does not own the virtual IP address.

The AlliedWare Plus VRRPv3 implementation supports one IPv6 virtual link local address per virtual router ID. Note that in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link- local address, not a specific global IPv6 address for the router. For the host's traffic to switch over to a backup router, the IPv6 link-local address of the router is used by VRRPv3.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv6 configuration details.

Examples

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

Related commands

router ipv6 vrrp (interface)

enable (VRRP)

vrrp vmac

Command changes

Version 5.5.2-2.1: command added on 10GbE UTM Firewall and AR4000S-Cloud

vrrp vmac

Overview Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

Syntax

```
vrrp vmac {enable|disable}
```

Mode Global Configuration

Examples To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

60 Ethernet Protection Switched Ring (EPSRing™) Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure Ethernet Protection Switched Ring (EPSRing™). For more information, see the EPSR Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

debug epsr

Overview This command enables EPSR debugging.

The **no** variant of this command disables EPSR debugging.

Syntax

```
debug epsr {info|msg|pkt|state|timer|all}
no debug epsr {info|msg|pkt|state|timer|all}
```

Parameter	Description
`info`	Send general EPSR information to the console. Using this parameter with the **no debug epsr** command will explicitly exclude the above information from being sent to the console.
`msg`	Send the decoded received and transmitted EPSR packets to the console. Using this parameter with the **no debug epsr** command will explicitly exclude the above packets from being sent to the console.
`pkt`	Send the received and transmitted EPSR packets as raw ASCII text to the console. Using this parameter with the **no debug epsr** command will explicitly exclude the above packets from being sent to the console.
`state`	Send EPSR state transitions to the console. Using this parameter with the **no debug epsr** command will explicitly exclude state transitions from being sent to the console.
`timer`	Send EPSR timer information to the console. Using this parameter with the **no debug epsr** command will explicitly exclude timer information from being sent to the console.
`all`	Send all EPSR debugging information to the console. Using this parameter with the **no debug epsr** command will explicitly exclude any debugging information from being sent to the console.

Mode Privileged Exec and Global Configuration

Examples To enable state transition debugging, use the command:

```
awplus# debug epsr state
```

To disable EPSR packet debugging, use the command:

```
awplus# no debug epsr pkt
```

Related commands undebug epsr

epsr

Overview This command sets the timer values for an EPSR instance. These are only valid for master nodes.

NOTE: *This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still may need to configure this command on whatever switch is the master within your EPSR network.*

Syntax

```
epsr <epsr-instance> {hellotime <1-32767>|failovertime
<2-65535> ringflaptime <0-65535>}
```

```
no epsr <epsr-instance>
```

CAUTION: *Using the no variant of this command will remove the specified EPSR instance.*

Parameter	Description
<epsr-instance>	Name of the EPSR instance.
hellotime *<1-32767>*	The number of seconds between the transmission of health check messages.
failovertime *<2-65535>*	The number of seconds that a master waits for a returning health check message before entering the failed state. **The failover time should be greater than twice the hellotime.** This is to force the master node to wait until it detects the absence of two sequential healthcheck messages before entering the failed state.
ringflaptime *<0-65535>*	The minimum number of seconds that a master must remain in the failed state.

Mode EPSR Configuration

Examples To set the hellotimer to 5 seconds for the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue hellotime 5
```

NOTE: *When stacking is used with EPSR, the EPSR **failovertime** should be at least 5 seconds.*

To delete the EPSR instance called blue, use the command:

```
awplus(config-epsr)# no epsr blue
```

Related commands

epsr mode master controlvlan primary port

epsr mode transit controlvlan

epsr configuration

epsr configuration

Overview Use this command to enter EPSR Configuration mode so that EPSR can be configured.

Syntax

```
epsr configuration
```

Mode Global Configuration

Example To change to EPSR mode, use the command:

```
awplus(config)# epsr configuration
```

Related commands

epsr mode master controlvlan primary port

epsr

show epsr

epsr datavlan

Overview This command adds a data VLAN or a range of VLAN identifiers to a specified EPSR instance.

The **no** variant of this command removes a data VLAN or data VLAN range from an EPSR instance.

Syntax

```
epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}
no epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}
```

Parameter	Description
<epsr-instance>	Name of the EPSR instance.
datavlan	Adds a data VLAN to be protected by the EPSR instance.
<vlanid>	The VLAN's VID - a number between 1 and 4094 excluding the number selected for the control VLAN.
<vlanid-range>	Specify a range of VLAN identifiers using a hyphen to separate identifiers.

Mode EPSR Configuration

Usage notes We recommend you

- set the EPSR control VLAN to vlan2, using the epsr mode master controlvlan primary port and epsr mode transit controlvlan commands, then
- set the EPSR data VLAN between to be a value between 3 and 4094, using the epsr datavlan command.

Examples To add `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan3
```

To add `vlan2` and `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan2-vlan3
```

To remove `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan3
```

To remove `vlan2` and `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan2-vlan3
```

Related commands epsr mode master controlvlan primary port

epsr mode transit controlvlan

show epsr

epsr enhancedrecovery enable

Overview This command enables EPSR's enhanced recovery mode. Enhanced recovery mode enables a ring to apply additional recovery procedures when a ring with more than one break partially mends. For more information, see the EPSR Feature Overview and Configuration Guide.

The **no** variant of this command disables the enhanced recovery mode.

Syntax

```
epsr <epsr-instance> enhancedrecovery enable
no epsr <epsr-instance> enhancedrecovery enable
```

Parameter	Description
<epsr-instance>	Name of the EPSR instance.

Default Default is that enhanced recovery mode disabled.

Mode EPSR Configuration

Example To apply enhanced recovery on the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue enhancedrecovery enable
```

Related commands show epsr

epsr flush-type

Overview Use this command to set how EPSR flushes Layer 2 entries when a topology change occurs. It can be configured to flush all Layer 2 entries on its EPSR interfaces or only flush the Layer 2 entries on its EPSR data VLANs.

Use the **no** variant of this command to revert to the default setting.

Syntax

```
epsr <epsr-name> flush-type {interface|vlan}
no epsr <epsr-name> flush-type
```

Parameter	Description
<epsr-name>	The name of the EPSR instance to set the flush-type for.
`interface`	Flush all Layer 2 entries from the EPSR interface on a topology change.
`vlan`	Flush the Layer 2 entries on the EPSR interface and data VLANs on a topology change.

Default The default flush-type is vlan

Mode EPSR Configuration

Usage notes To flush all entries on the EPSR interface (including non-EPSR data VLANs) the flush-type command must be explicitly configured on the EPSR ring with the **interface** parameter.

Select **interface** as the flush-type to help reduce latency caused during EPSR topology changes. This type of flushing is quicker and less granular than flushing per data vlan, as flushing on a data **vlan** may incur a higher overhead, reducing EPSR responsiveness to ring topology changes.

Interface flushing can be used to optimize EPSR rings with a large number of VLANs. It will however also require relearning on any VLANs that are on an EPSR interface but not part of the EPSR configuration.

Example To configure the behavior of EPSR ring 'red' transit node on topology changes to flush all Layer 2 entries on its EPSR ring interfaces, use the following commands:

```
awplus# configure terminal
awplus(config)# epsr configuration
awplus(config-epsr)# epsr red mode transit controlvlan 10
awplus(config-epsr)# epsr red datavlan 20-29
awplus(config-epsr)# epsr red flush-type interface
awplus(config-epsr)# epsr red state enable
```

Related commands show epsr

Command changes Version 5.4.9-1.1: command added

epsr mode master controlvlan primary port

Overview This command creates a master EPSR instance.

NOTE: *This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still need to configure this command on whatever switch is the master within your EPSR network.*

Syntax

```
epsr <epsr-instance> mode master controlvlan <2-4094>
primaryport <port>
```

Parameter	Description
<epsr-instance>	Name of the EPSR instance.
mode	Determines the node is acting as a master.
master	Sets switch to be the master node for the named EPSR ring.
controlvlan	The VLAN that will transmit EPSR control frames.
<2-4094>	VLAN id.
primaryport	Primary port for the EPSR instance.
<port>	The primary port. The port may be a switch port (e.g. port1.0.4) or a static channel group (e.g. sa3). It cannot be a dynamic (LACP) channel group.

NOTE: *The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.*

Mode EPSR Configuration

Example To create a master EPSR instance called blue with vlan2 as the control VLAN and port1.0.1 as the primary port, use the command:

```
awplus(config-epsr)# epsr blue mode master controlvlan vlan2
primaryport port1.0.1
```

Related commands epsr mode transit controlvlan

show epsr

epsr mode transit controlvlan

Overview This command creates a transit EPSR instance.

Syntax

```
epsr <epsr-instance> mode transit controlvlan <2-4094>
```

Parameter	Description
<epsr-instance>	Name of the EPSR instance.
mode	Determines the node is acting as a transit node.
transit	Sets switch to be the transit node for the named EPSR ring.
controlvlan	The VLAN that will transmit EPSR control frames.
<2-4094>	VLAN id.

NOTE: *The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.*

If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port.

EPSR does not support Dynamic link aggregation (LACP).

Mode EPSR Configuration

Example To create a transit EPSR instance called `blue` with `vlan2` as the control VLAN, use the command:

```
awplus(config-epsr)# epsr blue mode transit controlvlan vlan2
```

Related commands

epsr mode master controlvlan primary port

epsr mode transit controlvlan

show epsr

epsr priority

Overview This command sets the priority of an EPSR instance on an EPSR node. Priority is used to prevent "superloops" forming under fault conditions with particular ring configurations. Setting a node to have a priority greater than one turns on **superloop protection**.

The **no** variant of this command returns the priority of the EPSR instance back to its default value of 0, which also disables EPSR Superloop prevention.

Syntax

```
epsr <epsr-instance> priority <0-127>
no <epsr-instance> priority
```

Parameter	Description
<epsr-instance>	Name of the EPSR instance.
`priority`	The priority of the ring instance selected by the epsr-name parameter.
<0-127>	The priority to be applied (0 is the lowest priority and represents no superloop protection).

Default The default priority of an EPSR instance on an EPSR node is 0. The negated form of this command resets the priority of an EPSR instance on an EPSR node to the default value.

Mode EPSR Configuration

Example To set the priority of the EPSR instance called 'blue' to the highest priority (127), use the command:

```
awplus(config-epsr)# epsr blue priority 127
```

To reset the priority of the EPSR instance called 'blue' to the default (0), use the command:

```
awplus(config-epsr)# no epsr blue priority
```

Related commands epsr configuration

epsr state

Overview This command enables or disables an EPSR instance.

Syntax

```
epsr <epsr-instance> state {enabled|disabled}
```

Parameter	Description
<epsr-instance>	The name of the EPSR instance.
`state`	The operational state of the ring.
`enabled`	EPSR instance is enabled.
`disabled`	EPSR instance is disabled.

Mode EPSR Configuration

Usage notes In a super-loop protection scenario, if you have:

- a device on the common segment acting as the master node for multiple EPSR rings,
- and you disable the rings and later re-enable them (e.g., when doing EPSR configuration changes),
- then you must re-enable the ring with the highest EPSR SLP priority **last**.

If you do not re-enable the rings in that order, the primary port may end up permanently in a blocking state. If the primary port does end up in a permanent blocking state, recover by disabling and re-enabling the EPSR ring that has the highest priority.

Example To enable the EPSR instance called 'blue', use the command:

```
awplus(config-epsr)# epsr blue state enabled
```

Related commands epsr mode master controlvlan primary port

epsr mode transit controlvlan

epsr topology-change

Overview Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a “flush FDB” message.

Syntax

```
epsr <epsr-name> topology-change g8032
no epsr <epsr-name> topology-change g8032
```

Parameter	Description
<epsr-name>	The name of the EPSR instance for which the topology-change applies to.
`topology-change`	The topology-change value to be set for the instance.
`g8032`	Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring.

Default The default value is no notifications are accepted and in turn no “flush FDB” messages are sent.

Mode EPSR Configuration

Usage notes The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

Example To configure an EPSR instance named “red” to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named “red” to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

Command changes Version 5.4.7-1.1: command added

epsr trap

Overview This command enables SNMP traps for an EPSR instance. The traps will be sent when the EPSR instance changes state.

The **no** variant of this command disables SNMP traps for an EPSR instance. The traps will no longer be sent when the EPSR instance changes state.

Syntax

```
epsr <epsr-instance> trap
no epsr <epsr-instance> trap
```

Parameter	Description
<epsr-instance>	Name of the EPSR instance.
`trap`	SNMP trap for the EPSR instance.

Mode EPSR Configuration

Example To enable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue trap
```

To disable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue trap
```

Table 5: Parameters displayed in the output of the **show epsr** command

Parameter on Master Node	Parameter on Transit Node	Description
Name	Name	The name of the EPSR instance.
Mode	Mode	The mode in which the EPSR instance is configured - either Master or Transit
Status	Status	Indicates whether the EPSR instance is enabled or disabled
State	State	Indicates state of the EPSR instance's state machine. Master states are: Idle, Complete, and Failed. Transit states are Links-Up, Links-Down, and Pre-Forwarding.
Control Vlan	Control Vlan	Displays the VID of the EPSR instance's control VLAN.
Data VLAN(s)	Data VLAN(s)	The VID(s) of the instance's data VLANs.
Interface Mode	Interface Mode	Whether the EPSR instance's ring ports are both physical ports (Ports Only) or are both static aggregators (Channel Groups Only).
Primary Port	First Port	The EPSR instance's primary ring port.

Table 5: Parameters displayed in the output of the **show epsr** command (cont.)

Parameter on Master Node	Parameter on Transit Node	Description
- Status	- Status	Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port because it does not have physical control of it.
	- Direction	The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"
- Is On Common Segment	- Is On Common Segment	Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment.
- Blocking Control	- Blocking Control	Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs.
Secondary Port	Second Port	The EPSR instance's secondary port.
- Status	- Status	Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port, because it does not have physical control of it. Note that on a master configured for SuperLoop Prevention (non-zero priority) its secondary ring port can be physically forwarding, but logically blocking. This situation arises when it is not the highest priority node in the topology (and so does not receive LINKS-DOWN messages upon common segment breaks) and a break on a common segment in its ring is preventing reception of its own health messages.
	- Direction	The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"
- Is On Common Segment	- Is On Common Segment	Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment
- Blocking Control	- Blocking Control	Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs
Hello Time		The EPSR instance's setting for the interval between transmissions of health check messages (in seconds)
Failover Time		The time (in seconds) the EPSR instance waits to receive a health check message before it decides the ring is down
Ring Flap Time		The minimum time the EPSR instance must remain in the failed state
Trap	Trap	Whether the EPSR instance has EPSR SNMP traps enabled

Table 5: Parameters displayed in the output of the **show epsr** command (cont.)

Parameter on Master Node	Parameter on Transit Node	Description
`Enhanced Recovery`	`Enhanced Recovery`	Whether the EPSR instance has enhanced recovery mode enabled
`SLP Priority`	`SLP Priority`	The EPSR instance's priority (for SuperLoop Prevention)

Related commands

show epsr

show epsr summary

show epsr counters

show epsr config-check

Overview This command checks the configuration of a specified EPSR instance, or all EPSR instances.

If an instance is enabled, this command will check for the following errors or warnings:

- The control VLAN has the wrong number of ports.
- There are no data VLANs.
- Some of the data VLANs are not assigned to the ring ports.
- The failover time is less than 5 seconds for a stacked device.
- The instance is a master with its secondary port on a common segment.

Syntax

```
show epsr [<instance>] config-check
```

Parameter	Description
<instance>	Name of the EPSR instance to check on.

Mode User Exec and Privileged Exec

Example To check the configuration of all EPSR instances and display the results, use the command:

```
awplus# show epsr config-check
```

Table 60-1: Example output from **show epsr config-check**

```
EPSR             Status   Description
Instance
-------------------------------------------------------------------------
red              Warning  Failover time is 2s but should be 5s because
                          device is stacked.
white            OK.
blue             Warning  Primary port is not in data VLANs 29-99.
orange           OK.

Don't forget to check that this node's configuration is consistant with all
other nodes in the ring.

61 G.8032 Ethernet Ring Protection Switching Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure G.8032 Ethernet Ring Protection Switching.

For more information, see the G.8032 Ethernet Ring Protection Switching Feature Overview and Configuration Guide.

Command List

cfm-sf-notify

Overview Use this command to configure this ERP instance to receive signal fail notifications from a Local MEP(s). This command can be used multiple times to allow multiple Local MEPs to be specified.

Use the **no** variant of this command to remove a Local MEP from sending notifications to this G.8032 ERP instance.

Syntax

```
cfm-sf-notify mep mpid <mep-id> domain <domain-name> service
<ma-name>
```

```
no cfm-sf-notify mep mpid <mep-id> domain <domain-name> service
<ma-name>
```

Parameter	Description
`mep`	Specify that a Local Maintenance End Point (MEP) is to provide the Signal Fail notification to this G.8032 ERP instance.
`mpid`	Specify that the Local MEP is to be identified by MEP-id.
`<mep-id>`	1-8191. Specify the Local MEP's ID.
`domain`	Specify the Maintenance Domain that the Local MEP is associated with.
`<domain-name>`	Specify the Maintenance Domain's CLI instance name.
`service`	Specify the Maintenance Association that the Local MEP is associated with.
`<ma-name>`	Specify the Maintenance Association's CLI instance name.

Mode G8032 Configure Switch

Usage notes CFM and Continuity Check Messaging (CCM) can be configured to detect link faults on the East or West interface ports as a whole, or faults on the R-APS VLAN on the East or West interface. In this situation CFM Local MEPs can notify G.8032 of defects it detects. G.8032 will treat these notifications as a Signal Fail (SF) for that East or West ring port. Similarly, CFM Local MEPs can notify G.8032 that the fault has cleared. When this command is used, this G.8032 ERP instance will ensure that the specified Local MEP is a Down MEP for the East or West interface used by this instance or for the R-APS VLAN on the East or West interface used by this instance.

Example To configure an ERP instance to receive signal fail notifications from a local MEP with an MEP ID of “12”, an MD named “MD-INST1”, and an MA named “MA-INST1-1”, use the following commands:

```
awplus(config)# g8032 erp-instance ring2
```

```
awplus(g8032-config-switch)# cfm-sf-notify mep mpid 12 domain
MD-INST1 service MA-INST1-1
```

Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

clear g8032 erp-instance

Overview Use this command to:

- trigger a reversion immediately, without waiting for timers to expire, or
- clear a forced-switch or manual-switch command that was previously successfully entered on a G.8032 Ethernet Ring Protection (ERP) instance.

Syntax

```
clear g8032 erp-instance <erp-instance-name>
```

Parameter	Description
<erp-instance-name>	The name of the G.8032 ERP instance

Mode Privileged Exec

Usage notes This command can be used after a protection switch has occurred and the failure has cleared. If reversion is enabled, this command will trigger a reversion immediately, without having to wait for certain timers to expire (such as WTB or WTR). If reversion has been disabled, this command will trigger a reversion.

Alternatively, this command can be used on an ERP instance where a forced-switch or manual-switch command has been successfully entered to clear that action. The command will be ignored if a force-switch or manual-switch command had not been previously entered successfully, even if such node is in the FORCED_SWITCH or MANUAL_SWITCH state.

Examples To trigger a reversion immediately without waiting for a timer to expire on an ERP instance named “blue”, use the following command:

```
awplus# clear g8032 erp-instance blue
```

Alternatively, to clear a previously applied forced-switch from an ERP instance named “blue”, use the following command:

```
awplus# clear g8032 erp-instance blue
```

The forced-switch would be created using a command like this one, which forces a protection switch on the East interface of an ERP instance named “blue”:

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

Related commands

Command changes

Version 5.4.7-0.1: command added

Version 5.4.7-1.1: added to x310 series products

Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

clear g8032 erp-instance statistics

Overview Use this command to clear the statistics data being collected by a G.8032 Ethernet Ring Protection (ERP) instance.

Syntax

```
clear g8032 erp-instance <erp-instance-name> statistics
```

Parameter	Description
<erp-instance-name>	The name of a specific G.8032 ERP instance

Mode Privileged Exec

Usage notes A G.8032 ERP instance keeps statistical data as counts on a variety of data such as the number of certain types of Ring-Automatic Protection Switching (R-APS) messages sent and received over its ring port(s) and error conditions detected. Use this command to clear the statistics data.

Example To clear the statistics for an ERP instance named “blue”, use the following command:

```
awplus# clear g8032 erp-instance blue statistics
```

Related commands

g8032 erp-instance

show g8032 erp-instance statistics

Command changes

Version 5.4.7-0.1: command added

Version 5.4.7-1.1: added to x310 series products

Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

data-traffic

Overview Use this command to add a data traffic VLAN or a range of VLANs to be protected by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove a data traffic VLAN or a range of VLANs.

Syntax

```
data-traffic <vid-list>
no data-traffic <vid-list>
```

Parameter	Description
<vid-list>	The data traffic VLAN ID(s). This can be a single VLAN ID, or can be a range of VLAN IDs separated by hyphen, or a comma separated list of VLAN IDs and ranges. Each VLAN ID can take on the range of 1 to 4094

Mode G8032 Configure Switch

Usage notes

- A G.8032 ERP instance can protect 0, 1 or more VLANs carrying data traffic.
- This ERP instance must be associated with a physical ring instance.
- Other ERP instances using the same physical ring instance are not allowed to have the same data traffic VLAN(s) as this ERP instance.
- The data VLAN(s) must already exist.
- The data VLAN(s)' port members should be members of the ring interface(s), but it is not enforced.
- When a data traffic VLAN(s) is removed, any blocks that were in place on the ring ports for this VLAN(s) are removed. The user should make sure when removing the VLAN(s) from the ERP instance that a loop is not formed.
- Data traffic VLAN(s) can be added or removed while the ERP instance is enabled or disabled.

Example To add a data traffic VLAN with a VLAN ID of "103" to an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# data-traffic 103
```

Version 5.4.8-1.1: added to SBx908 GEN2 series products

debug g8032

Overview Use this command to enable G.8032 debugging.

Use the **no** variant of this command to disable G.8032 debugging.

Syntax

```
debug g8032 {all|event|rx|tx}
no debug g8032 {all|event|rx|tx}
```

Parameter	Description
`all`	Turn on all G.8032 debugging
`event`	Turn on G.8032 Event debugging
`rx`	Turn on G.8032 Receive debugging
`tx`	Turn on G.8032 Transmit debugging

Mode Privileged Exec

Example To enable all G.8032 debugging, use the following command:

```
awplus# debug g8032 all
```

Related commands

show debugging

show debugging g8032

undebug g8032

Command changes

Version 5.4.7-0.1: command added

Version 5.4.7-1.1: added to x310 series products

Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

enable (g8032-profile)

Overview Use this command to change the revertive or non-revertive operation of the associated G.8032 Ethernet Ring Protection (ERP) instance.

Syntax

```
enable {revertive|non-revertive}
```

Parameter	Description
`revertive`	This allows the ERP instance associated with this profile to operate in revertive mode.
`non-revertive`	This allows the ERP instance associated with this profile to operate in non- revertive mode.

Default By default, the mode of operation is revertive.

Mode G8032 Profile Configuration

Usage notes An ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. Once a ring failure has abated, a G.8032 ring instance will check its mode of operation, and if the mode is revertive, it will attempt to revert back to where the RPL-Owner controls the blocking of the ring. Otherwise, it operates in non-revertive mode.

Example To enable revertive mode for a profile named “prof_1”, use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# enable revertive
```

epsr topology-change

Overview Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a “flush FDB” message.

Syntax

```
epsr <epsr-name> topology-change g8032
no epsr <epsr-name> topology-change g8032
```

Parameter	Description
<epsr-name>	The name of the EPSR instance for which the topology-change applies to.
`topology-change`	The topology-change value to be set for the instance.
`g8032`	Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring.

Default The default value is no notifications are accepted and in turn no “flush FDB” messages are sent.

Mode EPSR Configuration

Usage notes The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

Example To configure an EPSR instance named “red” to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named “red” to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

Related commands show epsr

Command changes Version 5.4.7-1.1: command added

erp-instance

Overview Use this command to enable or disable a G.8032 Ethernet Ring Protection (ERP) instance.

Syntax

```
erp-instance {enabled|disabled}
```

Parameter	Description
`enabled`	The G.8032 ERP instance is enabled
`disabled`	The G.8032 ERP instance is disabled

Default The ERP instance is disabled.

Mode G8032 Configure Switch

Usage notes Once a G.8032 ERP instance has been configured with the correct parameter settings or defaults, it can be enabled to run the G.8032 protocol. To change certain ERP instance parameters, the instance may need to be disabled.

When enabled, the instance is restarted back to the G8032_ST_INIT state. In this state, if the node has an RPL-Owner or RPL-Neighbor port, it will be blocked. Otherwise the node will block one of its ring ports. All the nodes will send Ring-Automatic Protection Switching (R-APS) messages initially. The G.8032 protocol and state machines will transition the ring into another more appropriate state.

When disabled, the ERP instance will no longer process incoming R-APS messages for that instance, nor send any R-APS messages. The raps-channel VLAN and any data-traffic VLANs used by this instance will be put in the forwarding state for its physical ring ports. Caution should be taken to avoid loops when disabling an ERP instance.

Example To enable an ERP instance named “blue”, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# erp-instance enabled
```

g8032 erp-instance

Overview Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance, or to enter an existing instance's context.

Use the **no** variant of this command to destroy the specified instance.

Syntax

```
g8032 erp-instance <erp-instance-name>
no g8032 erp-instance <erp-instance-name>
```

Parameter	Description
<erp-instance-name>	The name of the G.8032 ERP instance. This can be up to 32 characters.

Mode Global Configuration

Usage notes The ERP protocol in AlliedWare Plus™ can run one or more instances. A G.8032 ERP instance is made up of:

- two ERP ring ports,
- a Control VLAN that carries Ring-Automatic Protection Switching (R-APS) messages, and
- zero, one, or more Protected traffic data VLANs that the instance protects when the ring fails.

An ERP instance must be associated with a G.8032 physical ring and a G.8032 profile.

Example To enter the context of an instance named “blue”, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)#
```

g8032 forced-switch erp-instance

Overview Use this command to force a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

Syntax
```
g8032 forced-switch erp-instance <erp-instance-name>
{east-interface|west-interface|terminating-interface}
```

Parameter	Description
<erp-instance-name>	The name of the G.8032 ERP instance
east-interface	The G.8032 ERP instance's East ring port
west-interface	The G.8032 ERP instance's West ring port
terminating-interface	The G.8032 ERP instance's Terminating ring port

Mode Privileged Exec

Usage notes G.8032 supports a Forced Protection Switch action initiated by the operator. A Forced Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Forced Switch message to flow around the ring causing the RPL to become unblocked.

Multiple Forced Switch actions can take place along a G.8032 ring. Care must be taken when using the Force Switch command as it can only be undone by issuing a Clear command and not by a failure nor the clearing of a failure. If a node that was issued a Force Switch command later fails, then it becomes difficult to remove the Force Switch condition from the ring. In this situation, the operator has to go to the nodes that are adjacent to the failed node, and for each one, issue a Forced Switch command on the ring link facing the failed node followed by a Clear command.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the clear g8032 erp-instance command.

Example To issue a Forced Protection Switch on the East interface of an ERP instance named “blue”, use the following command:

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

Related commands clear g8032 erp-instance

Version 5.4.8-1.1: added to SBx908 GEN2 series products

g8032 manual-switch erp-instance

Overview Use this command to manually cause a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

Syntax

```
g8032 manual-switch erp-instance <erp-instance-name>
{east-interface|west-interface|terminating-interface}
```

Parameter	Description
<erp-instance-name>	The name of the G.8032 ERP instance
east-interface	The G.8032 ERP instance's East ring port
west-interface	The G.8032 ERP instance's West ring port
terminating-interface	The G.8032 ERP instance's Terminating ring port

Mode Privileged Exec

Usage notes G.8032 supports a Manual Protection Switch action initiated by the operator. A Manual Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Manual Switch message to flow around the ring causing the RPL to become unblocked.

The difference between a Manual switch and a Forced switch is that the Manual Switch will be ignored under various conditions. In particular, only one Manual Switch is allowed on a G.8032 ring at a time.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the clear g8032 erp-instance command.

Example To issue a Manual Protection Switch on the East interface of an ERP instance named “blue”, use the following command:

```
awplus# g8032 manual-switch erp-instance blue east-interface
```

Version 5.4.8-1.1: added to SBx908 GEN2 series products

g8032 physical-ring

Overview Use this command to create a G.8032 Ethernet Ring Protection (ERP) physical ring profile which specifies the Ethernet ports that will be used as G.8032 ring ports.

Syntax

```
g8032 physical-ring <physical-ring-name> {east-interface
<interface-name1> west-interface <interface-name2>|
terminating-interface <interface-name>}
```

```
no g8032 physical-ring <physical-ring-name>
```

Parameter	Description
<physical-ring-name>	The name of the profile (up to 37 characters)
east-interface	The East G.8032 ring port
<interface-name1>	The name of the switch interface, either port or channel group, for the East ring port. It must differ from the West ring port.
west-interface	The West G.8032 ring port
<interface-name2>	The name of the switch interface, either port or channel group, for the West ring port. It must differ from the East ring port.
terminating-interface	The Terminating ring port. This should only be used for G.8032 ERP instance that is at the end of a sub-ring.
<interface-name>	The name of the switch interface, either port or channel group, for the Terminating ring port.

Mode Global Configuration

Usage notes Each ERP instance will be associated with a physical ring profile. A physical ring profile is made up of two physical Ethernet ports or aggregated interfaces, unless it is the terminating point of a sub-ring in which case only one port is needed. When two ports are used, they are referred to as East and West ports. When only a single port is used, it is referred to as a Terminating port.

Example To create a physical ring profile named “red” where the East interface port is port1.0.4 and the West interface port is port1.0.8, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# g8032 physical-ring red east-interface
port1.0.4 west-interface port1.0.8
```

g8032 profile

Overview Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance profile, or to enter that instance's profile context.

Use the **no** variant of this command to destroy the specified instance.

Syntax

```
g8032 profile {<erp-profile-name>|default-profile}
no g8032 profile <erp-profile-name>
```

Parameter	Description
<erp-profile-name>	The name of the G.8032 profile. This can be up to 32 characters.
default-profile	The name of the system's default profile for G.8032. This profile is created by the system automatically and can not be destroyed.

Default A profile with the name "default-profile" will exist in the system and is used by default by an ERP instance. All the parameters in the default profile take on the default values.

Mode Global Configuration

Example To enter the context of a profile named “prof_1”, use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)#
```

Related commands

Version 5.4.8-1.1: added to SBx908 GEN2 series products

level (g8032-switch)

Overview Use this command to configure the level for Ring-Automatic Protection Switching (R-APS) messages.

Syntax

```
level <0-7>
```

Parameter	Description
<0-7>	The level used by the G.8032 ERP instance.

Default The default level is 0.

Mode G8032 Configure Switch

Usage notes Inside the R-APS messages is the Level field. The G.8032 Ethernet Ring Protection (ERP) instance will use the configured level for sending R-APS messages, and is the level that the instance expects to receive. If the node receives an R-APS message with the improper level then the message will not be processed.

The ERP instance must be disabled to change the level, otherwise the setting is denied.

Example To set the R-APS message level field for an ERP instance named “blue” to 3, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# level 3
```

Related commands g8032 erp-instance

Version 5.4.8-1.1: added to SBx908 GEN2 series products

physical-ring

Overview Use this command to specify which G.8032 physical ring instance is to be used by this G.8032 Ethernet Ring Protection (ERP) instance.

Syntax

```
physical-ring <physical-ring-name>
```

Parameter	Description
<physical-ring-name>	The name of the physical ring instance.

Mode G8032 Configure Switch

Usage notes A G.8032 ERP instance in general has two ring ports, unless it is at the end of a sub-ring in which case it has only one ring port. Ring port(s) are specified using a G.8032 physical ring instance.

This command can only be accepted when the ERP instance is disabled.

Example To configure an ERP instance named “blue” to use a physical ring instance named “red”, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# physical-ring red
```

Version 5.4.8-1.1: added to SBx908 GEN2 series products

profile name

Overview Use this command to associate a G.8032 profile instance with this G.8032 Ethernet Ring Protection (ERP) instance.

Syntax

```
profile name <erp-profile-name>
```

Parameter	Description
<erp-profile-name>	The name of the G.8032 profile

Default If this command is not used, a profile with the name "default-profile" will be used for this G.8032 ERP instance.

Mode G8032 Configure Switch Mode

Usage notes A G.8032 ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. This configuration can be accepted regardless of the ERP instance being disabled or enabled. Any parameters from a changed profile will take effect the next time the G.8032 state machine uses the parameters in the updated profile.

Example To associate a G.8032 profile named "prof_1" with a G.8032 ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# profile name prof_1
```

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

raps-channel

Overview Use this command to specify which VLAN to use as a channel for G.8032 Ring-Automatic Protection Switching (R-APS) messages sent and received by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove the VLAN from being used as the R-APS channel VLAN.

Syntax

```
raps-channel <vid>
no raps-channel
```

Parameter	Description
<vid>	A single VLAN-id in the range 2 to 4094.

Mode G8032 Configure Switch

Usage notes For a G.8032 ERP instance, a VLAN is used as a channel for carrying an R-APS message. This VLAN is also used to identify the proper ring instance to all the other nodes in the ring.

The VLAN must be tagged members of the G.8032 physical ring instance associated with this ERP instance. A G.8032 physical ring instance must be associated with this ERP instance. The ERP instance can not be enabled until this raps-channel VLAN has been configured properly.

The ERP instance must be disabled when using the **no** variant.

Example To configure a VLAN with a VLAN-id of "103" as a R-APS channel for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# raps-channel 103
```

Related commands g8032 erp-instance

Version 5.4.8-1.1: added to SBx908 GEN2 series products

service onm

Overview Use this command to enable the ONM service, which underlies CFM and G.8032.

Use the **no** version of the command to disable the unused ONM service.

Syntax

```
service onm
no service onm
```

Default Enabled

Mode Global Configuration

Usage notes Disabling the service can reduce memory usage on the switch, particularly when many VLANs are configured on ports.

Disabling the service will only take effect after you save the configuration and restart the device.

Example To disable the ONM service, use the commands:

```
awplus# configure terminal
awplus(config)# no service onm
```

Output Figure 61-1: Example output from **no service onm**

```
awplus(config)#no service onm
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-2.1: command added

rpl role

Overview Use this command to specify the role of each G.8032 Ethernet Ring Protection (ERP) ring port (also known as a link). The role can be specified as to whether it is a Ring Protection Link (RPL) or not, and if it is an RPL, whether it is the Owner or Neighbor end of an RPL.

Use the **none** variant of this command to set all the ERP instance's ring ports' RPL role to **none**.

Syntax

```
rpl role {owner|neighbor}{east-interface|west-interface|
terminating-interface}
```

```
rpl role none
```

Parameter	Description
`owner`	This sets the specified ring port to be an RPL Owner
`neighbor`	This sets the specified ring port to be an RPL Neighbor
`east-interface`	The ring port's east-interface.
`west-interface`	The ring port's west-interface.
`terminating-interface`	The ring port's terminating-interface
`none`	This sets all the ERP instance's ring ports' RPL role to none.

Default A RPL role of “none” is the default.

Mode G8032 Configure Switch

Usage notes If a node has one of its ring ports set to Owner or Neighbor, then **none** is automatically set on any other ring port as **none** is the only possible setting for the other ring port.

When using this command to set the RPL role to **none**, an interface need not be specified, as this command will set all the ring ports RPL role to **none**.

The command can only be accepted when the G.8032 ERP Instance is disabled, and the ERP instance must also have an association to a ERP Physical Ring instance.

As in the case of a sub-ring with only one physical ring port, use **terminating-interface** when specifying the RPL role as Owner or Neighbor.

Example To configure the east-interface of a ring port named “blue” to be an RPL Owner, use the following commands:

```
awplus(config)# g8032 erp-instance blue
```

```
awplus(g8032-config-switch)# rpl role owner east-interface
```

-----------------------------------------------------------------
           East Sending            |            West Sending
-----------------------------------------------------------------
Version             1              | Version             1
Request             NR             | Request             NR
RPL-Block           RB             | RPL-Block           RB
DNF                 1              | DNF                 1
Block Port Ref      1              | Block Port Ref      1
NodeID              0000.cd37.0c25 | NodeID         0000.cd37.0c25
-----------------------------------------------------------------
```

Table 1: Parameters in the output from the **show g8032 erp-instance** command.

Parameter	Description
`Instance name`	The configured <erp-instance-name> for this instance.
`Admin State`	The configured administrative state of this instance, either enabled or disabled. When the ERP instance is disabled, all dynamic data for other parameters in this table will be shown as "-", except for the East Link or West Link which will show the last known block or unblocked state.
`G.8032 State`	A dynamic parameter showing the current state of the instance per the G.8032 state machine. If the ERP Instance is disabled, it will be in the INIT state.
`Phy Ring`	Shows the Physical Ring Instance name that this ERP Instance is associated with along with the East/West or Terminating Interface used by the Physical Ring Instance.
`East Link or West Link`	A dynamic variable showing whether the instance's ring port and its VLANs are blocked or not. In the special case of an interconnection node where a sub-ring terminates, both the East Link and the West Link are the same.
`RPL Role East Link or West Link`	Shows the configuration of the link's role.

Table 1: Parameters in the output from the **show g8032 erp-instance** command. (cont.)

Parameter	Description
`CFM MEP East or West`	Identifies the configured MEP, if any, that is being used to provide a CFM based Signal Fail indication to this instance. The MEP is identified by its direction (Up or Down), its MEP-id, and the Maintenance Domain (MD) and Maintenance Association (MA) it is associated with by name.
`ERP Profile`	Identifies the ERP Profile instance that was configured for use by this ERP Ring instance.
`Level`	The Level that was configured for R-APS messages that are used by this ERP Ring instance.
`Ring-ID`	The Ring-ID that is to be used by this ERP instance.
`RAPS-Channel VLAN`	The VLAN-id that is configured used for sending and receiving R-APS messages for this ERP instance.
`Sub-ring`	Specifies whether the ring is operating as a Sub-ring or otherwise as a Major ring.
`Virtual Channel`	Specifies whether the sub-ring is operating with a virtual channel or not.
`Data Traffic VLANs`	A comma-separated list of configured VLAN-ids (individually, or range) that are used for data-traffic and protected by this ERP instance.
`TCN To Inst`	A comma-separated list of protocols and their instances that are to be notified when a Topology Change Notification occurs for this ERP instance. This only applies to a sub-ring with a Terminating interface and in which case "-" will be displayed if no target instances have been identified. Otherwise a "-" is displayed anyway.Identifies the protocol to notify. Only "G8032" will be supported initially.<instance-name> - Identifies the instance to notify for the given protocol.
`TCN Flush Event`	Specifies if this instance as a target instance is to send out Flush FDB messages upon TCN notifications by a detecting instance.Identifies the notifying protocol allowed. Only "G8032" will be supported initially. If no protocols have been configured then display "-".
`SNMP Traps`	Indicates whether SNMP traps have been enabled or disabled for this ERP instance.

Table 1: Parameters in the output from the **show g8032 erp-instance** command. (cont.)

Parameter	Description
`Signal Fail`	Indicates whether a Signal Fail condition is being received over the East or West ring interface. <signal-fail> consists of: "-" no Signal Fail is being indicated "Link" - indicates the interface port or LAG has gone operationally down. "CFM MEP <mep-id>" - indicates that a local CFM MEP has indicated a Signal Fail, and which MEP by mep-id.
`Failure of Protocol`	Indicates that there are defects in the receipt of an R-APS message. There are the following types: FOP-PM (Provisioning Mismatch) - "true" indicates per G.8032,that the RPL-Owner is receiving R-APS(NR,RB) messages with a node-id not of itself. In addition, since the initial implementation does not support version 1, any R-APS messages with version 1 will also indicate a FOP-PM error. The FOP-PM error can occur on an East or a West Port. FOP-TO (Time Out) - "true" indicates that a node has not received an R-APS message on any of its ring ports for 3.5 times the R-APS message interval even though one or both ring ports are capable of receiving R-APS messages (no SF, Admin Up).
`Version`	The version of the R-APS message that is being received or sent over the East or West ring interface. An R-APS message version of "1" corresponds to G.8032 version 2.
`Request`	Indicates the protection switch request being sent or received in the R-APS message. Consists of one of: NR - No Request for protection switching SF - Signal Fail MS - Manual Switch request FS - Force Switch request Event - Request a Flush to be performed. Note this is a transient condition.
`RPL Block`	Indicates whether the RPL is being blocked or not. consists of one of the following: "RB" - RPL Block is being applied by the RPL-Owner. "-" - No RPL Block is being applied by the RPL-Owner, or the R-APS message originated from a non-RPL-Owner.
`DNF`	Indicates the value of the Do Not Flush bit in the R-APS message. The value is either "0" or "1".
`Block Port Ref`	Block Port Reference refers to the node's East or West port that is being blocked and shows as "0" or "1" in accordance to G.8032.
`Node-ID`	The MAC address of this Node or the MAC address used in sending/receiving R-APS messages.

Table 1: Parameters in the output from the **show g8032 erp-instance** command. (cont.)

Parameter	Description
`East Sending or West Sending`	If this local node is not sending R-APS, then all the fields are shown as "-"
`Timers`	Wait-to-Restore - "Running" indicates this timer is active, otherwise is "-".Wait-to-Block - "Running" indicates this timer is active, otherwise is "-".Hold Off Timer - "Running" indicates this timer is active, otherwise is "-".

show g8032 erp-instance statistics

Overview Use this command to show the G.8032 Ethernet Ring Protection (ERP) instance statistics.

Syntax

```
show g8032 erp-instance <erp-instance-name> statistics
```

Parameter	Description
<erp-instance-name>	The name of a specific G.8032 ERP instance

Mode User Exec and Privileged Exec

Example To show the statistics for an ERP instance named “blue”, use the following command:

```
awplus# show g8032 erp-instance blue statistics
```

Output Figure 61-4: Example output from the **show g8032 erp-instance statistics** command.

```
awplus#show g8032 erp-instance blue statistics
----------------------------------
Instance Name    : blue
Local Clear      : 0
FOP-TO           : 0
----------------------------------
 East Receiving  |  West Receiving
---------------- - ----------------
RAPS NR       15 | RAPS NR       11
RAPS NR-RB     2 | RAPS NR-RB     0
RAPS SF        0 | RAPS SF        0
RAPS FS        0 | RAPS FS        0
RAPS MS        0 | RAPS MS        0
RAPS Event     0 | RAPS Event     0
Drop Guard     0 | Drop Guard     0
Drop Error     0 | Drop Error     0
Local SF       1 | Local SF       1
FOP-PM         0 | FOP-PM         0
----------------------------------
  East Sending   |   West Sending
---------------- - ----------------
RAPS NR       17 | RAPS NR       17
RAPS NR-RB 20067 | RAPS NR-RB 20067
RAPS SF       10 | RAPS SF       10
RAPS FS        0 | RAPS FS        0
RAPS MS        0 | RAPS MS        0
RAPS Event     0 | RAPS Event     0
----------------------------------
```

Table 2: Parameters in the output from the **show g8032 erp-instance statistics** command

Parameter	Description
`Instance Name`	The configured <erp-instance-name> for this instance.
`Local clear`	The number of Clear commands invoked locally.
`FOP-TO`	The number of Failure of Protocol Time Out events seen locally.
`RAPS NR`	The number of R-APS messages with a No Request (NR) being received or sent.
`RAPS NR-RB`	The number of R-APS messages with a No Request, RPL Blocked (NR,RB) being received or sent.
`RAPS SF`	The number of R-APS messages with Signal Fail (SF) being received or sent.
`RAPS FS`	The number of R-APS messages with Forced Switch (FS) being received or sent.
`RAPS MS`	The number of R-APS messages with Manual Switch (MS) being received or sent.
`RAPS Event`	The number of R-APS messages with Event (Flush) being received or sent.
`Drop Guard`	The number of R-APS messages discarded due to Guard Timer.
`Drop Error`	The number of R-APS messages discarded due to incorrect MAC Address (unmatched Ring-ID), incorrect version, unusable Request/State, or other invalid code point in one of the message fields.
`Local SF`	The number of Signal Fail events seen locally.
`FOP-PM`	The number of Failure of Protocol events seen locally.

show g8032 physical-ring

Overview Use this command to show the G.8032 physical ring instance information.

Syntax

```
show g8032 physical-ring {<physical-ring-name>|all}
```

Parameter	Description
<physical-ring-name>	The name of the physical ring
`all`	This shows all physical ring instances that have been configured

Mode User Exec and Privileged Exec

Example To show the details of a physical ring instance named “red”, use the following command:

```
awplus# show g8032 physical-ring red
```

Output Figure 61-5: Example output from the **show g8032 physical-ring** command.

```
awplus#show g8032 physical-ring red
Ring : red
====================
East     : port1.0.4
West     : port1.0.8
ERP Inst : blue
```

Table 3: Parameters in the output from the **show g8032 physical-ring** command.

Parameter	Description
`Ring`	The name of the physical ring that was configured for this physical ring instance.
`East, West, Terminating`	The physical interface port or LAG of the East or West Ring interface, or the Terminating interface that was configured for this physical ring instance.
`ERP Inst`	A comma-separated list of ERP instances by name that have been configured to use this physical ring instance, or "-" if none.

show g8032 profile

Overview Use this command to show one specific G.8032 profile or all G.8032 profiles, and the configured information within each profile.

Syntax `show g8032 profile {<erp-profile-name>|default-profile|all}`

Parameter	Description
<erp-profile-name>	The name of the G.8032 profile that was created by the user.
`default-profile`	The default name of the G.8032 profile that was created automatically by the system.
`all`	Using this will show all G.8032 profiles.

Mode User Exec and Privileged Exec

Example To show the profile details for a profile named “prof1”, use the following command:

```
awplus# show g8032 profile prof1
```

Output Figure 61-6: Example output from the **show g8032 profile** command.

```
awplus#show g8032 profile prof1
Profile : prof1
============================
Wait-To-Restore : 5 mins
Hold Off Timer  : 0 ms
Guard Timer     : 500 ms
Wait-To-Block   : 5500 ms
Protection Type : Revertive
ERP Inst        : blue
```

Table 4: Parameters in the output from **show g8032 profile** command.

Parameter	Description
`Wait-To-Restore`	The configured value in <1-12> minutes.
`Hold Off Timer`	The configured value but shown instead in milliseconds which ranges from 0 to 10,000 (10s) in 100 ms increments.
`Guard Timer`	The configured value which ranges from 10 to 2000 in 10 ms increments.

Table 4: Parameters in the output from **show g8032 profile** command. (cont.)

Parameter	Description
`Wait-To-Block`	5 seconds more than the configured Guard Time. The range is 5010 to 5200.
`ERP Inst`	Comma separated list of ERP instances using this profile, or "-" if there are none.

Version 5.4.8-1.1: added to SBx908 GEN2 series products

sub-ring

Overview Use this command to configure the mode of operation for the G.8032 Ethernet Ring Protection (ERP) instance as a sub-ring.

Use the **no** variant of this command to change the mode of operation to that of a normal fully enclosed ring.

Syntax

```
sub-ring
no sub-ring
```

Default By default the mode is **no sub-ring**.

Mode G8032 Configure Switch

Usage notes An ERP instance can operate normally as a fully enclosed ring, commonly called a major ring, or as a partially enclosed ring, called a sub-ring. Sub-rings must be attached to either a major ring (one that is fully closed) or to other sub-rings where one of the other sub-rings itself is attached to a major ring.

Setting the mode to sub-ring should also be set for all nodes in the sub-ring, as the G.8032 state machine is different from that of a major ring.

This configuration can only be accepted when the ERP instance is disabled.

When the physical ring instance used by this ERP instance is configured for terminating interface, then this ERP instance will automatically be configured to be in the sub-ring mode and can not be changed.

Example To configure an ERP instance named “blue” as a sub-ring, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# sub-ring
```

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

timer (g8032-profile)

Overview Use this command to configure a timer for a specified G.8032 Ethernet Ring Protection (ERP) instance profile.

Syntax

```
timer wait-to-restore {<1-12>|default}
timer hold-off {<0-100>|default}
timer guard-timer {<1-200>|default}
```

Parameter	Description
`wait-to-restore`	This timer is used to soak signal failure abatement to ensure the signal failure abatement is not intermittent. This timer is only used by the RPL Owner when in the revertive operation, and thus is attempting to restore the ring. It is configurable in steps of 1 to 12 minutes (default is 5 minutes).
`hold-off`	This timer allows any other underlying protection schemes to recover before G.8032 reacts to its defect as this gives time for the G.8032 defect to clear. A classic example is when the ERP Physical ring port is carried over a SONET/SDH transmission system that itself has 50ms recovery times. If G.8032 detects a failure, then increasing this timer to some value greater than 50ms would allows the SONET/SDH system to recover and have the defect that G.8032 detected disappear thus preventing the need for G.8032 to try and recover. The Hold Off timer is configurable in 0 to 10 seconds in steps of 100ms (default is 0 ms).
`guard-timer`	This is the amount of time that an ERP instance discards most R-APS messages before being allowed to process them. It is used when a clearing condition occurs yet at the same time older messages are still propagating around the ring with failure indications. For example two nodes that just noticed a link failure abatement condition could start clearing and almost immediately one of them could receive an old Signal Fail indication message from the other node (that was still in flight) which in turn causes the receiving node to react to the Signal Fail inadvertently. This timer is particularly useful where R-APS propagation time through the ring is large. Refer to ITU-T G.8032 for more information. The Guard timer is configurable in 10ms steps between 10ms and 2 seconds (default is 50 for 500ms).

Mode G8032 Profile Configuration

Example To set the wait-to-restore timer of a profile named “prof_1” to a value of 1 minute, use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# timer wait-to-restore 1
```

topology-change

Overview Use this command to enable this G.8032 Ethernet Ring Protection (ERP) instance to send a Flush Event message after notification of a Topology Change Notification (TCN) by a detecting instance.

Use the **no** variant of this command to disable the sending of the Flush Event.

Syntax

```
topology-change {g8032}
no topology-change {g8032}
```

Parameter	Description
g8032	Specify that G.8032 is the protocol that is affected by this command.

Default Topology change is enabled by default for G.8032.

Mode G8032 Configure Switch

Usage notes If this ERP instance is on an interconnecting node, then the ERP instance may need to be notified of a topology change that occurred in another G.8032 sub-ring attached to this node. The former will be termed the "target" ERP instance, and the latter the "detecting" ERP instance.

The criteria for notification is:

- the detecting ERP instance is configured as a sub-ring with a Terminating interface,
- it is protecting the same data VLANs as the target instance, and
- the target ERP instance must have two ring ports.

When the detecting ERP instance detects a topology change on its sub-ring, AlliedWare Plus™ will automatically determine which target ERP instance(s) needs to be notified. It does this by comparing the same data VLANs in the detecting ERP instance with all the other instances.

If target ERP instances are identified and these instances also have both an East and a West interface configured, then those target instances are notified. Upon notification, the target ERP instance has a couple of actions that it has to perform:

- To flush the FDB on both its East and West interfaces for the protected VLANs.
- To send out an R-APS flush event message over its East and West interfaces. The flush event message is sent around the target ring and each node on the target ring will perform an FDB flush of its protected VLANs. The sending of a R-APS flush event may not be needed in some cases and as such it is configurable.

Example To enable sending of R-APS flush event messages on an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# topology-change g8032
```

trap (g8032-switch)

Overview Use this command to enable or disable SNMP traps for a G.8032 Ethernet Ring Protection (ERP) instance.

Syntax

```
trap {enabled|disabled}
```

Parameter	Description
`enabled`	Enable this ERP instance to generate traps.
`disabled`	Disable this ERP instance from generating traps.

Default The SNMP traps for the ERP instance are enabled.

Mode G8032 Configure Switch

Usage notes Globally, ERP traps are disabled by default but can be enabled globally using the snmp-server enable trap command.

Example To disable the SNMP traps for an ERP instance named “blue”, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# trap disabled
```

undebug g8032

Overview Use this command to turn off debugging for various G.8032 debug attributes.

Syntax

```
undebug g8032 {all|event|rx|tx}
```

Parameter	Description
`all`	All G.8032 debugging
`event`	G.8032 debugging events
`rx`	G.8032 debugging Receive activities
`tx`	G.8032 debugging Transmit activities

Mode Privileged Exec

Example To turn off all G.8032 debugging, use the following command:

```
awplus# undebug g8032 all
```

62 Media Redundancy Protocol (MRP) Commands

Introduction

Overview

This chapter provides an alphabetical list of Media Redundancy Protocol (MRP) commands.

For more information, see the MRP Feature Overview and Configuration Guide.

Command List

clear counter mrp

Overview Use this command to clear the MRP counters.

Syntax

```
clear counter mrp [global|ring <ring-id>]
```

Parameter	Description
`global`	Clear only global MRP counters.
`ring`	Clear only MRP counters for a specific MRP ring.
<ring-id>	<1-65535>. The ID of an MRP ring.

Mode Privileged Exec

Example To clear all MRP counters, use the command:

```
awplus# clear counter mrp
```

To clear only the global MRP counters, use the command:

```
awplus# clear counter mrp global
```

To clear all MRP counters for MRP ring 1, use the command:

```
awplus# clear counter mrp ring 1
```

Related commands mrp ring

show counter mrp

Command changes Version 5.5.0-2.1: command added

debug mrp

Overview Use this command to enable debug output for MRP.

Use the **no** variant of this command to disable debug output.

Syntax

```
debug mrp {all|fdb|fsm|port}
no debug mrp {all|fdb|fsm|port}
```

Parameter	Description
`all`	Enable all debug output options for MRP.
`fdb`	Enable debug output for MRP forwarding database events.
`fsm`	Enable debug output for MRP state machine events.
`port`	Enable debug output for MRP port events.

Default All MRP debug output is disabled.

Mode User Exec

Usage notes Note that enabling MRP debug is not saved to the config, so enabling debug output will not be persistent.

Example To enable all MRP debug output, use the command:

```
awplus# debug mrp all
```

To disable MRP port event debug output, use the command:

```
awplus# no debug mrp port
```

Related commands mrp ring

show debugging mrp

Command changes Version 5.5.0-2.1: command added

domain-id (mrp-ring)

Overview Use this command to configure the domain ID of an MRP ring. The domain ID is used to identify the nodes in the ring, and is set in the MRP PDU packets. All nodes in an MRP ring must have the same domain ID.

Use the **no** variant of this command to reset the domain ID to the default.

Syntax

```
domain-id <uuid>
no domain-id <uuid>
```

Parameter	Description
<uuid>	A hexadecimal string that identifies the MRP ring, with a format like FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFFFFFF.

Default A hexadecimal string, with the value:

FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFFFFFF - <Ring ID> + 1

Mode MRP Ring Configuration

Example To configure the domain ID of MRP ring 1 to FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFF3210, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# domain-id
FFFFFFFF-FFFF-FFFF-FFFF-FFFFFFFF3210
```

Related commands

enable (mrp-ring)

mrp ring

profile (mrp-ring)

role (mrp-ring)

vlan-id (mrp-ring)

Command changes Version 5.5.0-2.1: command added

domain-name (mrp-ring)

Overview Use this command to set the domain name of an MRP ring.

Use the **no** variant of this command to remove the domain name of an MRP ring.

Syntax

```
domain-name <name>
no domain-name
```

Parameter	Description
<name>	The domain name for the MRP ring.

Default No domain name is set.

Mode MRP Ring Configuration

Example To set the domain name of MRP ring 1 to 'ring1', use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# domain-name ring1
```

To clear the domain name of MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no domain-name
```

Command changes Version 5.5.0-2.1: command added

enable (mrp-ring)

Overview Use this command to enable MRP on an MRP ring.

Use the **no** variant of this command to disable MRP on an MRP ring.

Syntax

```
enable
no enable
```

Default MRP is enabled.

Mode MRP Ring Configuration

Example To disable MRP for MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no enable
```

Related commands

domain-id (mrp-ring)

domain-name (mrp-ring)

Command changes Version 5.5.0-2.1: command added

lc-react

Overview Use this command to configure the media redundancy manager (MRM) to react to MRP_LinkDown and MRP_LinkUp frames from media redundancy clients (MRCs). This may result in faster failover and recovery time.

Use the **no** variant of this command to set the MRM back to the default of ignoring those packets, and relying on the test frame interval timeout.

Syntax

```
lc-react
no lc-react
```

Default The MRM ignores MRP_LinkDown and MRP_LinkUp frames from MRCs, and relies on the test frame interval timeout.

Mode MRP Ring Manager Configuration

Example To configure MRP ring 1 to react to MRP_LinkDown and MRP_LinkUp frames, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# role manager
awplus(config-mrp-ring-manager)# lc-react
```

To reset MRP ring 1 to ignore MRP_LinkDown and MRP_LinkUp frames, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# role manager
awplus(config-mrp-ring-manager)# no lc-react
```

role (mrp-ring)

Command changes Version 5.5.0-2.1: command added

mrp ring

Overview Use this command to create an MRP Ring and enter MRP Ring Configuration mode, or to attach a port to an MRP ring.

In Global Configuration mode, this command will create an MRP ring and enter MRP Ring Configuration mode.

In Interface Configuration mode, this command will attach a port to an MRP ring. The MRP ring registers the port's VLAN in the MRP structure. If this is the second port to be attached to the MRP ring, it will first verify that the VLANs match.

Use the **no** variant of this command to remove a port from an MRP ring.

Syntax

```
mrp ring <ring-id>
no mrp ring <ring-id>
```

Parameter	Description
<ring-id>	<1-65535>. The ID of the MRP ring.

Mode Global Configuration mode to enter MRP Ring Configuration mode, or Interface Configuration mode to attach a port to or remove a port from an MRP ring.

Example To create MRP ring 1 and enter MRP Ring Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)#
```

To attach port1.0.1 to MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mrp ring 1
```

To remove port1.0.1 from MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no mrp ring 1
```

profile (mrp-ring)

Overview Use this command to set the maximum recovery timing profile for an MRP ring. This sets the worst case recovery time to 200ms or 500ms.

Use the **no** variant of this command to return to the default value (200ms).

Syntax

```
profile {200|500}
no profile
```

Parameter	Description
200	The worst-case recovery time is set to 200ms.
500	The worst-case recovery time is set to 500ms.

Default 200ms.

Mode MRP Ring Configuration

Example To configure the worst case recovery time for MRP ring 1 to 500ms, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# profile 500
```

To reset the worst case recovery time for MRP ring 1 to the default of 200ms, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no profile
```

role (mrp-ring)

Overview Use this command to set the operating role for a node in an MRP ring.

Use the **no** variant of this command to set the operating role to the default (client).

Syntax

```
role {client|manager}
no role [client|manager]
```

Parameter	Description
`client`	Assigns the operating role of media redundancy client (MRC) to the node.

Default Client.

Mode MRP Ring Configuration

Example To set the role of a node on MRP ring 1 to the default (client), use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# no role
```

Related commands mrp ring

Command changes Version 5.5.0-2.1: command added

service mrp

Overview Use this command to enable the Media Redundancy Protocol (MRP) service. This is required before any other MRP configuration can be entered.

Use the **no** variant of this command to disable the MRP service.

Syntax

```
service mrp
no service mrp
```

Default The MRP service is disabled.

Mode Global Configuration

Example To enable the MRP service, use the commands:

```
awplus# configure terminal
awplus(config)# service mrp
```

To disable the MRP service, use the commands:

```
awplus# configure terminal
awplus(config)# no service mrp
```

Related commands mrp ring

Command changes Version 5.5.0-2.1: command added

show counter mrp

Overview Use this command to show the MRP counters.

The global counters provide an overall count of protocol packets being sent and received, as well as the timer and dispatcher that show the service has not halted.

The ring counters provide per-ring counters for both ring ports. These count the different types of MRP PDU packets that are sent and received. They also provide topology and port state counters that record events on the ring.

Syntax `show counter mrp [global|ring <ring-id>]`

Parameter	Description
`global`	Show only global MRP counters.
`ring`	Show only MRP counters for a specific MRP ring.
<ring-id>	<1-65535>. The ID of an MRP ring.

Mode User Exec

Example To show all MRP counters, use the command:

```
awplus# show counter mrp
```

To show only the global MRP counters, use the command:

```
awplus# show counter mrp global
```

To show all MRP counters for MRP ring 1, use the command:

```
awplus# show counter mrp ring 1
```

Output Figure 62-1: Example output from **show counter mrp**

Port Blocked Set       ......... 4
Port Forwarding Set    ......... 2
Multiple Manager       ......... 0
```

Table 62-1: Parameters in the output from **show counter mrp**

Parameter	Description
MRP Started	The number of times the MRP service has been started with the service mrp command. This counter increases each time it is stopped and started.
MRP Dispatcher MRP Timer Tick	Internal timer tick that provides timing for the protocol and the dispatcher. This is called to process timing events, packet reception, and state changes.
MRP Packet RX	The number of MRP protocol packets received.
MRP Packet RX Error	The number of failures when receiving a packet.
MRP Packet TX	The number of MRP protocol packets sent.
MRP Packet TX Error	The number of failures when sending a packet.
MRP_Test	The number of test frames sent and received by the Media Redundancy Manager (MRM) to test if the ring is open or closed.
MRP_TopologyChange	The number of topology change frames sent from the MRM to indicate ring topology changes to Media Redundancy Clients (MRC).
MRP_LinkUp MRP_LinkDown	The number of Link Up/Down frames sent from MRC to indicate a link state change on one of its ring ports.
State Changes	The number of changes in the protocol state. These are triggered by test packets detecting the ring opening or closing, and MRP ring port link changes.
Port Blocked Set	The number of times a ring port has been set to blocking.

Table 62-1: Parameters in the output from **show counter mrp** (cont.)

Parameter	Description
Port Forwarding Set	The number of times a ring port has been set to forwarding.
Multiple Manager	A misconfiguration detected by the MRM that another manager is on the ring. This is detected from information in the MRP PDU frames.

Related commands

Command changes

Version 5.5.0-2.1: command added

show debugging mrp

Overview Use this command to show which debug options are enabled for MRP logging.

Syntax

```
show debugging mrp
```

Mode User Exec

Example To show the enabled MRP debugging options, use the command:

```
awplus# show debugging mrp
```

Output Figure 62-4: Example output from **show debugging mrp**

```
awplus#show debugging mrp
MRP debugging status:
  MRP Port debugging: On
  MRP FSM debugging: Off
  MRP FDB debugging: Off
```

Table 62-2: Parameters in the output from **show debugging mrp**

Parameter	Description
MRP Port debugging	Debug output for MRP port events.
MRP FSM debugging	Debug output for MRP state machine events.
MRP FDB debugging	Debug output for MRP forwarding database events.

Related commands

debug mrp

mrp ring

Command changes Version 5.5.0-2.1: command added

show mrp ports

Overview Use this command to show a summary of all ports that are configured for MRP rings.

Syntax

```
show mrp ports
```

Mode User Exec

Example To show a summary of the ports configured for MRP rings, use the command:

```
awplus# show mrp ports
```

Output Figure 62-5: Example output from **show mrp ports**

```
awplus#show mrp ports
Media Redundancy Protocol - Port Information

Connection          Port          State
-----------------------------------------
Ring 1              port1.0.23    Blocking
Ring 1              port1.0.24    Forwarding
```

Table 62-3: Parameters in the output from **show mrp ports**

Parameter	Description
Connection	The name of the MRP ring.
Port	The ID of the port.
State	The state of the port: Disabled - all packets received by the port are dropped. Blocking - all packets received by the port are dropped, with the exception of MRP protocol packets. Forwarding - all packets received by the port are forwarded.

Related commands mrp ring

Command changes Version 5.5.0-2.1: command added

show mrp ring

Overview Use this command to show the MRP ring settings for a specific ring, or for all rings.

Syntax

```
show mrp ring [<ring-id>]
```

Parameter	Description
<ring-id>	The ID of an MRP ring.

Mode Privileged Exec

Example To show the settings for all MRP rings, use the command:

```
awplus# show mrp ring
```

To show the settings for MRP ring 1, use the command:

```
awplus# show mrp ring 1
```

Output Figure 62-6: Example output from **show mrp ring** for a Client

```
awplus#show mrp ring
Media Redundancy Protocol - Ring Information
MRP Ring 1
 Domain ID:                  ffffffff-ffff-ffff-ffff-ffffffffffff
 Domain Name:
 Ring Status:                          Enabled
 Running State:                        Stopped
 Role:                                 Client
 Port1:                                port1.0.3
  Status:                              Forwarding
 Port2:                                port1.0.4
  Status:                              Forwarding
 Vlan ID:
 Profile:                              200ms
  Link Down Interval:                  20ms
  Link Up Interval:                    20ms
  Link Change Count:                   4
  Blocked port state supported:        Yes
```

Table 62-4: Parameters in the output from **show mrp ring**

Parameter	Description
Domain ID	The UUID that identifies the ring. The Domain ID is used in MRP PDU packets.
Domain Name	Description of the ring that can be set by the user.
Ring Status	Whether the ring is Enabled or Disabled.

Table 62-4: Parameters in the output from **show mrp ring** (cont.)

Parameter	Description
Operating Mode	CLI - the MRP ring is configured and controlled from the command line.
Role	Whether the node is a Manager (MRM) or Client (MRC).
Network Status	Whether the MRP ring is Open or Closed (MRM only).
Port Status	The state of the port: Disabled - all packets received by the port are dropped. Blocking - all packets received by the port are dropped, with the exception of MRP protocol packets. Forwarding - all packets received by the port are forwarded.
Vlan ID	If the MRP ring is configured with a trunked VLAN, this shows the configured VLAN ID.
Profile	Whether it is configured for 200ms or 500ms.

Related commands mrp ring

Command changes Version 5.5.0-2.1: command added

vlan-id (mrp-ring)

Overview Use this command to assign a VLAN to an MRP ring.

Syntax

```
vlan-id <vlan>
```

Parameter	Description
<vlan>	<1-4094> The ID of the VLAN to be assigned.

Mode MRP Ring Configuration

Usage notes This is only possible if the ports attached to the MRP ring are set to trunked mode. In access mode, MRP will automatically set this to the VLAN of the port.

Both ports must be in the same VLAN.

Example To assign VLAN 2 to MRP ring 1, use the commands:

```
awplus# configure terminal
awplus(config)# mrp ring 1
awplus(config-mrp-ring)# vlan-id 2
```

Part 7: Network Management

63 AMF and AMF Plus Commands

Introduction

Overview

This chapter provides an alphabetical reference for AMF and AMF Plus commands. AMF is the Allied Telesis Autonomous Management Framework™, and AMF Plus is an expanded version of AMF. Both AMF and AMF Plus are a suite of features that combine to simplify network management across all supported network equipment from the core to the edge. They also integrate with Vista Manager, our graphical monitoring and management platform.

On the AlliedWare Plus command line, AMF and AMF Plus are identical. The difference between them is in Vista Manager, where AMF Plus includes additional AMF Plus intent-based networking features.

In the rest of this chapter, we use 'AMF' to refer to both AMF and AMF Plus.

AMF master nodes

Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as a AMF master. See the AMF Feature Overview and Configuration Guide for information about master support.

AMF edge

AlliedWare Plus CentreCOM® Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

AMF naming convention

When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command hostname on page 322, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host_0016_76b1_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and apply an appropriate hostname to each device in your AMF network.

AMF and STP

On AR-Series UTM firewalls and Secure VPN routers, you cannot use STP at the same time as AMF.

Command List

application-proxy ip-filter

Overview Use this command to enable global IP filtering on a device. Once enabled the device will add a global ACL in response to a threat message from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable global IP filtering.

Syntax
```
application-proxy ip-filter
no application-proxy ip-filter
```

Default Global IP filtering is disabled by default.

Mode Global Configuration

Usage notes For this feature to work, the AMF Application Proxy service needs to be enabled on your network, using the command service atmf-application-proxy.

Example To enable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy ip-filter
```

To disable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy ip-filter
```

Related commands
application-proxy redirect-url

application-proxy threat-protection

clear application-proxy threat-protection

service atmf-application-proxy

show application-proxy threat-protection

Command changes Version 5.4.7-2.5: command added

application-proxy quarantine-vlan

Overview Use this command to set the quarantine VLAN to use when an AMF Security (AMF-Sec) Controller detects a threat. The port/s on which the threat is detected are moved to this VLAN if the application-proxy threat-protection action is set to **quarantine**.

Use the **no** variant of this command to delete the quarantine VLAN. If no quarantine VLAN is specified then no quarantine action will be performed.

Syntax

```
application-proxy quarantine-vlan <vlan-id>
no application-proxy quarantine-vlan
```

Parameter	Description
<vlan-id>	The ID of the VLAN to use. In the range 1-4094.

Default By default, no quarantine VLAN is configured.

Mode Global Configuration

Example To configure VLAN 100 as the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy quarantine-vlan 100
```

To delete the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy quarantine-vlan
```

service atmf-application-proxy

show application-proxy threat-protection

Command changes Version 5.4.7-2.2: command added

application-proxy redirect-url

Overview Use this command to redirect a user to a helpful URL when they are blocked because of an application-proxy ip-filter.

Use the **no** variant of this command to remove the URL redirect.

Syntax

```
application-proxy redirect-url <url>
no application-proxy redirect-url
```

Parameter	Description
<url>	URL to redirect the user to.

Default No URL is configured by default.

Mode Global Configuration

Example To configure a redirect URL, use the command:

```
awplus# application-proxy redirect-url http://my.dom/help.html
```

To remove a redirect URL, use the command:

```
awplus# no application-proxy redirect-url
```

Related commands

application-proxy ip-filter

application-proxy threat-protection

clear application-proxy threat-protection

service atmf-application-proxy

show application-proxy threat-protection

Command changes Version 5.4.9-0.1: command added

application-proxy threat-protection

Overview Use this command to set the blocking action to take when a threat detected message is received from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable threat protection blocking actions on the port.

Syntax

```
application-proxy threat-protection
{drop|link-down|quarantine|log-only}
```

```
no application-proxy threat-protection
```

Parameter	Description
`drop`	Drop the traffic that generates the threat reports. This is a Layer 2 drop. Note that the device will only drop packets that arrive at the port, not packets sent from the port.
`link-down`	Take the link down in response to threats, by setting it to error disabled.
`quarantine`	Move the offending port to a quarantine VLAN.
`log-only`	Log when a threat is detected.

Default Threat protection is disabled by default.

Mode Interface Configuration

Example To set the threat protection blocking action on port1.0.4 to drop, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy threat-protection drop
```

To disable threat protection blocking actions on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy threat-protection
```

Version 5.4.7-2.2: command added

application-proxy threat-protection send-summary

Overview Use this command to send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes. This command can only be performed on an AMF master.

Syntax
```
application-proxy threat-protection send-summary
```

Mode Privileged Exec

Example To send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes, use the command:

```
awplus# application-proxy threat-protection send-summary
```

Related commands
- application-proxy quarantine-vlan
- application-proxy threat-protection
- clear application-proxy threat-protection
- service atmf-application-proxy
- show application-proxy threat-protection

Command changes Version 5.4.7-2.2: command added

application-proxy whitelist advertised-address

Overview Use this command to register a Layer 3 interface, and the IPv4 address that is attached to this interface, as the advertised application-proxy whitelist address for a device.

Use the **no** variant of this command to stop advertising the Layer 3 interface and its associated IPv4 address.

Syntax

```
application-proxy whitelist advertised-address <interface>
no application-proxy whitelist advertised-address
```

Parameter	Description
<interface>	Layer 3 interface to configure as the advertised address.

Default No address advertised by default.

Mode Global Configuration

Example To configure the IPv4 address attached to VLAN 1as the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist advertised-address
vlan1
```

To remove the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist
advertised-address
```

Related commands application-proxy whitelist server

show application-proxy whitelist advertised-address

Command changes Version 5.4.9-1.1: command added

application-proxy whitelist enable

Overview Use this command to enable application-proxy whitelist based authentication on an interface.

Use the **no** variant of this command to disable the whitelist authentication.

Syntax

```
application-proxy whitelist enable
no application-proxy whitelist enable
```

Default Application-proxy whitelist is disabled by default.

Mode Interface Configuration

Usage notes When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be
removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Example To enable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy whitelist enable
```

To disable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy whitelist enable
```

Related commands

Command changes Version 5.4.9-0.1: command added

application-proxy whitelist protection tls

Overview Use this command to configure the application-proxy whitelist control channel to use TLS protection. If no trustpoint is specified then TLS will operate without authentication.

Use the **no** variant of this command to stop using TLS.

Syntax

```
application-proxy whitelist protection tls [trustpoint <name>]
no application-proxy whitelist protection tls
```

Parameter	Description
`trustpoint`	Specify an optional trustpoint. If no trustpoint is specified then TLS will operate without authentication.
<name>	Name of the trustpoint.

Default TLS is disabled by default.

Mode Global Configuration

Example To configure an AMF application-proxy whitelist to use TLS with the trustpoint 'corpca', use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist protection tls
trustpoint corpca
```

To configure an AMF application-proxy whitelist to stop using TLS, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist protection tls
```

Related commands

application-proxy whitelist enable

show application-proxy whitelist server

Command changes Version 5.5.0-2.1: command added

application-proxy whitelist server

Overview Use this command to set an AMF master to act as a whitelist authentication proxy between AMF members, acting as Network Access Servers, and an external whitelist RADIUS server.

Use the **no** variant of this command to disable the whitelist proxy functionality.

Syntax

```
application-proxy whitelist server <ip-address> key <key>
[auth-port <1-65535>]
```

```
no application-proxy whitelist server
```

Parameter	Description
<ip-address>	IPv4 address of the upstream RADIUS server in dotted decimal format A.B.C.D.
`key <key>`	Set the shared secret encryption key for communication with the upstream RADIUS server.
`auth-port <1-65535>`	Set the RADIUS server UDP port. This is only necessary if you don't want to use the default port 1812.

Default Disabled by default.

Mode Global Configuration

Example To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on port 1822, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey auth-port 1822
```

To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on the default port (1812), use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey
```

To disable the whitelist proxy, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist server
```

Command changes Version 5.4.9-0.1: command added

application-proxy whitelist trustpoint (deprecated)

Overview This command has been deprecated. It has been replaced by the application-proxy whitelist protection tls command.

This command sets the trustpoint to use when communicating with the external whitelist RADIUS server. This enables RADIUS over TLS (RadSec) protection.

Syntax

```
application-proxy whitelist trustpoint <name>
no application-proxy whitelist trustpoint
```

Command changes Version 5.4.9-1.1: command added

Version 5.5.0-2.1: command deprecated

area-link

Overview Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

Syntax

```
area-link <area-name>
no area-link
```

Parameter	Description
<area-name>	AMF area name of the container's area.

Mode AMF Container Configuration

Usage notes The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the atmf container command and an area-link configured with the **area-link** command, it can be enabled using the state command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

```
% AreaLink already configured for this container
```

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the bridge-group (amf-container) command.

See the AMF Feature Overview and Configuration_Guide for more information on these virtual interfaces and links.

Example To create the area-link to "wlg" on container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

Related commands

atmf container

show atmf container

Command changes

Version 5.4.7-0.1: command added

atmf-arealink

Overview This command to enable an Eth interface, on an AR-series device, as an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network. This command is only available if your network is running in AMF secure mode (see atmf secure-mode for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF area links that may exist for the selected Eth interface.

Syntax

```
atmf-arealink remote-area <area-name> vlan <2-4094>
no atmf-arealink
```

Parameter	Description
<area-name>	The name of the remote area that the interface is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

Default By default, no area links are configured

Mode Eth interface on an AR-series device.

Usage notes Run this command on the interface at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will synchronize the area information stored on the two nodes.

You can configure multiple area links between two area nodes, but only one area link at any time will be in use. All other area links will block information, to prevent network storms.

NOTE: *See the switchport atmf-arealink command to configure an AMF area link on an a switch port or link aggregator*

Example To configure eth1 as an AMF area link to the 'Auckland' area on VLAN 6, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# atmf-arealink remote-area Auckland vlan 6
```

To remove eth1 as an AMF area link, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# no atmf-arealink
```

Related commands

atmf area

atmf area password

Command changes

Version 5.5.0-1.1: command added

atmf-link

Overview Use this command to enable an Eth interface on an AR-series device as an up/down AMF link. This command is only available if your network is running in AMF secure mode (see atmf secure-mode for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF link that may exist for the selected Eth interface.

Syntax

```
atmf-link
no atmf-link
```

Mode Eth interface on an AR-series device.

Usage notes Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

If you run the command and AMF secure mode is not enabled, you will see the following error message:

```
Node_1(config)#int eth1
Node_1(config-if)#atmf-link
% Cannot configure eth1 because atmf secure-mode is not enabled.
```

NOTE: *See the switchport atmf-link command to configure an AMF up/down link on an a switch port or link aggregator*

Example To configure eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# atmf-link
```

To remove eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# no atmf-link
```

switchport atmf-link

Command changes Version 5.5.0-1.1: command added

atmf amfplus-license-only

Overview Use this command if you want to use the AMF Plus features in Vista Manager EX, and you have a mixture of AMF and AMF Plus licenses on your master node. This command sets the AMF network to only count **AMF Plus** licensed nodes.

Use the **no** variant of this command to include both AMF and AMF Plus licenses when calculating the number of licensed nodes in an area count.

Syntax

```
atmf amfplus-license-only
no atmf amfplus-license-only
```

Default The **no** version is the default. That is, consider both AMF and AMF Plus licenses when calculating the number of licensed nodes.

Mode Global Configuration

Usage notes From software version 5.5.2-2.3 onwards, AMF licenses are no longer available to purchase. Instead, AMF Plus licenses become available. Existing AMF licenses remain valid. You only need to change to AMF Plus licenses if you want to manage more nodes, or use the new AMF Plus menu in Vista Manager.

CAUTION: *If the network has more AMF nodes than are licensed with AMF Plus:*

- AMF Plus will still be enabled in Vista Manager EX (provided there is no AMF license)
- any AMF nodes above the license count won't join the AMF network.

The AMF Plus menu replaces the AOI menu in Vista Manager EX when all the AMF Masters and Controllers have:

- An AMF Plus Controller/Master license on all Masters and Controllers, and
- No AMF Controller/Master licenses applied, or AMF Controller/Master licenses disabled with this command.

Example To set the AMF network to only count AMF Plus licensed nodes, use the commands:

```
awplus#configure terminal
awplus(config)#atmf amfplus-license-only
```

Output Figure 63-1: Example using **atmf amfplus-license-only**

```
ATMF Summary Information:

```

Related commands show atmf

Command changes Version 5.5.3-0.1: command added

atmf area

Overview This command creates an AMF area and gives it a name and ID number.

Use the **no** variant of this command to remove the AMF area.

This command is only valid on AMF controllers, master nodes and gateway nodes.

Syntax

```
atmf area <area-name> id <1-4094> [local]
no atmf area <area-name>
```

Parameter	Description
<area-name>	The AMF area name. The area name can be up to 15 characters long. Valid characters are: a..z A..Z 0..9 - _ Names are case sensitive and must be unique within an AMF network. The name cannot be the word "local" or an abbreviation of the word "local" (such as "l", "lo" etc.).
<1-4094>	An ID number that uniquely identifies this area.
`local`	Set the area to be the local area. The local area contains the device you are configuring.

Mode Global Configuration

Usage notes This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

Example To create the AMF area named New-Zealand, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named Auckland, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

Related commands

switchport atmf-arealink

Command changes

Version 5.5.1-2.1: area **id** maximum increased to 4094

atmf area password

Overview This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

Syntax

```
atmf area <area-name> password [8] <password>
no atmf area <area-name> password
```

Parameter	Description
<area-name>	The AMF area name.
8	This parameter is displayed in **show running-config** output to indicate that it is displaying the password in encrypted form. You should not enter **8** on the CLI yourself.
<password>	The password is between 8 and 32 characters long. It can include spaces.

Mode Global Configuration

Usage notes You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the atmf area command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

Example To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

Related commands

switchport atmf-arealink

atmf authorize

Overview On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the show atmf authorization command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

Syntax

```
atmf authorize {<node-name> [area <area-name>]|all-pending}
no atmf authorize <node-name> [area <area-name>]
```

Parameter	Description
<node-name>	The name of the node to be authorized or have its authorization revoked.
area	Specify an AMF area.
<area-name>	This is the name of the area the node belongs to.
all-pending	Authorize all nodes in the pending queue.

Mode Privileged Exec

Usage notes On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

Example To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called “node2” in remote AMF area “area3”, use the command:

```
awplus# atmf authorize node2 area “area3”
```

To authorize a node called “node4” on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called “node4” on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

Related commands

Command changes Version 5.4.7-0.3: command added

atmf authorize provision

Overview Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the atmf secure-mode command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from and AMF controller or AMF master.

Syntax

```
atmf authorize provision [timeout <minutes>] node <node-name>
interface <interface-name> [area <area-name>]
atmf authorize provision [timeout <minutes>] mac <mac-address>
atmf authorize provision [timeout <minutes>] all
no atmf authorize provision node <node-name> interface
<interface-name> [area <area-name>]
no atmf authorize provision mac <mac-address>
no atmf authorize provision all
```

Parameter	Description
`timeout`	Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified.
<minutes>	Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.
`node`	Specify a node to provision by node name.
<node-name>	The name of the node to provisionally authorize.
`interface`	Specify the interface the node will connect on.
<interface-name>	The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.
`area`	Specify the AMF area.
<area-name>	This is the name of the area the node belongs to.
`mac`	Specify a node to provision by MAC address.
<mac-address>	Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.
`all`	Provision authorization for all secure mode capable nodes.

Default The default timeout is 60 minutes.

Mode Privileged Exec

Example To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

Related commands

show atmf authorization

show atmf secure-mode

Command changes

Version 5.4.7-0.3: command added

atmf backup

Overview This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

Syntax

```
atmf backup {default|<hh:mm> frequency <1-24>}
```

Parameter	Description
`default`	Restore the default backup schedule.
`<hh:mm>`	Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock.
`backup`	Enables AMF backup to external media.
`frequency <1-24>`	Sets the number of times within a 24 hour period that backups will be taken.

Default Backups run daily at 03:00 AM, by default

Mode Global Configuration

Usage notes Running this command only configures the schedule. To enable the schedule, you should then apply the command atmf backup enable.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
node_1(config)# atmf backup 11:00 frequency 2
```

CAUTION: *File names that comprise identical text, but with differing case, such as Test.txt and test.txt, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.*

Related commands atmf backup enable

atmf backup stop

show atmf backup

atmf backup area-masters delete

Overview Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

Syntax

```
atmf backup area-masters delete area <area-name> node
<node-name>
```

Parameter	Description
<area-name>	The area that contains the node whose backup will be deleted.
<node-name>	The node whose backup will be deleted.

Mode Privileged Exec

Example To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area Wellington
node well-gate
```

Related commands show atmf backup area

atmf backup area-masters enable

Overview Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

Syntax

```
atmf backup area-masters enable
no atmf backup area-masters enable
```

Mode Global configuration

Default Remote area backups are disabled by default

Usage notes Use the following commands to configure the remote area-master backups:

- atmf backup to configure when the backups begin and how often they run
- atmf backup server to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

Related commands

atmf backup server

atmf backup

show atmf backup area

atmf backup area-masters now

Overview Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

Syntax

```
atmf backup area-masters now [area <area-name>|area <area-name>
node <node-name>]
```

Parameter	Description
<area-name>	The area whose area-masters will be backed up.
<node-name>	The node that will be backed up.

Mode Privileged Exec

Example To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master “well-master” in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node
well-master
```

Related commands

atmf backup area-masters enable

atmf backup area-masters synchronize

show atmf backup area

atmf backup area-masters synchronize

Overview Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

Syntax
```
atmf backup area-masters synchronize
```

Mode Privileged Exec

Example To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

Related commands

atmf backup area-masters enable

atmf backup area-masters now

show atmf backup area

atmf backup bandwidth

Overview This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

NOTE: *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

Syntax

```
atmf backup bandwidth <0-1000>
no atmf backup bandwidth
```

Parameter	Description
<0-1000>	Sets the bandwidth in kilobytes per second (kBps)

Default The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

Mode Global Configuration

Examples To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

Related commands show atmf backup

atmf backup delete

Overview This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

Syntax

```
atmf backup delete <node-name>
```

Parameter	Description
<node-name>	The AMF node name of the backup file to be deleted.

Mode Privileged Exec

Example To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

Related commands

show atmf backup

atmf backup now

atmf backup stop

atmf backup enable

Overview This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the atmf backup command. Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

Syntax

```
atmf backup enable
no atmf backup enable
```

Default Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

Mode Global Configuration

Usage notes A warning message will appear if you run the atmf backup enable command with either insufficient or marginal memory availability on your external storage device.

You can use the command show atmf backup on page 3411 to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

Related commands

show atmf

show atmf backup

atmf backup

atmf backup now

atmf backup guests delete

Overview This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

Syntax

```
atmf backup guests delete <node-name> <guest-port>
```

Parameter	Description
<node-name>	The name of the guest's parent node.
<guest-port>	The port number on the parent node.

Mode User Exec/Privileged Exec

Example On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

Related Command

atmf backup delete

atmf backup area-masters delete

show atmf backup guest

atmf backup guests enable

Overview Use this command to enable backups of remote guest nodes from an AMF master.

Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

Syntax

```
atmf backup guests enable
no atmf backup guests enable
```

Default Guest node backups are enabled by default.

Mode Global Config

Usage notes We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

Related commands

atmf backup area-masters enable

show atmf backup guest

atmf backup guests synchronize

atmf backup guests now

Overview This command manually triggers an AMF backup of guest nodes on a AMF Master.

Syntax

```
atmf backup guests now [<node-name>] [<guest-port>]
```

Parameter	Description
<node-name>	The name of the guest's parent node.
<guest-port>	The port number that connects to the guest node.

Default n/a

Mode Privileged Exec

Example Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

Example To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

Related commands show atmf backup guest

atmf backup guests synchronize

Overview This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the atmf backup command.

Syntax
```
atmf backup guests synchronize
```

Default n/a

Mode User Exec/Privileged Exec

Example To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

Related commands
atmf backup redundancy enable

show atmf guests

atmf backup guests enable

atmf backup now

Overview This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

Syntax

```
atmf backup now [<nodename>]
```

Parameter	Description
<nodename> or *<hostname>*	The name of the AMF member to be backed up, as set by the command hostname on page 322. Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example host_0016_76b1_7a5e. Note that the node-name appears as the command Prompt when in Privileged Exec mode.

Default A backup is initiated for all nodes on the AMF (but stored on the master nodes).

Mode Privileged Exec

Usage notes Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

NOTE: *The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in Example 4 below.*

Example 1 In this example, an AMF member has not been assigned a host name. The following command is run on the AMF_Master_2 node to immediately backup the device that is identified by its MAC address of 0016.76b1.7a5e:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

NOTE: *When a host name is derived from its MAC address, the syntax format entered changes from XXXX.XXXX.XXXX to XXXX_XXXX_XXXX.*

Example 2 In this example, an AMF member has the host name, **office_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF_Master_2** and initiates an immediate backup on the device named **office_annex**.

Example 3 To initiate from AMF_master_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

Example 4 To initiate an immediate backup of the node with the host-name “office_annex” and store the configuration on both masters, use the following process:

From the AMF_master_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
============================
AMF_Master_1, AMF_Master_2
============================

Working set join
```

Backup the AMF member with the host name, **office_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

Related commands

atmf backup

atmf backup stop

hostname

show atmf backup

atmf backup redundancy enable

Overview This command is used to enable or disable AMF backup redundancy.

Syntax

```
atmf backup redundancy enable
no atmf backup redundancy enable
```

Default Disabled

Mode Global Configuration

Usage notes If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf backup redundancy enable
```

Related commands

atmf backup synchronize

show atmf backup

show atmf backup area

atmf backup server

Overview This command configures remote file servers as the destination for AMF backups.

Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

Syntax

```
atmf backup server id {1|2} <hostlocation> username <username>
[path <path>|port <1-65535>]
```

```
no atmf backup server id {1|2}
```

Parameter	Description
`id`	Remote server backup server identifier.
`{1|2}`	The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server.
<hostlocation>	Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).
`username`	Configure the username to log in with on the selected remote file server.
<username>	The selected remote file server's username.
`path`	The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.
<path>	The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.
`port`	The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.
`<1-65535>`	A TCP port within the specified range.

Defaults Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

Mode Global Exec

Usage notes The hostname and username parameters must both be configured.

Examples To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
```

```
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

Related commands show atmf backup

atmf backup stop

Overview Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

Syntax

```
atmf backup stop
```

Mode Privileged Exec

Usage notes This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

Example To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

Related commands

atmf backup

atmf backup enable

atmf backup now

show atmf backup

atmf backup synchronize

Overview For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

Syntax

```
atmf backup synchronize
```

Mode Privileged Exec

Example When connected to the master node AMF_Master_1, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

atmf cleanup

Overview This command is an alias to the erase factory-default command.

atmf container

Overview Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

Syntax

```
atmf container <container-name>
no atmf container <container-name>
```

Parameter	Description
<container-name>	The name of the AMF container to create, update, or remove.

Mode AMF Container Configuration

Usage notes You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

Examples To create or update the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

Command changes Version 5.4.7-0.1: command added

atmf container login

Overview Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Syntax

```
atmf container login <container-name>
```

Parameter	Description
<container-name>	The name of the AMF container you wish to login into.

Mode Privileged Exec

Usage notes If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

```
% Container does not exist or is not running.
```

To exit from a container and return to the host VAA press <Ctrl+a q>.

Example To login to container "vac-wlg-1", use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

Command changes Version 5.4.7-0.1: command added

atmf controller

Overview Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

Syntax

```
atmf controller
no atmf controller
```

Mode Global configuration

Usage notes If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

"An AMF Controller license must be installed before this feature will become active"

NOTE: *If the AMF controller functionality is removed from a device using the* ***no atmf controller*** *command then the device must be rebooted if it is to function properly as an AMF master.*

Example To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

Related commands atmf area

show atmf

atmf distribute firmware

Overview This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash on the new location.

The new release name is updated using the **boot system** command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

Syntax `atmf distribute firmware <filename>`

Parameter	Description
<filename>	The filename and path of the file. See the File Management Feature Overview and Configuration Guide for valid syntax.

Mode Privileged Exec

Examples To upgrade nodes in a AMF network with a predefined AMF group called 'teams', use the following command:

```
Team1# atmf working-set group teams
```

```
============================
Team1, Team2, Team3:
============================
Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3

ATMF Firmware Upgrade:

Node Name          New Release File           Status
-----------------------------------------------------------------
Team1              x510-5.4.7-1.1.rel         Release ready
Team2              x930-5.4.7-1.1.rel         Release ready
Team3              x930-5.4.7-1.1.rel         Release ready
Continue the rolling reboot ? (y/n):y
=================================================================

=================================================================
Copying Release    : x930-5.4.7-1.1.rel to Team2
Updating Release   : x930-5.4.7-1.1.rel information on Team2
=================================================================
Copying Release    : x930-5.4.7-1.1.rel to Team3
Updating Release   : x930-5.4.7-1.1.rel information on Team3

=================================================================
New firmware will not take effect until nodes are rebooted.
=================================================================

ATMF_NETWORK[3]#
```

Related commands atmf working-set

atmf domain vlan

Overview The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

CAUTION: *Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.*

CAUTION: *If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.*

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

Syntax

```
atmf domain vlan <2-4090>
no atmf domain vlan
```

Parameter	Description
<2-4090>	The VLAN number in the range 2 to 4090.

Default VLAN 4091

Mode Global Configuration

Usage notes We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named “test” and has 10 nodes:

```
test[10]#
```

3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

5) Save the configuration, using the command:

```
test[10]# write
```

6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

NOTE: *The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command atmf management subnet.*

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

Examples To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf domain vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

Related commands

atmf management subnet

atmf management vlan

atmf enable

Overview This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

Syntax

```
atmf enable
no atmf enable
```

Default Once AMF is configured, the AMF feature starts automatically when the device starts up.

Mode Global Configuration

Usage notes The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

Examples To turn off AMF, use the command:

```
MyNode# config terminal
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

atmf group (membership)

Overview This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

Syntax

```
atmf group <group-list>
no atmf group <group-list>
```

Parameter	Description
<group-list>	A list of group names. These should be entered as a comma delimited list without spaces. Names can contain alphanumeric characters, hyphens and underscores.

Mode Global Configuration

Usage notes You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the atmf group (membership) command to all members of the working set.

Example 1 To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

Example 2 To add the nodes *member_node_1* and *member_node_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member_node_1* and *member_node_2* are now part of the working-set:

```
============================
member_node_1, member_node_2
============================

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
====================
member_node_1
====================

AMF group information

building1, sales
```

Related commands

show atmf group

show atmf group members

atmf guest-class

Overview This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class.

These settings can then all be applied to a guest link by running the switchport atmf-guestlink command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

Syntax

```
atmf guest-class <guest-class-name>
no atmf guest-class <guest-class-name>
```

Parameter	Description
<guest-class-name>	The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters.

Mode Global Configuration

Example To create a guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)#
```

To remove the guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# no atmf guest-class camera
```

Related commands

atmf log-verbose

Overview This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

Syntax

```
atmf log-verbose <1-3>
no atmf log-verbose
```

Parameter	Description
<1-3>	The verbose limitation (3 = noisiest, 1 = quietest)

Default The default log display is 3.

Usage This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

Mode Global Configuration

Example To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

Validation Command show atmf

atmf management subnet

Overview This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

CAUTION: *Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.*

CAUTION: *If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.*

Use the **no** variant of this command to remove the assigned subnet.

Syntax

```
atmf management subnet <a.b.0.0>
no atmf management subnet
```

Parameter	Description
<a.b.0.0>	The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918.

Default 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

Mode Global Configuration

Usage notes Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the atmf management vlan
- 172.31.128.0/17 assigned to the atmf domain vlan.

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

3) Enter the new subnet address, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

5) Save the configuration, using the command:

```
test[10]# write
```

6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

Examples To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management subnet 172.25.0.0
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

Related commands

atmf domain vlan

atmf management vlan

atmf management vlan

Overview The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

CAUTION: *Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.*

CAUTION: *If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.*

Use the **no** variant of this command to restore the VID to the default of 4092.

Syntax

```
atmf management vlan <2-4090>
no atmf management vlan
```

Parameter	Description
<2-4090>	The VID assigned to the AMF management VLAN.

Default VLAN 4092

Mode Global Configuration

Usage notes We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

5) Save the configuration, using the command:

```
test[10]# write
```

6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

NOTE: *The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command atmf management subnet.*

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

Examples To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

Related commands atmf domain vlan

atmf management subnet

atmf master

Overview This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

NOTE: *Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.*

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

NOTE: *Node depth is the vertical distance (or level) from the master node (whose depth value is 0).*

Syntax

```
atmf master
no atmf master
```

Default The device is not configured to be an AMF master node.

Mode Global Configuration

Example To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

Related commands show atmf

show atmf group

atmf mtu

Overview This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

Syntax

```
atmf mtu <1300-1442>
no atmf mtu
```

Parameter	Description
<1300-1442>	The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device.

Default 1300

Mode Global Configuration

Usage notes The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

Example To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

Related commands show atmf detail

atmf network-name

Overview This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command atmf master.

Use the **no** variant of this command to remove the AMF network name.

Syntax

```
atmf network-name <name>
no atmf network-name
```

Parameter	Description
<name>	The AMF network name. Up to 15 printable characters can be entered for the network-name.

Mode Global Configuration

Usage notes This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

CAUTION: *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

Example To set the AMF network name to amf_net use the command:

```
Node_1(config)# atmf network-name amf_net
```

atmf provision (interface)

Overview This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

Syntax

```
atmf provision <nodename>
no atmf provision
```

Parameter	Description
<nodename>	The name of the provisioned node that will appear on the AMF network in the future.

Mode Interface Configuration for a switchport, a static aggregator, dynamic channel group or an Eth port on an AR-Series device.

Usage notes The port should be configured as an AMF link or cross link and should be 'down' to add or remove a provisioned node.

Example To provision an AMF node named node1 for port1.0.1, use the commands:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

switchport atmf-link

switchport atmf-crosslink

atmf provision node

Overview Use this command to provision a replacement node for a specified interface. Node provisioning is effectively the process of creating a backup file-set on a master node that can be loaded onto a provisioned node some time in the future. This file-set is created just as if the provisioned node really existed and was connected to the network. Typically these comprise configuration, operating system, and license files etc.

You can optionally provision a node with multiple device-type backups. When a device is then attached to the network, AMF uses its device-type to find the correct configuration to use. For example you can create an x510 and an x530 provisioning configuration for a node called 'node1' and if either an x510 or an x530 is attached to that node the appropriate configuration will be used.

Use the **no** variant of this command to remove a provisioned node.

Syntax

```
atmf provision node <nodename> [device <device-type>]
no atmf provision node <nodename> [device <device-type>]
```

Parameter	Description
<nodename>	The name of the provisioned node that will appear on the AMF network.
device	Optionally specify a device type.
<device-type>	Any valid device type e.g. AR3050s, ie200, x950. For a full list of valid device types use the command **atmf provision node <nodename> device ?**.

Mode Privileged Exec

Usage notes This command creates the directory structure for the provisioned node's file-set. It also switches to the AMF provision node prompt so that the nodes backup file-set can be created or updated. This is typically done with the create (amf-provision) or clone (amf-provision) commands.

For more information on AMF provisioning, see the AMF Feature Overview and Configuration Guide..

Example To configure node named 'node1', use the command:

```
awplus# atmf provision node node1
awplus(atmf-provision)#
```

To configure a node named 'node1' for device type 'x530', use the command:

```
awplus# atmf provision node node1 device x530
awplus(atmf-provision)#
```

Command changes

Version 5.4.9-0.1: command added

atmf reboot-rolling

Overview This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the url parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

Syntax

```
atmf reboot-rolling [force] [<url>]
```

Parameter	Description
`force`	Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot.
<url>	The path to the software upgrade file.

Mode Privileged Exec

Usage notes You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example usb:/5.5.2-2/x*-5.5.2-2-*.rel will select from the folder usb:/5.5.2-2 the latest file that matches the selection x(wildcard)-5.5.2-2-(wildcard).rel. Because x* is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

Entry	Used when loading software
card:*.rel:	from an SD card
tftp:<*ip-address*>:	from a TFTP server
usb:	from a USB flash drive
flash:	from flash memory, e.g. from one x930 switch to another
scp:	using secure copy
http:	from an HTTP file server

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system**<*release-name*> command, and the old release will become the backup release file.

NOTE: *If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.*

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

NOTE: *Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.*

Example 1 To reboot all x530 nodes in an AMF network, use the commands:

```
Bld2_Floor_1# atmf working-set group x530
```

This command returns the following type of screen output:

```
====================
node1, node2, node3:
====================

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```
Bld2_Floor_1#atmf working-set group x530

============================
SW_Team1, SW_Team2, SW_Team3:

Building_2             2         x950-5.5.2-2.1.rel           Release Ready
Continue upgrading releases ? (y/n):
```

atmf recover

Overview This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

Syntax

```
atmf recover [<node-name> master <node-name>]
atmf recover [<node-name> controller <node-name>]
```

Parameter	Description
<node-name>	The name of the device whose configuration is to be recovered or replicated.
`master` *<node-name>*	The name of the master device that holds the required configuration information. Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.
`controller` *<node-name>*	The name of the controller that holds the required configuration information. Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name.

Mode Privileged Exec

Usage notes The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

Example To recover the AMF node named Node_10 from the AMF master node named Master_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

Related commands

atmf backup stop

show atmf backup

show atmf

atmf recover guest

Overview Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

Syntax

```
atmf recover guest [<guest-port>]
```

Parameter	Description
<guest-port>	The port number that connects to the guest node.

Mode User Exec/Privileged Exec

Example To recover a guest on node1 port1.0.1, use the following command

```
node1# atmf recover guest port1.0.1
```

Related commands show atmf backup guest

atmf recover led-off

Overview This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the AMF Feature Overview and Configuration Guide.

Syntax
```
atmf recover led-off
```

Default Normal operational mode

Mode Privileged Exec

Example To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

Related commands atmf recover

atmf recover over-eth

Overview Use this command to enable AMF recovery over an AR-series device's Eth port. This setting persists even after restoring a device to a 'clean' state with the erase factory-default or atmf cleanup command.

Use the **no** variant of this command to disable AMF recover over an Eth port.

Syntax
```
atmf recover over-eth
no atmf recover over-eth
```

Default Eth ports cannot be used for recovery.

Mode Privileged Exec

Usage notes AMF links over Eth ports are only available if your network is running in AMF secure mode (see atmf secure-mode for more information on AMF secure mode).

Example To enable AMF recovery over an Eth port, use the command:

```
awplus# atmf recover over-eth
```

To disable AMF recovery over an Eth port, use the commands:

```
awplus# no atmf recover over-eth
```

Related commands
atmf-link
atmf recover
atmf secure-mode
erase factory-default
show atmf detail

Command changes Version 5.5.0-1.1: command added

atmf recovery-server

Overview Use this command on an AMF master to process recovery requests from isolated AMF nodes. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This option allows these nodes, which have no AMF neighbors, to be identified for recovery or provisioning purposes. They are identified using an identity token which is stored on the AMF master.

Use the **no** variant of this command to disable processing of recovery requests from isolated AMF nodes.

Syntax

```
atmf recovery-server
no atmf recovery-server
```

Default Recovery-server is disabled by default.

Mode Global Configuration

Usage notes Once **recovery-server** is enabled on an AMF network, the next time an isolated node is backed up its identity token will be stored in the AMF master's database. Should the device fail it can then be replaced and auto-recovery will occur as long as:

- the AMF master is accessible to the isolated node, and
- either, a DHCP server is configured to send the Uniform Resource Identifier (URI) of the AMF master to the recovering node, or
- a DNS server is configured to resolve the default recovery URI (https://amfrecovery.alliedtelesis.com) to the IP address of the AMF master.

Provisioning of isolated nodes is achieved by creating an identity token for the new node using the identity (amf-provision) command.

See the AMF Feature Overview and Configuration Guide for information on preparing your network for recovering or provisioning isolated nodes.

Example To enable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# atmf recovery-server
```

To disable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf recovery-server
```

Related commands

atmf cleanup

identity (amf-provision)

atmf virtual-link

Command changes Version 5.4.7-2.1: command added

atmf remote-login

Overview Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

Syntax

```
atmf remote-login [user <name>] <nodename>
```

Parameter	Description
<name>	The name of a user on the remote node.
<nodename>	The name of the remote AMF node you are connecting to.

Mode Privileged Exec (This command will only run at privilege level 15)

Usage notes You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that atmf restricted-login is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the exec-timeout time expires (10 minutes by default). If the exec-timeout time is set to infinity (**exec-timeout 0 0**), then the device is unable to ever close the remote session. To avoid this, we recommend you use the **exit** command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the exec-timeout to infinity.

Example To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3
node3> enable
```

Related commands atmf restricted-login

Command changes Version 5.4.6-2.1: changes to AMF user account requirements

atmf restricted-login

Overview By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

Syntax

```
atmf restricted-login
no atmf restricted-login
```

Mode Privileged Exec

Default Master nodes operate with **atmf restricted-login** disabled.

Member nodes operate with **atmf restricted-login** enabled.

NOTE: *The default conditions of this command vary from those applied by its "no" variant. This is because the restricted-login action is only applied by **master** nodes, and in the absence of a master node, the default is to apply the restricted action to all **member** nodes with AMF configured.*

Usage notes In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command's status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

Example To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

Related commands

atmf remote-login

Command changes Version 5.4.6-2.1: changes to AMF user account requirements

atmf retry guest-link

Overview Use this command to retry an AMF guest-link by restarting AMF guest discovery on a port if it is currently in the failed state.

If no port is specified then all configured AMF guest-link ports that are in the failed state are retried.

If a port is specified then that port will only be retried if it is both:

- configured as an AMF guest-link, and
- it is currently in the failed state.

Syntax

```
atmf retry guest-link [<interface>]
```

Parameter	Description
<interface>	Name of the interface the guest-link you want to retry is configured on.

Mode Privileged Exec

Example To retry all configured AMF guest-link currently in a failed state, use the command:

```
awplus# atmf retry guest-link
```

To retry an AMF guest-link configured on port1.0.2 currently in a failed state, use the command:

```
awplus# atmf retry guest-link port1.0.2
```

Related commands show atmf links guest

switchport atmf-guestlink

atmf secure-mode

Overview Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before and AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

Syntax

```
atmf secure-mode
no atmf secure-mode
```

Default Secure mode is disabled by default.

Mode Global Configuration

Usage notes When an AMF network is running in AMF secure mode the atmf restricted-login feature is automatically enabled. This restricts the atmf working-set command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Example To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

Command changes Version 5.4.7-0.3: command added

atmf secure-mode certificate expire

Overview Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

Syntax

```
atmf secure-mode certificate expire <node-name> [area
<area-name>]
```

Parameter	Description
<node-name>	Name of the AMF node you want to expire the certificate for.
area	Specify an AMF area.
<area-name>	Name of the AMF area you want to expire the AMF nodes certificate for.

Mode Privileged Exec

Example To remove an AMF node named “node3” from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named “node2” in an area named “area2”, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

Related commands

Command changes Version 5.4.7-0.3: command added

atmf secure-mode certificate expiry

Overview Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

Syntax

```
atmf secure-mode certificate expiry {<days>|infinite}
no atmf secure-mode certificate expiry
```

Parameter	Description
<days>	Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365.
infinite	The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.

Default The default expiry time is 180 days.

Mode Global Configuration

Example To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode certificate expiry
```

Related commands atmf secure-mode

atmf secure-mode certificate renew

Overview Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

Syntax
```
atmf secure-mode certificate renew
```

Mode Privileged Exec

Example To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

Related commands show atmf secure-mode certificates

show atmf secure-mode statistics

Command changes Version 5.4.7-0.3: command added

atmf secure-mode enable-all

Overview Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

Syntax

```
atmf secure-mode enable-all
no atmf secure-mode enable-all
```

Default Secure mode is disabled by default.

Mode Privileged Exec

Usage notes When an AMF network is running in AMF secure mode the atmf restricted-login feature is automatically enabled. This restricts the atmf working-set command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes clear atmf secure-mode certificates on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes atmf authorize provision **all** on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.

- Runs a script which executes atmf secure-mode and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no** atmf secure-mode and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

NOTE: *Enabling or disabling secure mode on the network saves the running-config on every device.*

Example To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

Related commands aaa authentication auth-web

Command changes Version 5.4.7-0.3: command added

atmf select-area

Overview Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

Syntax

```
atmf select-area {<area-name>|local}
no atmf select-area
```

Parameter	Description
<area-name>	Connect to the remote area-master of the area with this name.
`local`	Return to managing the local controller area.

Mode Privileged Exec

Usage notes After running this command, use the atmf working-set command to select the set of nodes you want to access in the remote area.

Example To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=============================================
Connected to area Canterbury via host Avensis:
=============================================
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

Related commands atmf working-set

atmf topology-gui enable

Overview Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

Syntax

```
atmf topology-gui enable
no atmf topology-gui enable
```

Default Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

Mode Global Configuration mode

Usage notes To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

Examples To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

Related commands atmf enable

service http

atmf trustpoint

Overview Use this command to set a PKI trustpoint for an AMF network. This command needs to be run on an AMF master or controller.

The self-signed certificate authority (CA) certificate is distributed to every node on the AMF network. It is used to verify client certificates signed by the trustpoint.

Use the **no** variant of this command to remove an AMF trustpoint.

Syntax

```
atmf trustpoint <trustpoint-name>
no atmf trustpoint <trustpoint-name>
```

Parameter	Description
<trustpoint-name>	Name of the trustpoint.

Default No trustpoint is configured by default.

Mode Global Configuration

Usage notes Before using the **atmf trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'our_trustpoint' with keypair 'our_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint our_trustpoint
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair our_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate our_trustpoint
awplus# crypto pki enroll our_trustpoint
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the Public Key Infrastructure (PKI) Feature Overview and Configuration Guide

Example To configure an AMF trustpoint for the trustpoint 'our_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# atmf trustpoint our_trustpoint
```

To remove an AMF trustpoint for the trustpoint 'our_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf trustpoint our_trustpoint
```

Related commands

crypto pki trustpoint

show atmf

Command changes

Version 5.4.7-2.1: command added

atmf virtual-crosslink

Overview Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a virtual crosslink.

Syntax

```
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id
<remote-id> remote-ip <remote-ip>
```

```
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id
<remote-id> remote-host <domainname>
```

```
no atmf virtual-crosslink id <local-id>
```

Parameter	Description
`id <local-id>`	ID of the local tunnel port, a value between 1 and 4094.
`ip <local-ip>`	IPv4 address of the local tunnel port in a.b.c.d format.
`remote-id <remote-id>`	ID of the remote tunnel port, a value between 1 and 4094.
`remote-ip <remote-ip>`	IPv4 address of the remote tunnel port in a.b.c.d format.
`remote-host <domainname>`	The domain name of the remote node.

Default No AMF virtual crosslinks are created by default.

Mode Global Configuration

Usage notes This command allows a virtual tunnel to be created between two remote sites over a Layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID, and a remote IP address or domain name. Each side of the tunnel must be configured with the same, but mirrored parameters.

NOTE: *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

Example To setup a virtual link from a local site, 'siteA', to a remote site, 'siteB', (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

Related commands

atmf virtual-crosslink

show atmf links

switchport atmf-crosslink

Command changes

Version 5.5.2-0.1: **remote-host** parameter added

Version 5.4.7-0.3: command added

atmf virtual-link

Overview This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove the specified virtual link.

Syntax

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
remote-ip <a.b.c.d> [remote-area <area-name>]

atmf virtual-link id <1-4094> interface <interface-name>
remote-id <1-4094> remote-ip <a.b.c.d> [remote-area
<area-name>]

atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
remote-host <domainname> [remote-area <area-name>]

atmf virtual-link id <1-4094> interface <interface-name>
remote-id <1-4094> remote-host <domainname> [remote-area
<area-name>]

no atmf virtual-link id <1-4094>
```

Parameter	Description
`id <1-4094>`	ID of the local tunnel point, in the range 1 to 4094.
`ip <a.b.c.d>`	Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).
`interface <interface-name>`	Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.
`remote-id <1-4094>`	The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes.
`remote-ip <a.b.c.d>`	The IP address of the remote node.
`remote-host <domainname>`	The domain name of the remote node.
`remote-area <area-name>`	The name of the remote area connected to this virtual-link.

Mode Global Configuration

Usage notes The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address or domain name. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:

- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

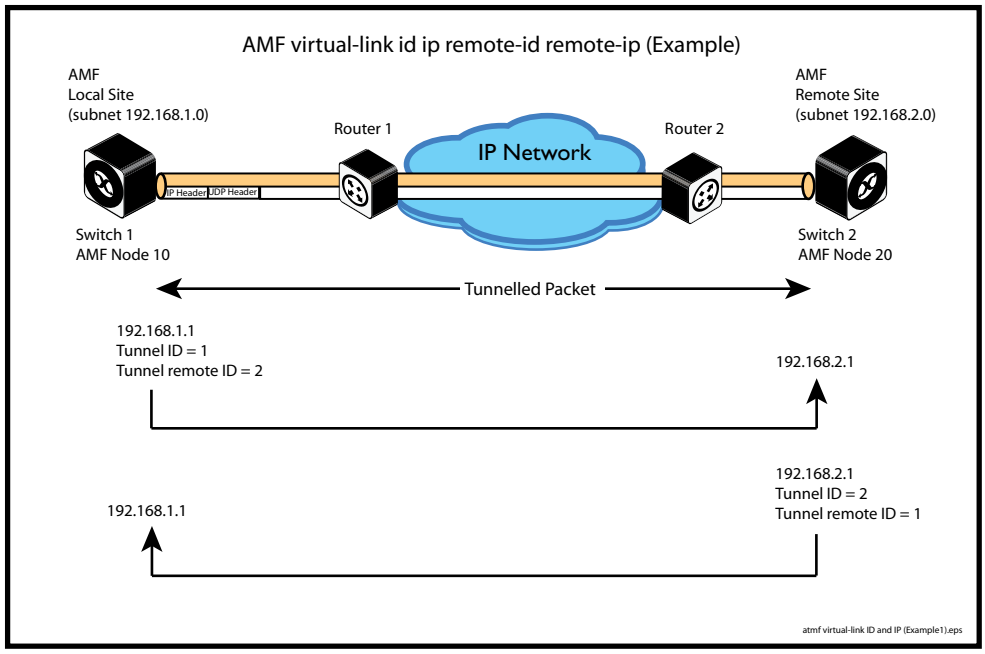
For instructions on how to configure dynamic IP addresses on virtual-links, see the AMF Feature Overview and Configuration Guide.

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

NOTE: *AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.*

Example 1 Use the following commands to create the tunnel shown in the figure below.

Figure 63-2: AMF virtual link example



```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
remote-id 2 remote-ip 192.168.2.1
```

```
Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
remote-id 1 remote-ip 192.168.1.1
```

Example 2 To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal
```

```
SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal
```

```
SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

Command changes

Version 5.5.2-0.1: **remote-host** parameter added

Version 5.4.9-0.1: **interface** parameter added

atmf virtual-link description

Overview Use this command to add a description to an existing AMF virtual-link.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a description from an AMF virtual-link.

Syntax

```
atmf virtual-link id <1-4094> description <description>
no atmf virtual-link id <1-4094> description
```

Parameter	Description
`id <1-4094>`	ID of the local tunnel point.
`<description>`	A description for the virtual-link.

Default No description is set by default.

Mode Global Configuration

Example To add a description to the virtual-link with id ‘5’, use the commands:

```
awplus# configure terminal
awplus(config)# atmf virtual-link id 5 description TO SITE B
```

To remove a description from the virtual-link with id ‘5’, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf virtual-link id 5
```

Related commands atmf virtual-link

show atmf links

show atmf virtual-links

atmf virtual-link protection

Overview Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

Syntax

```
atmf virtual-link id <1-4094> protection ipsec key [8]
<key-string>
```

```
no atmf virtual-link id <1-4094> protection
```

Parameter	Description
`id`	Specify the link ID.
`<1-4094>`	Link ID in the range 1 to 4094,
`protection`	Protection is on for this link.
`ipsec`	Security provided using IPsec.
`key`	Set the shared key.
`8`	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
`<key-string>`	Specify the shared key for the link.

Default Protection is off by default.

Mode Global Configuration

Usage notes The following limitations need to be considered when creating secure virtual-links.

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF Multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

Secure virtual-links are only supported on the following device listed in the table below. There is also a limit to the number of links these devices support.

Device	Virtual-link Limit
AMF Cloud/ VAA	300
AR4050S AR3050S AR2050V AR2010V	60
x220 x230/x230L x310 x510/x510L IX5-28GPX	2

Example To create and configure a virtual link with protection first create the virtual-link:

```
Host-A# configure terminal
Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id
2 remote-ip 192.168.2.1
```

Enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key
securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id
1 remote-ip 192.168.1.1
Host-B(config)# atmf virtual-link id 2 protection ipsec key
securepassword
```

Related commands

Command changes Version 5.4.9-0.1: command added

atmf working-set

Overview Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

Syntax

```
atmf working-set {[<node-list>]|[group
{<group-list>|all|local|current}]}
```

```
no atmf working-set {[<node-list>]|[group <group-list>]}
```

Parameter	Description
<node-list>	A comma delimited list (without spaces) of nodes to be included in the working-set.
`group`	The AMF group.
<group-list>	A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups.
`all`	All nodes in the AMF.
`local`	Local node Running this command with the parameters **group local** will return you to the local prompt and local node connectivity.
`current`	Nodes in current list.

Mode Privileged Exec

Usage notes You can put AMF nodes into groups by using the atmf group (membership) command.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.

- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in show atmf group command output.

If a node is an AMF master it will be automatically added to the master group.

Example 1 To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

NOTE: *This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.*

This command displays an output screen similar to the one shown below:

```
=========================================
node1, node2, node3, node4, node5, node6:
=========================================

Working set join

ATMF_NETWORK_Name[6]#
```

Example 2 To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

Parameter	Description
ATMF_Network_Name	The name of the AMF network, as set by the atmf network-name command.
[6]	The number of nodes in the working-set.
node1	The name of the local node, as set by the hostname command.

bridge-group (amf-container)

Overview Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine for AMF Cloud. This allows the AMF container to connect to a physical network.

Note that this command is only available on AMF Cloud, not on AlliedWare Plus switches.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

Syntax

```
bridge-group <bridge-id>
no bridge-group
```

Parameter	Description
<bridge-id>	The ID of the bridge group to join, a number between 1 and 64.

Mode AMF Container Configuration

Usage notes Each container has two virtual interfaces:

1) Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this area-link command.

2) Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the AMF Feature Overview and Configuration Guide for more information on configuring the bridge.

Example To assign a bridge group to AMF container 'vac-wlg-1', use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

Command changes Version 5.4.7-0.1: command added

clear application-proxy threat-protection

Overview Use this command to clear the threat protection for a specified address.

Syntax

```
clear application-proxy threat-protection {<ip-address>|
<mac-address>|all}
```

Parameter	Description
<ip-address>	The IPv4 address you wish to clear the threat for, in A.B.C.D format.
<mac-address>	The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format.
`all`	Clear the threat for all IPv4 and MAC addresses.

Mode Privileged Exec

Example To clear the threat for 10.34.199.117, use the command:

```
awplus# clear application-proxy threat-protection 10.34.199.117
```

Related commands

application-proxy quarantine-vlan

Command changes Version 5.4.7-2.2: command added

clear atmf links

Overview Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

Syntax

```
clear atmf links [<interface-list>]
```

Parameter	Description
<interface-list>	The interfaces or ports to perform the reset on. An interface-list can be: • a switchport (e.g. port1.0.1) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a local port (e.g. of0) • You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18). The specified interfaces must exist. If this parameter is left out then all links of the specified type will be reset on the device.

Mode Privileged Exec

Example To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

Related commands clear atmf links virtual

show atmf links

Command changes Version 5.4.8-2.1: command added

clear atmf links virtual

Overview Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

Syntax

```
clear atmf links virtual [<virtuallink-list>]
```

Parameter	Description
<virtuallink-list>	A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. *vlink1, vlink2, vlink3*. Specifying a link range e.g *vlink1-vlink3* is not supported.

Mode Privileged Exec

Example To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links vlink11 and vlink21, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

Related commands clear atmf links

show atmf links

Command changes Version 5.4.8-2.1: command added

clear atmf links statistics

Overview This command resets the values of all AMF link, port, and global statistics to zero.

Syntax
```
clear atmf links statistics
```

Mode Privilege Exec

Example To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

Related commands show atmf links statistics

clear atmf recovery-file

Overview Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

Syntax

```
clear atmf recovery-file
```

Mode Privileged Exec

Usage notes AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

Example To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

Output Figure 63-3: If AlliedWare Plus detects that a node contains a special link then the following message is displayed

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

Related commands show atmf recovery-file

Command changes Version 5.4.8-0.2: command added

clear atmf secure-mode certificates

Overview Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

Syntax

```
clear atmf secure-mode certificates
```

Mode Privileged Exec

Example To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!
All the nodes will become isolated and refuse to join any ATMF
network. The certificates on all the isolated nodes must be
cleared before rejoining an ATMF network will be possible.

To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

clear atmf secure-mode statistics

Overview Use this command to reset all secure mode statistics to 0.

Syntax
```
clear atmf secure-mode statistics
```

Mode Privileged Exec

Example To reset the AMF secure mode statistics information, use the command:
```
awplus# clear atmf secure-mode statistic
```

Related commands show atmf secure-mode

show atmf secure-mode statistics

Command changes Version 5.4.7-0.3: command added

clone (amf-provision)

Overview This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command create (amf-provision).

Syntax

```
clone <source-nodename>
```

Parameter	Description
<source-nodename>	The name of the node whose configuration is to be copied for loading to the clone.

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of <*media*>:atmf/<*atmf_name*>/nodes/<*source_node*>/flash will be made for the provisioned node and stored in the backup media.
- The directory <*node_backup_dir*>/flash/.config/ssh is excluded from the copy.
- All contents of <*root_backup_dir*>/nodes/<*nodename*> will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

Example To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3
device1(atmf-provision)# clone device2
```

Figure 63-4: Sample output from the **clone** command

```
device1# atmf provision node device3
device1(atmf-provision)#clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

Figure 63-5: Sample output from the **show atmf backup** command

```
device1#show atmf backup

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

configure boot config (amf-provision)

Overview This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

Syntax

```
configure boot config [backup] <file-path|URL>
configure no boot config [backup]
```

Parameter	Description
`backup`	Specify that this is the backup configuration file.
<file-path|URL>	The path or URL and name of the configuration file.

Default No boot configuration files or backup configuration files are specified for the provisioned node.

Mode AMF Provisioning

Usage notes When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

Examples To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot config
branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup
usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

configure boot system (amf-provision)

Overview This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

Syntax

```
configure boot system [backup] <file-path|URL>
configure no boot system [backup]
```

Parameter	Description
<file-path|URL>	The path or URL and name of the release file.

Default No boot release file or backup release files are specified for the provisioned node.

Mode AMF Provisioning

Usage notes When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

Examples To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system
x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system backup
card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system backup
```

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

copy (amf-provision)

Overview Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see copy (filename) in the File and Configuration Management chapter.

Syntax

```
copy [force] <source-name> <destination-name>
```

Parameter	Description
`force`	This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.
<source-name>	The filename and path of the source file. See the Introduction of the File and Configuration Management chapter for valid syntax.
<destination-name>	The filename and path for the destination file. See Introduction of the File and Configuration Management chapter for valid syntax.

Mode AMF Provisioning

Example To copy a configuration file named current.cfg from Node_4's Flash into the future_node directory, and set that configuration file to load onto future_node, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg
./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

show atmf provision nodes

Command changes Version 5.4.9-2.1: command added

create (amf-provision)

Overview This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command clone (amf-provision).

This command can only run on AMF master nodes.

Syntax

```
create
```

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

Example To create a new provisioned node named “device2” use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# create
```

Running this command will create the following directories:

- <*media*>:atmf/<*atmf_name*>/nodes/<*node*>
- <*media*>:atmf/<*atmf_name*>/nodes/<*node*>/flash

To confirm the new node’s settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node ‘device2’.

Figure 63-6: Sample output from the **show atmf backup** command

```
device1#show atmf backup

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

debug atmf

Overview This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

Syntax

```
debug atmf
[link|crosslink|arealink|database|neighbor|error|all]
```

```
no debug atmf
[link|crosslink|arealink|database|neighbor|error|all]
```

Parameter	Description
`link`	Output displays debugging information relating to uplink or downlink information.
`crosslink`	Output displays all crosslink events.
`arealink`	Output displays all arealink events.
`database`	Output displays only notable database events.
`neighbor`	Output displays only notable AMF neighbor events.
`error`	Output displays AMF error events.
`all`	Output displays all AMF events.

Default All debugging facilities are disabled.

Mode User Exec and Global Configuration

Usage notes If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

NOTE: *An alias to the **no** variant of this command is undebug atmf on page 3492.*

Examples To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

Related commands no debug all

debug atmf packet

Overview This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

Syntax
```
debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]
[timeout <seconds>] [num-pkts <quantity>]
[filter {node <name>|interface <ifname>}
[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]]
```

Simplified Syntax

`debug atmf packet`	`[direction {rx|tx|both}]`
	`[level {[1][2|3}]`
	`[timeout <seconds>]`
	`[num-pkts <quantity>]`
`debug atmf packet filter`	`[node <name>]`
	`[interface <ifname>]`
	`[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]`

NOTE: *You can combine the syntax components shown, but when doing so, you must retain their original order.*

Default Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

NOTE: *An alias to the **no** variant of this command - undebug atmf - can be found elsewhere in this chapter.*

Mode User Exec and Global Configuration

Usage notes If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

Parameter	Description
`direction`	Sets debug to packet received, transmitted, or both
`rx`	packets received by this node
`tx`	Packets sent from this node
`1`	AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level.
`2`	AMF Detailed Packet Information. Enter 2 to select this level.
`3`	AMF Packet HEX dump. Enter 3 to select this level.
`timeout`	Sets the execution timeout for packet logging

Parameter	Description
<seconds>	Seconds
num-pkts	Sets the number of packets to be dumped
<quantity>	The actual number of packets
filter	Sets debug to filter packets
node	Sets the filter on packets for a particular Node
<name>	The name of the remote node
interface	Sets the filter to dump packets from an interface (portx.x.x) on the local node
<ifname>	Interface port or virtual-link
pkt-type	Sets the filter on packets with a particular AMF packet type
1	Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type.
2	Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type.
3	Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.
4	Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.
5	Non broadcast hello unicast packets. Enter 5 to select this packet type.
6	Stack hello unicast packets. Enter 6 to select this packet type.
7	Database description. Enter 7 to select this packet type.
8	DBE request. Enter 8 to select this packet type.
9	DBE update. Enter 9 to select this packet type.
10	DBE bitmap update. Enter 10 to select this packet type.
11	DBE acknowledgment. Enter 11 to select this packet type.
12	Area Hello Packets. Enter 12 to select this packet type.
13	Gateway Hello Packets. Enter 13 to select this packet type.

Examples To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1
pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60
filter node x930 interface port1.0.1 pkt-type 4 7 10
```

delete (amf-provision)

Overview This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

Syntax

```
delete
```

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command atmf backup delete to delete the files.

NOTE: *This command allows provisioned entries to be deleted even if they have been referenced by the atmf provision (interface) command, so take care to only delete unwanted entries.*

Example To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Figure 63-7: Sample output showing the **show atmf backup** command

```
device1#show atmf backup

discovery

Overview Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of the internally defined discovery methods: dynamic, static, or agent.

Dynamic learning (the default method) means that AMF learns the guest's IP and MAC addresses from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With dynamic learning, ensure that the command ip dhcp snooping delete-by-linkdown is set.

Static learning uses the switchport atmf-guestlink command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

Agent learning uses the AMF agent to retrieve the guest's IP and MAC address. It is only available on guest nodes that support ATMF agent, such as TQ5403 series access points. For step-by-step instructions on using agent discovery for auto-recovery of an TQ5403 series AP, see the AMF Feature Overview and Configuration Guide.

The **no** variant of this command returns the discovery method to **dynamic**.

Syntax

```
discovery [dynamic|static|agent]
no discovery
```

Parameter	Description
`dynamic`	Learned from DCHCP Snooping or LLDP.
`static`	Statically assigned.
`agent`	Learned from the AMF agent.

Default Dynamic

Mode AMF Guest Configuration

Usage notes This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the switchport atmf-guestlink command.

NOTE: *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

Example 1 To configure static discovery for the guest-class 'camera', use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class camera
Node1(config-atmf-guest)# discovery static
```

Example 2 To return the discovery method for the guest class TQ6602 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class TQ6602
Node1(config-atmf-guest)# no discovery
```

Related commands

Command changes Version 5.5.3-0.1: **agent** parameter added

description (amf-container)

Overview Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Enter up to 128 characters of text describing the AMF container.

Mode AMF Container Configuration

Example To set the description for AMF container "vac-wlg-1" to "Wellington area", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

Related commands atmf container

show atmf container

Command changes Version 5.4.7-0.1: command added

erase factory-default

Overview This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

Syntax

```
erase factory-default
```

Mode Privileged Exec

Usage notes This command is an alias to the atmf cleanup command.

Note that this command can only be used on standalone switches, not stacked switches.

Example To erase data, use the command:

```
Node_1# erase factory-default
This command will erase all NVS, all flash contents except for
the boot release, a GUI resource file, and any license files,
and then reboot the switch. Continue? (y/n):y
```

Related commands atmf cleanup

firmware-url

Overview Use this command to specify the location of an AP guest node's firmware file when preparing the AP for auto-recovery. AMF cannot back up AP firmware files (only configuration files), so you need to store the firmware file somewhere accessible and use this command to provide the AlliedWare Plus device with the file's location.

For step-by-step instructions for auto-recovery of an TQ5403 series AP, see the AMF Feature Overview and Configuration Guide.

Use the **no** variant of this command to remove the URL.

Syntax

```
firmware-url <name>
no firmware-url
```

Parameter	Description
<name>	The file's directory or filename. We recommend specifying a directory because that makes it easier to keep the firmware file up to date. The following protocols are supported: http, https, tftp, usb, and card. Do not change the firmware file's filename.

Default No URL is configured

Mode AMF Guest Configuration

Example To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored in the top level of a USB stick, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url usb:
```

To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored on a TFTP server with an address of 192.168.2.1, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url tftp://192.168.2.1/
```

Command changes Version 5.5.3-0.1: command added

http-enable

Overview This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

Syntax

```
http-enable [port <port-number>]
no http-enable
```

Parameter	Description
`port`	TCP port number.
<port-number>	The port number to be configured.

Default Not set

Mode AMF Guest Configuration

Usage notes If **http-enable** is selected without a **port** parameter the port number will default to 80.

Example To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

Related commands atmf guest-class

switchport atmf-guestlink

show atmf nodes

identity (amf-provision)

Overview Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

Syntax

```
identity mac-address <mac-address> prefix
<ip-address/prefix-length>
```

```
identity serial-number <serial-number> prefix
<ip-address/prefix-length>
```

```
no identity
```

Parameter	Description
`mac-address`	Specify the next-hop MAC address of the device being provisioned.
`<mac-address>`	MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx.
`serial-number`	Specify the serial number of the device to be provisioned.
`<serial-number>`	Serial number of the device that is being provisioned.
`prefix`	IPv4 address, and prefix length, of the virtual-link interface on the isolated node
`<ip-address/ prefix-length>`	IPv4 address, and prefix length, in A.B.C.D/M format.

Mode AMF Provisioning

Usage notes To provision an isolated node, first create a configuration for the node using the create (amf-provision) and/or the clone (amf-provision) commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The atmf recovery-server option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the AMF Feature Overview and Configuration Guide for information on preparing your network for recovering or provisioning isolated nodes.

Example To create a identity token on your AMF master for a device named "my-x930" with serial number "A10064A172100008", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity serial-number
A10064A172100008 prefix 192.168.2.25/24
```

To create a identity token on your AMF master for a device named "my-x930" with next-hop MAC address "0000.cd28.0880", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity mac-address 0000.cd28.0880
prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named "my-x930", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# no identity
```

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

Version 5.4.7-2.1: command added

license-cert (amf-provision)

Overview This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

Syntax

```
license-cert <file-path|URL>
no license-cert
```

Parameter	Description
<file-path|URL>	The name of the certificate file. This can include the file-path of the file.

Default No license certificate file is specified for the provisioned node.

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

Example 1 To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert
tftp://192.168.1.1/cert1.txt
```

Example 2 To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command show atmf provision nodes. The output from this command is shown below, and displays license certification details in the last line.

Figure 63-8: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .............: SD (Total 3827.0MB, Free 3481.1MB)

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

locate (amf-provision)

Overview This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

NOTE: *We advise that after running this command, you return to a known working directory, typically flash.*

Syntax

```
locate
```

Mode AMF Provisioning

Example To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command pwd to check this, as shown in the following figure.

Figure 63-9: Sample output from the **pwd** command

```
device2#pwd
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

log event-host

Overview Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

Syntax

```
log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event
no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event
```

Parameter	Description
<ipv4-addr>	ipv4 address of the event host
<ipv6-addr>	ipv6 address of the event host

Default Log events are disabled by default.

Mode Global Configuration

Usage notes Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

Example To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

Related commands atmf topology-gui enable

login-fallback enable

Overview Use this command to enable login fallback on TQ model AMF guest nodes.This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

Syntax
```
login-fallback enable
no login-fallback enable
```

Default Disabled

Mode AMF Guest Configuration

Usage notes This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

Example To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

Related commands
atmf guest-class

Command changes Version 5.5.0-1.1: command added

modeltype

Overview This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

Syntax

```
modeltype {alliedware|aw+|onvif|tq|other}
no modeltype
```

Parameter	Description
alliedware	A legacy Allied Telesis operating system.
aw+	The Allied Telesis AlliedWare Plus operating system.
onvif	ONVIF (Open Network Video Interface Forum) Profile Q devices
tq	An Allied Telesis TQ Series wireless access point.
other	Used where the model type is outside the above definitions.

Default Default to **other**

Mode AMF Guest Configuration

Examples To assign the model type **tq** to the guest-class called 'tq_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# no modeltype
```

Related commands

Command changes Version 5.4.9-2.1: **onvif** parameter added

service atmf-application-proxy

Overview Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

Syntax

```
service atmf-application-proxy
no service atmf-application-proxy
```

Default The AMF Application Proxy service is disabled by default.

Mode Global Configuration

Usage notes The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see service http).

Example To enable the AMF Application Proxy service, use the commands

```
awplus# configure terminal
awplus(config)# service atmf-application-proxy
```

To disable the AMF Application Proxy service, use the commands

```
awplus# configure terminal
awplus(config)# no service atmf-application-proxy
```

show application-proxy threat-protection

Overview Use this command to list all the IP addresses blocked by the AMF Application Proxy service. It also shows the global threat-detection configuration.

Syntax
```
show application-proxy threat-protection [all]
```

Parameter	Description
`all`	Include information for non-local blocks.

Mode Privileged Exec

Example To list the addresses blocked by the AMF Application Proxy service, use the command:

```
awplus# show application-proxy threat-protection
```

Output Figure 63-10: Example output from **show application-proxy threat-protection**

```
awplus#show application-proxy threat-protection
Quarantine Vlan           : vlan200

application-proxy whitelist server

Command changes Version 5.4.9-1.1: command added

show application-proxy whitelist interface

Overview Use this command to display the status of port authentication on the specified interface.

Syntax

```
show application-proxy whitelist interface [<interface-list>]
```

Parameter	Description
<interface-list>	The interfaces or ports to display information about. An interface-list can be: • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list. The specified interface must exist.

Mode Privileged Exec

Example To display the port authentication information for all interfaces, use the command:

```
awplus# show application-proxy whitelist interface
```

To display the port authentication information for port1.0.4, use the command

```
awplus# show application-proxy whitelist interface port1.0.4
```

Output Figure 63-12: Example output from **show application-proxy whitelist interface**

```
awplus#sh application-proxy whitelist interface
Authentication Info for interface port1.0.1
  portEnabled: false - portControl: Auto
  portStatus: Unknown

show application-proxy whitelist supplicant

Command changes Version 5.4.9-0.1: command added

show application-proxy whitelist supplicant

Overview Use this command to display the current configuration and status for each supplicant attached to an application-proxy whitelist port.

Syntax
```
show application-proxy whitelist supplicant [interface
<interface-list>|<mac-addr>|brief]
```

Parameter	Description
`interface <interface-list>`	The interfaces or ports to display information about. An interface-list can be: • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list. The specified interface must exist.
`<mac-addr>`	MAC (hardware) address of the supplicant.Entry format is HHHH.HHHH.HHHH (hexadecimal)
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Example To display the supplicant information for all ports, use the command:

```
awplus# show application-proxy whitelist supplicant
```

To display the supplicant information for port1.0.4, use the command:

```
awplus# show application-proxy whitelist supplicant interface
port1.0.4
```

Command changes Version 5.4.9-0.1: command added

show atmf

Overview Displays information about the current AMF node.

Syntax

```
show atmf [summary|tech|nodes|session]
```

Parameter	Description
summary	Displays summary information about the current AMF node.
tech	Displays global AMF information.
nodes	Displays a list of AMF nodes together with brief details.
session	Displays information on an AMF session.

Default Only summary information is displayed.

Mode User Exec and Privileged Exec

Usage notes AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Example 1 To show summary information on AMF node_1 use the following command:

```
node_1# show atmf summary
```

Table 64: Output from the **show atmf summary** command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status             : Enabled
Network Name            : Test_network
Node Name               : node_1
Role                    : Master
Restricted login        : Disabled
Current ATMF Nodes      : 3
```

Example 2 To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

Example 3 The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node_1 and node_5 have active users logged in.

Table 65: Output from the **show atmf session** command

```
node_1#show atmf session

Number Events                         : 0
DBE Retransmit Queue Length           : 0
DBE Request List Length               : 0
```

Example 4 The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

Table 66: Output from the **show atmf tech** command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : ATMF_NET
Node Name             : node_1
Role                  : Master
Current ATMF Nodes    : 8

ATMF Technical information:

Network Name                       : ATMF_NET
Domain                             : node_1's domain
Node Depth                         : 0

Management VLAN                    : 4092
```

Table 67: Parameter definitions from the **show atmf tech** command

Parameter	Definition
ATMF Status	The Node's AMF status, either Enabled or Disabled.
Network Name	The AMF network that a particular node belongs to.

Table 67: Parameter definitions from the **show atmf tech** command (cont.)

Parameter	Definition
Node Name	The name assigned to a particular node.
Role	The role configured for this AMF device, either Master or Member.
Current ATMF Nodes	The count of AMF nodes in an AMF Network.
Node Address	An address used to access a remotely located node (.atmf).
Node ID	A unique identifier assigned to a Node on an AMF network.
Node Depth	The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
Domain State	The state of Node in a Domain in AMF network as Controller/Backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between Nodes of different domain (up/down links). • VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. • Management Subnet - Network prefix for the subnet. • Management IP Address - The IP address allocated for this traffic. • Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). • VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. • Domain Subnet. The subnet address used for this traffic. • Domain IP Address. The IP address allocated for this traffic. • Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).
Device Type	The Product Series name.
ATMF Master	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).
SC	The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.
Parent	The node to which the current node has an active uplink.
Node Depth	The number of nodes in the path from this node to the master node.

Related commands show atmf detail

show atmf area

Overview Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

Syntax `show atmf area [detail] [<area-name>]`

Parameter	Description
`detail`	Displays detailed information
`<area-name>`	Displays information about master and gateway nodes in the specified area only.

Mode Privileged Exec

Example 1 To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

Table 68: Example output from the **show atmf area** command on a Controller.

```
controller-1#show atmf area

  ATMF Area Information:

  * = Local area

  Area               Area   Local         Remote        Remote         Node
  Name               ID     Gateway       Gateway       Master         Count
-------------------------------------------------------------------------
* NZ                 1      Reachable     N/A           N/A             3
  Wellington         2      Reachable     Reachable     Auth OK         120
  Canterbury         3      Reachable     Reachable     Auth Error      -
  SiteA-AREA         14     Unreachable   Unreachable   Unreachable     -
  Auckland           100    Reachable     Reachable     Auth Start      -
  Southland          120    Reachable     Reachable     Auth OK         54

  Area count:        6                            Area node count:     177
```

The following figure shows example output from running this command on a remote master.

Table 69: Example output from the **show atmf area** command on a remote master.

```
Canterbury#show atmf area

  ATMF Area Information:

  * = Local area

  Area               Area   Local          Remote         Remote          Node
  Name               ID     Gateway        Gateway        Master          Count
-------------------------------------------------------------------------------
  NZ                 1      Reachable      N/A            N/A              -
* Canterbury         3      Reachable      N/A            N/A              40

  Area count:        2                        Local area node count:      40
```

Table 70: Parameter definitions from the **show atmf area** command

Parameter	Definition
*	Indicates the area of the device on which the command is being run.
Area Name	The name of each area.
Area ID	The ID of the area.
Local Gateway	Whether the local gateway node is reachable or not.
Remote Gateway	Whether the remote gateway node is reachable or not. This is one of the following: • Reachable, if the link has been established. • Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the switchport atmf-arealink command. • N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local. • Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match. • Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.? • Auth OK, which indicates that area authentication was successful and you can now use the atmf select-area command.
Remote Master	Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.
Node Count	The number of nodes in the area.
Area Count	The number of areas controlled by the controller.
Area Node Count	The total number of nodes in the area.

Example 2 To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

Table 71: Output from the **show atmf area detail** command

```
controller-1#show atmf area detail

 ATMF Area Detail Information:

 Controller distance       : 0

 Controller Id             : 21
 Backup Available          : FALSE

 Area Id                   : 2
 Gateway Node Name         : controller-1
 Gateway Node Id           : 342
 Gateway Ifindex           : 6013
 Masters Count             : 1
 Master Node Name          : well-master (329)
 Node Count                : 2

 Area Id                   : 3
 Gateway Node Name         : controller-1
 Gateway Node Id           : 342
 Gateway Ifindex           : 4511
 Masters Count             : 2
 Master Node Name          : cant1-master (15)
 Master Node Name          : cant2-master (454)
 Node Count                : 2
```

Related commands

show atmf area summary

show atmf area guests

Overview This command will display details of all guests that the controller is aware of.

Syntax

```
show atmf area guests [<area-name> [<node-name>]]
```

Parameter	Description
<area-name>	The area name for guest information
<node-name>	The name of the node that connects to the guests.

Default n/a

Mode User Exec/Privileged Exec

Example 1 To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

Output Figure 63-15: Example output from the **show atmf area guests** command

```
main-building Area Guest Node Information:
Device          MAC                                          IP/IPv6
Type            Address         Parent          Port         Address
-------------------------------------------------------------------------------
-               0008.5d10.7635  x230            1.0.3        192.168.5.4

main-building guest node count 4

GuestNode[1]#
```

Table 72: Parameters in the output from **show atmf area guests** command

Parameter	Description
Device Type	The device type as read from the guest node.
MAC Address	The MAC address of the guest-node
Parent	The device that directly connects to the guest-node
Port	The port number on the parent node that connects to the guest node.
IP/IPv6	The IP or IPv6 address of the guest node.

Related commands

show atmf area

show atmf area nodes

show atmf backup guest

show atmf area guests-detail

show atmf area guests-detail

Overview This command displays the local and remote guest information from an AMF controller.

Syntax

```
show atmf area guests-detail [<area-name> [<node-name>]]
```

Parameter	Description
<area-name>	The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller.
<node-name>	The name assigned to the network node.

Default n/a.

Mode Privileged Exec

Example To display detailed information for all guest nodes attached to "node1", which is located within the area named "northern", use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

Output Figure 63-16: Example output from the **show atmf guest detail** command.

```
#show atmf guest detail

Table 73: Parameters shown in the output of the **show atmf guest detail** command

Parameter	Description
`Node Name`	The name of the guest's parent node.
`Port Name`	The port on the parent node that connects to the guest.
`IFindex`	An internal index number that maps to the port number on the parent node.
`Guest Description`	A brief description of the guest node as manually entered into the description (interface) command for the guest node port on the parent node.
`Device Type`	The device type as supplied by the guest node itself.
`Backup Supported`	Indicates whether AMF supports backup of this guest node.
`MAC Address`	The MAC address of the guest node.
`IP Address`	The IP address of the guest node.
`IPv6 Address`	The IPv6 address of the guest node.
`HTTP Port`	The HTTP port enables you to specify a port when enabling http to allow a URL for the http user interface of a Guest Node. This is determined by the http-enable command.
`Firmware Version`	The firmware version that the guest node is currently running.

Related commands

show atmf area nodes-detail

show atmf area guests

show atmf area nodes

Overview Use this command to display summarized information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

Syntax `show atmf area nodes <area-name> [<node-name>]`

Parameter	Description
<area-name>	Displays information about nodes in the specified area.
<node-name>	Displays information about the specified node.

Mode Privileged Exec

Usage notes If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

Example To show summarized information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes Wellington
```

The following figure shows partial example output from running this command.

Table 74: Output from the **show atmf area nodes Wellington** command

```
controller-1#show atmf area nodes Wellington

 Wellington Area Node Information:
 Node           Device              ATMF           Parent                      Node
 Name           Type                Master  SC     Domain                      Depth
 ---------------------------------------------------------------------------------
 well-gate      x230-18GP           N       N      well-master                 1
 well-master    AT-x930-28GPX       Y       N      none                        0

Wellington node count 2
```

Table 75: Parameter definitions from the **show atmf area nodes** command

Parameter	Definition
Node Name	The name assigned to a particular node.
Device Type	The Product series name.
ATMF Master	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).

Table 75: Parameter definitions from the **show atmf area nodes** command

Parameter	Definition
SC	The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone.
Parent Domain	The node to which the current node has an active uplink.
Node Depth	The number of nodes in the path from this node to the master node.

Related commands

show atmf area

show atmf area nodes-detail

show atmf area nodes-detail

Overview Use this command to display detailed information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

Syntax

```
show atmf area nodes-detail <area-name> [<node-name>]
```

Parameter	Description
<area-name>	Displays detailed information about nodes in the specified area.
<node-name>	Displays detailed information about the specified node.

Mode Privileged Exec

Usage notes If you do not limit the output to a single area or node, this command displays information about all remote nodes that the controller is aware of. This can be a very large number of nodes.

Example To show information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes-detail Wellington
```

The following figure shows partial example output from running this command.

Table 76: Output from the **show atmf area nodes-detail Wellington** command

```
controller-1#show atmf area nodes-detail Wellington

Wellington Area Node Information:
  Node name  well-gate
  Parent node name    : well-master
  Domain id           : well-gate's domain
  Board type          : 368
  Distance to core    : 1
  Flags               : 50

  Parent node name    : none
  Domain id           : well-master's domain
  Board type          : 333
  Distance to core    : 0
  Flags               : 51
  Extra flags         : 0x0000000c
  MAC Address         : eccd.6d3f.fef7

...
```

Table 77: Parameter definitions from the **show atmf area nodes-detail** command

Parameter	Definition
`Node name`	The name assigned to a particular node.
`Parent node name`	The node to which the current node has an active uplink.
`Domain id`	The name of the domain the node belongs to.
`Board type`	The Allied Telesis code number for the device.
`Distance to core`	The number of nodes in the path from the current node to the master node in its area.
`Flags`	Internal AMF information
`Extra flags`	Internal AMF information
`MAC Address`	The MAC address of the current node

Related commands show atmf area

show atmf area nodes

show atmf area summary

Overview Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

Syntax

```
show atmf area summary [<area-name>]
```

Parameter	Description
<area-name>	Displays information for the specified area only.

Mode Privileged Exec

Example 1 To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

Table 78: Output from the **show atmf area summary** command

```
controller-1#show atmf area summary

 ATMF Area Summary Information:

Management Information
 Local IPv6 Address              : fd00:4154:4d46:1::15

Area Information
 Area Name                       : NZ (Local)
 Area ID                         : 1
 Area Master IPv6 Address        : -

 Area Name                       : Wellington
 Area ID                         : 2

Related commands

show atmf area

show atmf area nodes

show atmf area nodes-detail

show atmf authorization

Overview Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

Syntax

```
show atmf authorization {current|pending|provisional}
```

Parameter	Description
`current`	Show the status of all authorized nodes.
`pending`	Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with atmf secure-mode but have not yet been authorized with atmf authorize.
`provisional`	Show the status of provisionally authorized nodes. These are nodes that have been provisioned with atmf authorize provision.

Mode Privileged Exec

Example To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

Output Figure 63-17: Example output from **show atmf authorization current**

```
  NZ Authorized Nodes:
  Node Name             Signer                Expires
-----------------------------------------------------------------
  master_1              master_1              4 Mar 2017
  area_1_node_1         master_1              4 Mar 2017
  area_1_node_2         master_1              4 Mar 2017
```

Table 63-1: Parameters in the output from **show atmf authorization current**

Parameter	Description
Node Name	AMF node name of the authorized node.
Signer	Name of the AMF master that authorized the node.
Expires	Expiry date of the authorization. Authorization expiry time is set using atmf secure-mode certificate expiry.

Output Figure 63-18: Example output from **show atmf authorization pending**

```
  Pending Authorizations:

  NZ Requests:
  Node Name           Product          Parent Node      Interface
-------------------------------------------------------------------
  area_1_node_3       x230-18GP        master_1         port1.2.9
  area_1_node_4       x510-52GTX       master_1         sa1
```

Table 63-2: Parameters in the output from **show atmf authorization pending**

Parameter	Description
Node Name	Name of the node that is requesting authorization.
Product	Product name.
Parent Node	Authorization authority of the requesting node.
Interface	Interface that the authorization request came in on.

Output Figure 63-19: Example output from **show atmf authorization provisional**

```
 ATMF Provisional Authorization:

  Area - Node Name                 Start                  Timeout
  or MAC Address      Interface    Time                   Minutes
-------------------------------------------------------------------
  3333.4444.5555                   5 Sep 2016 02:35:54     3
  1111.2222.3333                   5 Sep 2016 02:35:24     60
  NZ - blue           port1.0.3    5 Sep 2016 02:35:06     60
```

Table 63-3: Parameters in the output from **show atmf authorization provisional**

Parameter	Description
`Area - Node Name or MAC Address`	MAC address or node name of the node that has been provisionally authorized.
`Interface`	Interface that the node has been provisioned on.
`Start Time`	Time the node was provisioned.
`Timeout Minutes`	Length of time from `Start Time` until the provisional authorization expires.

Command changes

Version 5.4.7-0.3: command added

show atmf backup

Overview This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf backup
show atmf backup logs
show atmf backup server-status
show atmf backup synchronize [logs]
```

Parameter	Description
`logs`	Displays detailed log information.
`server-status`	Displays connectivity diagnostics information for each configured remote file server.
`synchronize`	Display the file server synchronization status
`logs`	For each remote file server, display the logs for the last synchronization

Mode Privileged Exec

Example 1 To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

Table 63-4: Output from **show atmf backup**

```
Node_1# show atmf backup
ScheduledBackup ......Enabled
  Schedule............1 per day starting at 03:00
  Next Backup Time....04 May 2019 03:00
Backup Bandwidth .....Unlimited
Backup Media..........SD (Total 1974.0 MB, Free197.6MB)
Current Action........Starting manual backup
Started...............04 May 2019 10:08
CurrentNode...........atmf_testbox1

atmf_testbox2            04 May 2019  10:01:23  Yes      Yes        Good
```

Table 63-5: Output from **show atmf backup logs**

```
Node_1#show atmf backup logs

Backup Redundancy ..... Enabled
Local media ......... SD (Total 3788.0MB, Free 1792.8MB)
State ............... Inactive (Remote file server is not available)

Log File Location: card:/atmf/ATMF/logs/rsync_<node name>.log

Node
Name Log Details
-------------------------------------------------------------------------------
atmf_testbox
2019/05/04 18:16:51 [9045] receiving file list
2019/05/04 18:16:51 [9047] .d..t.... flash/
2019/05/04 18:16:52 [9047] >f+++++++ flash/a.rel
```

Example 2 To display the AMF backup synchronization status, use the command:

```
node_1# show atmf backup synchronize
```

To display log messages to do with synchronization of backups, use the command:

```
node_1# show atmf backup synchronize logs
```

Table 63-6: Output from **show atmf backup synchronize**

```
Node_1#show atmf backup synchronize

ATMF backup synchronization:

 * = Active file server

  Id  Date          Time       Status
-------------------------------------------------------------------
  1   04 May 2016   22:25:57   Synchronized
* 2   -             -          Active
```

Table 63-7: Output from **show atmf backup synchronize logs**

```
Node_1#show atmf backup synchronize logs

Id    Log Details
-------------------------------------------------------------------------------
1     2019/05/04 22:25:54 [8039] receiving file list

      2019/05/04 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

Example 3 To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```
Node1#sh atmf backup server-status

Id   Last Check    State
-------------------------------------
1    186 s         File server ready
2    1 s           SSH no route to host
```

Table 64: Parameter definitions from the **show atmf backup** command

Parameter	Definition
Scheduled Backup	Indicates whether AMF backup scheduling is enabled or disabled.
Schedule	Displays the configured backup schedule.
Next Backup Time	Displays the date and time of the next scheduled.
Backup Media	The current backup medium in use. This will be one of USB, SD, or NONE. Utilized and available memory (MB) will be indicated if backup media memory is present.
Current Action	The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).
Started	The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM
Current Node	The name of the node that is currently being backed up.
Backup Redundancy	Whether backup redundancy is enabled or disabled.
Local media	The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.
State	Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive.
Node Name	The name of the node that is storing backup data - on its backup media.
Date	The data of the last backup in the format DD MMM YYYY.
Time	The time of the last backup in the format HH:MM:SS.
In ATMF	Whether the node shown is active in the AMF network, (Yes or No).
On Media	Whether the node shown has a backup on the backup media (Yes or No).

Table 64: Parameter definitions from the **show atmf backup** command (cont.)

Parameter	Definition
`Status`	The output can contain one of four values: • "-" meaning that the status file cannot be found or cannot be read. • "Errors" meaning that there are issues - note that the backup may still be deemed successful depending on the errors. • "Stopped" meaning that the backup attempt was manually aborted. • "Good" meaning that the backup was completed successfully. • "In Progress" meaning that the backup is currently running on that node.
`Log File Location`	All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be: card:/amf/office/logs/rsync_amf_testbox1.log.
`Log Details`	The contents of the backup log file.
`server-status`	Displays connectivity diagnostics information for each configured remove file server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Related commands

show atmf

atmf network-name

show atmf backup area

Overview Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

Syntax `show atmf backup area [<area-name> [<node-name>]] [logs]`

Parameter	Description
`logs`	Displays the logs for the last backup of each node.
`<area-name>`	Displays information about nodes in the specified area.
`<node-name>`	Displays information about the specified node.

Mode Privileged Exec

Example To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

```

Table 63-1: Parameters in the output from **show atmf backup guest**

Parameter	Description
Guest Backup	The status of the guest node backup process
Scheduled Backup	The timing configured for guest backups.
Schedule	Displays the configured backup schedule.
Next Backup Time	The time the next backup process will be initiated.
Backup Bandwidth	The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow.
Backup Media	Detail of the memory media used to store the backup files and the current memory capacity available.

show atmf container

Overview Use this command to display information about the AMF containers created on a a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and_Configuration Guide for more information on running multiple tenants on a single VAA host.

Syntax

```
show atmf container [detail] [<container-name>]
```

Parameter	Description
`detail`	Show detailed information.
<container-name>	The name of the AMF container you wish to display information for.

Mode Privileged Exec

Output Figure 63-21: Example output from **show atmf container**

```
awplus#show atmf container

ATMF Container Information:

  Container       Area        Bridge   State      Memory    CPU%
-------------------------------------------------------------------

```

Table 63-2: Parameters in the output from **show atmf container**

Parameter	Description
Container	Name of the AMF container.
Area	Name of the area the container is in.
Bridge	Name of the bridge connecting the container to the physical network.
State	Container state, running or stopped. This is set with the state command.
Memory	The amount of memory the container is using on the VAA host.
CPU%	The percentage of CPU time the container is using on the VAA, at the time the show command is run.

Figure 63-23: Example output from **show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Table 63-3: Parameters in the output from **show atmf container detail**

Parameter	Description
Name	Name of the AMF container.
State	Container state, RUNNING or STOPPED. This is set with the state command.

Table 63-3: Parameters in the output from **show atmf container detail** (cont.)

Parameter	Description
PID	Internal container id.
IP	This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.
CPU use	The CPU usage of the container since it was enabled.
Memory use	Container memory usage.
Link	Each container has two links: 1 An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container. 2 A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container. See the AMF Feature Overview and Configuration_Guide for more information on these links.
TX/RX bytes	Bytes sent and received on a link.
Total bytes	Total bytes transferred on a link.

Command changes

Version 5.4.7-0.1: command added

show atmf detail

Overview This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf detail
```

Parameter	Description
`detail`	Displays output in greater depth.

Mode Privileged Exec

Example 1 To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name                        : Test_network
Network Mtu                         : 1300
Node Name                           : controller-1
Node Address                        : controller-1.atmf
Node ID                             : 342
Node Depth                          : 0
Domain State                        : BackupDomainController
Recovery State                      : None
Recovery Over ETH Ports             : Disabled
Log Verbose Setting                 : Verbose
Topology GUI                        : Disabled

Management VLAN
 VLAN ID                            : 4000
 Management Subnet                  : 172.31.0.0
 Management IP Address              : 172.31.1.86
 Management Mask                    : 255.255.128.0
 Management IPv6 Address            : fd00:4154:4d46:1::156
 Management IPv6 Prefix Length      : 64

Domain VLAN
 VLAN ID                            : 4091
 Domain Subnet                      : 172.31.128.0
 Domain IP Address                  : 172.31.129.86
 Domain Mask                        : 255.255.128.0
```

Table 64: Parameter definitions from the **show atmf detail** command

Parameter	Definition
`Network MTU`	The network MTU for the ATMF network.
`Network Name`	The AMF network that a particular node belongs to.
`Node Name`	The name assigned to a particular node.
`Node Address`	An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).
`Node ID`	A unique identifier assigned to a node on an AMF network.
`Node Depth`	The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
`Domain State`	The state of a node in a Domain in an AMF network as Controller/Backup.
`Recovery State`	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
`Recovery Over ETH Ports`	Allow AMF recovery over the Eth port on an AR-series device.
`Log Verbose Setting`	The state of the atmf log-verbose command.
`Topology GUI`	This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.
`Management VLAN`	The VLAN created for traffic between nodes of different domain (up/down links). • VLAN ID - in this example VLAN 4092 is configured as the Management VLAN. • Management Subnet - the network prefix for the subnet. • Management IP Address - the IP address allocated for this traffic. • Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).
`Domain VLAN`	The VLAN assigned for traffic between nodes of the same domain (crosslink). • VLAN ID - in this example VLAN 4091 is configured as the domain VLAN. • Domain Subnet - the subnet address used for this traffic. • Domain IP Address - the IP address allocated for this traffic. • Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).
`Node Depth`	The number of nodes in the path from this node to the core domain.

show atmf group

Overview This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

Syntax

```
show atmf group [user-defined|automatic]
```

Parameter	Description
`user-defined`	User-defined-group information display.
`automatic`	Automatic group information display.

Default All groups are displayed

Mode Privileged Exec

Example 1 To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information

master, x510

node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

Example 2 The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```
ATMF group information

master, poe, x8100

================================================
node1, node2, node3, node4, node5, node6:
================================================

ATMF group information

sysadmin, x8100

AMF_NETWORK[6]#
```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command atmf working-set on page 3339. This can be seen from the network level prompt, which in this case is *AMF_NETWORK[6]#*.

Table 65: Sample output from the **show atmf group** command for a working set.

```
AMF_NETWORK[6]#show atmf group
==============================
node3, node4, node5, node6:
==============================

ATMF group information

edge_switches, x510
```

Table 66: Parameter definitions from the **show atmf group** command for a working set

Parameter	Definition
`ATMF group information`	Displays a list of nodes and the groups that they belong to, for example: • master - Shows a common group name for Nodes configured as AMF masters. • Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example. • User-defined - Arbitrary groups created by the user for AMF nodes.

show atmf group members

Overview This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

Syntax

```
show atmf group members [user-defined|automatic]
```

Parameter	Description
`user-defined`	User defined group membership display.
`automatic`	Automatic group membership display.

Mode Privileged Exec

Example To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

Table 67: Sample output from the **show atmf group members** command

```
ATMF Group membership

Automatic         Total
Groups            Members   Members
------------------------------------------------------------
master            1         Building_1
poe               1         HW_Team1
x510              3         SW_Team1 SW_Team2 SW_Team3
x930              1         HW_Team1
x8100             2         Building_1 Building_2

ATMF Group membership

User-defined      Total
Groups            Members   Members
------------------------------------------------------------
marketing           1       Bld1_Floor_1
software            3       SW_Team1 SW_Team2 SW_Team3
```

Table 68: Parameter definitions from the **show atmf group members** command

Parameter	Definition
`Automatic Groups`	Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group.
`User-defined Groups`	Shows the grouping of AMF nodes in user defined groups.
`Total Members`	Shows the total number of members in each group.
`Members`	Shows the list of AMF nodes in each group.

Related commands

atmf group (membership)

show atmf guests

Overview This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

Syntax
```
show atmf guests
```

Mode User Exec/Privileged Exec

Usage notes Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the show atmf links guest command, which shows information about the guest nodes and also about their link to their parent node.

Example To display the AMF guest output, use the command:

```
awplus# show atmf guests
```

Output Figure 63-24: Example output from the **show atmf guests** command

```
master#show atmf guests

  Guest Information:

  Device          Device          Parent      Guest     IP/IPv6
  Name            Type            Node        Port      Address
-------------------------------------------------------------------------
  node1-2.0.1     x600-24Ts       node1       2.0.1     192.168.2.10
  wireless-zone1  AT-TQ4600       node2       1.0.1     192.168.1.10
  wireless-zone2  AT-TQ4600       node2       1.0.2     192.168.1.12

  Current ATMF guest node count 3
```

Table 69: Parameters shown in the output of the **show atmf guests** command

Parameter	Description
Device Name	The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number> You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the atmf guest-class command.

Table 69: Parameters shown in the output of the **show atmf guests** command

Parameter	Description
`Parent Node`	The name of the AMF node that directly connects to the guest node.
`Guest Port`	The port on the parent node that directly connects to the guest node.
`IP/IPv6 Address`	The address discovered from the node, or statically configured on the parent node's attached port.

Related commands

show atmf links guest

show atmf guests detail

Overview This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

Syntax

```
show atmf guests detail [<node-name>] [<guest-port>]
```

Parameter	Description
<node-name>	The name of the guest node's parent.
<guest-port>	The port name on the parent node.

Mode User Exec/Privileged Exec

Usage notes If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- show atmf links guest detail, which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

Example To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

Output Figure 63-25: Example output from **show atmf guests detail**

```
master#show atmf guests detail

ATMF Guest Node Information:

Node Name                       : master
Port Name                       : port1.0.9
Ifindex                         : 5009
Guest Description               : red-1.0.9
Device Type                     : x600-24Ts
Backup Supported                : No
MAC Address                     : 0000.cd38.0c4d
IP Address                      : 192.168.1.5
IPv6 Address                    : Not Set
HTTP Port                       : 0
Firmware Version                : 5.4.2-0.1
```

```
Node Name                       : node1
Port Name                       : port1.0.13
Ifindex                         : 5013
Guest Description               : node1-1.0.13
Device Type                     : AT-TQ4600
Backup Supported                : Yes
MAC Address                     : eccd.6df2.daa0
IP Address                      : 192.168.5.6
IPv6 Address                    : Not Set
HTTP Port                       : 80
Firmware Version                : 3.1.0 B01
```

Table 70: Parameters in the output from **show atmf guests detail**.

Parameter	Description
Node Name	The name of the parent node, which is the AMF node that directly connects to the guest node.
Port Name	The port on the parent node that connects to the guest.
IfIndex	An internal index number that maps to the port number on the parent node.
Guest Description	A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number>. You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the atmf guest-class command.
Username	The user name configured on the guest node.
Backup Supported	Whether the guest node supports AMF backup functionality.
MAC Address	The MAC address of the guest node.
IP Address	The IP address of the guest node.
IPv6 Address	The IPv6 address of the guest node.
Firmware Version	The version of the firmware operating on the guest node.
HTTP port	The HTTP port as specified with the http-enable command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

Related commands

atmf guest-class

switchport atmf-guestlink

show atmf backup guest

show atmf links

Overview This command displays information about AMF links on a switch. The display output contains link status state information.

Syntax

```
show atmf links [brief]
```

Parameter	Description
`brief`	A brief summary of AMF links, their configuration and status.

Mode User Exec and Privileged Exec

Usage notes The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the show atmf links detail command.

This command does not show links that are configured on provisioned ports.

Example To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

Figure 63-26: Example output from **show atmf links brief**

```
Example-core# show atmf links

ATMF Link Brief Information:

Local      Link       Link    ATMF         Adjacent       Adjacent    Link
Port       Type       Status  State        Node           Ifindex     State
-------------------------------------------------------------------------
1.0.10     Crosslink  Down    Init         *crosslink1     -          Blocking
1.0.14     Crosslink  Down    Init         *crosslink2     -          Blocking
1.0.1      Downlink   Down    Init         -               -          Blocking
1.0.2      Downlink   Up      Full         Node2           5001       Forwarding
1.0.8      Downlink   Up      Full         downlink1       5001       Forwarding

* = Provisioned.
```

Table 63-1: Parameter in the output from **show atmf links brief**

Parameter	Definition
`Local Port`	Shows the local port on the selected node.
`Link Type`	Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain).
`Link Status`	Shows the link status of the local port on the node as either Up or Down.

Table 63-1: Parameter in the output from **show atmf links brief** (cont.)

Parameter	Definition
ATMF State	Shows AMF state of the local port: • Init - Link is down. • Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. • Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. • OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain. • OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master. • Full - Link hello packets are sent and received from its neighbor with its own node id. • Shutdown - Link has been shut down by user configuration.
Adjacent Node	Shows the Adjacent AMF Node to the one being configured.
Adjacent IF Index	Shows the IF index for the Adjacent AMF Node connected to the node being configured.
Link State	Shows the state of the AMF link. Valid states are either Forwarding or Blocking.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

show atmf links detail

Overview This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf links detail
```

Parameter	Description
`detail`	Detailed AMF links information.

Mode User Exec

Usage notes For summarized link information see the show atmf links command.

This command does not show links that are configured on provisioned ports.

Example To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in show atmf links.

Table 65: Parameter definitions from the **show atmf links detail** command output

Parameter	Definition
`Crosslink Ports Information`	Show details of all Crosslink ports on this Node: • Port - Name of the Port or static aggregation (sa<*>). • Ifindex - Interface index for the crosslink port. • VR ID - Virtual router id for the crosslink port. • Port Status - Status of the local port on the Node as UP or DOWN. • Port State - AMF State of the local port. – Init - Link is down. – Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. – Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. – OneWay - Link is up and has waited the hold down period and now attempting to link to – another unit in another domain – Full - Link hello packets are sent and received from its neighbor with its own node id. – Shutdown - Link has been shut down by user configuration. Port BPDU Receive Count - The number of AMF protocol PDU's received. • Adjacent Node Name - The name of the adjacent node connected to this node. • Adjacent Ifindex - Adjacent AMF Node connected to this Node. • Adjacent VR ID - Virtual router id of the adjacent node in the domain. • Adjacent MAC - MAC address of the adjacent node in the domain. • Port Last Message Response - Response from the remote neighbor to our AMF last hello packet.
`Link State Entries`	Shows all the link state database entries: • Node.Ifindex - Shows adjacent Node names and Interface index. • Transaction ID - Shows transaction id of the current crosslink transaction. • MAC Address - Shows adjacent Node MAC addresses. • Link State - Shows AMF states of adjacent nodes on the link.
`Domain Nodes Tree`	Shows all the nodes in the domain: • Node - Name of the node in the domain. • Links on Node - Number of crosslinks on a vertex/node. • Link no - Shows adjacent Node names and Interface index. • Forwarding State - Shows state of AMF link Forwarding/Blocking.
`Crosslink Transaction Entries`	Shows all the transaction entries: • Node - Name of the AMF node. • Transaction ID - transaction id of the node. • Uplink Transaction ID - transaction id of the remote node.

Table 65: Parameter definitions from the **show atmf links detail** command output (cont.)

Parameter	Definition
`Uplink Information`	Show all uplink entries. • Waiting for Sync - Flag if uplinks are currently waiting for synchronization. • Transaction ID - Shows transaction id of the local node. • Number of Links - Number of up downlinks in the domain. • Number of Local Uplinks - Number of uplinks on this node to the parent domain. • Originating Node - Node originating the uplink information. • Domain - Name of the parent uplink domain. • Node - Name of the node in the parent domain, that is connected to the current domain. • Ifindex - Interface index of the parent node's link to the current domain. • VR ID - Virtual router id of the parent node's link to the current domain. • Transaction ID - Transaction identifier for the neighbor in crosslink. • Flags - Used in domain messages to exchange the state: ATMF_DOMAIN_FLAG_DOWN = 0 ATMF_DOMAIN_FLAG_UP = 1 ATMF_DOMAIN_FLAG_BLOCK = 2 ATMF_DOMAIN_FLAG_NOT_PRESENT = 4 ATMF_DOMAIN_FLAG_NO_NODE = 8 ATMF_DOMAIN_FLAG_NOT_ACTIVE_PARENT = 16 ATMF_DOMAIN_FLAG_NOT_LINKS = 32 ATMF_DOMAIN_FLAG_NO_CONFIG = 64 • Domain Controller - Domain Controller in the uplink domain • Domain Controller MAC - MAC address of Domain Controller in uplink domain
`Downlink Domain Information`	Shows all the downlink entries: • Domain - Name of the downlink domain. • Domain Controller - Controller of the downlink domain. • Domain Controller MAC - MAC address of the domain controller. • Number of Links - Total number of links to this domain from the Node. • Number of Links Up - Total number of links that are in UP state. • Number of Links on This Node - Number of links terminating on this node. • Links are Blocked - 0 links are not blocked to the domain. 1 All links are blocked to the domain.

Table 65: Parameter definitions from the **show atmf links detail** command output (cont.)

Parameter	Definition
`Node Transaction List`	List of transactions from this downlink domain node. • Node - 0 links are not blocked to the domain. 1 All links are blocked to the domain. • Transaction ID - Transaction id for this node. • Domain List: Shows list of nodes in the current domain and their links to the downlink domain.: • Domain - Domain name of the downlink node. • Node - Name of the node in the current domain. • Ifindex - Interface index for the link from the node to the downlink domain. • Transaction ID - Transaction id of the node in the current domain. • Flags - As mentioned above.
`Up/Downlink Ports Information`	Shows all the configured up and down link ports on this node: • Port - Name of the local port. • Ifindex - Interface index of the local port. • VR ID - Virtual router id for the local port. • Port Status - Shows status of the local port on the Node as UP/DOWN. • Port State - AMF state of the local port. • Adjacent Node - nodename of the adjacent node. • Adjacent Internal ID - Unique node identifier of the remote node. • Adjacent Ifindex - Interface index for the port of adjacent AMF node. • Adjacent Board ID - Product identifier for the adjacent node. • Adjacent VR ID - Virtual router id for the port on adjacent AMF node. • Adjacent MAC - MAC address for the port on adjacent AMF node. • Adjacent Domain Controller - nodename of the Domain controller for Adjacent AMF node. • Adjacent Domain Controller MAC - MAC address of the Domain controller for Adjacent AMF node. • Port Forwarding State - Local port forwarding state Forwarding or Blocking. • Port BPDU Receive Count - count of AMF protocol PDU's received. • Port Sequence Number - hello sequence number, incremented every time the data in the hello packet changes. • Port Adjacent Sequence Number - remote ends sequence number used to check if we need to process this packet or just note it arrived. • Port Last Message Response - response from the remote neighbor to our last hello packet.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Related commands

no debug all

clear atmf links statistics

show atmf

show atmf links guest

Overview This command displays information about guest nodes visible to an AMF device.

Syntax

```
show atmf links guest [interface <interface-range>]
```

Parameter	Description
`interface <interface-range>`	Select a specific range of ports to display information about guest nodes.

Default With no parameters specified this command will display its standard output for all ports with guest nodes connected.

Mode User Exec/Privileged Exec

Usage notes Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use show atmf guests.

Example 1 To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

Output Figure 63-27: Example output from **show atmf links guest**

```
node1#sh atmf links guest

Guest Link Information:

DC = Discovery configuration
  S = static D = dynamic

Local    Guest         Model        MAC             IP / IPv6
Port     Class         Type      DC Address         Address
-------------------------------------------------------------
1.0.1    -             other     D  0013.1a1e.4589  192.168.1.2
1.0.2    aastra-phone  other     D  0008.5d10.7635  192.168.1.3
1.0.3    cisco-phone2  other     S  -               192.168.2.1
1.0.4    panasonic...  other     D  0800.239e.f1fe  192.168.1.5
```

Table 63-1: Parameters in the output from **show atmf links guest**

Parameter	Description
`Local Port`	The port on the parent node that connects to the guest.
`Guest Class`	The name of the ATMF guest-class that has been assigned to the guest node by the atmf guest-class command.

Table 63-1: Parameters in the output from **show atmf links guest** (cont.)

Parameter	Description
`Model Type`	The model type of the guest node, as entered by the modeltype command. Can be one of the following: • alliedware • aw+ • tq • other
`DC`	The discovery method as applied by the discovery command. This can be either dynamic (D) or static (S).
`MAC Address`	The MAC address of the guest node.
`IP / IPv6 Address`	The IP address of the guest node.

Related commands

atmf guest-class

discovery

http-enable

modeltype

switchport atmf-guestlink

show atmf backup guest

show atmf links guest detail

Overview This command displays detailed information about guest nodes visible to an AMF device.

Syntax

```
show atmf links guest detail [interface <interface-range>]
```

Parameter	Description
`interface <interface-range>`	Select a specific range of ports to display information about guest nodes.

Mode User Exec and Privileged Exec

Usage notes Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use show atmf guests detail.

Note that the parameters that are displayed depend on the guest node's model and state.

Example To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

Output Figure 63-28: Example output from **show atmf links guest detail**

```
node1#show atmf links guest detail

Detailed Guest Link Information:

Interface                          : port1.0.13
Link State                         : Down

Firmware Version                   : 3.2.1 B02
HTTP port                          : 80
```

Table 63-2: Parameters in the output from **show atmf links guest detail**

Parameter	Description
`Interface`	The port on the parent node that connects to the guest.
`Link State`	The state of the link to the guest node; one of: • Down: The physical link is down. • Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up. • Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below. • Full: The node connected by this link has joined the AMF network. • Fail: The port is physically up but something has prevented the guest node from joining the AMF network.
`Class Name`	The name of the ATMF guest-class that has been assigned to the guest node by the atmf guest-class command.

Table 63-2: Parameters in the output from **show atmf links guest detail** (cont.)

Parameter	Description
Model Type	The model type of the guest node, as entered by the modeltype command. The mode type can be one of the following: • alliedware • aw+ • onvif • tq • other
Discovery Method	The discovery method as applied by the discovery command. This can be either dynamic or static.
IP Address	The IP address of the guest node.
Username	The user name configured on the guest node.
Login Fallback	Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.
Node state	The state of the guest node; one of: • Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down. • Getting IP: The AMF device is in the process of retrieving the IP address of the guest node. • Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node. • Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is. • Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full". • Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.
Backup Supported	Whether the guest node supports AMF backup functionality.
MAC Address	The MAC address of the guest node.

Table 63-2: Parameters in the output from **show atmf links guest detail** (cont.)

Parameter	Description
`Device Type`	Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type shows what a user entered as the type of device they intended this guest node to be.
`Description`	By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.
`Serial Number`	The serial number of the guest node.
`Firmware Name`	The name of the firmware operating on the guest node.
`Firmware Version`	The version of the firmware operating on the guest node.
`HTTP port`	The HTTP port as specified with the http-enable command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

Command changes

Version 5.5.0-1.1: **Login Fallback** parameter added

show atmf links statistics

Overview This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

Syntax `show atmf links statistics [interface [<port-number>]]`

Parameter	Description
`interface`	Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports will be displayed.
<port-number>	Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device.

Mode User Exec

Example 1 To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

Table 64: Sample output from the **show atmf links statistics** command

```
ATMF Statistics:

                                  Receive        Transmit
------------------------------------------------------------------------------

port1.0.4  Arealink Hello                       0              0
```

Figure 63-30: Parameter definitions from the **show atmf links statistics** command output

Parameter	Definition
Receive	Shows a count of AMF protocol packets received per message type.
Transmit	Shows the number of AMF protocol packets transmitted per message type.
Database Entries	Shows the number of AMF elements existing in the distributed database.
Database Full Ages	Shows the number of times the entries aged in the database.
ATMF Packet Discards	Shows the number of discarded packets of each type.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Related commands

no debug all

clear atmf links statistics

show atmf

show atmf nodes

Overview This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

Syntax

```
show atmf nodes [guest|all]
```

Parameter	Description
`guest`	Display only guest nodes in the AMF network.
`all`	Display all nodes in the AMF network, including guest nodes.

Mode Privileged Exec

Usage notes You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

Examples To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Table 63-1: Sample output from **show atmf nodes**

```
node1#show atmf nodes guest

Node Information:

  * = Local device

 SC = Switch Configuration:
  C = Chassis    S = Stackable    N = Standalone

  Node                 Device             ATMF          Parent               Node
  Name                 Type               Master  SC    Domain               Depth
-------------------------------------------------------------------------------
* M1                   x510-28GTX           Y     S     none                   0
  N3                   x230-18GP            N     N     M1                     1
  N1                   AR4050S              N     N     M1                     1

 Node map exchange is active
 Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

Table 64: Sample output from **show atmf nodes all**. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all

 Node and Guest Information:

  * = Local device

 SC = Switch Configuration:
  C = Chassis    S = Stackable    N = Standalone G = Guest

  Node/Guest            Device              ATMF          Parent               Node
  Name                  Type                Master  SC    Domain               Depth
-------------------------------------------------------------------------------

show atmf provision nodes

Overview This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

Syntax

```
show atmf provision nodes
```

Mode Privileged Exec

Usage notes This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

Example To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Figure 63-31: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .............: SD (Total 3827.0MB, Free 3481.1MB)

show atmf recovery-file

Overview Use this command to display the recovery file information for an AMF node.

AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

Syntax

```
show atmf recovery-file
```

Mode Privileged Exec

Example To display recovery file information for an AMF node, use the command:

```
node1# show atmf recovery-file
```

Output Figure 63-32: Example output from **show atmf recovery-file**

```
node1#show atmf recovery-file

ATMF Recovery File Info: Special Link Present
Location                      Date         Time
USB storage device            30 Apr 2018  14:50:32

```

Table 63-2: Parameters in the output from **show atmf secure-mode**

Parameter	Description
`Secure Mode Status`	Shows the status of secure mode, `Enabled` or `Disabled`.
`Certificate Expiry`	Certificate expiry time. Set with atmf secure-mode certificate expiry
`Certificates Total`	Total number of certificates.
`Certificates Revoked`	Certificates that have been revoked by the AMF master.
`Certificates Rejected`	Certificates that have been rejected by the AMF master.
`Certificates Active`	Certificates that are currently active.
`Provisional Authorization`	Number of nodes with provisional authorization. For more information use the show atmf authorization **provisional** command.
`Pending Requests`	Number of nodes waiting for authorization on the AMF master. For more information use the show atmf authorization **pending** command.
`Trusted Master`	List of trusted masters in the AMF area.
`Key Fingerprint`	The AMF node's key fingerprint.

show atmf secure-mode certificates

Overview Use this command to display the certificate status details when secure mode is enabled on an AMF network.

Syntax
```
show atmf secure-mode certificates [detail] [area <area-name>]
[node <node-name>]
```

Parameter	Description
`detail`	Display detailed certificate information.
`area`	Specify an AMF area.
<area-name>	The AMF area you want to see the certificate information for.
`node`	Specify an AMF node.
<node-name>	The AMF node you want to see information for.

Mode Privileged Exec

Example To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named “area_2_node_1” in an area named “area-2”, use the command:

```
awplus# show atmf secure-mode certificates detail area area-2
node area_2_node_1
```

Output Figure 63-37: Example output from **show atmf secure-mode certificates**

```
  Area-1 Certificates:
  Node Name             Signer                Expires               Status

                        master_2              4 Mar 2017            Active
  area_1_node_2         master_1              11 Mar 2017
                        master_2              4 Mar 2017            Revoked

  Area-2 Certificates:
  Node Name             Signer                Expires               Status
------------------------------------------------------------------------------
  area_2_node_1         master_1              18 Mar 2017           Active
  area_2_node_2         master_1              18 Mar 2017           Rejected
```

Table 63-5: Parameters in the output from **show atmf secure-mode certificates**

Parameter	Description
`Node Name`	Name of AMF node the certificate was issued to.
`Signer`	Name of AMF master that issued the certificate.
`Expires`	Certificate expiry date.
`Status`	The status column will display `Active` before a member node is trusted, and can be accessed using AMF commands. Valid statuses are `Active`, `Revoked`, and `Rejected`.

Output Figure 63-38: Example output from **show atmf secure-mode certificates detail area area-2 node area_2_node_1**

```
 Certificates Detail:

-------------------------------------------------------------------------------
area_2_node_1 (area:area-2)
  MAC Address     : 0000.cd37.0003
  Status          : Active
  Serial Number   : A24SC8001
  Product         : x510-28GTX
  Key Fingerprint : cd:b4:c9:cd:7b:87:6a:30:98:25:d7:3c:89:8e:cb:74:e8:91:56:9d
  Flags           : 00000011
  Signer          : master_1
  Expiry Date     : 18 Mar 2017 21:17:42
```

Table 63-6: Parameters in the output from **show atmf secure-mode certificates detail**

Parameter	Description
`MAC Address`	MAC address of AMF node.
`Status`	The device status will show `Active` if a member node is trusted, and can be accessed using AMF commands. Valid statuses are `Active`, `Revoked`, and `Rejected`.
`Serial Number`	Device serial number.
`Product`	Device product type.
`Key Fingerprint`	AMF node key fingerprint.
`Flags`	Internal AMF information.
`Signer`	Name of AMF master that issued the certificate.
`Expiry Date`	Certificate expiry date.

Command changes

Version 5.4.7-0.3: command added

show atmf secure-mode sa

Overview Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

Syntax

```
show atmf secure-mode sa [detail] [link|neighbor|broadcast]
```

Parameter	Description
`detail`	Display detailed security association information.
`link`	Display security associations for type links.
`neighbor`	Display security associations for type neighbors.
`broadcast`	Display security associations for type broadcast.

Mode Privileged Exec

Example To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

Output Figure 63-39: Example output from **show atmf secure-mode sa**

```
  ATMF Security Associations:

  Type                        State           ID            Details
-------------------------------------------------------------------------------
  Neighbor Node               Complete        175           master_1
  Broadcast                   Complete        4095
  CrossLink                   Complete        4501          sa1
  AreaLink                    Cert Exchg      4511          sa11

```

Table 63-7: Parameters in the output from **show atmf secure-mode sa**

Parameter	Description
`Type`	Security Association (SA) types: • Link - SA for link • CrossLink - SA for crosslink • AreaLink - SA for area link • Neighbor Node - SA for node neighbor relationship • Neighbor Gateway - SA for gateway neighbor relationship • Neighbor Cntl-Master - SA for controller/master neighbor relationship • Broadcast - SA for working-set broadcast requests
`State`	Current state of the Security Association. The state must be `Complete` before a member node is trusted, and can be accessed using AMF commands. • CA Exchg Init - SA is ready to begin the SA exchange process • CA Exchg - SA is currently exchanging CAs • Cert Exchg - SA is currently exchanging certificates • Key Exchg - SA is currently exchanging ephemeral keys • Complete - SA exchange has completed
`ID`	Security Association ID. • For Neighbor types this is the remote node ID. • For Link types this is the local ifindex. • For Broadcast type this is always 4095.
`Details`	Human readable translation of ID. • For Neighbor types this is the node name • For Link types this is the interface name
`Remote MAC Address`	MAC address of the remote partner of the security association.
`Flags`	Internal AMF information.

...
```

Table 65: Parameter definitions from the **show atmf tech** command

Parameter	Definition
ATMF Status	Shows status of AMF feature on the Node as Enabled/Disabled.
Network Name	The name of the AMF network to which this node belongs.
Node Name	The name assigned to the node within the AMF network.
Role	The role configured on the device within the AMF - either master or member.
Current ATMF Nodes	A count of the AMF nodes in the AMF network.
Node Address	The identity of a node (in the format name.atmf) that enables its access it from a remote location.
Node ID	A unique identifier assigned to an AMF node.
Node Depth	The number of nodes in the path from this node to the core domain.
Domain State	A node's state within an AMF Domain - either controller or backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between nodes of different domains (up/down links). VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. Management Subnet - the Network prefix for the subnet. Management IP Address - the IP address allocated for this traffic. Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)

Table 65: Parameter definitions from the **show atmf tech** command (cont.)

Parameter	Definition
`Domain VLAN`	The VLAN assigned for traffic between Nodes of same domain (crosslink). VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. Domain Subnet - the Subnet address used for this traffic. Domain IP Address - the IP address allocated for this traffic. Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)
`Device Type`	Shows the Product Series Name.
`ATMF Master`	Indicates the node's membership of the core domain (membership is indicated by Y)
`SC`	Shows switch configuration: • C - Chassis (such as SBx8100 series) • S - Stackable (VCS) • N - Standalone
`Parent`	A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.
`Node Depth`	Shows the number of nodes in path from the current node to the Core domain.

NOTE: *The **show atmf tech** command can produce very large output. For this reason only the most significant terms are defined in this table.*

show atmf virtual-links

Overview This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

Syntax

```
show atmf virtual-links [macaddr]
show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]
show atmf virtual-links detail [id <1-4094>]
```

Parameter	Description
`macaddr`	Display the virtual AMF links' MAC addresses.
`id <1-4094>`	ID of the local virtual link.
`remote-id <1-4094>`	ID of the remote virtual link
`detail`	Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted.

Mode Privileged Exec

Example 1 To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Table 63-1: Example output from **show atmf virtual-links**

```
ATMF Virtual-Link Information:

Local     Local                Remote               Tunnel    Tunnel
Port      ID   IP              ID   IP              Protect   State
-------------------------------------------------------------------------
vlink1    1    172.16.24.2     2    1.0.0.2         -         Complete
vlink2    2    172.16.24.2*    10   172.16.24.3*    ipsec     Complete
vlink3    3    (eth0)*         1    1.2.3.4         -         AcquireLocal

* = Dynamic Address.

Virtual Links Configured: 3
```

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

Example 2 To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

Table 63-2: Example output from **show atmf virtual-links**

```
  Virtual Link Detailed Information:

  ID 1     Description          : None
  ID 1     Local IP Address     : 192.168.5.1
  ID 1     Remote ID            : 1
  ID 1     Remote IP Address    : 192.168.5.20
  ID 1     Link Type            : virtual-link
  ID 1     Packets Received     : 236465
  ID 1     Packets Transmitted  : 192626
```

Example 3 To display AMF virtual links' MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Table 63-3: Example output from **show atmf virtual-links macaddr**

```
ATMF Link Remote Information:

ATMF Management Bridge Information:

Bridge: br-atmfmgmt

port no mac addr                is local?       ageing timer
  1     00:00:cd:27:c2:07       yes                0.00
  2     8e:c7:ae:81:7e:68       yes                0.00
  2     00:00:cd:28:bf:e7       no                 0.01
```

Table 63-4: Parameters in the output from **show atmf virtual-links**

Parameter	Definition
Local Port	The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.
Local ID	The local ID of the virtual link. This matches the vlink<number>
Tunnel Protect	Tunnel protection protocol.
Tunnel State	The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.
mac addr	AMF virtual links terminate on an internal soft bridge. The "show atmf virtual-links macaddress" command displays MAC Address information.
is local?	Indicates whether the MAC displayed is for a local or a remote device.
ageing timer	Indicates the current aging state for each MAC address.

Related commands atmf virtual-link

show atmf working-set

Overview This command displays the nodes that form the current AMF working-set.

Syntax

```
show atmf working-set
```

Mode Privileged Exec

Example To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

Table 64: Sample output from the **show atmf working-set** command.

```
ATMF Working Set Nodes:

node1, node2, node3, node4, node5, node6

Working set contains 6 nodes
```

2. Crosslink Hello BPDU pkt with downlink domain info
3. Crosslink Hello BPDU pkt with uplink info
4. Down and up link Hello BPDU pkts
6. Stack hello unicast pkts
8. DBE request
9. DBE update
10. DBE bitmap update
```

Related commands debug atmf

debug atmf packet

show running-config atmf

Overview This command displays the running system information that is specific to AMF.

Syntax
```
show running-config atmf
```

Mode User Exec and Global Configuration

Example To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Related commands show running-config

no debug all

state

Overview This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Syntax

```
state {enable|disable}
```

Parameter	Description
`disable`	Stop the AMF container. The container's state changes to `stopped`.
`enable`	Start the AMF container. The container's state changes to `running`.

Default By default, **state** is disabled.

Mode AMF Container Configuration

Usage notes The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
 atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the atmf container command and an area-link configured with the area-link command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

Example

To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

Command changes

Version 5.4.7-0.1: command added

switchport atmf-agentlink

Overview Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an "AMF agent", and the link between the x600 and this device is called an "agent link".

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

Syntax

```
switchport atmf-agentlink
no switchport atmf-agentlink
```

Default By default, no agent links exist and x600 Series switches are not visible to AMF networks.

Mode Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

Usage notes The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

Example To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

Related commands show atmf links guest

switchport atmf-arealink

Overview This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

Syntax

```
switchport atmf-arealink remote-area <area-name> vlan <2-4094>
no switchport atmf-arealink
```

Parameter	Description
<area-name>	The name of the remote area that the port is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

Default No arealinks are configured.

Mode Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

Usage notes Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

NOTE: *See the atmf-arealink command to configure an AMF area link on an AR-series Eth interface.*

Example To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

Related commands

atmf area

atmf area password

atmf virtual-link

show atmf links

switchport atmf-crosslink

Overview This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

Syntax

```
switchport atmf-crosslink
no switchport atmf-crosslink
```

Mode Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

Usage notes Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

Example 1 To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

Example 2 This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

Example 2A To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

Example 2B To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

NOTE: *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

Related commands show atmf links statistics

switchport atmf-guestlink

Overview Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

NOTE: *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

Syntax

```
switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D>|
ipv6 <X:X::X:X>]
no switchport atmf-guestlink
```

Parameter	Description
`class`	Set a guest class
<guest-class>	The name of the guest class.
`ip`	Specifies that the address following will have an IPv4 format
<A.B.C.D>	The guest node's IP address in IPv4 format.
`ipv6`	Specifies that the address following will have an IPv6 format
<X:X::X:X>	The guest node's IP address in IPv6 format.

Default No guest links are configured.

Mode Interface

Example 1 To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
```

Example 2 To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
```

Example 3 To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

Example 4 To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

Example 5 To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

switchport atmf-link

Overview This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

Syntax

```
switchport atmf-link
no switchport atmf-link
```

Mode Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

Usage notes Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

NOTE: *See the atmf-link command to configure an AMF up/down link on an AR-series Eth interface.*

Example To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

atmf-link

show atmf detail

show atmf links

type atmf guest

Overview This command configures a trigger to activate when an AMF guest node joins or leaves.

Syntax

```
type atmf guest {join|leave}
```

Parameter	Description
`join`	AMF guest node joins.
`leave`	AMF guest node leaves.

Mode Trigger Configuration

Example To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

Related commands show trigger

Command changes Version 5.5.1-1.1: command added

type atmf node

Overview This command configures a trigger to activate when an AMF node joins or leaves.

Syntax

```
type atmf node {join|leave}
```

Parameter	Description
join	AMF node joins.
leave	AMF node leaves.

Mode Trigger Configuration

Example 1 To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

Example 2 The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
====================
node1, node2, node3:
====================

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=======
node1:
=======

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
001 Periodic (2 min)   Periodic Status Chk  Y  N  Y Continuous  1   smtwtfs

undebug atmf

Overview This command is an alias for the **no** variant of the debug atmf command.

username (atmf-guest)

Overview This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. The password must be between 1 and 32 characters and will allow spaces.

Syntax

```
username <name> password [8] <userpass>
no username
```

Parameter	Description
<name>	User name of the guest node.
8	The parameter **8** means that the password that follows is in hashed form, not plain text. Do not type this 8 when creating a password with this command; it is only used in configuration files. In configuration files, the device prints 8 in front of passwords, to indicate that it is displaying the password in its hashed form.
<userpass>	The password to be entered for the guest node.

Default No usernames are configured

Mode AMF Guest Configuration

Example To assign the user name 'reception' and the password of 'secret' to an AMF guest node that has the guest class of 'phone1' use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class 'phone1', use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

64 Autonomous Wave Control Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Autonomous Wave Control (AWC).

AWC is an advanced network technology that utilizes game theory to deliver significant improvements in wireless network connectivity and performance. AWC can automatically minimize coverage gaps and reduce Access Point (AP) interference and respond to network configuration changes and bandwidth demands from user devices.

You can configure AWC through the command line, or through the Device GUI.

For more information, see the Vista Manager mini User Guide.

Command List

3gpp-info (wireless-network-passpoint-dot11u)

Overview Use this command to set the 3GPP (802.11u 3rd Generation Partnership Project) cellular network information.

Use the **no** variant of this command to revert to the default value.

Syntax

```
3gpp-info <code-list>
no 3gpp-info
```

Parameter	Description
<code-list>	Enter the MCC (Mobile Country Code) and MNC (Mobile Network Code): • MCC must be a 3 digit decimal number • MNC must be a 2 or 3 digit decimal number • MCC and MNC must be separated by commas • If setting multiple combinations of MCC and MNC, they must be separated by semicolons. • A maximum of 100 characters can be set including commas and semicolons. For more information on mobile country and network codes, go to: Wikipedia Mobile Country Codes.

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Example To set some of the MCC and MNC codes for Japan, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# 3gpp-info
440,00;440,50
```

Related commands show wireless network

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

additional-step-required enable (wireless-network-passpoint-dot11u)

Overview Use this command to configure an Additional Step Required for Access.

Use the **no** variant of this command to disable Additional Step Required for Access.

Syntax

```
additional-step-required enable
no additional-step-required enable
```

Default Disabled.

Mode Wireless Network Passpoint 802.11u Configuration

Usage notes Typically, access and authentication is automatic if a legacy hotspot is operated by the mobile device's Home Service Provider (SP) or if the user has previously authenticated to that hotspot. Additionally, user intervention is typically required in a roaming environment where the hotspot is not operated by the Home SP and additional steps are required to identify and authenticate with the Home SP.

Example To enable Additional Step Required for Access, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
additional-step-required enable
```

Related commands show wireless network

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

airtime-fairness enable (wireless-ap-prof-radio)

Overview Use this command to enable **airtime-fairness** for all wireless clients regardless of speed.

Use the **no** variant of this command to disable airtime-fairness for all wireless clients.

Syntax

```
airtime-fairness enable
no airtime-fairness enable
```

Default Disabled.

Mode Wireless AP Profile Radio Configuration

Usage notes Airtime-fairness ensures that every client has equal access to air time, regardless of client capability. Client capability includes the wireless standard 802.11 mode and Radio Frequency (RF) link signal strength.

If two clients were each assigned a 10 Mbps bandwidth and sending equally sized frames then they potentially could have unequal air time if their RF link characteristics were different.

RF link characteristics are based upon the distance of the client from the Access Point (AP). A client that is closer to the AP typically operates at a higher data rate than a client farther from the AP. This is because the AP and client are deliberately designed to adapt their transmission rates in order to maintain an optimal quality of the RF link.

This behavior is normal between the AP and clients since the client devices are not expected to remain at a constant or equal distance from the AP. This could mean that one device is consuming more airtime than it is entitled to, even though that device is not consuming more than its bandwidth limit.

Note: This command is valid on TQ series devices only.

Example To enable airtime-fairness for 'radio 2' on 'ap-profile100' use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-prof 100
awplus(config-wireless-ap-prof)# ap-prof 100
awplus(config-wireless-ap-prof-radio)# radio 2
awplus(config-wireless-ap-prof-radio)# airtime-fairness enable
```

Related commands radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

anqp-domain-id (wireless-network-passpoint-hs20)

Overview Use this command to set the ANQP (Access Network Query Protocol) domain identifier.

Use the **no** variant of this command to reset the ANQP domain identifier to the default value.

Syntax

```
anqp-domain-id <0-65535>
no anqp-domain-id
```

Parameter	Description
<0-65535>	ANQP domain identifier.

Default 0

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set the ANQP domain identifier on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# anqp-domain-id
1
```

Related commands show wireless network

hs20 (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

anqp-element (wireless-network-passpoint-dot11u)

Overview Use this command to configure the Arbitrary Access Network Query Protocol (ANQP) element.

ANQP is a query and response protocol that defines services offered by an access point (AP), typically at a Wi-Fi hot spot.

Use the **no** variant of this command to remove a specified ANQP element entry.

Syntax

```
anqp-element info-id <0-999> payload HEX
no anqp-element info-id <0-999>
```

Parameter	Description
<0-999>	Arbitrary ANQP element configuration's unique entry number.
HEX	Arbitrary ANQP element configuration. The maximum number of characters in HEX is 100.

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the ANQP element info ID to '1' and the payload HEX value to '0000', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# anqp-element
info-id 1 payload 0000
```

Related commands show wireless network

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

antenna (wireless-ap-prof-radio)

Overview Use the antenna command to set the antenna model for a wireless Access Point (AP).

Use the **no** variant of this command to remove the designated antenna model for a wireless AP.

Syntax

```
antenna {an2458-10dp|an5158-16dp|an5158-19dp}
no antenna
```

Parameter	Description
an2458-10dp	Antenna model AN2458-10DP
an5158-16dp	Antenna model AN5158-16DP
an5158-19dp	Antenna model AN5158-19DP

Default Not set.

Mode Wireless AP Profile Radio Configuration

Example To configure an AP radio configuration to use the antenna model AN5158-19DP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap)# hwtype tq single spec 11n
awplus(config-wireless-ap)# band 5

ap

Overview Use this command to configure an Access Point (AP).

If the AP doesn't already exist, then this command creates it.

Use the **no** variant of this command to remove an AP configuration.

Syntax

```
ap <1-65535>
```

Parameter	Description
<1-65535>	AP configuration ID number.

Default Not set.

Mode Wireless Configuration

Usage notes This command adds an AP configuration and enters the AP configuration mode.

Example To configure an AP with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
```

ap-profile (wireless)

Overview Use this command to configure an AP (Access Point) profile. If the AP profile doesn't already exist, then this command creates it.

Use the **no** variant of this command to delete an AP profile.

Syntax

```
ap-profile <1-65535>
no ap-profile <1-65535>
```

Parameter	Description
<1-65535>	The AP profile ID number.

Default Not set.

Mode Wireless Configuration

Example To configure an AP profile with the ID profile number of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
```

To remove the AP profile 10, use the following commands:

```

Use the **no** variant of this command to disable the Association Advertisement on the network configuration.

Syntax

```
association-advertisement enable
no association-advertisement enable
```

Default Disabled.

Mode Wireless Network Configuration

Example To enable the Association Advertisement for network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# association-advertisement
enable
```

Related commands show wireless network

network (wireless)

Command changes Version 5.5.1-0.1: command added

atmf-application-proxy port enable

Overview Use this command to enable AMF Security mini to communicate with the wireless controller. Optionally you can also specify a port number for that communication. This is needed for AMF Security mini to control how clients of TQ series APs access the wireless network.

Use the **no** variant of this command to stop AMF Security mini from communicating with the wireless controller. This also resets the port number to the default.

After entering this command, restart the wireless controller, using the command **no enable** followed by **enable**.

Syntax

```
atmf-application-proxy port enable [<1-65535>]
no atmf-application-proxy port enable
```

Parameter	Description
<1-65535>	The port number through which AMF Security mini will communicate with the wireless controller.

Default Status: Disabled

Port number: 5443

Mode Wireless Configuration

Usage notes We recommend configuring this feature through the AMF Security mini GUI, rather than through this command.

Example To enable AMF Security mini to communicate with the wireless controller through port 5000, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# atmf-application-proxy port enable
5000
awplus(config-wireless)# no enable
awplus(config-wireless)# enable
```

Command changes Version 5.5.2-2.1: command added

authentication (wireless-sec-wep)

Overview Use this command to enable or disable authentication on a wireless Access Point (AP).

Syntax

```
authentication {both|open-system|shared-key}
```

Parameter	Description
`both`	Use both types of authentication: open-system and shared-key authentication.
`open-system`	No authentication.
`shared-key`	WEP authentication.

Default Open-system.

Mode Wireless Security WEP Configuration

Usage notes For **MWS** series devices, select either the open-system or shared-key parameter. You can't select the **both** parameter.

Example To configure WEP as the security authentication mode for clients, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# authentication shared-key
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

auto-discovery disable

Overview Use this command to disable the automatic search for new APs in an AWC Smart Connect (AWC-SC) network.

Use the **no** variant of this command to enable the automatic search for new APs.

Syntax

```
auto-discovery disable
no auto-discovery disable
```

Default Enabled

Mode Wireless Smart Connect Profile Configuration

Usage notes Auto-discovery is a function that allows an AP that is in the factory default state to automatically become part of an AWC-SC network. This is because when a wireless AP is activated in the factory default state, its IP and MAC address are added to the AP profile and the Smart Connect profile.

Example To turn auto-discovery off for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# auto-discovery disable
```

Related commands smart-connect-profile

Command changes Version 5.5.0-0.1: command added

band

Overview Use this command to assign a frequency band to a single antenna wireless AP.

Use the **no** variant of this command to set the band to the default value of 2.

Syntax

```
band {2|5}
no band
```

Parameter	Description
2	2.4GHz band
5	5GHz band

Default The default band is 2 (2.4GHz).

Mode Wireless AP Profile Configuration

Usage notes The command can only be used with single antenna APs.

Example To configure a 5GHz band for a single antenna AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# band 5
```

Related commands

antenna (wireless-ap-prof-radio)

Command changes Version 5.4.7-2.4: command added

band-steering (wireless-network)

Overview Use this command to enable band steering on a wireless Access Point (AP).

Use the **no** variant of this command to disable band steering.

Syntax
```
band-steering
no band-steering
```

Default Disabled.

Mode Wireless Network Configuration

Usage notes Band Steering detects dual-band capable clients and steers them to the 5 GHz frequency. This leaves the more crowded 2.4 GHz band available for legacy clients.

This helps improve end user experience by reducing channel utilization, especially in high density environments

This command is not supported on the **MWS** series products.

Example To enable band steering, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# band-steering
```

Related commands network (wireless)

bandwidth (wireless-ap-prof-radio)

Overview Use this command to assign a bandwidth to an Access Point (AP).

Use the **no** variant of this command to revert to the default bandwidth.

Syntax

```
bandwidth {20|40|80}
no bandwidth
```

Parameter	Description
20	20MHz bandwidth
40	40MHz bandwidth
80	80MHz bandwidth

Default The default bandwidth value varies according to the configured hardware and radio type.

Mode Wireless AP Profile Radio Configuration

Example To assign a 40MHz bandwidth to AP-profile 100 for Radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# bandwidth 40
```

bcast-key-refresh-interval (wireless-sec-osen)

Overview Use this command to set the refresh interval for the broadcast (group) key used with an OSEN security configuration.

Use the **no** variant of this command to revert to the refresh interval default value.

Syntax

```
bcast-key-refresh-interval <0-86400>
no bcast-key-refresh-interval
```

Parameter	Description
<0-86400>	The key refresh interval in seconds. The range is 0 to 86400 seconds.

Default Zero (0) is the default.

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint). OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

Example To set a broadcast key refresh interval of 3600 for a security configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# bcast-key-refresh-interval 3600
```

Related commands security (wireless)

Command changes Version 5.5.0-2.3: command added

bcast-key-refresh-interval (wireless-sec-wpa-ent)

Overview Use this command to set the refresh interval for the broadcast key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval for the broadcast key to the default.

Syntax

```
bcast-key-refresh-interval <0-86400>
no bcast-key-refresh-interval
```

Parameter	Description
<0-86400>	The refresh interval in seconds For the **MWS series**, the broadcast key refresh rate is *<0, 30-3600>* seconds.

Default The default refresh interval is 0 seconds.

Mode Wireless Security WPA-enterprise Configuration

Example To set 3600 seconds as the broadcast key refresh interval, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)#
bcast-key-refresh-interval 3600
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

bcast-key-refresh-interval (wireless-sec-wpa-psnl)

Overview Use this command to set the refresh interval for a broadcast (group) key used in a WPA-personal security configuration.

Use the **no** variant of this command to set the refresh interval to the default value.

Syntax

```
bcast-key-refresh-interval <0-86400>
no bcast-key-refresh-interval
```

Parameter	Description
<0-86400>	The broadcast key refresh interval. For the **MWS series**, the broadcast key refresh rate is *<0, 30-3600>* seconds.

Default The default value is 0.

Mode Wireless Security WPA-personal Configuration

Example To set the broadcast key refresh interval to 3600 seconds on a WPA-personal security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
bcast-key-refresh-interval 3600
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

beacon-rssi-threshold (wireless-ap-prof-cb)

Overview Use this command to set the value of the beacon Received Signal Strength Indicator (RSSI) threshold for a wireless channel blanket configuration.

Use the **no** variant of this command to reset the beacon RSSI to the default value.

Syntax

```
beacon-rssi-threshold <0-91>
no beacon-rssi-threshold
```

Parameter	Description
<0-91>	The RSSI threshold value on Channel Blanket.

Default The default value is 30.

Mode Wireless AP Profile Channel Blanket Configuration

Example To configure a beacon RSSI threshold of 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# beacon-rssi-threshold 10
```

Command changes Version 5.5.2-0.1: default changed to 30

Version 5.5.1-2.1: command added

captive-portal

Overview Use this command to add a Captive Portal (web authentication) configuration and enter the Captive Portal configuration mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

This setting is only valid for AT-TQ series wireless access points.

Use the **no** variant of this command to remove a Captive Portal configuration.

Syntax

```
captive-portal
no captive-portal
```

Default Captive Portal is not set.

Mode Wireless Network Configuration

Example To enter the Captive Portal configuration mode of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
```

To reset all the Captive Portal configuration settings of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no captive-portal
```

bss-trans-manage enable

Overview Use this command to enable Basic Service Set (BSS) Transition Management on a wireless network configuration. The BSS consists of one redistribution point — typically an access point (WAP or AP) interconnecting all associated wireless clients.

Use the **no** variant of this command to disable BSS Transition Management on a wireless network configuration.

Syntax

```
bss-trans-manage enable
no bss-trans-manage enable
```

Default Disabled.

Mode Wireless Network Configuration

Example To configure enable BSS Transition Management, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# bss-trans-manage enable
```

Command changes Version 5.5.0-2.3: command added

captive-portal virtual-ip

Overview Use this command to configure the virtual IP address on Captive Portal.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to remove the virtual IP address on Captive Portal.

Syntax

```
captive-portal virtual-ip <ip-address>
no captive-portal virtual-ip
```

Parameter	Description
<ip-address>	The IPv4 address uses the format A.B.C.D

Default Not set.

Mode Wireless AP Profile Configuration

Usage notes Captive Portal uses the AP's management IP address to show an authentication page. To avoid a potential security risk, this command allows you to hide the AP management IP address by providing a virtual IP address for Captive Portal authentication.

Example To configure a virtual IP address for Captive Portal, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 5
awplus(config-wireless-ap-prof)# captive-portal virtual-ip
1.1.1.1
```

cb-channel

Overview Use this command to designate the fixed channel for channel blanket used by each of the radios in an AP profile.

Use the **no** variant of this command to revert to the default channel setting.

Syntax

```
cb-channel radio <1-3> channel <channel-number>
no cb-channel radio <1-3>
```

Parameter	Description
<1-3>	Select the radio interface number to be a fixed channel.
<channel-number>	Fixed channel number. Select the channel from the eligible channels listed in the AP profile.

Default Not set. When the parameter is blank, an eligible channel is configured. automatically.

Mode Wireless AP Profile Channel Blanket Configuration

Example To configure cb-channel 10 to radio1 and cb-channel 40 to radio2 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof)# cb-channel radio 1 channel 10
awplus(config-wireless-ap-prof)# cb-channel radio 2 channel 40
```

cb-proxy-arp enable

Overview Use this command to enable Proxy ARP on an AP profile channel blanket configuration.

Use the **no** variant of this command to disable Proxy ARP on an AP profile channel blanket configuration.

Syntax
```
cb-proxy-arp enable
no cb-proxy-arp enable
```

Default Disabled.

Mode Wireless AP Profile Channel Blanket Configuration

Example To enable Proxy ARP for AP profile 1 channel blanket, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# cb-proxy-arp enable
```

channel-blanket

Command changes Version 5.5.1-0.1: command added

channels (wireless-ap-prof-radio)

Overview Use this command to set the channel that a wireless Access Point (AP) uses when it is set to auto.

Use the **no** variant of this command to return the AP channel to its default.

Syntax

```
channels <1-255>
no channels
```

Parameter	Description
<1-255>	The channel number.

Default The default channel varies with each type of AP, its country-code, and outdoor settings.

Mode Wireless AP Profile Radio Configuration

Example To set the wireless AP radio channel, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# channels 10
```

Related commands

Command changes Version 5.4.7-2.4: command added.

channel-blanket

Overview Use this command to enter the wireless-AP-profile-channel-blanket configuration mode. Once in this mode, you can modify the channel blanket configuration parameters for a wireless AP profile. A wireless AP profile defines the radio settings, such as band and channel selection and the control VLAN. The AP profile names the SSIDs to which it applies.

NOTE: *The channel-blanket setting can only be used with APs that support channel blanket. If this is set for other APs, you will not be able to manage those APs. See your AP's datasheet to see if it supports channel blanket.*

Use the **no** variant of this command to reset all parameters for channel blanket to default.

Syntax

```
channel-blanket
no channel-blanket
```

Default Not set

Mode Wireless AP Profile Configuration

Usage notes When the command is entered, if the "key" parameter is empty, the automatically generated value is set.

Example To enter the channel blanket configuration mode for AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)#
```

To reset all the channel blanket parameters of AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# no channel-blanket
```

Related commands show wireless ap-profile

vap (wireless-ap-prof-radio)

Command changes Version 5.4.9-1.1: command added

channel (wireless-ap-radio)

Overview Use this command to configure a channel on an Access Point (AP). You can configure an AP to automatically select a channel or use a fixed channel.

Use the **no** variant of this command to remove any configured channels and return to the default value.

Syntax

```
channel {auto|<1-255>}
no channel
```

Parameter	Description
`auto`	The channel is automatically selected.
<1-255>	A list of fixed channels. The list is determined by the country-code.

Default The default is **auto**.

Mode Wireless AP Radio Configuration

Example To configure a fixed channel for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# channel 1
```

ciphers (wireless-sec-osen)

Overview Use this command to set which cipher suite to use with OSEN wireless security configuration.

Use the **no** variant of this command to revert to the default cipher suite.

Syntax

```
ciphers <cipher-list>
no ciphers
```

Parameter	Description
<cipher-list>	Designate the cipher suite(s) in a list format. The cipher options are either **ccmp** or **tkip** or both in any order. The combinations you can select depend on the WPA version as follows: • If the version is a combination of **wpa** and **wpa2**, the cipher suite can be either **ccmp** only or a combination of **ccmp** and **tkip**. • If the version is only **wpa2**, the cipher suite can be selected from **ccmp** only or a combination of **ccmp** and **tkip**. • If the version is only **wpa3**, only **ccmp** can be selected as the cipher suite.

Default **ccmp**

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint). OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

Example To configure both ccmp (AES) and tkip as the cipher suite on a security configuration of OSEN, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# ciphers ccmp tkip
```

Related commands security (wireless)

ciphers (wireless-sec-wpa-ent)

Overview Use this command to set the cipher suite(s) used by WPA-personal security configurations.The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

Syntax

```
ciphers <cipher-list>
no ciphers
```

Parameter	Description
<cipher-list>	The available cipher suite(s) in list format. The list can contain either **ccmp** or **tkip** or both and can be in any order.

Default CCMP.

Mode Wireless Security WPA-enterprise Configuration

Usage notes For **MWS** series devices, a combination of versions and ciphers are supported as follows:

- versions wpa2 and ciphers ccmp
- versions wpa, wpa2, and ciphers tkip and ccmp

Example To set both CCMP (AES) and TKIP as cipher suites on a security WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# ciphers ccma tkip
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

ciphers (wireless-sec-wpa-psnl)

Overview Use this command to set the cipher suite(s) used by WPA-personal security configurations.The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

Syntax

```
ciphers <cipher-list>
no ciphers
```

Parameter	Description
<cipher-list>	The available cipher suite(s) in list format. The list can contain either **ccmp** or **tkip** or both and can be in any order.

Default ccmp.

Mode Wireless Security WPA-personal Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions wpa2 and ciphers ccmp
- versions wpa, wpa2, and ciphers tkip and ccmp

Example To configure WPA-personal to use both CCMP (AES) and TKIP as cipher suites in a security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# ciphers ccmp tkip
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

community read-only (wireless-ap-prof-snmp)

Overview Use this command to set an SNMP read-only community name for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to set the SNMP read-only community name back to the default (public).

Syntax

```
community read-only <community-name>
no community read-only
```

Parameter	Description
<community-name>	The community name to set. Valid characters are: - alphanumeric characters - symbols except for the following 6 symbols: " ' \ & < >

Default public

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP read-only community name to 'private', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# community read-only
private
```

To set the SNMP trap community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp

Use the **no** variant of this command to set the SNMP trap community name to the default (public).

Syntax

```
community trap <community-name>
no community trap
```

Parameter	Description
<community-name>	The community name to set. Valid characters are: - alphanumeric characters - symbols except for the following 6 symbols: " ' \ & < >

Default public

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP trap community name to 'private', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# community trap private
```

To set the SNMP trap community name back to the default (public), use the commands:

```
awplus# configure terminal

conn-capability protocol (wireless-network-passpoint-hs20)

Overview Use this command to specify the protocols supported by the network connection and the corresponding port numbers and whether the port is open or closed.

Use the **no** variant of this command to remove the settings for the specified protocol number.

Syntax

```
conn-capability protocol <0-255> port <0-65535> status [closed|open|unknown]
no conn-capability protocol <0-255>
```

Parameter	Description
<0-255>	Protocol number, as in the assigned protocol numbers listed at: www.iana.org.
<0-65535>	Port number
`closed`	Indicates the connection is in closed mode
`open`	Indicates the connection is in open mode
`unknown`	Indicates the connection status is unknown

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Usage notes These settings signify the capabilities of the wired network that the AP is connected to. They provide information on the connection status of the most commonly used communication protocols and ports within the hotspot.

Example To set the connection capability on port 161 to 'closed' for protocol 17 (UDP), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
conn-capability protocol 17 port 161 status closed
```

control-vlan

Overview Use this command to create a control VLAN ID for a wireless AP belonging to channel blanket.

Use the **no** variant of this command to clear an AP's designated channel blanket VLAN ID.

Syntax

```
control-vlan <vlan-id>
no control-vlan
```

Parameter	Description
<vlan-id>	The designated VLAN ID <1-4094> used on a wireless AP belonging to channel blanket.

Default Not set

Mode Wireless AP Profile Channel Blanket Configuration

Example To set the channel blanket control VLAN for AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# control-vlan 10

country-code

Overview Use this command to set the country code for an AP-profile.

Use the **no** variant of this command to revert back to the default country code for the device's region.

Syntax

```
country code <code>
no country code
```

Parameter	Description
<code>	A two letter code representing the country. Use the command show wireless country-code to see the full list of country codes available.

Default The default country code is '**jp**' for Japan or '**us**' for other regions.

Mode Wireless AP Profile Configuration

Usage notes To display a list of the country codes that can be applied, use the command **show wireless country-code**

Note, applying a new country code will reset the following configuration for the **ap-profile** and **ap-radio** modes:

- mode, bandwidth, and channel

Example To set the country code to 'New Zealand' for AP-profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# country-code nz
```

Related commands

Command changes Version 5.4.7-2.4: command added

day (wireless-task)

Overview Use this command to set a day or range of days to run a task.

You can use the **time** command along with the **day** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the day set to run a task.

Syntax

```
day {<day> <month> <year>|<daysofweek>|every-day}
no day
```

Parameter	Description
<day>	The day set for the task. Select a number from1-31.
<month>	The month to run the task. Enter the first three letters of the month, for example Jan, Feb, Mar...
<year>	The year to run the task. Select a year between <2000-2035>.
<daysofweek>	The day or days of the week to run the task. (sunday|monday|tuesday|wednesday|thursday|friday|saturday)
every-day	Set the task to run on every day of the week.

Default Not set.

Mode Wireless Task Configuration

Example To configure task 5 to run on the 22nd of September 2017, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# day 22 Sep 2017
```

Related commands

time (wireless-task)

Command changes Version 5.4.7-2.4: command added.

deauth-req-timeout (wireless-network-passpoint-hs20)

Overview Use this command to configure the deauthentication request timeout.

Use the **no** variant of this command to revert the deauthetication timeout time to the default value.

Syntax

```
deauth-req-timeout <0-65535>
no deauth-req-timeout
```

Parameter	Description
<0-65535>	The timeout, in seconds, for client deauthentication after sending WNM notification frames. WNM notification requests allow the hotspot feature to send clients the URLs of servers that allow the client to access information about how to subscribe to the service, correct connection errors, or extend the current session.

Default 60 seconds.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure a deauthentication request timeout of 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
deauth-req-timeout 120
```

Related commands show wireless network

hs20 (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

debug wireless

Overview Use this command to enable wireless debugging. Debugging filters can be based on severity level and module name.

Use the **no** variant of this command to disable all wireless debugging.

Syntax

```
debug wireless level
{all|debug|dump|error|info|notice|trace|warning}
```

```
debug wireless module
{all|apca|apmgr|apreq|clnmgr|cwmcore|rogue|syncscan}
```

```
no debug wireless
```

Parameter	Description	
`level`	Filters logging events by severity level and displays the output by one of the following configured options:	
	`all`	All level events
	`debug`	Debug events
	`dump`	Dump events
	`error`	Error conditions
	`info`	Information messages
	`notice`	Normal, but significant conditions
	`trace`	Trace events
	`warning`	Warning conditions
`module`	Filters logging events by module name and displays the output by one of the following configured options:	
	`all`	All module events
	`apca`	Auto power/channel assignment events
	`apmgr`	AP manager events
	`apreq`	HTTP AP request events
	`clnmgr`	Client manager events
	`cwmcore`	CWM core events
	`rogue`	Rogue events
	`syncscan`	Sync scan events

Default Disabled

Mode User Exec

Example

To enable debugging of wireless with 'info' level on the 'apca' module, use the command:

```
awplus# debug wireless level info module apca
```

To disable debugging of wireless, use the command:

```
awplus# no debug wireless
```

description (wireless-ap)

Overview Use this command to specify a description to identify an Access Point (AP).

Use the **no** variant of this command to remove the description of a selected AP.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text to describe a specific AP.

Default Not set.

Mode Wireless AP Configuration

Example To specify a description for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
awplus(config-wireless-ap)# description AP10_MEETING_SPACE
```

Related commands

description (wireless-ap-prof)

Overview Use this command to configure an AP-profile description. You must be in the **config-wireless-ap-prof** mode to use this command.

Use the **no** variant of this command to remove an AP-profile description.

Syntax

```
description <description>
no description
```

Default Not set.

Mode Wireless AP Profile Configuration

Example To configure the description "PROF10" for an AP-profile, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# description PROF10
```

Related commands ap-profile (wireless)

show wireless ap-profile

Command changes Version 5.4.7-2.4: command added

description (wireless-mac-flt)

Overview Use this command to set the description of a wireless MAC filter.

Use the **no** variant of this command to remove the description.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text describing the wireless MAC filter.

Default No description set by default.

Mode Wireless MAC Filter Configuration

Example To set the description of MAC filter '20' to 'mywhitelist', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# description mywhitelist
```

To remove the description from MAC filter '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no description
```

description (wireless-network)

Overview Use this command to set a description for the wireless network.

Use the **no** variant of this command to remove a description for a wireless network.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Set a description for a wireless network.

Default Not set.

Mode Wireless Network Configuration

Example To set the description for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# description GUEST_NETWORK
```

description (wireless-sc-prof)

Overview Use this command to configure a descriptive name for a Smart Connect profile.

Use the **no** variant of this command to remove a Smart Connect profile name.

Syntax

```
description <sc-profile-name>
no description
```

Parameter	Description
<sc-profile-name>	The descriptive name given to a Smart Connect profile.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Example To set the descriptive name of SC-PROF10 for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# description SC-PROF10
```

Related commands smart-connect-profile

Overview Use this command to set a description for a wireless task configuration.

Use the **no** variant of this command to remove a description for a wireless task configuration.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	The description for a wireless task configuration.

Default Not set.

Mode Wireless Task Configuration

Example To set a description for the wireless task 5 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# description PERIODIC_AWC_CALC
```

Related commands task

Overview Use this command to set a description for a wireless trigger.

Use the **no** variant of this command to delete the descrption for a wireless trigger.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text to describe the wireless trigger.

Default Not set.

Mode Wireless Trigger Configuration

Example To set a description on a wireless trigger, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-trigger 1
awplus(config-wireless-trigger)# description TRIGGER DESC 1
```

Related commands

designated-ap

Overview Use this command to designate an AP to determine the BSSID (or name) of a channel blanket profile.

BSSIDs are used to describe sections of a wireless local area network. It recognizes the AP because it has a unique physical MAC address, which creates the wireless network.

This command configures the BSSID of the designated AP to be used as the BSSID of the channel blanket.

Use the **no** variant of this command to remove a designated AP.

Syntax

```
designated-ap <1-65535>
no designated-ap
```

Parameter	Description
<1-65535>	The ID of the designated AP.

Default Not set.

Mode Wireless AP Profile Channel Blanket Configuration

Usage notes If you do not designate an AP, the AP with the lowest ID is assigned automatically.

Example To designate AP 1001 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# designated-ap 1001
```

dgaf enable (wireless-network-passpoint-hs20)

Overview Use this command to enable Downstream Group-Addressed Forwarding (DGAF).

Use the **no** variant of this command to disable DGAF.

Syntax

```
dgaf enable
no dgaf enable
```

Default Enabled.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To disable Downstream Group-Addressed Forwarding on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# no dgaf enable
```

domain-name (wireless-network-passpoint-dot11u)

Overview Use this command to configure one or more domain names for the entity operating the AP.

Use the **no** variant of this command to revert to the default value.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	The Domain Name(s) • Use the FQDN format, e.g. domain-name example.com • Multiple domain name entries must be separated by a comma • The length of a character in the OI-List must be less than 255 , and 10 elements or less.

Default Not set

Mode Wireless Network Passpoint 802.11u Configuration

Example To set two domain names, mydomain.com and example.net, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# domain-name
mydomain.com,example.net
```

dtim-period

Overview Use this command to set the Delivery Traffic Indication Map (DTIM) period on the network configuration. A DTIM period value is a number that determines how often a beacon frame includes a Delivery Traffic Indication Message, and this number is included in each beacon frame.

Use the **no** variant of this command to reset the DTIM period to the default (1).

Syntax

```
dtim-period <1-5>
no dtim-period
```

Parameter	Description
<1-5>	DTIM period in seconds. Increasing this number will increase the power saving effect, but it will slow down the response.

Default 1.

Mode Wireless Network Configuration

Usage notes The DTIM is how the AP warns its clients that it is about to transmit the multicast (and broadcast) frames it queued up since the previous DTIM.

This queueing and scheduled delivery is done to allow power-conscious devices to save power by turning off their receivers for brief stretches of time, only waking up their receivers when the AP indicates is has traffic for them.

Example To set a DTIM period of 2 seconds on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# dtim-period 2
```

dup-auth-received (wireless-network)

Overview Use this command to set a wireless network to accept or ignore 'Duplicate AUTH received' messages. If the message is accepted, then connected clients are disconnected.

Use the **no** variant of this command to use the default action.

Syntax

```
dup-auth-received {disconnect|ignore}
no dup-auth-received
```

Parameter	Description
`disconnect`	Accept the disconnect connection request.
`ignore`	Ignore the disconnection request.

Default Disconnect.

Mode Wireless Network Configuration

Example To configure network 5 to ignore 'Duplicate AUTH received' messages, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# dup-auth-received ignore
```

dynamic-vlan enable (wireless-sec-osen)

Overview Use this command to enable the dynamic-vlan function on wireless APs using the OSEN security mode.

Use the **no** variant of this command to disable the dynamic-vlan function.

Syntax

```
dynamic-vlan enable
no dynamic-vlan enable
```

Default Enabled.

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

This command is not supported by MWS series APs.

Example To disable the dynamic-vlan function for security 100, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode osen
awplus(config-wireless-sec-osen)# no dynamic-vlan enable
```

enable (wireless-ap-prof-snmp)

Overview Use this command to enable an SNMP configuration for the target AP profile.

Use the **no** variant of this command to disable the SNMP configuration for the target AP profile.

Syntax

```
enable
no enable
```

Default Disabled

Mode Wireless AP Profile SNMP Configuration

Example To enable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# enable
```

To disable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no enable

emergency-mode

Overview Use this command to set emergency mode on a wireless network. Wireless networks in emergency mode are only active when AWC is also in emergency mode. You can use emergency mode to prevent people from being isolated from infrastructure in the event of a natural disaster such as an earthquake or typhoon.

Use the **no** variant of this command to remove the emergency mode from a wireless network.

Syntax
```
emergency-mode
no emergency-mode
```

Default Disabled.

Mode Wireless Network Configuration

Example To configure an emergency mode for network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# emergency-mode
```

Related commands

wireless emergency-mode

wireless emergency-mode usb mark key

Command changes Version 5.5.0-0.3: command added

emergency-mode usb enable

Overview Use this command to allow AlliedWare Plus to put your wireless network into Emergency Mode by inserting a pre-prepared USB stick. Emergency mode makes your wireless network available to the public in an emergency, such as a natural disaster. This feature makes it easy to start emergency mode, because you don't have to log into the AlliedWare Plus device to do so.

Use the **no** variant of this command to stop allowing the network to enter emergency mode through a pre-prepared USB stick.

Syntax

```
emergency-mode usb enable
no emergency-mode usb enable
```

Default Disabled

Mode Wireless Configuration

Example To configure this feature, first create a suitable wireless network and reserve it for emergency mode only. To reserve the network, use the command emergency-mode.

Then insert an empty USB stick into the AlliedWare Plus device and use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# emergency-mode usb enable
awplus(config-wireless)# emergency-mode usb key ExampleKey
description ExampleEmergencyUSB
awplus(config-wireless)# end
awplus# wireless emergency-mode usb mark key ExampleKey
```

The **key** parameter in the commands emergency-mode usb key and wireless emergency-mode usb mark key must match.

After this, to put the network into emergency mode, just insert the USB stick. As long as the keys on the device and the stick match, emergency mode will automatically activate. The device's port LEDs will blink to indicate it is in emergency mode.

Related commands

emergency-mode

emergency-mode usb key

wireless emergency-mode usb mark key

Command changes Version 5.5.2-1.1: command added

emergency-mode usb key

Overview Use this command to enter a key for putting your wireless network into Emergency Mode by inserting a pre-prepared USB stick. If someone inserts a USB stick into the device, the device will look to see if the USB stick also contains this key. If it does, then the device will put the network into emergency mode.

You can enter up to 10 keys, to allow you to have multiple pre-prepared USB sticks.

Along with this command, use wireless emergency-mode usb mark key to prepare the USB stick and put the same key on it.

Use the **no** variant of this command to remove a key.

Syntax

```
emergency-mode usb key <key> [description <description>]
no emergency-mode usb key <key>
```

Parameter	Description
`key <key>`	The key, which can be up to 32 characters long. You can use any printable ASCII characters. If you use spaces or symbols, enclose the key in quote marks, for example “Example Key1”.
`description <description>`	An optional description of this key, up to 64 characters long. You can use any printable ASCII characters.

Default No keys exist

Mode Wireless Configuration

Example To configure this feature, first create a suitable wireless network and reserve it for emergency mode only. To reserve the network, use the command emergency-mode.

Then insert an empty USB stick into the AlliedWare Plus device and use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# emergency-mode usb enable
awplus(config-wireless)# emergency-mode usb key ExampleKey
description ExampleEmergencyUSB
awplus(config-wireless)# end
awplus# wireless emergency-mode usb mark key ExampleKey
```

The **key** parameter in the commands emergency-mode usb key and wireless emergency-mode usb mark key must match.

After this, to put the network into emergency mode, just insert the USB stick. As long as the keys on the device and the stick match, emergency mode will

automatically activate. The device's port LEDs will blink to indicate it is in emergency mode.

no enable
```

Default Not set.

Mode Wireless WDS Configuration

Example To enable a wireless WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# enable
```

Related commands wds

show wireless wds

Command changes Version 5.4.7-2.4 command added.

external-page-url

Overview Use this command to configure the external URL authentication page for Captive Portal.

To use this command, you must first specify external-page-redirect using the **mode** command.

Use the **no** variant of this command to reset the external authentication page URL.

Syntax

```
external-page-url <URL>
no external-page-url
```

Parameter	Description
<URL>	URL of the external authentication page

Default Disabled

Mode Wireless Network Captive Portal Configuration

Example To enable and set URL string 'http://www.example.com' for a Captive Portal external web authentication server on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# external-page-url
http://www.example.com
```

Command changes Version 5.5.0-1.3: command added

filter-entry

Overview Use this command to add a filter entry to a wireless MAC filter. You can optionally include a description for the filter.

Use the **no** variant of this command to remove an entry from the MAC filter list.

Syntax

```
filter-entry <mac-address> [description <description>]
no filter-entry <mac-address>
```

Parameter	Description
<mac-address>	MAC address of the filter entry in hexadecimal format HHHH.HHHH.HHHH. You can add up to 3072 MAC addresses per MAC filter, depending on your AP model.
`description`	Set an optional description for the filter entry.
<description>	Text describing the filter entry.

Default No filter entries exist

Mode Wireless MAC Filter Configuration

Usage notes If you need to add a large number of filter entries, you can use the Device GUI instead of this command. The GUI lets you upload the entries as a CSV file.

Example To add a filter entry to the MAC filter numbered 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# filter-entry
0000.cd28.0880.1234 description PC01
```

To remove a filter entry from the MAC filter numbered 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no filter-entry
0000.cd28.0880.1234
```

Command changes

Version 5.5.2-1.1: maximum entries per filter increased for some APs

Version 5.4.8-2.1: command added

force-disable (wireless-ap-radio)

Overview Use this command to override and force the disabling of an Access Point (AP) radio status.

Use the **no** variant of this command to stop overrides of an AP radio status.

Syntax

```
force-disable
no force-disable
```

Default **no force-disable** (do not override the AP profile radio status).

Mode Wireless AP Radio Configuration

Example To force a disable of an AP radio status, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# force-disable
```

Related commands show wireless ap-profile

radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added

force-power-save-disable

Overview Use this command to prevent wireless clients from changing to power saving mode. Some models of wireless client may unintentionally change to power saving mode, even if the connection between the AP and client is alive. Enabling this command prevents these clients from changing to power saving mode.

Use the **no** variant of this command to allow clients to change to power saving mode again.

Syntax

```
force-power-save-disable
no force-power-save-disable
```

Default Clients can change to power saving mode (the **no** variant of this command)

Mode Wireless AP Profile Channel Blanket Configuration

Example To prevent wireless clients from changing to power saving mode on AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# force-power-save-disable
```

Related commands show wireless ap-profile

Command changes Version 5.5.2-2.1: command added

gas-address-behavior (wireless-network-passpoint-dot11u)

Overview Use this command to set the GAS (Generic Advertisement Services) Address 3 behavior for 802.11u.

Use the **no** variant of this command to revert to the default value.

Syntax

```
gas-address-behavior <0-2>
no gas-address-behavior
```

Parameter	Description
<0-2>	GAS Address 3 behavior. • 0: P2P specification (Address3 = AP BSSID) workaround enabled by default based on GAS request Address3. • 1: IEEE 802.11 standard compliant regardless of GAS request Address3 • 2: Force non-compliant behavior (Address3 = AP BSSID for all cases)

Default 0.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the GAS Address 3 behavior value to 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
gas-address-behavior 1
```

Related commands show wireless network

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

gas-comeback-delay (wireless-network-passpoint-dot11u)

Overview Use this command to set the generic advertisement service (GAS) comeback-delay for 802.11u.

Use the **no** variant of this command to revert to the default value.

Syntax

```
gas-comeback-delay <0-65535>
no gas-comeback-delay <0-65535>
```

Parameter	Description
<0-65535>	GAS comeback delay Time Unit (TU) 1 TU = 1024 microseconds (approx 1 millisecond)

Default 0.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the GAS comeback-delay value to 100, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
gas-comeback-delay 100
```

Related commands show wireless network

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

hessid (wireless-network-passpoint-dot11u)

Overview Use this command to set the HESSID (Homogeneous Extended Service Set Identifier).

Use the **no** variant of this command to revert to the default value.

Syntax

```
hessid MAC
no hessid
```

Parameter	Description
MAC	Homogeneous ESS Identifier, in Hexidecimal notation and MAC address format: HHHH.HHHH.HHHH.HHHH

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Usage notes In typical Wi-Fi deployments, if two APs have different SSIDs, they are considered to be in different wireless networks.

If two APs have the same SSID, they are considered to be part of the same wireless network. But because SSIDs are not globally administered, it is possible that two APs with the same SSID are, in fact, in different wireless networks.

The homogeneous extended service set identifier (HESSID) element allows mobile devices to detect this condition. When two APs have the same SSID but from different wireless networks, the two networks have different HESSIDs

Example To set the Homogeneous ESS Identifier '02AA.BBCC.1122', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# hssid
02AA.BBCC.1122
```

Related commands show wireless network

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

hide-ssid (wireless-network)

Overview Use this command to hide the SSID for a selected wireless network.

Use the **no** variant of this command to stop hiding the SSID for a selected wireless network.

Syntax

```
hide ssid
no hide ssid
```

Default The default is Disabled, which means the SSID **is** included in the Access Point (AP) beacon frames. For more information, see the **Usage** section below.

Mode Wireless Network Configuration

Usage notes The SSID differentiates one wireless network from another, so all APs and all devices attempting to connect to a specific wireless network must use the same SSID to enable effective roaming.

SSIDs are included in beacon frames.

A beacon frame is one of the management frames in the IEEE 802.11 standard. Every compliant AP periodically sends beacon frames to advertise the presence of an AP in an area, its capabilities, and some configuration and security information to the client devices.

Example To hide the SSID for network 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# hide-ssid
```

Related commands ssid (wireless-network)

network (wireless)

Command changes Version 5.4.7-2.4: command added.

hs20 (wireless-network-passpoint)

Overview Use this command to add a new Hotspot 2.0 configuration and enter the configuration mode.

Use the **no** variant of this command to revert to the default.

Syntax

```
hs20
no hs20
```

Default Not set.

Mode Wireless Network Passpoint Configuration

Example To enter Hotspot 2.0 configuration mode on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
```

hwtype

Overview Use this command to configure the hardware type used for a wireless AP profile.

Use the **no** variant of this command to revert the AP hardware type to the default.

Syntax

```
hwtype <modelname>
hwtype tq {single|dual|triple} spec {11ac|11n}
no hwtype
```

Parameter	Description
<modelname>	Set the model name. See the table below for a list of model names and associated settings.
`tq`	The hardware type used for the AT-TQ series
`mws`	The hardware type used for the AT-MWS series
`single`	Single antenna model. Only available for the AT-TQ series.
`dual`	Dual antenna model.
`spec`	Enable selection of support mode of the hardware type
`11ac`	Support for 802.11ac mode.
`11n`	Support for 802.11n mode.

Table 1: AP **modelname** parameters with applicable values

AP	modelname parameter	series	bands supported	standard supported
TQ6602 GEN2, TQm6602 GEN2, TQ6702 GEN2, TQm6702 GEN2	at-tq6602gen2 at-tqm6602gen2 at-tq6702gen2 at-tqm6702gen2	tq	dual	11ax

Default hwtype tq dual spec 11ac

Mode Wireless AP Profile Configuration

Usage notes This command may reset the following configuration commands for:

- antenna (AP profile)
- mode
- bandwidth
- channel

Example To configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype tq triple 11ac
```

To use the <*modelname*> parameter to configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype at-tq5403
```

index

Overview Use this command to designate the key index number for WEP security.

Use the **no** variant of this command to use the default key index number for WEP security.

Syntax

```
index <1-4>
no index
```

Parameter	Description
<1-4>	The index number for the WEP security key.

Default The default key index number is set to **1**.

Mode Wireless Security WEP Configuration

Example To assign key index number 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# index 3
```

Related commands security (wireless))

initialization-button enable

Overview Use this command to enable the initialization button on a wireless AP using the selected AP profile.

Use the **no** variant of this command to disable the initialization button on a wireless AP using the selected AP profile.

Syntax

```
initialization-button enable
no initialization-button enable
```

Default Enabled.

Mode Wireless AP Profile Configuration

Usage notes This command effects only APs which have an initialization button.

Example To enable the initialization button on APs which use **ap-profile 100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# initialization-button enable
```

Related commands ap-profile (wireless)

show wireless ap-profile

Command changes Version 5.4.7-2.4: command added.

internet-access enable (wireless-network-passpoint-dot11u)

Overview Use this command to enable Internet access. This informs the mobile device whether Internet access is available at a hotspot – which might not be the case in walled-garden environments, where the Hotspot Operator (for example, an hotel) may limit Wi-Fi access to locally available content.

Use the **no** variant of this command to disable Internet access.

Syntax

```
internet-access enable
no internet-access enable
```

Default Disabled.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure Internet access, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
internet-access enable
```

Related commands show wireless network

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

ip-addr-type-availability (wireless-network-passpoint-dot11u)

Overview Use this command to set the IPv4 and IPv6 Address Type Availability for 802.11u.

This is information about the IP address version and type that the Hotspot Operator uses and that would be allocated and available to a mobile device after it authenticates to the network.

Use the **no** variant of this command to reset the IPv4 and IPv6 Address Type Availability to their default value.

Syntax

```
ip-addr-type-availability
{no-exist|public|port-restrict|private-nat1|private-nat2|port-
private-nat1|port-private-nat2|unknown} ipv6
{no-exist|exist|unknown}
```

```
no ip-addr-type-availability
```

Parameter	Description
`no-exist (ipv4)`	Not exist IPv4.
`public (ipv4)`	Public IPv4.
`port-restrict (ipv4)`	IPv4 with port restrictions.
`private-nat1 (ipv4)`	Private IPv4 address with Network Address Translation (NAT) once.
`private-nat2 (ipv4)`	Private IPv4 address with Network Address Translation (NAT) twice.
`port-private-nat1 (ipv4)`	Private IPv4 with port restrictions and Network Address Translation (NAT) once.
`port-private-nat2 (ipv4)`	Private IPv4 with port restrictions and Network Address Translation (NAT) twice.
`unknown (ipv4)`	Availability unknown IPv4
`no-exist (ipv6)`	Not exist IPv6
`exist (ipv6)`	Exist IPv6
`unknown (ipv6)`	Availability unknown IPv6

Default IPv4: port-private-nat1.

IPv6: no-exist

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the IPv4 Address Type Availability to public and the IPv6 to no-exist, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
ip-addr-type-availability public ipv6 no-exist
```

ip-address (wireless-ap)

Overview Use this command to specify the IP address of a wireless Access Point (AP).

Use the **no** variant of this command to remove the IP address of the selected wireless AP.

Syntax

```
ip-address <ip-address>
no ip-address
```

Parameter	Description
<ip-address>	IPv4 address of the wireless AP.

Default Not set.

Mode Wireless AP Configuration

Example To specify an IPv4 address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# ip address 192.168.0.100
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

key

Overview Use this command to designate the shared secret key used on a wireless AP belonging to channel blanket.

Use the **no** variant of this command to remove a designated key for a wireless AP belonging to channel blanket.

Syntax

```
key [encrypted] <key-string>
no key
```

Parameter	Description
`encrypted`	This parameter is displayed in show running-config output to indicate that it is displaying the password in encrypted form. You should not enter encrypted on the CLI yourself.
<key-string>	The usable key-string characters. They can be up to16 letters using ASCII Printable excluding double-quote and single-quote.

Default Not set.

Mode Wireless AP Profile Channel Blanket Configuration

Usage notes When not set, a random shared key is automatically genererated.

Example To configure AP profile100, with a channel blanket key, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# key L51nJ6Cp/A-bwXx3
```

Command changes Version 5.4.9-1.1: command added

key (wireless-sc-prof)

Overview Use this command to set the Smart Connect profile security key.

Use the **no** variant of this command to remove the security key from the Smart Connect profile.

Syntax

```
key <key-word>
no key
```

Parameter	Description
<key-word>	The WPA shared key. This is an alphanumeric string 8-64 characters long.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Usage notes This command configures the WPA shared key for the Smart Connect network. If no key is set, the security key will be automatically generated.

Example To set the security key for Smart Connect profile 10 to 'sc10-secret-keyword', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# key sc10-secret-keyword
```

Related commands smart-connect-profile

Command changes Version 5.5.0-0.1: command added

key (wireless-sec-wep)

Overview Use this command to set the key-string for a WEP security configuration.

Use the **no** variant of this command to remove a key-string for a WEP security configuration.

Syntax

```
key <1-4> [encrypted] <key-string>
no key <1-4>
```

Parameter	Description
<1-4>	The key's index number. To configure the index number(s), use the **index** command.
`encrypted`	This parameter is displayed in **show running-config** output to indicate that it is displaying the password in encrypted form. You should not enter **encrypted** on the CLI yourself.
<key-string>	The usable key-string characters, which depend on the key-string type. Use the **type** command to configure the key-string character type. See the table in the usage section below for more information.

Default Not set.

Mode Wireless Security WEP Configuration

Usage notes When using the **key** command, also use the **type** command to set the key-string type to either ASCII or Hex, this will also set the character and bit number limits as follows.

Type	Number of bits	Number of characters	Case sensitive
ascii	64	5	Yes
ascii	128	13	Yes
hex	64	10	No
hex	128	26	No

Example To assign the word 'friend' as the key-string at index 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
awplus(config-wireless-sec-wep)# key 3 friend
```

Related commands

Command changes

Version 5.4.7-2.4: command added.

key (wireless-sec-wpa-psnl)

Overview Use this command to set a string as the shared secret key on a wireless security WPA-personal configuration.

Use the **no** variant of this command to reset the shared key to the default.

Syntax

```
key [encrypted] <key-string>
no key
```

Parameter	Description
`encrypted`	This parameter is displayed in **show running-config** output to indicate that it is displaying the password in encrypted form. You should not enter **encrypted** on the CLI yourself.
<key-string>	The usable key-string characters for the configuration. You can enter 8 to 63 ASCII characters which are case-sensitive.

Default Not set.

Mode Wireless Security WPA-personal Configuration

Example To set **friend** as the shared secret key for a WPA-personal configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# key friend
```

l2tif enable (wireless-network-passpoint-hs20)

Overview Use this command to enable Layer 2 Traffic Inspection and Filtering (l2tif).

Use the **no** variant of this command to disable Layer 2 Traffic Inspection and Filtering.

Syntax

```
l2tif enable
no ltif enable
```

Default Disabled.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To enable Layer 2 Traffic Inspection and Filtering on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# l2tif enable
```

legacy-rates

Overview Use this command to set the legacy rates on the AP profile radio configuration.

Use the **no** variant of this command to delete any configured fixed legacy rates and return to the default.

Syntax

```
legacy-rates {all|<rates>}
no legacy-rates
```

Parameter	Description
`all`	All available rate candidates are set for the specified radio.
<rates>	Multiple usable rate candidates can be set on the specified radio, separated by commas. **For 2.4 GHz radios**: • Select from: 54, 48, 36, 24, 18, 12, 11, 9, 6, 5.5, 2,1. • If the bandwidth is 20MHz, one of 1, 2, 5.5, 11 must be specified. • If the bandwidth is 40MHz, then 1 must be specified **For 5 GHz radios**: • Select from: 54, 48, 36, 24,18,12, 9, 6. Regardless of bandwidth, one of 6, 12, 24 must be specified.

Default All.

Mode Wireless AP Profile Radio Configuration

Example To set specific legacy rates to an AP profile radio configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# legacy-rates

Overview Use this command to set the key length for a WEP key on a wireless security WEP configuration.

Use the **no** variant of this command to reset the key length for a WEP key to the default value.

Syntax

```
length {64|128}
no length
```

Parameter	Description
64	Set 64 bit as the key length for a WEP key
128	Set 128 bit as the key length for a WEP key

Default 128 bit.

Mode Wireless Security WEP Configuration

Example To configure 64 bit length as the key length for a WEP key on a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# length 64
```

Related commands security (wireless)

key (wireless-sec-wep)

Command changes Version 5.4.7-2.4: command added.

log enable destination

Overview Use this command to enable the external media function storing of wireless client and neighbor AP log files.

Use the **no** variant of this command to disable the external media function storing of wireless client and neighbor AP log files.

Syntax

```
log enable destination {usb|card}
no log enable
```

Parameter	Description
`usb`	USB storage device
`card`	SD card storage device

Default Disabled, there is no destination storage device set as a default.

Mode Wireless Configuration

Example To enable the log function and configure the log store destination to USB, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log enable destination usb
```

Related commands

log size wireless-client

Command changes Version 5.4.9-2.3: command added

log interval neighbor-ap

Overview Use this command to configure the interval times for storing a neighbor AP log.

Use the **no** variant of this command to revert to the default interval time of 30 minutes.

Syntax

```
log interval neighbor-ap <30-1440>
no log interval
```

Parameter	Description
<30-1440>	The interval time between storing neighbor AP logs. Enter a number in the range of 30 (min) -1440 (1 day).

Default 30 minutes

Mode Wireless Configuration

Example To configure a 60 minute interval time for storing neighbor AP logs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log interval neighbor-ap 60
```

Related commands

log enable destination

log rotate neighbor-ap

show wireless

Command changes Version 5.4.9-2.3: command added

log rotate neighbor-ap

Overview Use this command to configure the number of rotations for storing neighbor AP log files. When the configured value is reached, the oldest log file is deleted and the latest log file is stored.

Use the **no** variant of this command to revert to the default value of 1.

Syntax

```
log rotate neighbor-ap <0-65534>
no log rotate neigbor-ap
```

Parameter	Description
<0-65534>	The number of rotations a neighbor AP log is stored for, before deleting the oldest stored file.

Default 1

Mode Wireless Configuration

Example To configure 100 generations of a neighbor's AP log files to be stored, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate neighbor-ap 100
```

Related commands

log enable destination

log interval neighbor-ap

show wireless

Command changes Version 5.4.9-2.3: command added

log rotate wireless-client

Overview Use this command to configure the number of rotations for storing wireless client log files.

You can determine the size of each wireless client log by using this command and the **log size wireless-client** command together.

For example, log size wireless-client 50, log rotate wireless-client 4 -> 50 / (4+1) = 10Kbytes.

Use the **no** variant of this command to revert to the default value of 1.

Syntax

```
log rotate wireless-client <0-255>
no log rotate wireless-client
```

Parameter	Description
<0-255>	The number of rotations for a wireless-client log. Set a number in the range 0-255.

Default The default number of rotations is 1.

Mode Wireless Configuration

Example To configure 10 generations of a wireless-client log file, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate wireless-client 10
```

Related commands

log enable destination

log size wireless-client

show wireless

Command changes Version 5.4.9-2.3: command added

log size wireless-client

Overview Use this command to configure the file size used for storing wireless client logs.

You can determine the size of each wireless client log by using this command and the **log rotate wireless-client** commands together.

For example, log size wireless-client 50, log rotate wireless-client 4 -> 50 / (4+1) = 10Kbytes.

Use the **no** variant of this command to revert to the default log size value.

Syntax

```
log size wireless-client <50-4194304>
no log size wireless-client
```

Parameter	Description
<50-4194304>	Wireless client log size in kilobytes

Default 50 kilobytes.

Mode Wireless Configuration

Example To configure a wireless-client log size of 1Mbyte, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log size wireless-client 1000000
```

Related commands

log enable destination

login username (wireless-ap)

Overview Use this command to specify a username and password for a wireless Access Point (AP).

Use the **no** variant of this command to remove a username and password for a wireless AP.

Syntax

```
login username <username> password <password>
no login username
```

Parameter	Description
<username>	The username for the selected AP. The first character of the AP username must be a letter.
<password>	An alphanumeric string of characters used as the password for the selected AP.

Default Not set

Mode Wireless AP Configuration

Example To set the username **manager** and password **friend** for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login username manager password friend
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

login-password (wireless-ap)

Overview Use this command to set the login password for an Access Point (AP).

Use the **no** variant of this command to remove the login password for an AP.

Syntax

```
login-password <password>
no login-password
```

Parameter	Description
<password>	An alphanumeric string of characters used as the password for the selected AP.

Default Not set.

Mode Wireless AP Configuration

Example To configure a password for AP 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login-password friend
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

mac-address (wireless-ap)

Overview Use this command to specify the MAC address for a wireless Access Point (AP).

Use the **no** variant of this command to remove the MAC address of the selected wireless AP.

Syntax

```
mac-address <mac-address>
no mac-address
```

Parameter	Description
<mac-address>	The MAC address of the wireless AP in hexadecimal notation with the format HHHH.HHHH.HHHH.

Default Not set.

Mode Wireless AP Configuration

Example To specify a MAC address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# mac-address 0000.5e00.5301
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

mac-auth critical-mode enable

Overview Use this command to enable MAC authentication critical mode on a wireless network.

Use the **no** variant of this command to disable MAC authentication critical mode on a wireless network.

Syntax
```
mac-auth critical-mode enable
no mac-auth critical-mode enable
```

Default Disabled

Mode Wireless Network Configuration

Usage notes We recommend configuring this feature through the AMF Security mini GUI, rather than through this command.

Example To enable MAC authentication critical mode on wireless network 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth critical-mode enable
```

Related commands show wireless network

wireless

Command changes Version 5.5.2-2.1: command added

mac-auth mode

Overview Use this command to choose the MAC address authentication mode for a wireless network. You can choose to authenticate clients through RADIUS or through AMF Security mini.

Use the **no** variant of this command to reset the mode to the default of RADIUS.

Syntax

```
mac-auth mode {atmf-application-proxy|radius}
no mac-auth mode
```

Parameter	Description
`atmf-application-proxy`	Use AMF Security mini to authenticate clients.
`radius`	Use RADIUS to authenticate clients.

Default RADIUS

Mode Wireless Network Configuration

Usage notes We recommend configuring this feature through the AMF Security mini GUI, rather than through this command.

Example To authenticate clients through AMF Security mini on network 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth mode
atmf-application-proxy
```

Related commands

wireless

Command changes Version 5.5.2-2.1: command added

mac-auth password

Overview Use this command to change the password for MAC-based authentication.

Use the **no** variant of this command to return the password to its default.

Syntax

```
mac-auth password <password>
no mac-auth password
```

Parameter	Description
<password>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except ?, " (double quotes), and spaces.

Default By default the password is the MAC address of the supplicant.

Mode Wireless Network Configuration

Example To set the password for MAC authentication to be 'SECRET', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth password SECRET
```

To reset the password for MAC authentication to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth password
```

Related commands

enable (wireless-network-cp)

network (wireless)

mac-auth radius auth group (wireless-network)

mac-auth username

Command changes Version 5.4.9-2.1: command added

mac-auth radius auth group (wireless-network)

Overview Use this command to enable MAC authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable MAC authentication with a RADIUS group.

Syntax

```
mac-auth radius auth group {radius|<group-name>}
no mac-auth radius auth group
```

Parameter	Description
`radius`	Use a RADIUS group, which means **all** RADIUS servers.
<group-name>	The RADIUS server group.

Default Not set.

Mode Wireless Network.

Usage notes This command enables MAC authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

Example To enable MAC authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth radius auth group
radius
```

Related commands network (wireless)

Command changes Version 5.4.7-2.4: command added.

mac-auth username

Overview Use this command to set the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Use the **no** variant of this command to reset the format to the default of hyphen and lower-case.

Syntax

```
mac-auth username {hyphen|colon|unformatted}
{lower-case|upper-case}
```

```
no mac-auth username
```

Parameter	Description
`hyphen`	The MAC address includes hyphens, e.g. xx-xx-xx-xx-xx-xx.
`colon`	The MAC address includes colons, e.g. xx:xx:xx:xx:xx:xx.
`unformatted`	The MAC address does not include hyphens or colons, e.g. xxxxxxxxxxxx.
`lower-case`	The MAC address uses lower-case characters (a-f).
`upper-case`	The MAC address uses upper-case characters (A-F).

Default Default format is hyphen lower-case.

Mode Wireless Network Configuration

Example To configure the format of the MAC address in the username and password field to be colon and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth username colon
upper-case
```

To reset the format of the MAC address in the username and password field to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth username
```

Related commands

Command changes Version 5.4.9-2.1: command added

management address

Overview Use this command to configure a management address on the router for transmitting Autonomous Wave Control (AWC) packets to Access Points (APs). The management address must already exist on a device interface.

Use the **no** variant of this command to turn off AP management by AWC on the management address.

Syntax

```
managment address <ipv4-addr>
no management address
```

Parameter	Description
<ipv4-addr>	Set the IPv4 interface address used for AP management by AWC.
`no`	Unset the IPv4 management address used for AP management by AWC.

Default Not enabled.

Mode Wireless Configuration

Example To configure an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# management address 192.168.0.1
```

To remove an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no management address
```

Related commands enable (wireless)

Command changes Version 5.4.7-2.4: command added.

management-frame-protection enable (wireless-sec-osen)

Overview Use this command to enable management frame protection (MFP) for wireless Access Points (APs) using the OSEN security mode.

MFP provides security for management messages passed between APs and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

Syntax

```
management-frame-protection enable [type {capable|required}]
no management-frame-protection enable
```

Parameter	Description
`type`	The type of protection, select **capable** or **required**. If protection **type** is omitted, then **capable** is the default protection type.
`capable`	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
`required`	Prevents clients that do not support 802.11w from associating with the SSID.

Default Enabled.

Mode Wireless Security OSEN Configuration

Usage notes Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

Example To enable management frame protection for clients that do not support 802.11w, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode osen
awplus(config-wireless-sec-osen)# management-frame-protection
enable type required
```

To disable management frame protection, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode osen
awplus(config-wireless-sec-osen)# no
management-frame-protection enable
```

Related commands

security (wireless)

versions (wireless-sec-osen)

Command changes

Version 5.5.0-2.3: command added

management-frame-protection enable (wireless-sec-wpa-ent)

Overview Use this command to enable management frame protection (MFP) in a WPA-enterprise configuration.

MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

Syntax

```
management-frame-protection enable [type{capable|required}]
no management-frame-protection enable
```

Parameter	Description
`type`	The type of protection, select **capable** or **required**. If protection **type** is omitted, then **capable** is the default protection type.
`capable`	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
`required`	Prevents clients that do not support 802.11w from associating with the SSID.

Default Enabled.

Mode Wireless Security WPA-enterprise Configuration

Usage notes Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

Example To **disable** MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-enterprise
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

Related commands

Command changes

Version 5.4.7-2.4: command added.

Version 5.5.0-2.3: parameter **type** added

management-frame-protection enable (wireless-sec-wpa-psnl)

Overview Use this command to enable Management Frame Protection (MFP). MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

This parameter will be ignored when the version list includes **wpa3** as WPA3 requires that MFP is enabled, see versions (wireless-sec-wpa-psnl).

Use the **no** variant of this command to disable MFP.

Syntax

```
management-frame-protection enable[type{capable|required}]
no management-frame-protection enable
```

Parameter	Description
`type`	The type of protection, select **capable** or **required**. If protection **type** is omitted, then **capable** is the default protection type.
`capable`	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
`required`	Prevents clients that do not support 802.11w from associating with the SSID.

Default Enabled.

Mode Wireless Security WPA-personal Configuration

Usage notes Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

Example To disable MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

Command changes

Version 5.4.7-2.4: command added.

Version 5.5.0-2.3: parameter **type** added

max-clients

Overview Use this command to set the number of clients able to connect to a wireless Access Point (AP).

Use the **no** variant of this command to return the number of clients able to connect to the default value.

Syntax

```
max-clients <0-200>
no max-clients
```

Parameter	Description
<0-200>	The number of clients able to connect to the wireless AP. Configuring the **number 0** will disable all clients from connecting to the selected AP. For the **MWS** series, the range is: *<0 -127>* with a default of 127.

Default 200.

Mode Wireless AP Profile Radio Configuration

Example To set the maximum number of clients that can connect to a wireless AP to 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# max-clients 100
```

Related commands radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

mode (wireless-ap-prof-radio)

Overview Use this command to set the **wireless standard** and **bandwidth** mode used by the Access Points (APs) in a secure wireless security configuration. The AP type or model determines which mode to select.

Use the **no** variant of this command to set the mode to the default values specified for an AP type.

Syntax

```
mode {a|bg|a-n|bg-n|n-only-a|n-only-g|a-n-ac|n-ac}
no mode
```

Parameter	Standard	Description
a	802.11a	Bandwidth 54Mbps - 5GHz
bg	802.11bg	Bandwidths 11 and 54Mbps- 2.4GHz.
a-n	802.11a/n	Bandwidths 54 and 300 Mbps - 2.4GHz.
bg-n	802.11b/g/n	Bandwidths 11, 54, and 300 Mbps - 2.4GHz
n-only-a	802.11n	Bandwidth 300 Mbps using the 5GHz bandwidth
n-only-g	802.11n	Bandwidth 300 Mbps using the 2.4GHz bandwidth
a-n-ac	802.11a/n/ac	Dual-band: supporting simultaneous connections on both the 2.4 GHz and 5 GHz Wi-Fi bands. 802.11ac offers backward compatibility to 802.11b/g/n and bandwidth rated up to 1300 Mbps on the 5 GHz band plus up to 450 Mbps on 2.4 GHz.
n-ac	802.11n/ac	Dual-band: Bandwidth 54, and 300Mbps using both the 2.4 and 5GHz frequencies.

Default The default values change with each antenna type and AP.

Mode Wireless AP Profile Radio Configuration

Example To configure the wireless mode **a-n-ac** for AP profile 100, radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# mode a-n-ac
```

Related commands

hwtype

radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

mode (wireless-network-cp)

Overview Use this command to set the Captive Portal (web authentication) mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to reset the Captive Portal mode to default.

Syntax

```
mode {click-through|radius|external-page-redirect}
no mode
```

Parameter	Description
`radius`	The user name and password entered from the browser screen are sent to the RADIUS server and a network connection is permitted after successful authentication.
`click-through`	This method asks users to agree to the terms of use (click-through agreement) before allowing them to connect to the wireless network.
`external-page-redirect`	Redirect the authentication page to a user configured URL such as a third party Captive Portal vendor page.

Default click-through

Mode Wireless Network Captive Portal Configuration

Usage notes Click-through is only valid for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 wireless access points.

Click-through is not supported on TQ2450, TQ3200, TQ3400 or TQ3600 APs. Set the mode to **radius** (external RADIUS authentication) for these devices.

Example To set the Captive Portal authentication mode as RADIUS, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius

Version 5.4.9-1.1: command added

Version 5.5.0-1.3: **external-page-redirect** parameter added

nai-realm (wireless-network-passpoint-dot11u)

Overview Use this command to set the NAI (Network Access Identifier) Realm information.

Use the **no** variant of this command to remove a specified NAI Realm entry.

Syntax

```
nai-realm <realm-number> realm-name <realm-name> eap-method
<eap-method>
```

```
no nai-realm <realm-number>
```

Parameter	Description
<realm-number>	NAI Realm information's unique entry number in the range <1-10>
<realm-name>	NAI Realm name: • The NAI Realm Name in FQDN (Fully Qualified Domain Name) format. • Multiple NAI Realm Names must be separated by a comma. • The maximum number of characters allowed including commas is 100.
<eap-method>	Designated EAP method(s) in a list format. The list can use either **eap-tls** or **eap-ttls** or **eap-sim** or two of these three in any order.

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Usage notes A network access identifer (NAI) is a standardized (RFC 4282) format for identifying users requesting access to a network (e.g.user@realm.com). Thus, an NAI Realm identifes the proper authentication server or domain for the user's authentication exchange.

Example To configure an NAI Realm Name and EAP method(s), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# nai-realm 2

network-auth-type (wireless-network-passpoint-dot11u)

Overview Use this command to set the network authentication type.

Use the **no** variant of this command to remove the specified network authentication type.

Syntax

```
network-auth-type
{online-enrollment|terms-and-conditions|redirect-http-https|
redirect-dns} [redirect-url <url>]
```

```
no network-auth-type
{online-enrollment|terms-and-conditions|redirect-http-https|
redirect-dns}
```

Parameter	Description
`online-enrollment`	Authentication type as online enrollment.
`terms-and-conditions`	Authentication type as terms and conditions.
`redirect-http-https`	Redirect using HTTP/HTTPS.
`redirect-dns`	Redirect using DNS.
`redirect url <url>`	Redirect using URL. The URL is an ASCII string of up to 128 characters other then the following characters. {, }, |, \, ^, [,], ` Refer to RFC-2396

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Example To set the network authentication type as online-enrollment with a redirect URL, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
network-auth-type online-enrollment redirect-url example.com
```

To delete the network authentication type online-enrollment, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# no
network-auth-type online-enrollment
```

Related commands

Version 5.5.0-2.3: command added

network-type (wireless-network-passpoint-dot11u)

Overview Use this command to select the access network type.

Use the **no** variant of this command to revert to the default access network type.

Syntax

```
network-type {private|guest-private|chargeable-public|
free-public|personal-device|emergency|test|wildcard}
no network-type
```

Parameter	Description
`private`	Private network
`guest-private`	Private network with guest access
`chargeable-public`	Chargeable public network
`free-public`	Free public network
`personal-device`	Personal device network
`emergency`	Emergency service only network
`test`	Test or experimental network
`wildcard`	Wildcard

Default Private.

Mode Wireless Network Passpoint 802.11u Configuration

Example To enter the 802.11u configuration mode and set the network access type to free-public, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# network-type
free-public
```

Related commands

Command changes Version 5.5.0-2.3: command added

network (wireless)

Overview Use this command to configure an Autonomous Wave Control (AWC) network.

If the network doesn't exist, then this command creates it.

Use the **no** variant of this command to remove an AWC network.

Syntax

```
network <1-65535>
```

Parameter	Description
<1-65535>	The network ID number

Default Not set.

Mode Wireless Configuration

Usage notes This commands adds a network configuration and enters the network configuration mode.

Example To configure an AWC network with an ID of 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
```

Command changes Version 5.4.7-2.4: command added.

ntp designated-server

Overview Use this command to designate the NTP server that a wireless Access point (AP) refers to.

Use the **no** variant of this command to remove the configured IP address or host-name of the NTP server.

Syntax

```
ntp designated-server {ip <ip-address>|host <host-name>}
no ntp designated-server
```

Parameter	Description
<ip-address>	Specify the IP address of the NTP server, entered in the form A.B.C.D for an IPv4 address.
<host-name>	Specify the host-name for the NTP server

Default Disabled.

Mode Wireless AP Profile Configuration

Usage notes This command sets the NTP server that a wireless AP refers to. If the NTP server is disabled, then the AP will synchronize its time with the AWC router.

This is because the AP can not hold current time after a reboot because it does not have a real-time clock.

Therefore, the NTP master must be configured on the AWC router.

Example To configure an NTP server with an IP address of 192.168.0.254 for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
192.168.0.154
```

Command changes Version 5.4.7-2.4: command added

ntp designated-server enable

Overview Use this command to configure NTP on a wireless Access Point (AP).

Use the **no** variant of this command to disable the NTP feature on an AP.

Syntax

```
ntp designated-server enable
no ntp designated-server enable
```

Default Enabled.

Mode Wireless AP Profile Configuration

Example To disable NTP for AP-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no ntp designated-server
enable
```

Related commands ntp designated-server

Command changes Version 5.4.7-2.4: command added.

ntp designated-server period

Overview Use this command to set the time adjustment period for an NTP server. This is the time adjustment period for a wireless AP using the selected AP profile.

Use the **no** variant of this command to reset the time adjustment period to the default of 10 minutes.

Syntax

```
ntp designated-server period <1-9999>
no ntp designated-server period
```

Parameter	Description
<1-9999>	The time adjustment period for the NTP server in minutes.

Default 10 minutes.

Mode Wireless AP Profile Configuration

Example To configure 30 minutes as the NTP server time adjustment period for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server 192.168.0.254
awplus(config-wireless-ap-prof)# ntp designated-server period 30
```

Related commands

operating-class (wireless-network-passpoint-hs20)

Overview Use this command to set the Operating Class for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
operating-class <HEX-value>
no operating-class
```

Parameter	Description
<HEX-value>	Operating Class Indication value in HEX. Refer to Table E-4 of IEEE Std 802.11-2012 Annex E

Default 51

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set an Operating Class Indication value of 51, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
operating-class 51
```

Related commands show wireless network

hs20 (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

operator (wireless-network-passpoint-hs20)

Overview Use this command to configure the operator friendly name, unique entry number, and language code of a Hotspot 2.0 entry.

Use the **no** variant of this command to remove the configuration details of a Hotspot 2.0 entry.

Syntax

```
operator <operator-id> lang <language-code> friendly-name
<friendly-name>
```

```
no operator <operator-id>
```

Parameter	Description
<operator-id>	The unique operator entry number. Select from the range 1-10.
<language-code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<friendly-name>	The text field used to identify the Hotspot venue operator. You can use up to 252 octets of special characters (utf-8 encode). For example: "Allied Bld.5th floor".

Default Not set

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the language code and operator friendly name on Operator ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# operator 2
lang eng friendly-name Allied-Telesis
```

osu-providers friendly-name lang name

Overview Use this command to set the OSU Providers Friendly Name. This information is required with Passpoint Hotspot2.0 configurations.

Use the **no** variant of this command to remove the specified OSU Providers Friendly Name.

Syntax

```
osu-providers friendly-name lang <language-code> name
<friendly-name>
```

```
no osu-providers friendly-name lang <language-code> name
<friendly-name>
```

Parameter	Description
<language-code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<friendly-name>	The text field used to identify the OSU operator. You can use up to 252 octets of special characters (utf-8 encode). For example: "Allied Bld.5th floor".

Default None.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the OSU Provider's Friendly Name, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers
friendly-name lang eng name Example operator
```

Related commands

show wireless network

osu status enable

osu ssid

osu-providers method-list

osu-providers service-desc lang desc

osu-providers icon lang file

osu-providers server-uri

Command changes Version 5.5.2-0.1: command added

osu-providers icon lang file

Overview Use this command to set the Online Sign-up (OSU) provider icon for a Hotspot2.0 configuration.

When OSU services are available, a list of the OSU providers that are reachable from the hotspot are presented to the client. The list is typically displayed as an icon, title, and description, for each provider. The icon is actually embedded within the certificate issued to the OSU server, thus ensuring that clients don't connect to 'rogue' provisioning systems.

Use the **no** variant of this command to remove an OSU provider icon.

Syntax

```
osu-providers icon lang <language-code> file <file-name>
no osu-providers icon lang <language-code> file <file-name>
```

Parameter	Description
<language-code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<file-name>	The icon's file name: Range: <= 255 characters Format: ASCII printable string without the following characters:\/:*?"<>| Extensions: **.png** only. Size: < 64K Byte.

Default N/A.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set the OSU provider icon, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers
icon lang eng file TestIcon.png
```

To copy the OSU Provider icon from USB to flash, use the command:

```
awplus# copy usb:/TestIcon.png flash:/gui-userdata/osu-icon/
```

To check the OSU Provider icon file, use the command:

```
awplus# dir flash:/gui-userdata/osu-icon/
```

Command changes

Version 5.5.2-0.1: command added

osu-providers method-list

Overview Use this command to set the list of protocols (methods) that OSU Providers use to communicate between mobile devices.

Use the **no** variant of this command to reset the OSU Providers method list.

Syntax

```
osu-providers method-list oma-dm
osu-providers method-list soap-xml-spp
osu-providers method-list oma-dm soap-xml-spp
osu-providers method-list soap-xml-spp oma-dm
no osu-providers method-list
```

Parameter	Description
`oma-dm`	Provisioning using Open Mobile Alliance (OMA) Device Management (DM)
`soap-xml-spp`	Provisioning using Subscription Provisioning Protocol based on Simple Object Access Protocol XML.

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Usage notes The list includes the OMA-DM and SOAP-XML SPP protocols. You can configure the list priority. For example, **oma-dm soap-xml-spp** indicates the method OMA-DM has a higher priority than SOAP-XML-SPP.

Example To set the OSU Providers method list to OMA-DM and SOAP-XML SPP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers
method-list oma-dm soap-xml-spp
```

osu-providers nai

Overview Use this command to configure the OSU Providers NAI (Network Access Indentifier) on a Hotspot2.0 configuration.

Use the **no** variant of this command to remove a specified NAI Realm entry.

Syntax

```
osu-providers nai <realm-name>
no osu-providers nai <realm-name>
```

Parameter	Description
<realm-name>	NAI Realm name: • The NAI Realm Name in FQDN (Fully Qualified Domain Name) format, as described in RFC4282, Section 2.8. For example, realm@example.com • Range: <253 octets

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the OSU Provider NAI, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers
nai realm@example.com

osu-providers server-uri

Overview Use this command to configure the OSU Providers Server URI (Uniform Resource Identifier). You will need to set this on Passpoint Hotspot2.0 configurations.

Use the **no** variant of this command to reset the OSU Providers Server URI.

Syntax

```
osu-providers server-uri <uri>
no osu-providers server-uri
```

Parameter	Description
<uri>	The OSU Providers Server URI. Range: <= 253 characters, Format: ASCII printable characters.

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the OSU Provider's Server URI, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

osu-providers service-desc lang desc

Overview Use this command to set the OSU Providers Service Description. This information is required with Passpoint Hotspot2.0 configurations.

Use the **no** variant of this command to remove an OSU Providers Service Description.

Syntax

```
osu-providers service-desc lang <language-code> desc
<service-name>
```

```
no osu-providers service-desc lang <language-code> desc
<service-name>
```

Parameter	Description
<language-code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<service-name>	The text field used to identify the OSU Providers Service. You can use up to 252 octets of special characters (utf-8 encode).

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the OSU Provider's Service Description, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers

osu ssid

Overview Use this command to set the Online-signup (OSU) SSID that wireless clients will use with a Hotspot2.0 configuration.

Use the **no** variant of this command to reset the OSU Status configuration.

Syntax

```
osu ssid <ssid-value>
no osu ssid
```

Parameter	Description
<ssid-value>	The OSU SSID for the Hotspot2.0 configuration. Enter a string up to 32 characters in length. If the name contains spaces then you must enclose it in "quotation marks". For example, "test ssid" requires quotes but test-ssid does not.

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Usage notes The Passpoint OSU options allow you to register a mobile device with a service provider and choose a plan to gain network access. When you sign up, your device will send you user credentials to connect to the network.

Example To set an OSU SSID named 'test-ssid', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu ssid
test-ssid
```

To set an OSU SSID 'test ssid' (which contains a space), include double-quotes around the SSID, as shown in the following command:

```
awplus(config-wireless-network-passpoint-hs20)# osu ssid "test
ssid"
```

Related commands

Command changes Version 5.5.2-0.1: command added

osu status enable

Overview Use this command to enable OSU (Online Sign-up). OSU is an optional setting included with Passpoint configuration on a wireless network. OSU allows you to register a mobile device with a service provider and choose a plan to gain network access. When you sign up, your device will send you user credentials to connect to the network.

Use the **no** variant of this command to disable OSU.

Syntax

```
osu status enable
no osu status enable
```

Default Disabled.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To enable OSU, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

outdoor

Overview Use this command to designate that a wireless AP is located outdoors.

Use the **no** variant of this command to designate when a wireless AP is not located outdoors.

Syntax

```
outdoor
no outdoor
```

Default No outdoor.

Mode Wireless AP Profile Configuration

Usage notes This command indicates whether the wireless AP is located outdoors, and selects the mode and channel that corresponds to this. To configure a channel number, use the **channel** command in **wireless-ap-prof-radio** mode. If you configure an invalid channel number, an error message displays the valid channels that you may select in your region.

The command is ignored when the AP is already configured using the **hwtype** command.

Example To configure an AP to be located outdoors, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# outdoor
```

page-proxy-url

Overview Use this command in Captive Portal mode to set the location of the custom page to display for web authentication. This page will be displayed instead of the wireless access point's built-in authentication or click-through page.

Use the **no** variant of this command to remove the URL pointing to the custom web authentication page.

Syntax

```
page-proxy-url <URL>
no page-proxy-url
```

Parameter	Description
<URL>	URL of external web server (hostname or dotted IP notation).

Default No custom page is set by default.

Mode Wireless Network Captive Portal Configuration

Usage notes This setting is valid only for AT-TQ5403, AT-TQm5403, AT-TQ5403e, AT-TQ1402, and AT-TQm1402 wireless access points.

Example To enable and set the web authentication proxy page, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# page-proxy-url

passpoint

Overview Use this command to enter the passpoint configuration mode.

Use the **no** variant of this command to revert to the default setting.

Syntax

```
passpoint
no passpoint
```

Default Not set.

Mode Wireless Network Configuration

Example To enter passpoint configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)#
```

peer (wireless-wds)

Overview Use this command to add a pair of wireless Access Points (APs) to a WDS peer list.

Use the **no** variant of this command to remove a pair of wireless APs from a WDS peer list.

Syntax

```
peer ap <1-65535> radio <1-3> {ap <1-65535>|mac <mac-addr>}
radio <1-3>
no peer
```

Parameter	Description
`ap`	Signifies that the first AP identifier follows.
<1-65535>	The first AP identifier.
`radio`	Select the radio interface of the first AP.
<1-3>	Designate the radio interface for the first AP.
`ap`	Signifies that the second AP identifier follows.
<1-65535>	The second AP identifier.
`mac`	Signifies that the MAC address of the second AP follows.
<mac-addr>	The MAC address of the second AP. Enter the address in the format <*HHHH.HHHH.HHHH*> where *H* is a hexadecimal number.
`radio`	Select the radio interface of the second AP.
<1-3>	The radio interface for the second AP.

Default There are no APs configured in a WDS peer list by default.

Mode Wireless WDS Configuration

Example To add a pair of wireless APs to a WDS peer list, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# peer ap 10 radio 1 ap 20 radio 1
```

Related commands wds

Command changes Version 5.4.7-2.4: command added.

permit host (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP permit host for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to remove the SNMP permit host from the AP profile.

Syntax

```
permit host <host-name>
no permit host
```

Parameter	Description
<host-name>	Respond only to SNMP requests from the specified host name. For example FQDN, IP address, or subnet mask (manager.your.domain.com, 10.10.1.37, 192.168.1.1/24.

Default Not set

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP permit host to '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# permit host 192.168.1.1
```

To remove the SNMP permit host '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no permit host
```

port (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP listening port number for the target AP profile.

Use the **no** variant of this command to set the SNMP listening port back to the default (161).

Syntax

```
port <1-65535>
no port
```

Parameter	Description
<1-65535>	The SNMP listening port number to set.

Default 161

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP listening port to 166, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# port 166
```

To set the SNMP listening port back to the defautl (161), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no port
```

power (wireless-ap-radio)

Overview Use this command to set the power level for client devices on a wireless Access Point (AP).

Use the **no** variant of this command to return the power level to its default value.

Syntax

```
power <1-100>
no power
```

Parameter	Description
<1-100>	The percentage power level value.

Default A power level of 100% is the default.

Mode Wireless AP Radio Configuration

Example To set a power level of 30% for radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# power 30
```

Related commands show wireless ap

radio (wireless-ap)

Command changes Version 5.4.7-2.4: command added

pre-authentication enable (wireless-sec-osen)

Overview Use this command to allow wireless Access Points (APs) that have WPA2 clients to share the pre-authentication packets from the WPA2 clients with other APs.

When enabled, this speeds up authentication for roaming clients who connect to multiple APs.

Use the **no** variant of this command to disable pre-authentiction

Syntax

```
pre-authentication enable
no pre-authentication enable
```

Default Enabled.

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

This command is not supported by WPA clients.

Example To disable pre-authentication for an OSEN security configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# no pre-authentication enable
```

Related commands security (wireless)

show wireless security

Command changes Version 5.5.0-2.3: command added

pre-authentication enable (wireless-sec-wpa-ent)

Overview Use this command to enable WPA-enterprise pre-authentication for Access Points (APs) that have WPA2 clients.

Use the **no** variant of this command to disable WPA-enterprise pre-authentication.

Syntax

```
pre-authentication enable
no pre-authentication enable
```

Default Enabled.

Mode Wireless Security WPA-enterprise Configuration

Usage notes Enable this option if the AP has WPA2 clients and you want the AP to share the pre-authentication packets from the clients with other access points. If it is enabled, this can speed up authentication for roaming clients who connect to multiple access points. This option does not apply to WPA clients.

The MWS series of devices do not support pre-authentication, therefore, you should **disable** this command on these devices.

Example To disable pre-authentication on a WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# no pre-authentication
enable
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

proxy-arp enable

Overview Use this command to enable proxy ARP on the wireless network. When Downstream Group-Addressed Forwarding (DGAF) is disabled, AlliedWare Plus enables Proxy ARP on the Access Points.

Use the **no** variant of this command to disable proxy ARP.

Syntax
```
proxy-arp enable
no proxy-arp enable
```

Default Disabled.

Mode Wireless Network Configuration

Example To enable Proxy ARP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# proxy-arp enable
```

Related commands

qos-map-set (wireless-network-passpoint-dot11u)

Overview Use this command to set the QoS map set for 802.11u.

Use the **no** variant of this command to revert to the default value.

Syntax

```
qos-map-set <qos-map>
no qos-map-set
```

Parameter	Description
<qos-map>	QoS map configuration. • The QoS map is a comma delimited list of decimal values in the range 0-63 or 255. • The maximum number of elements in the list is 29. (21(DSCP Exception) + (8(User Priority). Refer to: IEEE Std 802.11-2012, 8.4.2.97. • Total length of QOSMAP < 190. Format: [<DSCP Exceptions[DSCP,UP]>,]<UP 0 range[low,high]>,...<UP 7 range[low,high]>

Default 0

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the qos map set, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# qos-map-set
53,2,22,6,8,15,0,7,255,16,31,32,39,255,255,40,47,255,255
```

radio (wireless-ap-profile)

Overview Use this command to enter AP profile radio configuration mode. Once in this mode, you can create and modify the radio configuration parameters for an AP profile.

Syntax

```
radio <1-3>
```

Parameter	Description
<1-3>	The radio interface within the AP profile.

Mode Wireless AP Profile Configuration

Example To enter the AP profile radio configuration mode for interface 1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# radio 1

radius accounting enable

Overview Use this command to configure RADIUS accounting on Captive Portal with external RADIUS.

Use the **no** variant of this command to disable RADIUS accounting on Captive Portal.

Syntax

```
radius accounting enable
no radius accounting enable
```

Default Disabled.

Mode Wireless Network Captive Portal Configuration

Usage notes The server settings used by Captive Portal RADIUS accounting are those configured by the **radius auth group** command. The port number used is the same one set on the primary server by the command **radius-server host**.

Example To configure RADIUS accounting on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# radius accounting enable
```

Related commands

radius accounting enable

radius auth group (wireless-network-cp)

Command changes Version 5.5.0-1.3: command added

radius auth group (wireless-network-cp)

Overview Use this command to set the RADIUS server/s that wireless APs use for Captive Portal (web authentication).

Use the **no** variant of this command to remove the RADIUS server/s used for authentication.

Syntax

```
radius auth group {radius|<groupname>}
no radius auth group {radius|<groupname>}
```

Parameter	Description
`radius`	Use a RADIUS server registered with the radius-server host command.
`<groupname>`	Use a RADIUS server that belongs to the specified server group. Use a server group created with the aaa group server radius command.

Default No RADIUS server set by default.

Mode Wireless Network Captive Portal Configuration

Usage notes This setting is only valid for TQ series APs. It has no effect on MWS series APs.

Example To use the RADIUS group 'my_rad' for Captive Portal authentication, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
awplus(config-wireless-network-cp)# radius auth group my_rad
```

radius authentication group (wireless-sec-osen)

Overview Use this command to assign a RADIUS server group for authenticating wireless AP clients using the OSEN security mode.

Use the **no** variant of this command to revert to the default RADIUS server group.

Syntax

```
radius auth group {radius|<group-name>}
no radius auth group
```

Parameter	Description
`radius`	Use RADIUS servers.
<group-name>	Use the RADIUS server group

Default RADIUS.

Mode Wireless Security OSEN Configuration

Usage notes The RADIUS server group is configured with the **aaa group server** command.

The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command. However, this command, (**radius authentication group**) uses only the first two configured servers.

Example To configure the RADIUS authentication group to authenticate APs using the OSEN security mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# radius authentication group radius
```

Related commands

Command changes Version 5.5.0-2.3: command added

radius auth group (wireless-sec-wpa-ent)

Overview Use this command to set the RADIUS server group used to authenticate clients in a wireless WPA-enterprise.

Use the **no** variant of this command to set the RADIUS server group to the default.

Syntax

```
radius auth group {radius|<group-name>}
no radius auth group
```

Parameter	Description
`radius`	Use all RADIUS servers.
<group-name>	Server group name

Default RADIUS (all RADIUS servers).

Mode Wireless Security WPA-enterprise Configuration

Example To set **radius**, which means all RADIUS servers, to authenticate a wireless WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# radius auth group radius
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

redirect-url

Overview Use this command to enable the redirect-url feature. After successful authentication this feature redirects the web browser to the URL specified in the command. If both session-keep and **redirect-url** are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the redirect-url feature.

Syntax

```
redirect-url <URL>
no redirect-url
```

Parameter	Description
<URL>	URL of page to redirect the user to (hostname or dotted IP notation).

Default Not set by default.

Mode Wireless Network Captive Portal Configuration

Usage notes This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

Example To enable and set the redirect-url for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# redirect-url
http://www.mydomain.com/welcome

rogue-ap-detection enable (wireless)

Overview Use this command to enable rogue application detection.

Use the **no** variant of this command to disable rogue application detection.

Syntax

```
rogue-ap-detection enable
no rogue-ap-detection enable
```

Default Disabled.

Mode Wireless Configuration

Example To enable rogue application detection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# rogue-ap-detection enable
```

Related commands show wireless

Command changes Version 5.4.7-2.4 command added.

roaming-oi (wireless-network-passpoint-dot11u)

Overview Use this command to set the Roaming Consortium List. A Roaming Consortium List contains multiple Organisation Identifiers (OIs) whose security credentials can be used to connect to a network.

Use the **no** variant of this command to revert to the default value.

Syntax

```
roaming-oi <oi-list>
no roaming-oi
```

Parameter	Description
<oi-list>	Roaming Consortium List. • You can have multiple OIs in a list • Each OI is between 3 and 15 octets and is configured as a headecimal string. • Separate OIs with a comma. • The maximum number of OIs is 15. • The length of a character in the OI-List must be less than 465 including commas.

Default None

Mode Wireless Network Passpoint 802.11u Configuration

Usage notes The Roaming Consortium Element tell a mobile device which roaming consortiums or service providers are available through an AP.

Example To set a Roaming Consortium List containing two OIs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# roaming-oi
021122,2233445566
```

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.1: command added.

sc-profile

Overview Use this command to add a Smart Connect profile configuration and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to remove a Smart Connect profile configuration.

Syntax

```
sc-profile <1-65535>
no sc-profile
```

Parameter	Description
<1-65535>	The Smart Connect profile ID.

Default Not set

Mode Wireless AP Profile Configuration

Example To add Smart Connect profile 1 to AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# sc-profile 1
```

Related commands

smart-connect-profile

Command changes Version 5.5.0-0.1: command added

sc-channel

Overview Use this command to set a fixed radio channel for an access point (AP) using Smart Connect.

Use the **no** variant of this command to delete this setting.

Syntax

```
sc-channel radio <1-3> channel {<channel-number>|auto}
no sc-channel
```

Parameter	Description
<1-3>	Select the radio channel fixed for AWC-SC use
<channel-number>	Select the radio channel that is defined in the AP profile
`auto`	The radio channel is automatically selected

Default Not set.

Mode Wireless Smart Connect Profile Configuration

Example To automatically configure the Smart Connect channel with AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# sc-channel radio 2 channel
auto
```

security (wireless)

Overview Use this command to configure a wireless security instance and enter a configuration mode. If the instance doesn't already exist, then this command creates it. The command has four different types of configuration mode: OSEN, WEP, WPA-Personal, and WPA-Enterprise.

Use the **no** variant of this command to remove a wireless security instance.

Syntax

```
security <1-65535> mode {osen|wep|wpa-personal|wpa-enterprise}
no security <1-65535>
```

Parameter	Description
<1-65535>	Wireless security instance identification number
`mode`	Security mode
`osen`	Security mode OSEN. This assigns the configuration identifier to **config-wireless-sec-osen** mode and enters the mode.
`wep`	Security mode WEP. This assigns the configuration identifier to **config-wireless-sec-wep** mode and enters the mode.
`wpa-personal`	Security mode WPA-Personal. This assigns the configuration identifier to **config-wireless-sec-wpa-psnl** mode and enters the mode.
`wpa-enterprise`	Security mode WPA-Enterprise. This assigns the configuration identifier to **config-wireless-sec-wpa-ent** mode and enters the mode.

Default Not set.

Mode Wireless Configuration

Usage notes You create a wireless security instance by designating a security instance ID and selecting a security mode. There are four types of security modes:

- OSEN
- WEP
- WPA-Personal
- WPA-Enterprise

Example To configure and enter the wireless security mode for WPA-Personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
```

Command changes

Version 5.4.7-2.4: command added

Version 5.5.0-2.3: **osen** parameter added

security (wireless-network)

Overview Use this command to designate a security configuration identifier for a wireless security configuration.

Use the **no** variant of this command to remove a security configuration identifier.

Syntax

```
security <1-65535>
no security
```

Parameter	Description
<1-65535>	The wireless security configuration identifier.

Default Not set.

Mode Wireless Network Configuration

Example To assign a security configuration identifier of 10 to wireless network 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 2
awplus(config-wireless-network)# security 10
```

Related commands network (wireless)

show wireless network

Command changes Version 5.4.7-2.4: command added.

security (wireless-wds)

Overview Use this command to set a wireless security configuration identifier to the WDS configuration mode.

Use the **no** variant of this command to remove the WDS security configuration identifier.

Syntax

```
security <1-65535>
no security
```

Parameter	Description
<1-65535>	The wireless security configuration identifier.

Default Not set.

Mode Wireless WDS Configuration

Example To designate the wireless security configuration identifier to the WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# security 2
```

Related commands wds

show wireless wds

Command changes Version 5.4.7-2.4: command added

service wireless

Overview Use this command to enable wireless services.

Use the **no** version of the command to disable unused wireless services.

Syntax

```
service wireless
no service wireless
```

Default Enabled

Mode Global Configuration

Usage notes On devices that support the wireless manage feature, sometimes it may be desirable to disable unused services, in order to reduce memory use. Disabling the wireless services will only take effect after you save the configuration and restart the device.

Example To disable the wireless service, use the commands:

```
awplus# configure terminal
awplus(config)# no service wireless
```

Output Figure 64-1: Example output from **no service wireless**

```
awplus(config)#no service wireless
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-0.1: command added

session-keep

Overview Use this command to enable the session-keep feature. After successful authentication this feature redirects the web browser back to the originally requested URL. If both **session-keep** and redirect-url are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the session-keep feature.

Syntax
```
session-keep
no session-keep
```

Default Not set by default.

Mode Wireless Network Captive Portal Configuration

Usage notes This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

Example To configure session-keep for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-keep
```

Related commands
captive-portal
enable (wireless-network-cp)
mac-auth password
mac-auth username
page-proxy-url
radius auth group (wireless-network-cp)
redirect-url
session-keep
mode (wireless-network-cp)

Command changes Version 5.4.9-1.1: command added

session-key-refresh-action

Overview Use this command to set the action after the interval has expired for the session key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to revert to the default action.

Syntax

```
session-key-refresh-action {reauthentication|disconnection}
no session-key-refresh-action
```

Parameter	Description
`reauthentication`	The client will be asked to re-authenticate after the session expires.
`disconnection`	The client will be disconnected when the session expires.

Default Reauthentication.

Mode Wireless Security WPA-enterprise Configuration

Usage notes This command will not work if the **session-key-refresh-interval** command is set to a non-zero value.

Example For a WPA-enterprise configuration, to set disconnect as the action after the expire session-key refresh interval, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)#
session-key-refresh-action disconnection
```

Related commands show wireless security

session-key-refresh-interval

Command changes Version 5.5.1-2.1: command added

session-key-refresh-interval

Overview Use this command to set the refresh interval for the session key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval to the default.

Syntax

```
session-key-refresh-interval <0-86400>
no session-refresh-key-interval
```

Parameter	Description
<0-86400>	The refresh interval in seconds.

Default The default refresh interval is 0 seconds.

Mode Wireless Security WPA-enterprise Configuration

Usage notes This command is for TQ series devices only.

Example To set 7200 seconds as the session key refresh rate, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wep-ent)#
session-key-refresh-interval 7200
```

Related commands security (wireless)

session-timeout-interval (wireless network-cp)

Command changes Version 5.4.7-2.4: command added

session-timeout-action (wireless network-cp)

Overview Use this command to limit the connection time for clients on a Captive Portal session. When the session times-out, the client will either be presented with the authentication page or be disconnected.

Use the **no** variant of this command to revert to the default action.

Syntax

```
session-timeout-action {reauthentication|disconnection}
no session-timeout-action
```

Parameter	Description
`reauthentication`	The client must re-authenticate before continuing to use the Captive Portal session.
`disconnection`	The client will be disconnected when the Captive Portal session expires. The client can decide whether or not to go through the process of re-authentication.

Default Reauthentication.

Mode Wireless Network Captive Portal Configuration

Usage notes This command will not work if the **session-timeout-interval** command is set to a non-zero value.

Example To disconnect an AP after its Captive Portal session has expired, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-timeout-action
disconnection
```

Related commands show wireless network

session-timeout-interval (wireless network-cp)

Command changes Version 5.5.1-2.1: command added

session-timeout-interval (wireless network-cp)

Overview Use this command to set the session-timeout-interval for authenticated clients in a Captive Portal configuration.

Use the **no** variant of this command to revert to the default session-timeout-interval value.

Syntax

```
session-timeout-interval <0-86400>
no session-timeout-interval
```

Parameter	Description
<0-86400>	The session-timeout-interval value in seconds. To disable the timeout function, set a value of '0' seconds.

Default 3600 seconds.

Mode Wireless Network Captive Portal Configuration

Example To configure a session-timeout-interval of 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-timeout-interval
1800
```

show debugging wireless

Overview Use this command to see what debugging is turned on for wireless management.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show debugging wireless
```

Mode User Exec and Privileged Exec

Example

```
awplus# show debugging wireless
```

Output Figure 64-2: Example output from the **show debugging wireless** command

```
awplus#show debugging wireless
 Wireless debugging is on
 Wireless all modules debugging is on
 Wireless warning level debugging is on
```

Related commands show wireless

show wireless

Overview Use this command to show the overall status information for Autonomous Wave Control (AWC).

Syntax

```
show wireless
```

Mode Privileged Exec

Example To show the status of AWC on a device, use the command:

```
awplus# show wireless
```

Output Figure 64-3: Example output from **show wireless**

```
awplus> show wireless
Wireless Controller Mode ........ Enable
Management IP Address ........... 192.168.8.30
Rogue AP Detection .............. Enable

Command changes Version 5.4.7-2.4: command added.

show wireless ap

Overview Use this command to display the configuration and status of wireless Access Points (APs).

Syntax

```
show wireless ap {<ap-id-range>|all} [brief|status|detail]
```

Parameter	Description
<ap-id-range>	Display the configuration and status for a selected AP or range of APs, <1-65535>.
`all`	Display the configuration and status of APs.
`brief`	Display the brief configuration details of APs.
`status`	Display the status of APs.
`detail`	Display the detailed status and device information of APs.

Mode Privileged Exec

Example To display the status and configuration of wireless APs, use the following commands:

```
awplus# show wireless ap
```

Output Figure 64-4: Example output from **show wireless ap**

```
awplus#show wireless ap

Command changes

Version 5.4.7-2.4: command added.

show wireless ap capability

Overview Use this command to display the configured specifications of a supported wireless Access Point (AP).

Syntax

```
show wireless ap capability
show wireless ap capability hwtype <modelname>
show wireless ap capability hwtype {tq|mws}
[single|dual|triple] [spec {11ac|11n}] [radio {1|2|3}] [country
<country-code>]
```

Parameter	Description
`hwtype`	To specify the display of a hardware type. When omitted, all hardware types will be displayed.
`<modelname>`	The model name of the wireless AP capabilities to be displayed. See hwtype for a full list of model names.
`tq`	Display hardware type AT-TQ series only.
`mws`	Display hardware type AT-MWS series only.
`single`	Display a single radio interface.
`dual`	Display a dual radio interface.
`spec`	To specify the display of an IEEE wireless networking standard mode. When omitted, all modes are displayed.
`11ac`	Display information for the 802.11ac mode only.
`11n`	Display information for the 802.11n mode only.
`radio`	To specify a radio bandwidth. When omitted, all radio bandwidths are displayed.
`1`	Display information for radio bandwidth 2.4GHz only.
`2`	Display information for radio 2 bandwidth 5GHz only.
`3`	Display information for radio 3 bandwidth 5GHz only.
`country`	To specify the display for a country. When omitted, the default country will be displayed.
`<country-code>`	Display the specified country code. The default country code is 'jp' for Japan or 'us' for other regions.

Mode User Exec and Privileged Exec

Output Figure 64-8: Example output from **show wireless ap capability**

```
awplus#show wireless ap capability
Country: jp

Command changes

Version 5.4.7-2.4: command added.

Version 5.4.9-1.1: <*modelname*> parameter added.

show wireless ap client

Overview Use this command to display the client information on a managed wireless Access Point (AP).

Syntax

```
show wireless ap [<ap-id-range>] client [radio <1-3>]
```

Parameter	Description
<ap-id-range>	Display information for the selected Access Point, or range <1-65535>.
radio	Select a radio interface on the AP.
<1-3>	Radio interface number.

Mode User Exec and Privileged Exec

Example To display the wireless AP client settings, use the following commands:

```
awplus# show wireless ap client
```

Output Figure 64-9: Example output from **show wireless ap client**

```
awplus#show wireless ap client
IP Address      Mac Address    AP  SSID        Radio Ch Signal Age
--------------- -------------- --- ----------- ----- -- ------ --------------

```

Related commands radio (wireless-ap)

Command changes Version 5.4.7-2.4: command added

show wireless ap neighbors

Overview Use this command to display the neighboring wireless Access Points (APs) connected to a radio or range of radios. If no parameters are specified, then all configurations are displayed.

Syntax

```
show wireless ap [<ap-id-range>|all] neighbors [radio <1-3>]
```

Parameter	Description
<ap-id-range>	Show the radio and wireless neighbors associated with an AP or range of APs. To select a range, use the range format <1-65535>.
`all`	Display the radio and neighbors for all APs.
`radio`	Display the configured radio.
<1-3>	Radio interface number.

Mode User Exec and Privileged Exec

Usage notes If the total number of AP neighbors in the system exceeds 12500, this command will only show the first 12500 neighbors. You can specify the AP ID to see all neighbors of each AP.

Example To display all wireless AP neighbors, use the following command:

```
awplus# show wireless ap neighbors
```

Output Figure 64-10: Example output from **show wireless ap neighbors**

```
awplus#show wireless ap neighbors
BSSID          ESSID                    R Ch  Sig AP    Detected

Related commands radio (wireless-ap)

Command changes Version 5.4.7-2.4: command added.

Version 5.4.8-1.1: display limited to 12500 neighbors

show wireless ap power-channel

Overview Use this command to display the currently configured status of an Access Point (AP) power-channel. If the command parameters are omitted, then the status for all APs will display.

Syntax

```
show wireless ap [<ap-id-range>|all] power-channel
```

Parameter	Description
<ap-id-range>	Display the current power-channel status for a selected AP or range of APs in the format <1-65535>
`all`	Display the current power-channel status for all APs.

Mode User Exec and Privileged Exec

Example To display the currently configured power-channel status for APs, use the command:

```
awplus# show wireless ap power-channel
```

Output Figure 64-11: Example output from **show wireless ap power-channel**

```
awplus#show wireless ap power-channel
AP    MAC address    Radio1         Radio2
----- -------------- -------------- -------------
1   001a.ebbc.0200   Ch:120 (100%) -
```

Related commands

wireless power-channel ap all

show wireless power-channel calculate

Command changes Version 5.4.7-2.4: command added.

show wireless ap-profile

Overview Use this command to display the AP-profile configuration for Autonomous Wave Control.

Syntax

```
show wireless ap-profile [<ap-profile-id-range>|all] [brief]
```

Parameter	Description
<ap-profile-id-range>	Displays the AP-profile information for an ID range. The ID range is <1-65535>.
`all`	Displays all AP-profile configurations.
`brief`	Displays a brief summary of AP-profile configurations.

Mode User Exec and Privileged Exec

Output Figure 64-12: Example output from **show wireless ap-profile brief**

```
awplus#show wireless ap-profile brief

show wireless captive-portal network walled-garden

Overview Use this command to display wireless network walled garden entries for Captive Portal.

Syntax

```
show wireless captive-portal {<network-ID>|all} walled-garden
```

Parameter	Description
<network-ID>	Display output for the specified wireless network ID or range of network IDs, valid network IDs are <1- 65535>.
`all`	Display all wireless network walled garden entries.

Mode Privileged Exec

Example To display the walled garden entries for Captive Portal on network 5, use the commands:

```
awplus# show wireless captive-portal network 5 walled-garden
```

Output Figure 64-14: Example output from **show wireless captive-portal network 5 walled-garden**

```
awplus#show wireless captive-portal network 5 walled-garden
WALLED GARDEN LIST FOR NETWORK ID 5:
 Entries ..................... 3
    Walled Garden
    -----------------------------
    example.com
    1.1.1.1
    1.1.1.0/24
```

Command changes Version 5.5.0-1.3: command added

show wireless channel-blanket ap status

Overview Use this command to display the channel blanket status for a single or range of wireless APs. An AP whose AP ID is displayed as "-" is an AP that is not part of an AWC Lite configuration. If an AP ID (or range) is not selected, then the status of all APs will be displayed.

Syntax
```
show wireless channel-blanket ap {<ap-idrange> | all} status
```

Parameter	Description
<ap-idrange>	The AP ID, or range of IDs <1-65535>.
`all`	Display the channel blanket status of all APs

Mode Privileged Exec

Example To display the wireless channel blanket status for AP 100, use the command:

```
awplus# show wireless channel-blanket ap 100 status
```

Output Figure 64-15: Example output from **show wireless channel-blanket ap status**

```
awplus#show wireless channel-blanket ap 100 status
 AP: 100
 Last Update Time: 2018-10-04 01:33:33

Command changes Version 5.4.9-1.1: command added

show wireless channel-blanket ap-profile status

Overview Use this command to display the channel blanket status of AP profiles. The command displays the number of channel blanket APs configured and visible from each AP to which the profile is assigned. An AP whose member is displayed as "-" is an AP that is not part of the channel blanket. If an AP Profile (or range) is not selected, then all APs profiles will be displayed.

Syntax

```
show wireless channel-blanket ap-profile {<profile-id> | all}
status
```

Parameter	Description
<profile-id>	The AP Profile ID, or range of IDs <1-65535>.
`all`	Display the status of all APs in the AP profile.

Mode Privileged Exec

Example To display the wireless channel blanket status for APs belonging to AP profile 100, use the following command:

```
awplus# show wireless channel-blanket ap-profile 100 status
```

Output Figure 64-16: Example output from **show wireless channel-blanket ap-profile**

```
awplus#show wireless channel-blanket ap-profile 100 status
AP Profile: 100
 AP    Member TimeStamp
 ----- ------ -------------------

show wireless country-code

Overview Use this command to display a list of country codes that can be used on an Access Point (AP) Autonomous Wave Control (AWC) configuration.

Syntax

```
show wireless county-code
```

Mode User Exec and Privileged Exec

Example To display the list of AWC country codes, use the command:

```
awplus# show wireless country-code
```

Output Figure 64-17: Example output extract from **show wireless country-code**

```
awplus#show wireless country-code
Code  Country
----  ------------------------------
AD    Andorra
AE    United Arab Emirates
AF    Afghanistan

show wireless network

Overview Use this command to display the wireless network configuration for Autonomous Wave Control (AWC).

If you use the **brief** parameter, a summary of the configuration will be displayed, otherwise a detailed version is displayed.

Syntax

```
show wireless network [<network-id-range>|all] [brief]
```

Parameter	Description
<network-id-range>	Display the network configuration for a selected network ID or network ID range <1-65535>.
`all`	Display the configuration for all wireless networks.
`brief`	Display a brief summary of the network configuration.

Mode User Exec

Example To display the brief wireless network configuration, use the command:

```
awplus# show wireless network brief
```

Output Figure 64-18: Example output from **show wireless network brief**

```
awplus#show wireless network brief

show wireless power-channel calculate

Overview Use this command to display the result of the optimal power per channel as calculated by Autonomous Wave Control (AWC).

Note: To see the currently assigned power per channel, use the command show wireless ap power-channel.

Syntax
```
show wireless power-channel calculate
```

Mode Privileged Exec

Example To display the optimal power for each channel as calculated by AWC, use the following command:

```
awplus# show wireless power-channel calculate
```

Output Figure 64-20: Example output from **show wireless power-channel calculate**

```
awplus#show wireless power-channel calculate

show wireless sc-profile

Overview Use this command to display the Smart Connect profile configuration.

Syntax

```
show wireless sc-profile [<sc-profile-range>|all] [brief]
```

Parameter	Description
<sc-profile-range>	The Smart Connect profile ID or IDs to display. Select from the range 1-65535
`all`	Display all Smart Connect profiles
`brief`	Display a brief summary of the Smart Connect profile configuration

Mode Privileged Exec

Example To display all the Smart Connect profile information, use the command:

```
awplus# show wireless sc-profile all
```

Output Figure 64-21: Example output from **show wireless sc-profile all**

```
awplus#show wireless sc-profile all

show wireless security

Overview Use this command to display the Autonomous Wave Control (AWC) security configuration. If the **brief** parameter is specified, then a summary of the configuration is displayed, otherwise the detailed configuration is displayed.

Syntax

```
show wireless security [<security-id-range>|all] [brief]
```

Parameter	Description
<security-id-range>	Display the security configuration for a specified ID range. Specify the ID range using the format <1-65535>
`brief`	Display the brief summary of the security configuration.
`all`	Display all wireless security configurations.

Mode Privileged Exec

Examples To display a detailed AWC security configuration, use the following command:

```
awplus# show wireless security
```

Output Figure 64-23: Example output from **show wireless security**

```
awplus# show wireless security
Security ID 1:

show wireless task

Overview Use this command to display the tasks associated with Autonomous Wave Control (AWC).

Syntax

```
show wireless task [<task-id-range>] [brief|status]
```

Parameter	Description
<task-id-range>	Display the task information for a specific task ID or ID range.
`brief`	Display the task information in summary format.
`status`	Display the task status information. For example the date and time that the task will be performed next.

Mode User Exec and Privileged Exec

Usage notes An AWC task is a periodic or scheduled action to be taken, such as applying a configuration to an Access Point (AP) on a specified date, or calculating optimal AP power-channel usage and applying the results to all APs. See the **task** command for more details.

Example To display the configured AWC tasks in detail, use the command:

```
awplus# show wireless task
```

Output Figure 64-25: Example output from **show wireless task**

show wireless wds

Overview Use this command to display the configuration of a Wireless Distribution System (WDS) with Autonomous Wave Control. A WDS enables the wireless interconnection of Access Points (APs) or Peers in an IEEE802.11 network.

Syntax

```
show wireless wds [<wds-id-range>][brief]
```

Parameter	Description
<wds-id-range>	Display the configured information for a specified ID or a range of IDs. To display a range of WDS IDs, use the format <1-65535>.
`brief`	Display a brief summary of the WDS configuration.

Mode User Exec and Privileged Exec

Example To display the full detail of a WDS configuration for a wireless network, use the following command:

```
awplus# show wireless wds
```

Output Figure 64-28: Example output from **show wireless wds**

```
awplus#show wireless wds
WDS ID 1: Enable
 Peer 1st AP ..................... 10
      2nd AP ..................... 11
 Security ....................... 100

WDS ID 2: Enable
 Peer AP1 ....................... 20
      AP2 ....................... abcd.1234.6789
 Security ....................... 100

WDS ID 3: Disable
Peer AP1 ....................... 30
     AP2 ....................... 16
Security ....................... 200
```

Figure 64-29: Example output from **show wireless wds brief**

```
awplus# show wireless wds brief
ID    Status  Peer 1st AP    Peer 2nd AP    Security
----- ------- -------------- -------------- --------
1     Enable  10             11             100
2     Enable  20             abcd.1234.6789 100

show wireless wireless-mac-filter

Overview Use this command to display the wireless MAC filter configuration for Autonomous Wave Control.

Syntax
```
show wireless wireless-mac-filter [<mac-filter-range>|all]
[brief]
```

Parameter	Description
<mac-filter-range>	<1-65535> Display the information for a specified ID or range of IDs.
`all`	Display the information for all MAC filters.
`brief`	Display a brief summary of the information

Mode Privileged Exec

Output Figure 64-30: Example output from **show wireless-mac-filter**

```
awplus#show wireless wireless-mac-filter

WIRELESS MAC FILTER ID 100:
  Description ................... Floor 1
  Entries ....................... 3
  Entries ....................... 2
    MAC address    Description
    -------------- ---------------
    1234.5678.abcd PC lab 1
    0987.6543.abcd guest
    abcd.9876.5432

show wireless wireless-trigger

Overview Use this command to display the wireless trigger status on a wireless network.

Syntax

```
show wireless wireless-trigger [all|<trigger-id>]
```

Parameter	Description
<trigger-id>	Select an ID number between 1-8. You can also select a range of IDs using a comma separated list.

Default All

Mode Privileged Exec and User Exec

Example To display the status for all wireless triggers, use the commands:

```
awplus# show wireless wireless-trigger
```

Output Figure 64-31: Example output from **show wireless wireless-trigger**

```
awplus> show wireless wireless-trigger
Wireless Trigger ID 1:
 Description ................... Trigger 1
 Status ........................ Inactive
Wireless Trigger ID 2:
 Description ................... Trigger 2
 Status ........................ Active
  Activated User ............... Admin
  Activated Time ............... 2020-12-28 12:11:34
```

smart-connect-profile

Overview Use this command to create a Smart Connect profile and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to delete a Smart Connect profile from the wireless configuration.

Syntax

```
smart-connect-profile <1-65535>
no smart-connect-profile <1-65535>
```

Parameter	Description
<1-65535>	The Smart Connect profile ID

Default Not set

Mode Wireless Configuration

Example To configure Smart Connect profile 10 and enter the Smart Connect profile configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)#
```

To delete Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no smart-connect-profile 10
```

snmp (wireless-ap-prof)

Overview Use this command to enter SNMP configuration mode so you can add an SNMP configuration.

Use the **no** variant of this command to reset the SNMP parameters back to the default (not set).

Syntax

```
snmp
no snmp
```

Default Not set

Mode Wireless AP Profile Configuration

Example To enter the SNMP configuration mode of AP profile 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)#
```

To disable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# no snmp
awplus(config-wireless-ap-prof)#
```

Command changes Version 5.5.0-2.1: command added

ssid (wireless-network)

Overview Use this command to configure the SSID (Service Set Identifier) for the wireless network.

Syntax

```
ssid <value>
```

Parameter	Description
<value>	The unique alphanumeric description or name of the SSID. The maximum character length is 32.

Default Default- {NETWORKID}.

Except for the default Guest Network, the default SSID for each network is 'Default-' followed by the unique Network ID.

Mode Wireless Network Configuration

Usage notes A network must be configured with an SSID of one or more alphanumeric characters. The SSID can be modified, but cannot be deleted.

Example To configure a SSID name for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# ssid GUEST_NETWORK_1
```

Related commands network (wireless)

show wireless network

Command changes Version 5.4.7-2.4: command added.

ssid (wireless-sc-prof)

Overview Use this command to set the SSID used for wireless communication between APs in a Smart Connect network.

Use the **no** variant of this command to remove the SSID from a Smart Connect profile.

Syntax

```
ssid <ssid-value>
no ssid
```

Parameter	Description
<ssid-value>	The SSID for the Smart Connect network. Enter a string up to 32 characters in length.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Example To set the SSID ID of 10 used for wireless communication between APs in Smart Connect network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 20
awplus(config-wireless-sc-prof)# ssid SC-NETWORK-10
```

station-isolation enable

Overview Use this command to enable to the station-isolation option on channel blanket for a wireless AP profile. When station-isolation is enabled, the AP blocks communication between wireless clients on the same virtual access point (VAP). The AP still allows data traffic between its wireless clients and wired devices on the network.

Use the **no** variant of this command to disable the station-isolation option.

Syntax

```
station-isolation enable
no station-isolation enable
```

Default Disabled.

Mode Wireless AP Profile Channel Blanket Configuration

Example To enable station-isolation for channel blanket on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# station-isolation enable
```

Related commands

Command changes Version 5.4.9-1.1: command added

station-isolation enable (wireless-ap-prof-radio)

Overview Use this command to enable the **station-isolation** option. This option designates whether to allow communication between wireless clients which are connected to the same Virtual Access Point (VAP).

Use the **no** variant of this command to disable the station-isolation option on a selected VAP.

Syntax

```
station-isolation enable
no station-isolation enable
```

Default Disabled.

Mode Wireless AP Profile Radio Configuration

Example To enable the station-isolation option for **radio 2** on **ap-profile100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# station-isolation
enable
```

Related commands radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

task

Overview Use this command to configure an Autonomous Wave Control (AWC) task.

If the task doesn't exist, then this command creates it.

Use the **no** variant of this command to remove the task.

Syntax

```
task <1-65535>
no task <1-65535>
```

Parameter	Description
<1-65535>	Task ID number

Default Not set.

Mode Wireless Configuration

Usage notes A task is a configuration for a periodic or scheduled action to be taken. For example, the task may be to run a configuration, start an AWC calculation, or download AP firmware. Use commands such as **description**, **time**, and **day** to configure the task actions.

Example To add a task with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 10
```

To remove task ID 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no task 10
```

time (wireless-task)

Overview Use this command to set a time to run a task using the 24-hour format.

You can use the **day** command along with the **time** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the time set to run a task.

Syntax

```
time <HH:MM>
no time
```

Parameter	Description
<HH:MM>	The time set to run a task in 24-hour time format.

Default Not set.

Mode Wireless Task Configuration

Example To set task 5 to run at 11:15 pm, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# time 23:15
```

Related commands

trap host (wireless-ap-prof-snmp)

Overview Use this command to add an SNMP trap host to the entry for the target AP Profile.

Use the **no** variant of this command to remove the specified SNMP trap host from the entry.

Syntax

```
trap host <host-name>
no trap host <host-name>
```

Parameter	Description
<host-name>	The host that sends the SNMP trap. Specify the host name (FQDN) or IP address. For example manager.your.domain.com, 10.10.1.37.

Default The entry is empty.

Mode Wireless AP Profile SNMP Configuration

Usage notes The maximum number of registrations is 3 entries.

Example To add the SNMP trap host 192.168.1.1 to the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# trap host 192.168.1.1
```

To remove the SNMP trap host 192.168.1.1 from the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no trap host 192.168.1.1
```

type (wireless-sec-wep)

Overview Use this command to assign the key-string type for a wireless security WEP configuration.

Use the **no** variant of this command to reset the assigned WEP key-string type to the default.

Syntax

```
type {ascii|hex}
no type
```

Parameter	Description
ascii	Use ASCII as the type for the WEP key
hex	Use Hex as the type for the WEP key

Default Hex.

Mode Wireless Security WEP Configuration

Example To configure ASCII as the key-string type for WEP for a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

type ap-configuration apply ap

Overview Use this command to apply a task configuration type to a selected wireless Access Point (AP) or range of wireless APs.

Syntax

```
type ap-configuration apply ap {all|<ap-id-range>}
```

Parameter	Description
`all`	Apply the configuration to all APs.
<ap-id-range>	Apply the configuration to a selected range of APs.

Default Not set.

Mode Wireless Task Configuration

Example To assign task 5 configuration to wireless AP ranges: 5-9 and 15-19, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type ap-configuration apply ap 5-9,15-19
```

Related commands

task

show wireless task

ap

type download ap (wireless-task)

Command changes Version 5.4.7-2.4: command added.

type download ap (wireless-task)

Overview Use this command to download and update wireless Access Point (AP) firmware. The firmware must be stored on an HTTP server.

Syntax

```
type download ap {all|<ap-id-range>} url <URL> [username
<user-name> password <password>]
```

Parameter	Description
`all`	Run the task on all managed APs.
<ap-id-range>	Run the task on the selected identifier.
<URL>	The URL where the firmware is stored and can be downloaded from.
<user-name>	The username requiring authentication and access to the URL.
<password>	The password requiring authentication and access to the URL.

Mode Wireless Task Configuration

Example To set a task to download new firmware from the IP address192.168.0.1 to a wireless AP which is assigned '7' as its identifier, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type download ap 7 url
http://192.168.0.1/AT-TQ4600-4.0.3.b02.img
```

Related commands

task

show wireless task

ap

type ap-configuration apply ap

type power-channel ap all

Command changes Version 5.4.7-2.4: command added.

type power-channel ap all

Overview Use this command to calculate the power usage on wireless Access Point (AP) channels and apply the results manually or automatically.

Syntax

```
type power-channel ap all {calculate|apply|calculate-and-apply}
```

Parameter	Description
`calculate`	Run the AWC power calculation on all APs.
`apply`	Apply the latest AWC power calculation results to all APs.
`calculate-and-apply`	Run the AWC power calculation and apply the results to all APs.

Default Not set.

Mode Wireless Task Configuration

Usage notes This command allows you to monitor how APs are being utilized at various times and adjust AP power levels if required.

Example To calculate all AP power-channel usage and apply the results to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config)# type power-channel ap all calculate-and-apply
```

unauth-emergency-service-access enable (wireless-network-passpoint-dot11u)

Overview Use this command to configure unauthenticated access to emergency services. This makes emergency services available to any user, with or without a valid authentication credential.

Use the **no** variant of this command to disable unauthenticated access to emergency services.

Syntax

```
unauth-emergency-service-access enable
no unauth-emergency-service-access enable
```

Default Disabled.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure unauthenticated access to emergency services, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
unauth-emergency-service-access enable
```

Related commands show wireless network

Command changes Version 5.5.0-2.3: command added

username (wireless-ap-prof-snmp)

Overview Use this command to set an SNMP version v3 username and password for the target AP profile. This command is valid for SNMP version v3 only.

Use the **no** variant of this command to remove an SNMP username and password.

Syntax

```
username <username> password [encrypted] <password>
no username
```

Parameter	Description
<username>	The user name that is used for user authentication and encryption. Enter up to 12 alphanumeric characters. The user name cannot begin with a number.
encrypted	Indicates that the following password is in its encrypted form. Its primary purpose is to use to store the shared key to startup-configuration. You should not use it when entering the command manually.
<password>	The password is used for encryption. Enter from 8 to 32 characters. Valid characters are: - alphanumeric characters - symbols except for the following 8 symbols: " $ & ' * : < >

Default Not set

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP username to 'manager' and the password to 'friend001', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# username manager
password friend001
```

To remove the SNMP username and password, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof)# no username
```

vap (wireless-ap-prof-radio)

Overview Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on a radio.

Use the **no** variant of this command to remove the network configuration for a VAP.

Syntax

```
vap <0-15> network <1-65535> [channel-blanket]
no vap <0-15>
```

Parameter	Description
<0-15>	VAP identification number
<1-65535>	Network configuration of the designated VAP
`channel-blanket`	Set the VAP to channel blanket mode

Default Not set

Mode Wireless AP Profile Radio Configuration

Usage notes The number of VAPs available depends on the access point model. See the AP's datasheet for details.

vap0 is the only VAP identification number valid on the **MWS series**.

Example To associate an AP with network (ID 100) to VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# vap 2 network 2
```

Related commands radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

venue group (wireless-network-passpoint-dot11u)

Overview Use this command to designate the venue group used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to reset a venue group.

Syntax

```
venue group <0-255>
no venue group
```

Parameter	Description
<0-255>	The venue group code. See IEEE 802.11-2016, Table 9-61 page 756.

Default 7

Mode Wireless Network Passpoint 802.11u Configuration

Example To set a venue group, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue group
2
```

Related commands show wireless network

venue type (wireless-network-passpoint-dot11u)

Command changes Version 5.5.1-1.1: command added.

venue name (wireless-network-passpoint-dot11u)

Overview Use this command to designate the venue name and language code used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to remove a venue name.

Syntax

```
venue name <1-10> lang <lang-code> name <venue-name>
no venue name <1-10>
```

Parameter	Description
<1-10>	The venue name identifier number. If the specified identifier number does not exist, then a new one will be created. If it does exist, the language code and venue name will be overwritten.
<lang-code>	The language code. The code is 2 or 3 characters as specified in ISO-639. For example, 'eng', 'jpn'
<venue-name>	The venue name. • You can enter up to 10 separate entries • The maximum number of characters is 252.

Default No name is set

Mode Wireless Network Passpoint 802.11u Configuration

Example To set a venue name, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue name 1
lang eng name Allied Telesis Ltd
```

Related commands show wireless network

Command changes Version 5.5.1-1.1: command added.

venue type (wireless-network-passpoint-dot11u)

Overview Use this command to designate the venue type used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to reset a venue type.

Syntax

```
venue type <0-255>
no venue type
```

Parameter	Description
<0-255>	The venue type code. See IEEE 802.11-2016, Table 9-62 page 756-759.

Default 1

Mode Wireless Network Passpoint 802.11u Configuration

Example To set a venue type, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue type 2
```

Related commands show wireless network

venue group (wireless-network-passpoint-dot11u)

Command changes Version 5.5.1-1.1: command added.

version (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP agent version for the target AP profile.

Use the **no** variant of this command to set it back to the default (v1 and v2c).

Syntax

```
version {v1v2c|v3}
no version
```

Parameter	Description
v1v2c	Set when the SNMP agent version is at v1 or v2c.
v3	Set when the SNMP agent version is v3.

Default v1v2c

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP version as v3, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# version v3
```

To set the SNMP listening port back to the default (v1v2c), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no version
```

versions (wireless-sec-osen)

Overview Use this command to set which Wi-Fi Protected Access (WPA) version to use with OSEN wireless security configuration. OSEN is Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. It is used with Release 2 of Hotspot 2.0 (Passpoint).

Use the **no** variant of this command to revert to the default setting (WPA2).

Syntax

```
versions <version-list>
no versions
```

Parameter	Description
<version-list>	The supported WPA version(s) list. The list can use either **wpa** or **wpa2** or **wpa3**, or two of these three, or all in any order. OSEN only allows the following combinations: • two combinations of **wpa** and **wpa2** • **wpa** only • **wpa3** only

Default WPA2.

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

Example To set both WPA and WPA2 as WPA versions on a security configuration of OSEN, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# versions wpa wpa2
```

Related commands show wireless security

security (wireless)

ciphers (wireless-sec-osen)

Command changes Version 5.5.0-2.3: command added

versions (wireless-sec-wpa-ent)

Overview Use this command to set the WPA version used for a WPA-enterprise wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

Syntax

```
versions <version-list>
no versions
```

Parameter	Description
<version-list>	The version list. You can use either **wpa**, **wpa2**, **wpa3**, or any combination of the three in any order.

Default wpa2.

Mode Wireless Security WPA-enterprise Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

Example To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# versions wpa wpa2
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

Version 5.4.9-1.1: **wpa3** parameter added.

versions (wireless-sec-wpa-psnl)

Overview Use this command to set the WPA version used for a WPA-personal wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

Syntax

```
versions <version-list>
no versions
```

Parameter	Description
<version-list>	The version list. You can use either **wpa**, **wpa2**, **wpa3**, or any combination of the three in any order.

Default wpa2.

Mode Wireless Security WPA-personal Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

Example To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# versions wpa wpa2
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

Version 5.4.9-1.1: **wpa3** parameter added.

vlan (wireless-network)

Overview Use this command to configure the wireless VLAN that clients belong to.

Use the **no** variant of this command to reset the wireless VLAN to the default.

Syntax

```
vlan <1-4094>
no vlan
```

Parameter	Description
<1-4094>	VLAN ID number.

Default VLAN1.

Mode Wireless Network Configuration

Example To configure a VLAN ID, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# vlan 100
```

To restore VLAN 20 to its default value, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no vlan
```

Related commands network (wireless)

Command changes Version 5.4.7-2.4: command added

walled-garden entry

Overview Use this command to configure walled garden entry to a wireless network Captive Portal.

On the Internet, a walled garden typically controls a user's access to web content and services. The walled garden directs the user's navigation within particular areas to allow access to a selection of websites or prevent access to other websites.

A common example could be a hotel environment where unauthenticated users are allowed to navigate to a designated login page (for example, a hotel website) and all its contents.

Use the **no** variant of this command to remove a walled garden on a wireless network that's configured with a Captive Portal.

Syntax

```
walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}
no walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}
```

Parameter	Description
A.B.C.D	IPv4 address format, e.g. 1.1.1.1
A.B.C.D/M	IPv4 address format with subnet mask, e.g. 1.1.1.0/24
FQDN	FDQN format. Sequence of {LETTER/DIGIT/HYPHEN}.{LETTER/DIGIT/HYPHEN}...while each dotted part of the name (aa or bb or cc in this example) MUST NOT end with HYPHEN and the first character MUST be a LETTER or a DIGIT. And each dotted part (aa or bb or cc in this example) must be 63 characters or less, e.g. example.com www.example.com

Default Not set

Mode Wireless Network Captive Portal Configuration

Example To add a new entry to a walled garden list on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# walled-garden entry
example.com
```

wan-metrics downlink-load (wireless-network-passpoint-hs20)

Overview Use this command to set the wan-metrics downlink-load for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics downlink-load <0-255>
no wan-metrics downlink-load
```

Parameter	Description
<0-255>	WAN Metrics Down Link Load value Calculation formula: WAN line load factor (%) /100*255 For example: 75% -> 75/100*255=191

Default 80.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Down Link Load of 191, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics
downlink-load 191
```

Related commands show wireless network

Command changes Version 5.5.0-2.3: command added

wan-metrics downlink-speed (wireless-network-passpoint-hs20)

Overview Use this command to set the wan-metrics downlink-speed for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics downlink-speed <1-4294967295>
no wan-metrics downlink-speed
```

Parameter	Description
<1-4294967295>	WAN Metrics Down Link Speed (kbps)

Default 8000.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Down Link Speed of 191 kbps, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics
downlink-speed 191
```

wan-metrics info (wireless-network-passpoint-hs20)

Overview Use this command to configure the WAN Metrics Link Status information for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics info <HEX-value>
no wan-metrics info
```

Parameter	Description
<HEX-value>	A one or two digit hexadecimal number.
	Calculation formula: . • (At Capacity << 3) | (Symmetric Link << 2) | (Link Status & 0x3) Bit placement: • Bit[3]: At Capacity • Bit[2]: Symmetric Link • Bit[1:0]: Link Status **At Capacity**: Set to 1 to notify you that the line capacity on the WAN side has reached the upper limit. **Symmetric Link**: Set to 1 to notify you that Uplink/Downlink speed are the same value. **Link Status**: Configure as shown below: • 1 (0b01) : Link up • 2 (0b10) : Link down • 3 (0b11) : Link in test state

Default 01

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set the WAN Metrics Li nk Status information, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics
info 01
```

Related commands show wireless network

wan-metrics load-measure-duration (wireless-network-passpoint-hs20)

Overview Use this command to set the wan-metrics load measure-duration for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics load-measure-duration <0-65535>
no wan-metrics load-measure-duration
```

Parameter	Description
<0-65535>	WAN Metrics Load Measure Duration value Calculation formula: Measurement interval (seconds)*10 For example: 2 second interval -> 2*10=20

Default 3000.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Load Measure Duration value of 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics

wan-metrics uplink-load (wireless-network-passpoint-hs20)

Overview Use this command to set the wan-metrics uplink-load for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics uplink-load <0-255>
no wan-metrics uplink-load
```

Parameter	Description
<0-255>	WAN Metrics Up Link Load value Calculation formula: WAN line load factor (%) /100*255 For example: 75% -> 75/100*255=191

Default 240.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Up Link Load of 191, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics uplink-speed <1-4294967295>
no wan-metrics uplink-speed
```

Parameter	Description
<1-4294967295>	WAN Metrics Up Link Speed (kbps)

Default 1000.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Up Link Speed of 10000 kbps, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint

wds

Overview Use this command to add a Wireless Distribution System (WDS) configuration.

Use the **no** variant of this command to remove a WDS configuration.

Syntax

```
wds <1-65535>
```

Parameter	Description
<1-65535>	WDS configuration ID number.

Default Not set.

Mode Wireless Configuration

Usage notes This command adds a WDS configuration and enters the configuration mode.

Example To add a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
```

To remove a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wds 10
```

Related commands

Command changes Version 5.4.7-2.4: command added.

wds radio (wireless-ap)

Overview Use this command to designate a radio interface for an Access Point (AP) in a Wireless Distribution System (WDS) network.

Use the **no** variant of this command to remove a wireless radio interface.

Syntax

```
wds radio <1-3>
no wds radio
```

Parameter	Description
<1-3>	Designate a radio interface for the WDS connection.

Default Not set.

Mode Wireless AP Configuration

Example To configure 'radio 2' as the radio interface for a WDS connection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# wds radio 2
```

Command changes Version 5.4.7-2.4: command added.

web-auth radius auth group

Overview Use this command to enable Web authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable Web authentication with a RADIUS group.

Syntax

```
web-auth radius auth group {radius|<group-name>}
no web-auth radius auth group
```

Parameter	Description
`radius`	Use a RADIUS group, which means **all** RADIUS servers.
<group-name>	The RADIUS server group.

Default Not set.

Mode Wireless Network.

Usage notes This command enables Web authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

Example To enable Web authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# web-auth radius auth group radius
```

Related commands aaa group server

network (wireless)

Command changes Version 5.4.7-2.4: command added.

wireless

Overview Use this command to enter wireless configuration mode.

Use the **no** variant of this command to exit wireless configuration mode.

Syntax

```
wireless
no wireless
```

Mode Global Configuration

Example To enter wireless configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)#
```

Command changes Version 5.4.7-2.4: command added.

wireless ap-configuration apply ap

Overview Use this command to apply a configuration to a single Access point (AP) or a range of APs. The configuration must exist before you use this command.

Syntax

```
wireless ap-configuration apply ap {all|<ap-idrange>}
```

Parameter	Description
`all`	Apply the configuration to all APs.
<ap-idrange>	Apply the configuration to a range of APs. The range format is 1-65535.

Mode Privileged Exec

Example To apply a configuration to the AP range 1-10, use the command:

```
awplus# configure terminal
awplus(config)# wireless ap-configuration apply 1-10
```

To apply a configuration to all APs, use the command:

```
awplus# wireless ap-configuration apply ap all
```

Related commands ap

Command changes Version 5.4.7-2.4: command added.

wireless channel-blanket ap-profile bssid-renew

Overview Use this command to renew the BSSID assigned to the channel blanket for the specified AP-profile(s).

Syntax

```
wireless channel-blanket ap-profile
{<ap-profile-id-range>|all} bssid-renew
```

Parameter	Description
`<ap-profile-id-range>`	Renew the BSSID of the channel blanket for a specific AP-profile or range of AP-profiles <1-65535>.
`all`	Renew the BSSID of the channel blanket for all AP-profiles.

Default Not set

Mode Privileged Exec

Example To renew the channel blanket BSSID for AP-profile 1 and 2, use the commands:

```
awplus# wireless channel-blanket ap-profile 1,2 bssid-renew
```

Related commands show wireless ap-profile

vap (wireless-ap-prof-radio)

Command changes Version 5.5.1-0.1: command added

wireless download ap url

Overview Use this command to download Access Point (AP) firmware from a URL.

Syntax
```
wireless download ap {all|<aprange>} url [username <user-name>
password <password>]
```

Parameter	Description
`all`	All APs.
`<aprange>`	A range of APs *<1-65535>*
`username <user-name>`	The login username. The username can contain: • up to 255 characters. • any printable ASCII characters (ASCII 32-126) • special characters: backslash, double-quote or space, but they should be escaped with a backslash.
`password <password>`	Passwords can be up to 64 characters in length and can contain printable characters, except: • ? • "(double quotes) • space

Default Not set.

Mode Privileged Exec

NOTE: *AWC supports the following firmware version:*

- TW series: v4.0.5B02
- MWS2533AP: v2.2.1, v2.2.3
- MWS600AP/MWS1750AP: v2.2.3

Example To download new firmware to all APs from the URL 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless download ap all url
http://192.168.0.1/AT-TQ4600-4.0.3.n.b02.img
```

Command changes Version 5.4.7-2.4: command added.

wireless emergency-mode

Overview Use this command to activate or deactivate AWC emergency mode. Wireless networks that have been flagged for emergency-mode are activated or deactivated when this command is configured.

Syntax
```
wireless emergency-mode {activate|deactivate}
```

Default Deactivated

Mode Privileged Exec

Example To activate the emergency mode in AWC, use the command:

```
awplus# wireless emergency-mode activate
```

Related commands emergency-mode

show wireless

Command changes Version 5.5.0-0.3: command added

wireless emergency-mode usb mark key

Overview Use this command to prepare a USB stick for putting your wireless network into Emergency Mode and add a key to that stick. If someone inserts that USB stick into the device, AlliedWare Plus will check whether the device also contains this key. If it does, then the device will put the network into emergency mode.

Along with this command, use emergency-mode usb key to add the same key to the device.

Syntax

```
wireless emergency-mode usb mark key <key>
wireless emergency-mode usb unmark
```

Parameter	Description
`key <key>`	The key, which can be up to 32 characters long. You can use any printable ASCII characters. If you use spaces or symbols, enclose the key in quote marks, for example "Example Key1".
`mark`	Prepare the USB stick for emergency mode use.
`unmark`	Remove the emergency mode configuration and key from the USB stick.

Default No USB sticks are configured.

Mode Privileged Exec

Example To configure this feature, first create a suitable wireless network and reserve it for emergency mode only. To reserve the network, use the command emergency-mode.

Then insert an empty USB stick into the AlliedWare Plus device and use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# emergency-mode usb enable
awplus(config-wireless)# emergency-mode usb key ExampleKey
description ExampleEmergencyUSB
awplus(config-wireless)# end
awplus# wireless emergency-mode usb mark key ExampleKey
```

The **key** parameter in the commands emergency-mode usb key and wireless emergency-mode usb mark key must match.

After this, to put the network into emergency mode, just insert the USB stick. As long as the keys on the device and the stick match, emergency mode will automatically activate. The device's port LEDs will blink to indicate it is in emergency mode.

wireless export

Overview Use this command to export MAC filter entries to a CSV file. If the specified file does not exist, it will be created. If the file does exist then it will be overwritten with the new data.

Syntax

```
wireless export wireless-mac-filter <mac-filter-id> <url>
```

Parameter	Description
<mac-filter-id>	<1-65535> The ID of the MAC filter to export.
<url>	Path and filename of the export file.

Mode Privileged Exec

Example To export MAC filter '20' to a CSV file named 'whitelist.csv', use the following command:

```
awplus# wireless export wireless-mac-filter 20
flash://whitelist.csv
```

Figure 64-32: Sample export file:

```
"00:1a:eb:12:34:56","client1"
"00:1a:eb:12:34:57","client2"

wireless get-tech abort

Overview Use this command to stop getting technical support files from managed APs.

Syntax

```
wireless get-tech abort
```

Mode Privileged Exec

Usage notes This command aborts **all** technical-support files executed by the commands: **wireless get-tech ap**, **wireless get-tech ap-profile** and **wireless get-tech sc-profile**. You cannot limit it to an AP or profile.

Example To abort all technical support files, use the command:

```
awplus# wireless get-tech abort
```

Output Figure 64-33: Example output from **show wireless ap 1 status** before and after issuing the command **wireless get-tech abort**. You can see the operation 'rupt' state changes from '**E**' (Executing) to '**F**' (Failed).

```

wireless import

Overview Use this command to import MAC filter entries from a CSV file. The imported entries can either replace or be appended to the existing entries.

Syntax
```
wireless import <url> wireless-mac-filter <mac-filter-id>
{add|replace}
```

Parameter	Description
<url>	Path and filename of the import file.
<mac-filter-id>	<1-65535> The ID of the MAC filter to import the entries to.
add	Add the filter entries to the specified MAC filter
replace	Overwrite the existing MAC filter with the imported entries.

Mode Privileged Exec

Example To add MAC filter entries from the file 'whitelist.csv' to MAC filter '20', use the following command:

```
awplus# wireless import flash://whitelist.csv
wireless-mac-filter 20 add
```

Figure 64-34: Sample import file:

```
"00:1a:eb:12:34:56","client1"
"00:1a:eb:12:34:57","client2"
"00:1a:eb:12:34:58","client3"

wireless power-channel ap all

Overview This command activates AWC to calculate the optimal power-channel levels for all the Access Points (APs) in a wireless network. You can use this command to calculate and apply the latest AWC calculation results to the APs automatically or you can choose to apply them manually.

Syntax

```
wireless power-channel ap all
{calculate|apply|calculate-and-apply}
```

Parameter	Description
`calculate`	Use AWC to calculate the optimal power-channel levels for all APs.
`apply`	Apply the latest AWC optimal power-channel level results to all APs.
`calculate-and-apply`	Use AWC to calculate the optimal power-channel levels for all APs, and apply the results to the APs.

Default Not set.

Mode Privileged Exec

Example To activate AWC to calculate the optimal power-channel levels for all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all calculate
```

To apply the latest optimal power-channel results manually to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all apply
```

To activate AWC to calculate the optimal power-channel levels for all APs and then automatically apply the results to the APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all
calculate-and-apply
```

Related commands show wireless ap power-channel

Command changes Version 5.4.7-2.4: command added.

wireless reset ap

Overview Use this command to reset the current configuration applied to a wireless Access Point (AP).

Syntax

```
wireless reset ap {all|<aprange>}
```

Parameter	Description
<aprange>	Reset the range of APs in the format *<1-65535>*
`all`	Reset all APs.

Mode Privileged Exec

Example To reset the configuration for wireless APs in the range 1-10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap 1-10
```

To reset the configuration for all wireless APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap all
```

Related commands ap

Command changes Version 5.4.7-2.4: command added.

wireless-mac-filter (wireless)

Overview Use this command to configure a wireless MAC filter. If the filter does not already exist it will be created when you issue this command.

Use the **no** variant of this command to remove a wireless MAC filter.

Syntax

```
wireless-mac-filter <mac-filter-id>
no wireless-mac-filter <mac-filter-id>
```

Parameter	Description
<mac-filter-id>	The ID of the MAC filter, in the range 1 to 65535.

Default No MAC filters are set by default.

Mode Wireless Configuration

Example To add a MAC filter with ID '20' and enter configuration mode for that filter, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)#
```

To remove a MAC filter with ID '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-mac-filter 20
```

wireless-mac-filter enable

Command changes Version 5.4.8-2.1: command added

wireless-mac-filter (wireless-ap-prof)

Overview Use this command to assign a MAC filter to a wireless AP profile. You can configure the filter as a 'whitelist' or a 'blacklist'. An AP profile can only have one MAC filter assigned to it.

Use the **no** variant of this command to remove a MAC filter from an AP profile.

Syntax

```
wireless-mac-filter {permit|deny} <mac-filter-id>
no wireless-mac-filter
```

Parameter	Description
`permit`	Set the MAC filter as a whitelist.
`deny`	Set the MAC filter as a blacklist.
<mac-filter-id>	The ID of the MAC filter to assign to the AP profile, in the range 1 to 65535.

Default No MAC filter assigned by default.

Mode Wireless AP Profile Configuration

Example To assign the MAC filter '20' as a whitelist to wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# wireless-mac-filter permit 20
```

To remove a MAC filter from wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# no wireless-mac-filter
```

wireless-mac-filter (wireless)

wireless-mac-filter enable

Command changes Version 5.4.8-2.1: command added

wireless-mac-filter enable

Overview Use this command to enable the MAC filter on a Virtual Access Point (VAP). It will enable the MAC filter based on the filter entry set in the AP profile.

Use the **no** variant of this command to disable the AMC filter on a VAP.

Syntax

```
wireless-mac-filter enable
no wireless-mac-filter enable
```

Default Disabled by default.

Mode Wireless Network Configuration

Example To enable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# wireless-mac-filter enable
```

To disable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# no wireless-mac-filter enable
```

wireless wireless-trigger

Overview Use this command to activate or deactivate a wireless-trigger. You can set an action for a specific trigger ID, range of IDs, or all wireless-trigger IDs.

Syntax

```
wireless wireless-trigger [all|<trigger-id>] activate
wireless wireless-trigger [all|<trigger-id>] deactivate
```

Parameter	Description
`all`	Action all wireless-triggers.
<trigger-id>	The trigger ID. This can be a number in the range of 1-8. You can also specify multiple trigger IDs using a comma separated list.
`activate`	Activate wireless-trigger.
`deactivate`	Deactivate wireless-trigger.

Default Not set.

Mode Privileged Exec

Example To activate wireless-trigger 1, use the command:

```
awplus# wireless wireless-trigger 1 activate
```

To deactivate all wireless-triggers, use the command:

```
awplus# wireless wireless-trigger all deactivate
```

Related commands

wireless-trigger

Overview Use this command to add a wireless trigger and enter the wireless-trigger configuration mode.

Use the **no** variant of this command to delete a specific wireless-trigger ID configuration.

Syntax

```
wireless-trigger <trigger-id>
no wireless-trigger <trigger-id>
```

Parameter	Description
<trigger-id>	Enter an ID number in the range 1-8.

Default Not set

Mode Wireless Configuration

Example To add a wireless trigger and enter the wireless-trigger configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-trigger 1
awplus(config-wireless-trigger)#
```

To delete a wireless trigger, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-trigger 1
```

Related commands

wireless-trigger-id

Overview Use this command to mark a network for a wireless-trigger.

Use the **no** variant of this command to unmark a wireless trigger on a network.

Syntax

```
wireless-trigger-id <trigger-id>
no wireless-trigger-id <trigger-id>
```

Parameter	Description
<trigger-id>	Trigger ID, a numerical value in the range 1-8. The trigger must already exist.

Default Not set.

Mode Wireless Network Configuration

Example To mark a wireless trigger in network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# wireless-trigger-id 1
```

65 Device Discovery using SNMP Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Device Discovery using SNMP.

SNMP Device Discovery is available from the AlliedWare Plus CLI and is also available from Vista Manager mini. This feature provides information that allows the CLI to display third party vendor device data in real time.

For more information, see the Device Discovery and Monitoring using SNMP Feature Overview and Configuration Guide.

Command List

clear snmp-discovery

Overview Use this command to remove information learned by the SNMP Discovery process.

Syntax

```
clear snmp-discovery ip [<ipv4-address>]
clear snmp-discovery nodes [<ipv4-address>]
```

Parameter	Description
`ip`	Internet Protocol (IP)
`<ipv4-address>`	IPv4 network address for the discovered device, for example 192.168.3.1
`nodes`	Node information
`<ipv4-address>`	IPv4 network address for the discovered nodes, for example 192.168.3.1

Default No information is cleared.

Mode Privileged Exec

Examples To remove all SNMP discovered devices, use the command:

```
node1# clear snmp-discovery nodes
```

To remove a particular SNMP discovered device, use the command:

```
node1# clear snmp-discovery nodes 192.168.3.1
```

To remove all entries from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip
```

To remove a particular entry from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip 192.168.3.1
```

Related commands show snmp-discovery

Command changes Version 5.5.0-0.3: command added

service snmp-discovery

Overview Use this command to enable SNMP Discovery to discover devices on an AMF network.

Use the **no** variant of this command to disable SNMP Discovery.

Syntax

```
service snmp-discovery
no service snmp-discovery
```

Default Disabled

Mode Global Configuration

Usage notes The server starts a process which detects IP addresses reachable on a network. An SNMP 'get' request is performed on these IP addresses to detect device information. The SNMP name, SNMP description, SNMP location, and SNMP serial number are obtained if they are available.

SNMP Discovery will not run if there are no Layer 3 IP interfaces configured.

Example To start the discovery service on the AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# service snmp-discovery
```

show running-config snmp-discovery

Overview Use this command to display the running configuration for SNMP Discovery.

Syntax

```
show running-config snmp-discovery
```

Mode Privileged Exec

Example To display the running configuration for SNMP Discovery, use the command:

```
awplus# show running-config snmp-discovery
```

Output Figure 65-1: Example output from **show running-config snmp-discovery**

```
node1#show running-config snmp-discovery

snmp-discovery permit ip 192.168.3.2
snmp-discovery permit ip 192.168.3.6
snmp-discovery deny ip 192.168.3.5
```

Related commands show snmp-discovery

Command changes Version 5.5.0-0.3: command added

show snmp-discovery

Overview Use this command to show information about the SNMP Discovery process.

Syntax

```
show snmp-discovery [detail|ip|nodes]
```

Parameter	Description
`detail`	SNMP Discovery node detail
`ip`	SNMP Discovery IP addresses
`nodes`	SNMP Discovery node information

Mode User Exec

Examples To display information about the SNMP Discovery status, use the command:

```
awplus# show snmp-discovery
```

To display information about the SNMP Discovery IPv4 addresses learned, use the command:

```
awplus# show snmp-discovery ip
```

To display information about the SNMP Discovery nodes learned, use the command:

```
awplus# show snmp-discovery nodes
```

To display information about the SNMP Discovery in greater detail, use the command:

```
awplus# show snmp-discovery detail
```

Output Figure 65-2: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery

SNMP Discovery information:

SNMP Discovery                : Enabled
SNMP Polling interval         : 300

service snmp-discovery

show running-config snmp-discovery

snmp-discovery arp-polling-interval

snmp-discovery deny

snmp-discovery permit

snmp-discovery snmp-polling-interval

Command changes

Version 5.5.0-0.3: command added

snmp-discovery arp-polling-interval

Overview Use this command to configure the SNMP ARP polling interval.

Use the **no** variant of this command to set the SNMP ARP polling interval back to the default (60 seconds).

Syntax

```
snmp-discovery arp-polling-interval <1-3600>
no snmp-discovery arp-polling-interval
```

Parameter	Description
<1-3600>	The polling number in seconds to interval in the range from 1 to 3600.

Default ARP requests are sent out every 60 seconds

Mode Global Configuration

Usage notes SNMP Discovery first uses ARP to discover subnets that are reachable from the AMF node. This polling happens every 60 seconds by default. Use this command to change the polling interval.

Examples To configure the SNMP Discovery ARP polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery arp-polling-interval 120
```

To set the SNMP Discovery ARP polling interval back to the default (60 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery arp-polling-interval
```

Related commands service snmp-discovery

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery community

Overview Use this command to create an SNMP community in read-only mode for SNMPv1 and v2c only.

Use the **no** variant of this command to remove an SNMP community.

Syntax

```
snmp-discovery community <community-name>
```

Parameter	Description
<community-name>	The name of the community that can be up to 20 characters long and is case sensitive.

Default The SNMP Discovery community name is 'public' by default

Mode Global Configuration

Usage notes This command creates an SNMP community in read-only mode. The community allows access to all MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used for SNMPv3.

Examples To configure an SNMP community named 'accounting', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery community accounting
```

To set the SNMP community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery community
```

Related commands service snmp-discovery

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery deny

Overview Use this command to prevent ARP requests from being sent. When an interface or IPv4 address is denied, it means an ARP request and SNMP 'get' request will never be sent to that device when the command **service snmp-discovery** is enabled.

Use the **no** variant of this command to remove the configuration.

Syntax

```
snmp-discovery deny interface <interface-range>
snmp-discovery deny ip <ipv4-address>
no snmp-discovery deny interface <interface-range>
no snmp-discovery deny ip <ipv4-address>
```

Parameter	Description
`interface`	Interfaces to deny
<interface-name>	Interface name, for example VLAN2
`ip`	IP address
<ipv4-address>	IPv4 address to deny

Default AMF and stacking management VLANs are denied

Mode Global Configuration

Examples To configure a deny interface command for VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny interface vlan2
```

To stop interface VLAN2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny interface vlan2
```

To configure a deny IP command for IP address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny ip 192.168.3.2
```

To stop IP address 192.168.3.2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny ip 192.168.3.2
```

Output Figure 65-6: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:

IP Address       MAC Address     Type     State         Last Seen Time
-------------------------------------------------------------------------------
192.168.3.2      -               Deny     -             -
1.2.3.6          -               Permit   -             30 Jul, 2020 06:30:55
1.2.3.4          -               Permit   -             31 Jul, 2020 05:49:04
192.168.2.2      3863.bb5c.b900  Dynamic  Up            -
```

Related commands

service snmp-discovery

show snmp-discovery

Command changes

Version 5.5.0-0.3: command added

snmp-discovery permit

Overview Use this command if you want to allow SNMP Discovery to do requests on interfaces with greater than 256 members. You can permit a specific IP address.

Syntax

```
snmp-discovery permit ip <ipv4-address>
no snmp-discovery permit ip <ipv4-address>
```

Parameter	Description
ip	Internet Protocol (IP)
<ipv4-address>	IPv4 network address

Default All IPv4 interfaces with 256 members or less are included in SNMP Discovery.

Mode Global Configuration

Examples To configure a permit IP command for the address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery permit ip 192.168.3.2
```

To remove the permit configuration for the address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery permit ip 192.168.3.2
```

Output Figure 65-7: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:

IP Address       MAC Address     Type     State         Last Seen Time
-------------------------------------------------------------------------
1.2.3.5          -               Deny     -             -
1.2.3.6          -               Permit   -             Jul 27, 2020 03:33:39
1.2.3.4          -               Permit   -             Jul 28, 2020 04:25:05
192.168.2.2      3863.bb5c.b900  Dynamic  Up            -
192.168.3.2      4263.cc3c.b500  permit   Up            -
```

Related commands service snmp-discovery

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery snmp-polling-interval

Overview Use this command to change the SNMP request polling interval (in seconds).

Use the **no** variant of this command to set the SNMP request polling interval back to the default (300 seconds).

Syntax

```
snmp-discovery snmp-polling-interval <60-3600>
no snmp-discovery snmp-polling-interval
```

Parameter	Description
<60-3600>	The number of seconds for the SNMP polling interval. From the range 60 to 3600.

Default 300 seconds (5 minutes)

Mode Global Configuration

Usage notes ARP polling and SNMP Discovery uses SNMP 'get' requests to poll the devices discovered by the ARP polling. This polling happens every 300 seconds (5 minutes) by default.

SNMP polling is enabled when **service snmp-discovery** is enabled.

Examples To configure the SNMP discovery polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-polling-interval 120
```

To set the SNMP discovery polling interval back to the default (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-polling-interval
```

Related commands service snmp-discovery

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery snmp-version

Overview Use this command to set the SNMP version that you are using.

Use the **no** variant of this command to set the SNMP version back to the default (v2c).

Syntax

```
snmp-discovery snmp-version {v1|v2c|v3}
no snmp-discovery snmp-version
```

Parameter	Description
v1	Enter the SNMP version number you are using
v2c	If you are using SNMP version v2c, set the community name with the command **snmp-discovery community**
v3	If you are using SNMP version v3, set the security with the command **snmp-discovery user**

Default SNMP version v2c

Mode Global Configuration

Usage notes This command defaults to SNMP version v2c and creates an SNMP community in read-only mode. The community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

If using SNMPv3, you can choose the security level and then the authentication protocol and privacy protocol.

Examples To configure SNMP Discovery to use SNMP version 3, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-version v3
```

To set the SNMP Discovery SNMP version back to the default (v2c), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-version
```

Related commands service snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery user

Overview Use this command to create a user for SNMPv3 'get' requests only.

Use the **no** variant of this command to remove an SNMPv3 user.

Syntax

```
snmp-discovery user <user-name> [encrypted] [auth {md5|sha}
<auth-password>] [priv {des|aes} <privacy-password>]
```

```
no snmp-discovery user <user-name>
```

Parameter	Description
<user-name>	The user name is a string up to 20 characters long and is case sensitive. For example, 'Rodger'.
`encrypted`	Use the encrypted parameter when you want to enter encrypted passwords.
`auth`	Authentication protocol that can be either MD5 or SHA.
`md5`	MD5 Message Digest Algorithms.
`sha`	SHA Secure Hash Algorithm.
<auth-password>	Authentication password that is a string from 8 to 20 characters and is case sensitive.
`priv`	Privacy protocol that can be either DES or AES.
`des`	DES Data Encryption Standard.
`aes`	AES Advanced Encryption Standards.
<privacy-password>	Privacy password is a string from 8 to 20 characters and is case sensitive.

Default No user is configured

Mode Global Configuration

Usage notes Additionally, this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

The authentication method must match what is used on the devices being configured.

Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configurations stored on the switch.

User passwords are entered using plain text without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.

User passwords are viewed as encrypted passwords in running and startup configurations shown from the **show running-config** and **show startup-config**

commands. Copy and paste encrypted passwords from the running configuration or startup configuration to avoid entry errors.

Examples To add SNMP Discovery user 'authuser' with authentication protocol 'md5', authentication password 'authpass' privacy protocol 'des' and privacy password privpass, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser auth md5 Authpass
priv des Privpass
```

To enter existing SNMP user 'authuser' with existing passwords with authentication protocol 'md5' plus the encrypted authentication password '0x1c74b9c22118291b0ce0cd883f8dab6b74', privacy protocol 'des' plus the encrypted privacy password '0x0e0133db5453ebd03822b004eeacb6608f', use the following commands:

Note Copy and paste the encrypted passwords from the running-config or the startup-config displayed, using the show running-config and show startup-config commands respectively, into the command line to avoid key stroke errors issuing this command.

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser encrypted auth
md50x1c74b9c22118291b0ce0cd883f8dab6b74 priv des
0x0e0133db5453ebd03822b004eeacb6608f
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery user authuser
```

Output Figure 65-8: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery
SNMP Discovery information:

SNMP Discovery                : Enabled
SNMP Polling interval         : 300
ARP Polling interval          : 60
SNMP Discovery version        : v3

SNMPv2 Discovery Community    : accounting
SNMPv3 Discovery User         : authuser
User Encrypted auth           : md5
User Encrypted password       : 0x1c74b9c22118291b0ce0cd883f8dab6b74
User Privilege                : des

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

66 Dynamic Host Configuration Protocol (DHCP) Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure DHCP.

For more information, see the DHCP Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

bootfile

Overview This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

Syntax

```
bootfile <filename>
no bootfile
```

Parameter	Description
<filename>	The boot file name.

Mode DHCP Configuration

Example To configure the boot filename for a pool `P2`, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

clear ip dhcp binding

Overview This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

Syntax
```
clear ip dhcp binding {ip <ip-address>|mac
<mac-address>|all|pool <pool-name>|range <low-ip-address>
<high-ip-address>}
```

Syntax (VRF-lite)
```
clear ip dhcp binding [vrf <name>|global] {ip <ip-address>|mac
<mac-address>|all|pool <pool-name>|range <low-ip-address>
<high-ip-address>}
```

Parameter	Description
`vrf`	Display the output for a VRF instance
`<name>`	The name of the specific VRF instance.
`global`	Display the output for the Global VRF instance
`ip` *`<ip-address>`*	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.
`mac` *`<mac-address>`*	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.
`all`	All DHCP bindings.
`pool` *`<pool-name>`*	Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in “quotation marks”.
`range` *`<low-ip-address>`* *`<high-ip-address>`*	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.

Mode User Exec and Privileged Exec

Usage A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

Examples To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

Example (VRF-lite)

To clear all dynamic binding from VRF red instance, use the command:

```
awplus# clear ip dhcp binding vrf red all
```

Related commands

show ip dhcp binding

default-router

Overview This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

Syntax

```
default-router <ip-address>
no default-router [<ip-address>]
```

Parameter	Description
<ip-address>	IPv4 address of the default router, in dotted decimal notation.

Mode DHCP Configuration

Examples To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

dns-server

Overview This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

Note that if you add a user-defined option 6 using the option command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

Syntax

```
dns-server <ip-address>
no dns-server [<ip-address>]
```

Parameter	Description
<ip-address>	IPv4 address of the DNS server, in dotted decimal notation.

Mode DHCP Configuration

Examples To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

Related commands

default-router

option

service dhcp-server

show ip dhcp pool

subnet-mask

domain-name

Overview This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the option command, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode DHCP Configuration

Examples To add the domain name Nerv_Office to DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name Nerv_Office from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

Related commands

option

service dhcp-server

show ip dhcp pool

subnet-mask

host (DHCP)

Overview This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

Syntax

```
host <ip-address> <mac-address>
no host <ip-address>
no host all
```

Parameter	Description
<ip-address>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<mac-address>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH

Mode DHCP Configuration

Usage Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

Examples To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

Related Commands lease

range

show ip dhcp pool

host client-id

Overview Use this command to add a static host address reservation to the DHCP address pool you are configuring for the DHCP client with the given client identifier.

Use the **no** variant of this command to remove the specified host address reservation from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

Syntax

```
host <ip-address> client-id <client-identifier>
no host <ip-address>
```

Parameter	Description
<ip-address>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<client-identifier>	An alphanumeric string to be used as a client identifier. This is from 1 to 63 characters in length. This string can also contain special characters '#', '-', '_' and '.'.

Default No host static IP address reservations are defined for a pool.

Mode DHCP Configuration

Usage notes The client with the matching client-id is permanently assigned this IP address. No other clients can request it. If a subscriber identifier for a client identifier substitution is enabled for a remote pool, the DHCP server will expect to see the subscriber identifier sub-option being included in the relay agent information option on the relay client packet. And the subscriber-id is matched against the static host reservation with the matching client identifier.

A network/mask must be configured using the **network** command before issuing a host command. Also note that a host address must match a network to add a static host address.

Example To add a static host address for client-id 'office-pc-21' to a pool, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Campus-1
awplus(dhcp-config)# host 192.168.2.5 client-id office-pc-21
```

Output Figure 66-1: Example output from **show ip dhcp binding**

```
awplus#show ip dhcp binding Campus-1

Pool Campus-1 Network 192.168.2.0/24
DHCP Client Entries
IP Address      ClientId                          Type    Expiry
-----------------------------------------------------------------
192.168.2.5     office-pc-21                      Static  Infinite

awplus#show ip dhcp pool Campus-1
Pool Campus-1 :
  subscriber-id substition for client-id is enabled
  network: 192.168.2.0/24
  address ranges:
    addr: 192.168.2.50 to 192.168.2.100
  static host addresses:
    addr: 192.168.2.5      Client-id: office-pc-21
  lease  <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  dns servers:  192.168.2.2
  default-router(s):  192.168.2.2
  Probe:                        Default Values
    Status:       Enabled       [Enabled]
    Type:         Ping          [Ping]
    Packets:      5             [5]
    Timeout:      200 msecs     [200]
  Dynamic addresses:
    Total:        51
    Leased:       0
    Utilization:  0.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Related commands network (DHCP)

Command changes Version 5.5.2-0.1: command added

ip address dhcp

Overview This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1— the subnet mask for your device.
- Option 3— a list of default routers.
- Option 6 — a list of DNS servers. This list appends the DNS servers set on your device with the ip name-server command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the ip domain-name command. Your device ignores this domain name if it has a domain list set using the ip domain-list command.
- Option 51—lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

Syntax

```
ip address dhcp [client-id <interface>] [hostname <hostname>]
no ip address dhcp
```

Parameter	Description
`client-id <interface>`	The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field. Default: no default
`hostname <hostname>`	The hostname for the DHCP client on this interface. Typically this name is provided by the ISP. Default: no default

Mode Interface Configuration for VLAN interfaces.

Examples To set the interface vlan2 to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

Related commands

ip address (IP Addressing and Protocol)

show ip interface

show running-config

ip dhcp bootp ignore

Overview This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

Syntax

```
ip dhcp bootp ignore
no ip dhcp bootp ignore
```

Mode Global Configuration

Examples To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

Related commands show ip dhcp server summary

ip dhcp leasequery enable

Overview Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp leasequery enable
no ip dhcp leasequery enable
```

Default DHCP leasequery support is disabled by default.

Mode Global Configuration

Examples To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

Related commands

show counter dhcp-server

show ip dhcp server statistics

show ip dhcp server summary

ip dhcp option

Overview This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

You can use this option when configuring a DHCP pool, by using the option command.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

Syntax

```
ip dhcp option <1-254> [name <option-name>] [<option-type>]
no ip dhcp option [<1-254>|<option-name>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default	
<option-type>	The option value. You must specify a value that is appropriate to the option type:	
	`asci`	An ASCII text string
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ip`	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value that either sets (to 1) or unsets (to 0) a flag: **true**, **on**, or **enabled** will set the flag. **f alse**, **off** or **disabled** will unset the flag.

Mode Global Configuration

Examples

To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name tcpip-node-type, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

Related commands

default-router

dns-server

domain-name

option

service dhcp-server

show ip dhcp server summary

subnet-mask

ip dhcp pool

Overview This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

Syntax

```
ip dhcp pool <pool-name>
no ip dhcp pool <pool-name>
```

Parameter	Description
<pool-name>	Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Global Configuration

Example To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

Related commands service dhcp-server

ip dhcp-client default-route distance

Overview Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

Syntax

```
ip dhcp-client default-route distance [<1-255>]
no ip dhcp-client default-route distance
```

Parameter	Description
<1-255>	Administrative Distance (AD) from the range 1 though 255.

Default 1

Mode Interface Configuration for VLAN interfaces.

Usage notes DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as an interface with lower bandwidth or a particular role like the management interface.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

Examples To configure vlan10 as a DHCP client and to set the AD for the default route added by DHCP to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-client default-route distance
```

Related commands

show ip route

show ip route database

Command changes

Version 5.4.7-0.2 Command added.

ip dhcp-client request vendor-identifying-specific

Overview Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

Syntax

```
ip dhcp-client request vendor-identifying-specific
no ip dhcp-client request vendor-identifying-specific
```

Default The vendor-identifying-specific request is not configured by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes The DHCP client must be activated on the interface, using the ip address dhcp command, so that DHCP discovery packets are sent.

Example To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request
vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request
vendor-identifying-specific
```

Related commands ip address dhcp

ip dhcp-client vendor-identifying-class

Command changes Version 5.4.7-2.1: command added

ip dhcp-client vendor-identifying-class

Overview Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

Syntax

```
ip dhcp-client vendor-identifying-class
no ip dhcp-client vendor-identifying-class
```

Default The vendor-identifying-class is not configured by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes The DHCP client must be activated on the interface, using the ip address dhcp command, so that DHCP discovery packets are sent.

Example To remove the vendor-identifying-class on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

Related commands ip address dhcp

ip dhcp-client request vendor-identifying-specific

Command changes Version 5.4.7-2.1: command added

ip dhcp-relay agent-option

Overview This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

NOTE: *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands ip dhcp-relay agent-option and ip dhcp-relay information policy have been configured.*

Syntax

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

Default DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the ip dhcp-relay max-message-length command.

This command cannot be enabled if DHCP snooping is enabled on your device (service dhcp-snooping command), and vice versa.

Examples To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

Related commands

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

ip dhcp-relay max-message-length

service dhcp-relay

ip dhcp-relay agent-option checking

Overview

This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that ip dhcp-relay agent-option must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (ip dhcp-relay agent-option), and
- DHCP Relay Agent is enabled on the device (service dhcp-relay)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay agent-option checking
no ip dhcp-relay agent-option checking
```

Mode

Interface Configuration for VLAN interfaces.

Examples

To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

service dhcp-relay

ip dhcp-relay agent-option remote-id

Overview Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

Default The Remote ID is set to the device's MAC address by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (ip dhcp-relay agent-option), and
- DHCP Relay Agent is enabled on the device (service dhcp-relay)

Examples To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

show ip dhcp-relay

ip dhcp-relay agent-option subscriber-id

Overview Use this command to set an ASCII string as a subscriber identifier for a port.

Use the **no** variant of this command to unset the string as a subscriber identifier for a port.

Syntax

```
ip dhcp-relay agent-option subscriber-id <subscriber-id>
no ip dhcp-relay agent-option subscriber-id
```

Parameter	Description
<subscriber-id>	An alphanumeric string to use as a client identifier. It is from 1 to 63 characters in length. This string may also contain special characters '#', '-', '_' and "..

Default No string is set.

Mode Interface Configuration

Usage notes The subscriber identifier is used by the relay agent to add a subscriber identifier sub-option to the relay-agent information option added by the relay-agent before forwarding the client packets coming from the switch port to the server. The agent option fields in responses sent from the servers to clients are stripped before forwarding such responses back to the client.

Example To set subscriber identifier 'office-1' to packets coming from the client directly connected to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp-relay agent-option subscriber-id
office-1
```

Output Figure 66-2: Example output from **show interface**

```
awplus#show interface port1.0.1
Interface port1.0.1
  Scope: both
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is e01a.ea60.087f
  index 5010 metric 1 mru 1500
  configured duplex auto, configured speed auto, configured polarity auto
  <UP,BROADCAST,MULTICAST>
  SNMP link-status traps: Disabled
  DHCP subscriber-id substitution for client-id is not enabled
  DHCP subscriber-id is office-1
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0, broadcast packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
  Time since last state change: 0 days 17:51:00
```

Related commands show interface

Command changes Version 5.5.2-0.1: command added

ip dhcp-relay information policy

Overview This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

NOTE: *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands ip dhcp-relay agent-option and ip dhcp-relay information policy have been configured.*

Syntax

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

Parameter	Description
`append`	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
`drop`	The DHCP Relay Agent discards the packet.
`keep`	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
`replace`	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

Mode Interface Configuration for VLAN interfaces.

Examples

To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

service dhcp-server

ip dhcp-relay maxhops

Overview This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay maxhops <1-255>
no ip dhcp-relay maxhops
```

Parameter	Description
<1-255>	The maximum hop count value.

Default The default hop count threshold is 10 hops.

Mode Interface Configuration for VLAN interfaces.

Example To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

Related commands service dhcp-relay

ip dhcp-relay max-message-length

Overview This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay max-message-length <548-1472>
no ip dhcp-relay max-message-length
```

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

Default The default is 1400 bytes.

Mode Interface Configuration for VLAN interfaces.

Usage notes When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

NOTE: *Before setting this command, you must first run the ip dhcp-relay agent-option command. This will allow the DHCP Relay Agent Option 82 fields to be appended.*

Example To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

Related commands service dhcp-relay

ip dhcp-relay server-address

Overview This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}
```

```
no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}
```

```
no ip dhcp-relay
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

Mode Interface Configuration for VLAN interfaces.

Usage notes For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the service dhcp-relay command to enable the DHCP Relay Agent on your device. The ip dhcp-relay server-address command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

Examples: DHCP for IPv4

To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

Examples: DHCPv6

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

Example: disabling DHCP relay

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

Related commands

service dhcp-relay

ip dhcp-relay use-client-side-address

Overview Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

Syntax

```
ip dhcp-relay use-client-side-address
no ip dhcp-relay use-client-side-address
```

Parameter	Description
`use-client-side-address`	Use the client side interface IP address as the source IP address for relayed DHCP packets.

Default By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

Mode Global Configuration

Usage notes In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients' DHCP requests to be used as the source IP address of the relayed DHCP packets.

Example To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

Output Figure 66-3: Example output from **show ip dhcp-relay**

The second line of the display output shows the status of the client-side address being enabled as the source IP address.

```
awplus#sh ip dhcp-relay

DHCP Relay Service is enabled
Use of client side address as source address is enabled
...
```

Related commands ip dhcp-relay server-address

Command changes Version 5.4.9-0.7: command added

ip dhcp use-subscriber-id

Overview Use this command in Global Configuration mode to configure the DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from all switch ports.

Use this command in Interface Configuration mode to configure a DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from a DHCP client directly connected to an interface.

Use the **no** variant of this command to disable the configuration.

Syntax

```
ip dhcp use-subscriber-id
no ip dhcp use-subscriber-id
```

Default Disabled

Mode Global Configuration

Interface Configuration

Usage notes In Global Configuration mode, other DHCP packets coming from other interface types, for example Ethernet, are not affected by this command.

In Interface Configuration mode, the subscriber-id used in the substitution is derived from the port name of an interface. For example, for a DHCP packet coming in from a DHCP client directly attached to switchport port1.0.1, the subscriber-id is port1.0.1. This subscriber identifier for the client identifier substitution can only be applied to packets coming from switchport interfaces, consequently this command is only applicable to switchport interfaces.

Example 1 In Global Configuration mode, to configure the subscriber-id client-id substitution for the DHCP packets coming from all switch port interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp use-subscriber-id
```

Output Figure 66-4: Example output from **show ip dhcp server summary**

```
awplus#show ip dhcp server summary

DHCP Server service is enabled
DHCP Server is running
BOOTP ignore is disabled
DHCP leasequery support is disabled
DHCP subscriber-id substition for client-id is enabled
Pool list: pool_direct pool_relay Campus-1
```

Example 2 In Interface Configuration mode, to configure subscriber identifier substitution for the client identifier on packets sent by a DHCP client directly attached to port port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp use-subscriber-id
```

Output Figure 66-5: Example output from **show interface**

```
awplus#show interface port1.0.1
Interface port1.0.1
  Scope: both
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is e01a.ea60.087f
  index 5010 metric 1 mru 1500
  configured duplex auto, configured speed auto, configured
polarity auto

  SNMP link-status traps: Disabled
  DHCP subscriber-id substitution for client-id is enabled
  DHCP subscriber-id is office-1
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0, broadcast
packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
  Time since last state change: 0 days 17:51:00
```

Related commands show ip dhcp server summary

show interface

Command changes Version 5.5.2-0.1: command added

lease

Overview This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the option command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

Syntax

```
lease <days> <hours> <minutes> [<seconds>]
lease infinite
no lease
```

Parameter	Description
<days>	The number of days, from 0 to 120, that the lease expiry time is configured for. Default: 1
<hours>	The number of hours, from 0 to 24, that the lease expiry time is configured for. Default: 0
<minutes>	The number of minutes, from 0 to 60, the lease expiry time is configured for. Default: 0
<seconds>	The number of seconds, from 0 to 60, the lease expiry time is configured for.
`infinite`	The lease never expires.

Default The default lease time is 1 day.

Mode DHCP Configuration

Examples To set the lease expiration time for address pool `P2` to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

Related commands

option

service dhcp-server

short-lease-threshold

network (DHCP)

Overview This command sets the network (subnet) that the DHCP address pool applies to.

The **no** variant of this command removes the network (subnet) from the DHCP address pool.

Syntax

```
network
{<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}
no network
```

Parameter	Description
<ip-subnet-address/prefix-length>	The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.
<ip-subnet-address/mask>	The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation.

Mode DHCP Configuration

Usage notes This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring.

The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

Examples To configure a network for the address pool `P2`, where the subnet is `192.0.2.5` and the mask is `255.255.255.0`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

Related commands service dhcp-server

subnet-mask

next-server

Overview This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

Syntax

```
next-server <ip-address>
no next-server
```

Parameter	Description
<ip-address>	The server IP address, entered in dotted decimal notation.

Mode DHCP Configuration

Example To set the next-server address for the address pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

option

Overview This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

Syntax

```
option [<1-254>|<option-name>] <option-value>
no option [<1-254>|<option-value>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ip`	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCP Configuration

Examples

To add the ASCII-type option named `tftp-server-name` to the pool `P2` and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool `P2` and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option `179` to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

show ip dhcp pool

probe enable

Overview Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

Syntax

```
probe enable
no probe enable
```

Default Probing is enabled by default.

Mode DHCP Pool Configuration

Examples To enable probing for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

Related commands

probe packets

probe timeout

probe type

show ip dhcp pool

probe packets

Overview Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

Syntax

```
probe packets <0-10>
no probe packets
```

Parameter	Description
<0-10>	The number of probe packets sent.

Default The default is 5.

Mode DHCP Pool Configuration

Examples To set the number of probe packets to 2 for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

Related commands

probe enable

probe timeout

probe type

show ip dhcp pool

probe timeout

Overview Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

Syntax

```
probe timeout <50-5000>
no probe timeout
```

Parameter	Description
<50-5000>	Timeout interval in milliseconds.

Default The default timeout interval is 200 milliseconds.

Mode DHCP Pool Configuration

Examples To set the probe timeout value to 500 milliseconds for pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool `P2` to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

Related commands

probe enable

probe packets

probe type

show ip dhcp pool

probe type

Overview Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

Syntax

```
probe type {arp|ping}
no probe type
```

Parameter	Description
`arp`	Probe using ARP.
`ping`	Probe using ping.

Default The default probe type is ping.

Mode DHCP Pool Configuration

Examples To set the probe type to `arp` for the pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool `P2` to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

show ip dhcp pool

range

Overview This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

Syntax

```
range <ip-address> [<ip-address>]
no range <ip-address> [<ip-address>]
no range all
```

Parameter	Description
<ip-address>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool.

Mode DHCP Configuration

Examples To add an address range of 192.0.2.5 to 192.0.2.16 to the pool Nerv_Office, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

Related commands

ip dhcp pool

service dhcp-server

show ip dhcp pool

route

Overview This command allows the DHCP server to provide static routes to clients.

Syntax

```
route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}
```

Parameter	Description
`A.B.C.D/M`	Subnet for the route
`A.B.C.D`	Next hop for the route
`both`	opt249 and rft3442
`opt249`	Classless static route option for DHCP
`rfc3442`	Classless static route option for DHCP

Mode DHCP Configuration

Examples To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool pubic
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

Related commands ip dhcp pool

service dhcp-relay

Overview This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

Syntax

```
service dhcp-relay
no service dhcp-relay
```

Mode Global Configuration

Usage notes A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

Default The DHCP-relay service is enabled by default.

Examples To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

service dhcp-server

Overview This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

Syntax

```
service dhcp-server
no service dhcp-server
```

Mode Global Configuration

Example To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

Related commands

ip dhcp pool

show ip dhcp server summary

subnet-mask

short-lease-threshold

Overview Use this command to configure a short lease threshold.

Use the **no** variant of this command to return the short lease threshold to the default of one minute.

Syntax

```
short-lease-threshold <hours> <minutes>
no short-lease-threshold
```

Parameter	Description
<hours>	The number of hours, from 0 to 24.
<minutes>	The number of minutes, from 0 to 60.

Default 1 minute.

Mode DHCP Configuration

Usage notes DHCP leases need to be backed up in NVS so that when the DHCP server reboots or goes through a power cycle it won't lose all the knowledge of these leases.

Some networks have a high number of mobile devices repeatedly requesting DHCP leases every few seconds before their existing lease expires. This can happen for example, when mobile devices move in and out of a Wi-Fi zone or when Wi-Fi signal strength changes. This means the same IP address can have multiple lease entries which can take up unnecessary backup file space.

The **short-lease-threshold** command allows you to configure the threshold for a short lease, from 1 minute to 24 hours. Any lease less than the threshold is deemed to be a short lease and will NOT be backed up to NVS.

This is useful if you have:

- limited backup file space, and
- you don't need to restore leases after a device reboot or power cycle

Example To set the short lease threshold for address pool P2 to 40 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# short-lease-threshold 0 40
```

To set the short lease threshold for address pool Nerv_Office to 5 hours and 35 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# short-lease-threshold 5 35
```

To return the short lease threshold to the default of one minute, use the following commands:

```
awplus# configure terminal
awplus(config)# no short-lease-threshold
```

Command changes Version 5.4.8-2.1: command added

show counter dhcp-client

Overview This command shows counters for the DHCP client on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show counter dhcp-client
```

Mode User Exec and Privileged Exec

Example To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

Output Figure 66-6: Example output from the **show counter dhcp-client** command

```
show counter dhcp-client

DHCPDISCOVER out      ......... 10
DHCPREQUEST out       ......... 34
DHCPDECLINE out       ......... 4
DHCPRELEASE out       ......... 0
DHCPOFFER in          ......... 22
DHCPACK in            ......... 18
DHCPNAK in            ......... 0
```

Table 1: Parameters in the output of the **show counter dhcp-client** command

Parameter	Description
DHCPDISCOVER out	The number of DHCP Discover messages sent by the client.
DHCPREQUEST out	The number of DHCP Request messages sent by the client.
DHCPDECLINE out	The number of DHCP Decline messages sent by the client.
DHCPRELEASE out	The number of DHCP Release messages sent by the client.
DHCPOFFER in	The number of DHCP Offer messages received by the client.
DHCPACK in	The number of DHCP Acknowledgement messages received by the client.
DHCPNAK in	The number of DHCP Negative Acknowledgement messages received by the client.

Related commands ip address dhcp

show counter dhcp-relay

Overview This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show counter dhcp-relay
```

Syntax (VRF-lite)
```
show counter dhcp-relay [vrf <vrf-name>|global]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
`global`	Display the output for the Global VRF instance

Mode User Exec and Privileged Exec

Examples To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

Output Figure 66-7: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

DHCPv6 Relayed to Client ......... 0
```

Output (VRF-lite)

Figure 66-8: Example output from the **show counter dhcp-relay** command for VRF instance red

```
DHCP relay counters

[VRF red]
Requests In ..................... 4
Replies In ...................... 4
Relayed To Server ............... 4
Relayed To Client ............... 4
Out To Server Failed ............ 0
Out To Client Failed ............ 0
Invalid hlen .................... 0
Bogus giaddr .................... 0
Corrupt Agent Option ............ 0
Missing Agent Option ............ 0
Bad Circuit ID .................. 0
Missing Circuit ID .............. 0
Option Insert Failed ............ 0
```

Parameter	Description
`Requests In`	The number of DHCP Request messages received from clients.
`Replies In`	The number of DHCP Reply messages received from servers.
`Relayed To Server`	The number of DHCP Request messages relayed to servers.
`Relayed To Client`	The number of DHCP Reply messages relayed to clients.
`Out To Server Failed`	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
`Out To Client Failed`	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
`Invalid hlen`	The number of incoming messages dropped due to an invalid hlen field.
`Bogus giaddr`	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
`Corrupt Agent Option`	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.

Parameter	Description
`Missing Agent Option`	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
`Bad Circuit ID`	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Missing Circuit ID`	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Bad Remote ID`	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Missing Remote ID`	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command

Parameter	Description
`Option Insert Failed`	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: • the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the ip dhcp-relay information policy command. • there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.
Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running	
`DHCPv6 Requests In`	The number of incoming DHCPv6 Request messages.
`DHCPv6 Replies In`	The number of incoming DHCPv6 Reply messages.
`DHCPv6 Relayed to Server`	The number of DHCPv6 messages relayed to the server.
`DHCPv6 Relayed to Client`	The number of DHCPv6 messages relayed to the client.

show counter dhcp-server

Overview This command shows counters for the DHCP server on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show counter dhcp-server
```

Syntax (VRF-lite)
```
show counter dhcp-server [vrf <vrf-name>]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
`<vrf-name>`	The name of the specific VRF instance.

Mode User Exec and Privileged Exec

Example To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

Output Figure 66-9: Example output from the **show counter dhcp-server** command

```
DHCP server counters
DHCPDISCOVER in       ......... 20
DHCPREQUEST in        ......... 12

```

Table 2: Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
`DHCPDISCOVER in`	The number of Discover messages received by the DHCP server.
`DHCPREQUEST in`	The number of Request messages received by the DHCP server.
`DHCPDECLINE in`	The number of Decline messages received by the DHCP server.
`DHCPRELEASE in`	The number of Release messages received by the DHCP server.
`DHCPINFORM in`	The number of Inform messages received by the DHCP server.
`DHCPOFFER out`	The number of Offer messages sent by the DHCP server.

Table 2: Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
`DHCPACK out`	The number of Acknowledgement messages sent by the DHCP server.
`DHCPNAK out`	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
`BOOTREQUEST in`	The number of bootp messages received by the DHCP server from bootp clients.
`BOOTREPLY out`	The number of bootp messages sent by the DHCP server to bootp clients.

show dhcp lease

Overview This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see "Controlling "show" Command Output" in the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dhcp lease [<interface>]
```

Parameter	Description
<interface>	Interface name to display DHCP lease details for.

Mode User Exec and Privileged Exec

Example To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan2, use the command:

```
awplus# show dhcp lease vlan2
```

Output Figure 66-11: Example output from the **show dhcp lease vlan1** command

```
Interface vlan1

Related commands ip address dhcp

show ip dhcp binding

Overview This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip dhcp binding [<ip-address>|<address-pool>]
```

Syntax (VRF-lite)
```
show ip dhcp binding [vrf <name>] [<ip-address>|<address-pool>]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
<name>	The name of the specific VRF instance.
<ip-address>	IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address.
<address-pool>	Name of an address pool. This displays the lease information for all clients within the address pool.

Mode User Exec and Privileged Exec

Examples To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
  static host addresses:
    addr: 192.168.1.12     MAC addr: 1111.2222.3333
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                        Default Values
    Status:       Enabled       [Enabled]
    Type:         ARP           [Ping]
    Packets:      2             [5]
    Timeout:      200 msecs     [200]
  Dynamic addresses:
    Total:        8
    Leased:       2
    Utilization:  25.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Output Figure 66-15: Example output from the **show ip dhcp pool** command with IP address 192.168.1.12 assigned to a VLAN interface on the device:

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
            (interface addr 192.168.1.12 excluded)
            (static host addr 192.168.1.12 excluded)
  static host addresses:
    addr: 192.168.1.12     MAC addr: 1111.2222.3333
            (= interface addr, so excluded)
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                       Default Values
    Status:       Enabled      [Enabled]
    Type:         ARP          [Ping]
    Packets:      2            [5]
    Timeout:      200 msecs    [200]
  Dynamic addresses:
    Total:        8
    Leased:       2
    Utilization:  25.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Output Figure 66-16: Example output from the **show ip dhcp pool** command with a host with MAC 0000.cd38.05f9 is registered as a static host by DHCP Framed IP Lease feature from AUTHD:

```
Pool p1 :
  network: 10.1.1.0/24
  address ranges:
    addr: 10.1.1.101 to 10.1.1.199
            (static host addr 10.1.1.122 excluded)
            (static host addr 10.1.1.111 excluded)
  static host addresses:
    addr: 10.1.1.122       MAC addr: 0000.1111.2222
    addr: 10.1.1.111       MAC addr: 0000.cd38.05f9
                           Netmask : 255.255.255.0
                           Gateway : 10.1.1.1
                           Lease   : 60 seconds
                           Added by AUTHD
  lease  <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                       Default Values
    Status:       Enabled      [Enabled]
    Type:         Ping         [Ping]
    Packets:      5            [5]
    Timeout:      200 msecs    [200]
  Dynamic addresses:
    Total:        97
    Leased:       1
    Utilization:  1.0 %
  Static host addresses:
    Total:        2
    Leased:       2
```

Table 3: Parameters in the output of the **show ip dhcp pool** command

Parameter	Description
Pool	Name of the pool.
network	Subnet and mask length of the pool.
address ranges	Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only. Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry.

Table 3: Parameters in the output of the **show ip dhcp pool** command (cont.)

Parameter	Description
static host addresses	The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry.
lease <days:hours:minutes>	The lease duration for address allocated by this pool.
domain	The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.
subnet mask	The subnet mask sent by the pool to clients.
Probe - Status	Whether lease probing is enabled or disabled.
Probe - Type	The lease probe type configured. Either ping or ARP.
Probe - Packets	The number of packets sent for each lease probe in the range 0 to 10.
Probe - Timeout	The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.
dns servers	The DNS server addresses sent to by the pool to clients.
default-router(s)	The default router addresses sent by the pool to clients.
user-defined options	The list of user-defined options sent by the pool to clients.
Dynamic addresses- Total	The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.
Dynamic addresses- Leased	The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.
Dynamic addresses - Utilization	The percentage of IP addresses in the pool that are currently dynamically allocated to clients.
Static host addresses- Total	The number of static IP addresses configured in the pool for specific DHCP client hosts.
Static host addresses - Leased	The number of static IP addresses assigned to specific DHCP client hosts.

show ip dhcp-relay

Overview This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip dhcp-relay [interface <interface-name>]
```

Syntax (VRF-lite)
```
show ip dhcp-relay [vrf <name>|global] [interface
<interface-name>]
```

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
global	The Global VRF instance.

Mode User Exec and Privileged Exec

Example To display the DHCP Relay Agent's configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

Output Figure 66-17: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers :   192.168.1.200
```

Output (VRF-lite)

Figure 66-18: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :   192.168.1.3
```

show ip dhcp server statistics

Overview This command shows statistics related to the DHCP server.

You can display the server counters using the show counter dhcp-server command as well as with this command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip dhcp server statistics
```

Syntax (VRF-lite)
```
show ip dhcp server statistics [vrf <name>]
```

Parameter	Description
`vrf`	Display the output for a VRF instance.
<name>	The name of the specific VRF instance.

Mode User Exec and Privileged Exec

Example To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

Output Figure 66-19: Example output from the **show ip dhcp server statistics** command

```
DHCP server counters
DHCPDISCOVER in       ......... 20
DHCPREQUEST in        ......... 12
DHCPDECLINE in        ......... 1
DHCPRELEASE in        ......... 0
DHCPINFORM in         ......... 0
DHCPOFFER out         ......... 8
DHCPACK out           ......... 4
DHCPNAK out           ......... 0
BOOTREQUEST in        ......... 0
BOOTREPLY out         ......... 0
DHCPLEASEQUERY in       ....... 0
DHCPLEASEUNKNOWN out    ....... 0
DHCPLEASEACTIVE out     ....... 0
DHCPLEASEUNASSIGNED out ....... 0
```

Output (VRF-lite)

Figure 66-20: Example output from the **show ip dhcp server statistics** command for VRF instance red

```
DHCP relay counters
[VRF: RED]
DHCPDISCOVER in          ....... 0
DHCPREQUEST in           ....... 7
DHCPDECLINE in           ....... 0
DHCPRELEASE in           ....... 0
DHCPINFORM in            ....... 0
DHCPOFFER out            ....... 0
DHCPACK out              ....... 7
DHCPNAK out              ....... 0
BOOTREQUEST in           ....... 0
BOOTREPLY out            ....... 0
DHCPLEASEQUERY in        ....... 0
DHCPLEASEUNKNOWN out     ....... 0
DHCPLEASEACTIVE out      ....... 0
DHCPLEASEUNASSIGNED out ....... 0
```

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPDECLINE in	The number of Decline messages received by the DHCP server.
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.
DHCPNAK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.

Parameter	Description
`BOOTREPLY out`	The number of bootp messages sent by the DHCP server to bootp clients.
`DHCPLEASEQUERY in`	The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.
`DHCPLEASEUNKNOWN out`	The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.
`DHCPLEASEACTIVE out`	The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.
`DHCPLEASEUNASSIGNED out`	The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.

Command changes

Version 5.5.1-1.1: **vrf <name>** parameter added

show ip dhcp server summary

Overview This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the show ip dhcp pool command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip dhcp server summary
```

Mode User Exec and Privileged Exec

Example To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

Output Figure 66-21: Example output from the **show ip dhcp server summary** command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

Related commands

ip dhcp leasequery enable

ip dhcp pool

service dhcp-server

subnet-mask

Overview This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the option command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the next-server command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

Syntax

```
subnet-mask <mask>
no subnet-mask
```

Parameter	Description
<mask>	Valid IPv4 subnet mask, in dotted decimal notation.

Mode DHCP Configuration

Examples To set the subnet mask option to `255.255.255.0` for DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

Related commands

service dhcp-server

show ip dhcp pool

use-subscriber-id

Overview Use this command to configure a DHCP server to use a subscriber identifier substitution for a client identifier on all DHCP packets for a given remote address pool.

Use the **no** variant of this command to remove the subscriber identifier substitution for a client identifier.

Syntax

```
use-subscriber-id
no use-subscriber-id
```

Default Disabled

Mode DHCP Configuration

Usage notes If the subscriber identifier for the client identifier substitution is enabled for a remote pool, then all relayed packets destined for the poll must contain the relay agent information option. This includes the subscriber identifier sub-option.

If not, then the relayed packet will be silently ignored as the situation is considered as an invalid operation.

Example To set the subscriber-id and client-id substitution for the DHCP pool 'Campus-1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Campus-1
awplus(dhcp-config)# use-subscriber-id
```

Output Figure 66-22: Example output from **show ip dhcp pool Campus-1**

```
awplus#show ip dhcp pool Campus-1
Pool Campus-1 :
  subscriber-id substitution for client-id is enabled
  network: 192.168.2.0/24
  address ranges:
    addr: 192.168.2.50 to 192.168.2.100
  static host addresses:
    addr: 192.168.2.5      Client-id: office-pc-21
  lease  <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  dns servers:  192.168.2.2
  default-router(s):  192.168.2.2
  Probe:                        Default Values
    Status:       Enabled       [Enabled]
    Type:         Ping          [Ping]
    Packets:      5             [5]
    Timeout:      200 msecs     [200]
  Dynamic addresses:
    Total:        51
    Leased:       0
    Utilization:  0.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

show ip dhcp pool

Command changes Version 5.5.2-0.1: command added

vrf

Overview Use this command to add a VRF name to a DHCP server's address pool. This enables the DHCP server to become VRF-aware and allocate IP addresses which are the same as other pools.

One of the benefits of using this command is that it allows you to share DHCP leases across multiple isolated networks.

Use the **no** variant of this command to remove a VRF name from the DHCP server pool.

Syntax

```
vrf <vrf-name>
no vrf
```

Parameter	Description
<vrf-name>	The name of the specific VRF instance.

Default Global VRF

Mode DHCP Configuration

Usage notes You need to enter this **vrf** command before entering the network (DHCP) and range address commands.

For more information, see the DHCP Feature Overview and Configuration Guide.

Example To add the VRF name 'red' to the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# vrf red
```

To remove a VRF name from the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# no vrf
```

67 DHCP for IPv6 (DHCPv6) Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the DHCPv6 Feature Overview and Configuration Guide.

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

NOTE: *The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.*

Command List

address prefix

Overview Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

Syntax

```
address prefix <ipv6-prefix/prefix-length> [lifetime
{<valid-time>|infinite} {<preferred-time>|infinite}]
```

```
no address prefix <ipv6-prefix/prefix-length>
```

Parameter	Description
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`lifetime`	Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional lifetime parameter with this command then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Usage notes This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the address range command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the

DHCPv6 Server REPLY packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples To add IPv6 address prefix `2001:0db8:1::/48` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

Related commands

address range

ipv6 dhcp pool

Validation Commands

show ipv6 dhcp binding

show ipv6 dhcp pool

address range

Overview Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

Syntax

```
address range <first-ipv6-address>
<last-ipv6-address>[lifetime {<valid-time>|infinite}
{<preferred-time>|infinite}]
```

```
no address range <first-ipv6-address> <last-ipv6-address>
```

Parameter	Description
<first-ipv6-address>	Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
<last-ipv6-address>	Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
lifetime	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-31536000>. The default valid lifetime is 2592000 seconds.
infinite	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a preferred lifetime in seconds in the range <5-31536000>. The default preferred lifetime is 604800 seconds.

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Usage Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples

To add the IPv6 address range `2001:0db8:1::1` to `2001:0db8:1fff::1` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

Related commands

address prefix

show ipv6 dhcp pool

clear counter ipv6 dhcp-client

Overview Use this command in Privileged Exec mode to clear DHCPv6 client counters.

Syntax
```
clear counter ipv6 dhcp-client
```

Mode Privileged Exec

Example To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

Related commands show counter ipv6 dhcp-client

clear counter ipv6 dhcp-server

Overview Use this command in Privileged Exec mode to clear DHCPv6 server counters.

Syntax

```
clear counter ipv6 dhcp-server
```

Mode Privileged Exec

Example To clear DHCPv6 server counters, use the following command:

```
awplus# clear counter ipv6 dhcp-server
```

Related commands show counter ipv6 dhcp-server

clear ipv6 dhcp binding

Overview Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

Syntax `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

Parameter	Description
`ipv6 <prefix>`	Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format `X:X::X:X`.
`duid <DUID>`	Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.
`all`	All DHCPv6 bindings.
`pool <name>`	Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".

Mode Privileged Exec

Usage notes A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The clear ipv6 dhcp binding command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the clear ipv6 dhcp binding command.

If the **clear ipv6 dhcp binding** command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the **clear ipv6 dhcp binding** command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

Example To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

Output Figure 67-1: Example output from the **clear ipv6 dhcp binding all** command

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

Related commands show ipv6 dhcp binding

clear ipv6 dhcp client

Overview Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

Syntax

```
clear ipv6 dhcp client <interface>
```

Parameter	Description
<interface>	Specify the interface name to restart a DHCPv6 client on.

Mode Privileged Exec

Example To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

Related commands show ipv6 dhcp binding

dns-server (DHCPv6)

Overview Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the option (DHCPv6) command, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

Syntax

```
dns-server <ipv6-address>
no dns-server [<ipv6-address>]
```

Parameter	Description
<ipv6-address>	Specify an IPv6 address of the DNS server, in hexadecimal notation in the format X:X::X:X. This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the no dns-server command without this parameter.

Mode DHCPv6 Configuration

Examples To add the DNS server with the assigned IPv6 address 2001:0db8:3000:3000::32 to the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address 2001:0db8:3000:3000::32 from the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

Related commands

ipv6 dhcp pool

option (DHCPv6)

show ipv6 dhcp pool

domain-name (DHCPv6)

Overview Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks".

Mode DHCPv6 Configuration

Usage This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre- defined option 15. Note that if you add a user-defined option 15 using the option (DHCPv6) command, then you will override any settings created with this command.

Examples To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

Related commands

dns-server (DHCPv6)

option (DHCPv6)

show ipv6 dhcp pool

ip dhcp-relay agent-option

Overview This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

NOTE: *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands ip dhcp-relay agent-option and ip dhcp-relay information policy have been configured.*

Syntax

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

Default DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the ip dhcp-relay max-message-length command.

This command cannot be enabled if DHCP snooping is enabled on your device (service dhcp-snooping command), and vice versa.

Examples To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

Related commands

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

ip dhcp-relay max-message-length

service dhcp-relay

ip dhcp-relay agent-option subscriber-id-auto-mac

Overview This command causes the relay agent to insert the requesting clients' MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID option to assign the same IPv6 address to that requesting client every time it requires an address.

Use the no form of this command to disable this feature.

Syntax

```
ip dhcp-relay agent-option subscriber-id-auto-mac
no ip dhcp-relay agent-option subscriber-id-auto-mac
```

Default Disabled

Usage notes By default, DHCPv6 uses a DUID-LLT client identifier instead of a MAC address. This is generated by the operating system when DHCP first starts. If the OS is reinstalled the DUID-LLT can change, and any multiple operating systems on the machine will all have different DUIDs.

Configuring the subscriber-id-auto-mac option causes the relay agent to insert the requesting client's MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID to assign the same IPv6 address to that requesting client every time it connects.

The client must be in the same L2 network as the relay. If there are multiple relays between the client and the server, only the first relay will add a subscriber ID option.

Example To enable this feature on VLAN1, use the following commands:

```
awplus(config)#int vlan1
awplus(config-if)#ip dhcp-relay agent-option
subscriber-id-auto-mac
```

For an example of how to configure a relay agent and server, see the document "How to use DHCPv6 to assign specific IPv6 addresses to specific devices", available from www.alliedtelesis.com.

ip dhcp-relay agent-option checking

Overview This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that ip dhcp-relay agent-option must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (ip dhcp-relay agent-option), and
- DHCP Relay Agent is enabled on the device (service dhcp-relay)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay agent-option checking
no ip dhcp-relay agent-option checking
```

Mode Interface Configuration for VLAN interfaces.

Examples To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

service dhcp-relay

ip dhcp-relay agent-option remote-id

Overview Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

Default The Remote ID is set to the device's MAC address by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (ip dhcp-relay agent-option), and
- DHCP Relay Agent is enabled on the device (service dhcp-relay)

Examples To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

show ip dhcp-relay

ip dhcp-relay information policy

Overview This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

NOTE: *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands ip dhcp-relay agent-option and ip dhcp-relay information policy have been configured.*

Syntax

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

Parameter	Description
`append`	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
`drop`	The DHCP Relay Agent discards the packet.
`keep`	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
`replace`	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

Mode Interface Configuration for VLAN interfaces.

Examples

To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

service dhcp-server

ip dhcp-relay maxhops

Overview This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay maxhops <1-255>
no ip dhcp-relay maxhops
```

Parameter	Description
<1-255>	The maximum hop count value.

Default The default hop count threshold is 10 hops.

Mode Interface Configuration for VLAN interfaces.

Example To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

Related commands service dhcp-relay

ip dhcp-relay max-message-length

Overview This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay max-message-length <548-1472>
no ip dhcp-relay max-message-length
```

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

Default The default is 1400 bytes.

Mode Interface Configuration for VLAN interfaces.

Usage notes When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

NOTE: *Before setting this command, you must first run the ip dhcp-relay agent-option command. This will allow the DHCP Relay Agent Option 82 fields to be appended.*

Example To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

Related commands service dhcp-relay

ip dhcp-relay server-address

Overview This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}
```

```
no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}
```

```
no ip dhcp-relay
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

Mode Interface Configuration for VLAN interfaces.

Usage notes For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the service dhcp-relay command to enable the DHCP Relay Agent on your device. The ip dhcp-relay server-address command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

Examples: DHCP for IPv4

To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

Examples: DHCPv6

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

Example: disabling DHCP relay

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

Related commands

service dhcp-relay

ipv6 address (DHCPv6 PD)

Overview Use this command to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

Syntax

```
ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length>
[eui64]
```

```
no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length>
[eui64]
```

Parameter	Description
<ipv6-prefix-name>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<ipv6-addr/prefix-length>	Specifies the IPv6 address to be set, for example ::1/64. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`eui64`	EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

Mode Interface Configuration for VLAN interfaces.

Usage notes When specifying the **eui64** parameter, the interface identifier of the IPv6 address is derived from the MAC address of the device.

For more information about EUI64, see the IPv6 Feature Overview and Configuration Guide.

Examples To assign the IPv6 address 2001:0db8::a2/48 to the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address 2001:0db8::a2/48 from the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the **eui64** derived address in the prefix 2001:0db8::/64 to VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix 2001:0db8::/64 from VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

To configure a PD prefix named 'prefix1' on interface vlan2 and then add an IPv6 address, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be ::1 for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

Related commands

prefix-delegation pool

show ipv6 dhcp binding

show ipv6 interface

show ipv6 route

show running-config

ipv6 address dhcp

Overview Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6 —a list of DNS servers. This list appends the DNS servers set on your device with the dns-server (DHCPv6) command.
- Option 15—a domain name used to resolve host names. This option replaces any domain name that you have set with the domain-name (DHCPv6) command.
- Option 51—lease expiration time.

Syntax

```
ipv6 address dhcp [default-route-to-server]
no ipv6 address dhcp
```

Parameter	Description
`default-route-to-server`	Allow the automatic configuration of a default route to the DHCPv6 server. This option is not enabled by default when you enable the DHCP client on an interface.

Mode Interface Configuration for VLAN interfaces.

Usage notes Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

Examples To set the interface vlan2 to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

Related commands

clear ipv6 dhcp client

ipv6 address

ipv6 address (DHCPv6 PD)

show ipv6 dhcp interface

show running-config

ipv6 dhcp client pd

Overview Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see the DHCPv6 Feature Overview and Configuration Guide.

Syntax

```
ipv6 dhcp client pd <prefix-name> <default-route-to-server>
no ipv6 dhcp client pd
```

Parameter	Description
<prefix-name>	Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<default-route-to-server>	Specify the default route to the DHCP server

Mode Interface Configuration for VLAN interfaces.

Default Prefix delegation is disabled by default on an interface.

Usage notes Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required *<prefix-name>* placeholder parameter. The ipv6 address command can then refer to the prefixes stored in the IPv6 prefix pool.

Examples To enable prefix delegation with the prefix name my-prefix-name on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

Related commands

ipv6 dhcp option

Overview Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the option (DHCPv6) command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

Syntax

```
ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]
no ipv6 dhcp option <1-254>|<option-name>
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”. Default: no default	
<option-type>	The option value. You must specify a value that is appropriate to the option type:	
	`asci`	An ASCII text string
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ipv6`	An IPv6 address or prefix that has hexadecimal notation in the format `HHHH:HHHH::HHHH:HHHH`. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value that either sets (to 1) or unsets (to 0) a flag: **true**, **on**, or **enabled** will set the flag. **f alse**, **off** or **disabled** will unset the flag.

Mode Global Configuration

Examples

To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip- node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number `12`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

Related commands

domain-name (DHCPv6)

option (DHCPv6)

show ipv6 dhcp

ipv6 dhcp pool

Overview Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on devices with multiple interfaces. This allows the device to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

Syntax

```
ipv6 dhcp pool <DHCPv6-poolname>
no ipv6 dhcp pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Global Configuration

Usage All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples To create the DHCPv6 pool named `P2` and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

ipv6 dhcp server

Overview Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

Syntax

```
ipv6 dhcp-server [<DHCPv6-poolname>]
no ipv6 dhcp-server
```

Parameter	Description
<DHCPv6-poolname>	Specify a named DHCPv6 server pool as defined with the ipv6 dhcp pool command. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode Interface Configuration for VLAN interfaces.

Usage notes The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

Examples To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

Related commands

ipv6 dhcp pool

show ipv6 dhcp pool

ipv6 local pool

Overview Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

Syntax

```
ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>
<ipv6-prefix/prefix-length> <assigned-length>
[exclude-local-prefix]

no ipv6 local pool
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.
<delegated-prefix-name>	Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in “quotation marks”.
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<assigned-length>	Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the *assigned-length* parameter entered cannot be less than or equal to the *prefix-length* parameter value entered. An assigned length must be longer than a prefix length.
exclude-local-prefix	Specify this keyword to exclude the locally assigned prefix from the pool.

Default No DHCPv6 server prefix delegation pool is configured by default.

Mode Global Configuration

Usage notes All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples

To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

Related commands

ipv6 dhcp pool

show ipv6 dhcp pool

ipv6 nd prefix (DHCPv6)

Overview Use this command to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 server for DHCPv6 prefix-delegation for an interface.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

Syntax

```
ipv6 nd prefix <ipv6-prefix-name>
<ipv6-prefix/length>{<valid-lifetime>|infinite}
{<preferred-lifetime>|infinite} {off-link|no-autoconfig}
```

```
no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}
```

Parameter	Description
<ipv6-prefix-name>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<ipv6-prefix/length>	The IPv6 prefix and prefix length advertised on the router advertisement message sent from the device. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<valid-lifetime>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.
`infinite`	Specifying this keyword instead of entering a value for the <*valid-lifetime*> parameter applies an infinite valid lifetime.
<preferred-lifetime>	Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry.
`infinite`	Specifying this keyword instead of entering a value for the <*preferred-lifetime*> parameter applies an infinite valid lifetime.
`off-link`	Specify the IPv6 prefix off-link flag.
`no-autoconfig`	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.
`all`	Specify all prefix names and all prefixes are removed when used with the no variant of this command.

Mode Interface Configuration for VLAN interfaces.

Usage notes This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples The following example configures the device to issue RAs (Router Advertisements) on the VLAN interface vlan2, and advertises the DHCPv6 prefix name prefix1 and the IPv6 address prefix of 2001:0db8::/32.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface vlan2, so the address prefix of 2001:0db8::/32 is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

link-address

Overview Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

Syntax

```
link-address <ipv6-prefix/prefix-length>
no link-address
```

Parameter	Description
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Default No DHCPv6 Server pool configuration link address prefix is configured by default.

Mode DHCPv6 Configuration

Usage notes Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and RELAY-REPL relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

For more information, see the DHCPv6 Feature Overview and Configuration Guide.

Examples

To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

Related commands

ipv6 dhcp pool

show ipv6 dhcp pool

option (DHCPv6)

Overview Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

Syntax

```
option [<1-254>|<option-name>] <option-value>
no option [<1-254>|<option-value>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ipv6`	An IPv6 prefix that has the hexadecimal `X:X::X:X` notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCPv6 Configuration

Usage You must define a DHCPv6 option using the ipv6 dhcp option command before using the option (DHCPv6) command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the`X:X::X:X` address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Examples

To add the IPv6 type option named `sntp-server-addr` to the pool `P2` and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool `P2` and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool `P2`and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option `179` to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

Related commands

dns-server (DHCPv6)

ipv6 dhcp option

ipv6 dhcp pool

show ipv6 dhcp pool

prefix-delegation pool

Overview Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the ipv6 dhcp pool command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

Syntax

```
prefix-delegation pool <DHCPv6-poolname> [lifetime
{<valid-time>|infinite} {<preferred-time>|infinite}]
```

```
no prefix-delegation pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
`lifetime`	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-315360000>.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a valid lifetime in seconds in the range <5-315360000>.

Default No IPv6 local prefix pool is specified by default.

Mode DHCPv6 Configuration

Usage notes The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the ipv6 local pool command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source

address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Example This example adds DHCPv6 Prefix Delegation pool pd_pool1 to DHCPv6 pool pool1:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48 56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

Related commands

ipv6 dhcp pool

show ipv6 dhcp pool

service dhcp-relay

Overview This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

Syntax

```
service dhcp-relay
no service dhcp-relay
```

Mode Global Configuration

Usage notes A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

Default The DHCP-relay service is enabled by default.

Examples To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

```

Parameter	Description
`Requests In`	The number of DHCP Request messages received from clients.
`Replies In`	The number of DHCP Reply messages received from servers.
`Relayed To Server`	The number of DHCP Request messages relayed to servers.
`Relayed To Client`	The number of DHCP Reply messages relayed to clients.
`Out To Server Failed`	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
`Out To Client Failed`	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
`Invalid hlen`	The number of incoming messages dropped due to an invalid hlen field.
`Bogus giaddr`	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
`Corrupt Agent Option`	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.

Parameter	Description
`Missing Agent Option`	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
`Bad Circuit ID`	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Missing Circuit ID`	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Bad Remote ID`	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Missing Remote ID`	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command

Parameter	Description
`Option Insert Failed`	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: • the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the ip dhcp-relay information policy command. • there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.
Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running	
`DHCPv6 Requests In`	The number of incoming DHCPv6 Request messages.
`DHCPv6 Replies In`	The number of incoming DHCPv6 Reply messages.
`DHCPv6 Relayed to Server`	The number of DHCPv6 messages relayed to the server.
`DHCPv6 Relayed to Client`	The number of DHCPv6 messages relayed to the client.

show counter ipv6 dhcp-client

Overview Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See show counter ipv6 dhcp-server for DHCPv6 server information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show counter ipv6 dhcp-client
```

Mode User Exec and Privileged Exec

Example To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

Output Figure 67-4: Example output from the **show counter ipv6 dhcp-client** command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out              ......... 20
ADVERTISE in             ......... 12
REQUEST out              ......... 1
CONFIRM out              ......... 0
RENEW out                ......... 0
REBIND out               ......... 0
REPLY in                 ......... 0
RELEASE out              ......... 0
DECLINE out              ......... 0
INFORMATION-REQUEST out ......... 0
```

Table 1: Parameters in the output of the **show counter ipv6 dhcp-client** command

Parameter	Description
SOLICIT out	Displays the count of SOLICIT messages sent by the DHCPv6 client.
ADVERTISE in	Displays the count of ADVERTISE messages received by the DHCPv6 client.
REQUEST out	Displays the count of REQUEST messages sent by the DHCPv6 client.
CONFIRM out	Displays the count of CONFIRM messages sent by the DHCPv6 client.
RENEW out	Displays the count of RENEW messages sent by the DHCPv6 client.

Table 1: Parameters in the output of the **show counter ipv6 dhcp-client** command (cont.)

Parameter	Description
`REBIND out`	Displays the count of REBIND messages sent by the DHCPv6 client.
`REPLY in`	Displays the count of REPLY messages received by the DHCPv6 client.
`RELEASE out`	Displays the count of RELEASE messages sent by the DHCPv6 client.
`DECLINE out`	Displays the count of DECLINE messages sent by the DHCPv6 client.
`INFORMATION-REQUEST out`	Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client.

Related commands show counter ipv6 dhcp-server

show counter ipv6 dhcp-server

Overview Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See show counter ipv6 dhcp-client for DHCPv6 client information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show counter ipv6 dhcp-server
```

Mode User Exec and Privileged Exec

Example To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

Output Figure 67-5: Example output from the **show counter ipv6 dhcp-server** command

```
awplus#show counter ipv6 dhcp-server
SOLICIT in              ......... 20
ADVERTISE out           ......... 12
REQUEST in              ......... 1
CONFIRM in              ......... 0
RENEW in                ......... 0
REBIND in               ......... 0
REPLY out               ......... 0
RELEASE in              ......... 0
DECLINE in              ......... 0
INFORMATION-REQUEST in  ......... 0
RELAY FORWARD in        ......... 0
LEASEQUERY in           ......... 0
DHCPv4 QUERY in         ......... 0
```

Table 2: Parameters in the output of the **show counter ipv6 dhcp-server** command

Parameter	Description
SOLICIT in	Displays the count of SOLICIT messages received by the DHCPv6 server.
ADVERTISE out	Displays the count of ADVERTISE messages sent by the DHCPv6 server.
REQUEST in	Displays the count of REQUEST messages received by the DHCPv6 server.
CONFIRM in	Displays the count of CONFIRM messages received by the DHCPv6 server.

Table 2: Parameters in the output of the **show counter ipv6 dhcp-server** command (cont.)

Parameter	Description
`RENEW in`	Displays the count of RENEW messages received by the DHCPv6 server.
`REBIND in`	Displays the count of REBIND messages received by the DHCPv6 server.
`REPLY out`	Displays the count of REPLY messages sent by the DHCPv6 server.
`RELEASE in`	Displays the count of RELEASE messages received by the DHCPv6 server.
`DECLINE in`	Displays the count of DECLINE messages received by the DHCPv6 server.
`INFORMATION-REQUEST in`	Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server
`RELAY FORWARD in`	Displays the count of Relay forward in messages received by the DHCPv6 server
`LEASEQUERY in`	Displays the count of LEASE QUERY messages received by the DHCPv6 server
`DHCPv4 QUERY in`	Displays the count of DHCPv4 QUERY messages received by the DHCPv6 server

Related commands show counter ipv6 dhcp-client

show ip dhcp-relay

Overview This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip dhcp-relay [interface <interface-name>]
```

Syntax (VRF-lite)
```
show ip dhcp-relay [vrf <name>|global] [interface
<interface-name>]
```

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
vrf	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
global	The Global VRF instance.

Mode User Exec and Privileged Exec

Example To display the DHCP Relay Agent's configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

Output Figure 67-6: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers :   192.168.1.200
```

Output (VRF-lite)

Figure 67-7: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :   192.168.1.3
```

Related commands

ip dhcp-relay agent-option checking

ip dhcp-relay information policy

ip dhcp-relay maxhops

ip dhcp-relay server-address

show ipv6 dhcp

Overview Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 dhcp
```

Mode User Exec and Privileged Exec

Usage notes The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

Example To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

Output Figure 67-8: Example output from the **show ipv6 dhcp** command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

Related commands ipv6 address dhcp

show ipv6 dhcp binding

Overview Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional *summary* keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 dhcp binding [summary]
```

Parameter	Description
`summary`	Optional. Specify the **summary** keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes.

Mode User Exec and Privileged Exec

Example 1 To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

Output Figure 67-9: Example output from the **show ipv6 dhcp binding summary** command

```
awplus# show ipv6 dhcp binding summary
Pool Name                  Number of Leased Addresses
-------------------------------------------------
ia-na1                     3
ia-pd1                     5

Total in all Pools:        8
```

Table 3: Parameters in the output of the **show ipv6 dhcp binding summary** command

Parameter	Description
`Pool Name`	Displays a list of all the pool names.
`Number of Leased Addresses`	Displays the number of leased address entries for the pool.
`Total in all Pools`	Displays the total number of leased address entries for all pools.

Example 2 To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

Output Figure 67-10: Example output from the **show ipv6 dhcp binding** command

```
awplus#show ipv6 dhcp binding
Pool ia-na1
 Address 2002:0:3c0::1
         client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 18:38:29
         expires at 19 Sep 2012 18:38:29
Pool ia-pd1
 Prefix  2002:0:3c0::/42
         client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 18:38:29
         expires at 19 Sep 2012 18:38:29
```

Table 4: Parameters in the output of the **show ipv6 dhcp binding** command

Parameter	Description
`Address`	Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
`Prefix`	Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
`DUID`	DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.
`IAID`	Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.
`preferred lifetime`	The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
`valid lifetime`	The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Table 4: Parameters in the output of the **show ipv6 dhcp binding** command

Parameter	Description
`starts at`	The date and time at which the valid lifetime expires.
`expires at`	The date and time at which the valid lifetime expires.

Related commands

clear ipv6 dhcp binding

ipv6 dhcp pool

show ipv6 dhcp pool

show ipv6 dhcp interface

Overview Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 dhcp interface [<interface-name>]
```

Parameter	Description
<interface-name>	Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on.

Mode User Exec and Privileged Exec

Example1 To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

Output Figure 67-11: Example output from the **show ipv6 dhcp interface** command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
 Address 1001::3c0:1
         preferred lifetime 9000, valid lifetime 5000
         starts  at 20 Jan 2021 09:21:35
         expires at 20 Jan 2021 10:25:32
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
         prefix 2002:0:3c0::/42
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2021 09:21:33
         expires at 19 Sep 2021 09:21:33
vlan3 is in server mode
 Using pool  : pool-1; Preference:0
```

Example 2 To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

Output Figure 67-12: Example output from the **show ipv6 dhcp interface** command for a specific interface

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
         prefix 2002:0:3c0::/42
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2021 09:21:33
         expires at 19 Sep 2021 09:21:33
```

Table 5: Parameters in the output of the **show counter dhcp-client** command

Parameter	Description
`<interface> is in server/client/(Prefix-Delegation) mode`	Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface.
`Address`	Displays the address of the DHCPv6 server on the interface.
`Prefix name`	Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.
`Using pool`	Displays the name of the pool used by the interface.
`Preference`	Displays the preference value for the DHCPv6 server.

Related commands ipv6 dhcp client pd

show ipv6 dhcp pool

Overview Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 dhcp pool [<DHCPv6-address-pool-name>]
```

Parameter	Description
<DHCPv6-address-pool-name>	Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 dhcp pool
```

Output Figure 67-13: Example output from the **show ipv6 dhcp pool** command

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
 Address Prefix   : 1001::/64
         Lifetime: 2592000(valid), 604800(preferred)
 DNS Server: 2001::1
 DNS Server: 2001::2
 Domain Name: example.com
 Domain Name: example.co.jp
 SNTP Server: 2001::5
 SNTP Server: 2001::6
 Option Code : 150
        Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
 PD Pool Name: pd1
    Prefix    : 2002::/38-42
    Lifetime : 2592000(valid), 604800(preferred)
```

Table 6: Parameters in the output of the **show ipv6dhcp pool** command

Parameter	Description
DHCPv6 Pool	Name of the DHCPv6 pool.
Address Prefix	Address prefix to the DHCPv6 pool.

Table 6: Parameters in the output of the **show ipv6dhcp pool** command (cont.)

Parameter	Description
`Address Lifetime`	Valid and preferred lifetimes to the DHCPv6 pool. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
`DNS Server`	IPv6 address of the DNS Server
`Domain name`	URL for the domain name.
`SNTP Server`	IPv6 address of the SNTP (Simple Network Time Protocol) Server.
`Option Code`	DHCP Option code (see RFC 2132).
`Option Value`	DHCP Option value type (see RFC 2132).

Related commands ipv6 dhcp pool

sntp-address

Overview Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

Syntax

```
sntp-address <ipv6-address>
no sntp-address <ipv6-address>
```

Parameter	Description
<ipv6-address>	Specify an SNTP Server IPv6 address, in hexadecimal notation in the format `X:X::X:X`.

Mode DHCPv6 Configuration

Examples The following example adds an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp-address 2001:0db8::/32
```

68 NTP Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the NTP Feature Overview and_Configuration Guide.

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Command List

ntp authentication-key

Overview This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

Syntax

```
ntp authentication-key <keynumber> md5 <key-string> [trusted]
ntp authentication-key <keynumber> sha1 <key-string> [trusted]
```

When in secure mode, MD5 is not available and the syntax in config files will be:

```
ntp authentication-key <keynumber> sha1-encrypted
<encrypted-key-string> [trusted]
no ntp authentication-key <keynumber>
```

Parameter	Description
<keynumber>	*<1-4294967295>* An identification number for the key.
md5	Define an MD5 key.
sha1	Define an SHA1 key.
<key-string>	The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.
sha1-encrypted	This parameter indicates in running config that the key is in its encrypted form instead of in plaintext. If secure mode is enabled and you enter a SHA1 key, the running config will display this sha1-encrypted parameter instead of sha1, and will display the key in encrypted form. Do not enter a key using the sha1-encrypted parameter. Instead, enter sha1 and the unencrypted key string.
<encrypted-key-string>	The encrypted authentication key.
trusted	Add this key to the list of authentication keys that this server trusts.

Mode Global Configuration

Examples To define an MD5 authentication key number 134343 and a key value ‘mystring’, use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value ‘mystring’, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authentication-key 134343
```

Command changes

Version 5.4.9-2.1 sha1-encrypted parameter added.

ntp broadcastdelay

Overview Use this command to set the estimated round-trip delay for broadcast packets.

Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

Syntax

```
ntp broadcastdelay <delay>
no ntp broadcastdelay
```

Parameter	Description
<delay>	*<1-999999>* The broadcast delay in microseconds.

Default 0 microsecond offset, which can only be applied with the **no** variant of this command.

Mode Global Configuration

Examples To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

ntp master

Overview Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

Syntax

```
ntp master [<stratum>]
no ntp master
```

Parameter	Description
<stratum>	*<1-15>* The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12.

Mode Global Configuration

Usage notes The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: www.ntp.org

Examples To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

ntp peer

Overview Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

Syntax

```
ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]
[version <version>]
```

```
no ntp peer {<peeraddress>|<peername>}
```

Syntax (VRF-lite)

```
ntp peer {<peeraddress>} [vrf <vrf-name>] [prefer] [key <key>]
[version <version>]
```

```
no ntp peer {<peeraddress>}
```

Parameter	Description
<peeraddress>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address.
<peername>	Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.
`prefer`	Prefer this peer when possible.
`vrf <vrf-name>`	Specify the VRF the peer runs in. Note: this does not work when a hostname is used. It only works if an IP address is specified.
`key <key>`	*<1-4294967295>* Configure the peer authentication key.
`version <version>`	*<1-4>* Configure for this NTP version.

Mode Global Configuration

Examples To set an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

To set an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

To set the preferred peer to be IPv4 192.0.2.23 and the version to 4, with the authentication key '1234', use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
```

Examples (VRF-lite)

To configure an NTP peer association for the peer with IP address 192.0.5.27, on the VRF 'red', use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.5.27 vrf red
```

To remove an NTP peer association for the peer with IP address 192.0.5.27, on the VRF 'red', use the commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.5.27
```

Related commands

ntp server

ntp source

Command changes

Version 5.5.2-2.1: VRF parameter added

ntp rate-limit

Overview Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

Syntax

```
ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}
no ntp rate-limit
```

Parameter	Description
`interval`	The minimum interval between responses configured in seconds. The default interval is 8 seconds.
`burst`	The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.
`leak`	The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response.

Mode Global Configuration

Default Interval - 8 seconds.

Burst - 8 responses.

Leak - 4.

Example To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp rate-limit interval 30
```

Related commands ntp restrict

Command changes Version 5.4.8-1.1: command added

ntp restrict

Overview Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

Syntax

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}
```

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} query
{allow|deny}
```

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} serve
{allow|deny}
```

```
no ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
```

Parameter	Description
`default-v4`	Apply this restriction to all IPv4 hosts.
`default-v6`	Apply this restriction to all IPv6 hosts.
<host-address>	Apply this restriction to the specified IPv4 or IPv6 host. Enter an IPv4 address in the format A.B.C.D. Enter an IPv6 address in the format X:X::X:X.
<host-subnet>	Apply this restriction to the specified IPv4 subnet or IPv6 prefix. Enter an IPv4 subnet in the format A.B.C.D/M. Enter an IPv6 prefix in the format X:X::X:X/X.
`query`	Control NTP server status queries to matching hosts.
`serve`	Control NTP time service to matching hosts.
`allow`	Allow the configured restriction.
`deny`	Deny the configured restriction.

Default By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

Mode Global Configuration

Example

To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

Related commands

ntp rate-limit

Command changes

Version 5.4.8-1.1: command added

ntp server

Overview Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa. You can configure an NTP server association by hostname or IP address.

Use the **no** variant of this command to remove the configured NTP server.

Syntax

```
ntp server {<serveraddress>|<servername>} [prefer] [key <key>] [version <version>]
no ntp server {<serveraddress>|<servername>}
```

Syntax (VRF-lite)

```
ntp server <serveraddress> [vrf <vrf-name>] [prefer] [key <key>] [version <version>]
no ntp server <serveraddress>
```

Parameter	Description
<serveraddress>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.
<servername>	Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.
prefer	Prefer this server when possible.
key *<key>*	Configure the server authentication key from the range 1 to 4294967295.
version *<version>*	Configure for this NTP version from the range 1 to 4.
vrf *<vrf-name>*	Specify a VRF for the server to run in. Note that this does not work when a hostname is used. It only works if an IP address is specified.

Mode Global Configuration

Examples To obtain the time by synchronizing with the server at 192.0.1.23, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
```

To obtain the time by synchronizing with the server at 192.0.1.23, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23 prefer
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2 prefer
```

To stop using the time server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

Examples (VRF-lite)

To configure an NTP server association for the server with IP address 192.0.5.27, on the VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.5.27 vrf red
```

To remove an NTP server association for the server with an IPv4 address of 192.0.5.27, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp server 192.0.5.27
```

Related commands

ntp peer

ntp source

Command changes

Version 5.5.2-2.1: VRF parameter added

ntp source

Overview Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework) or VCStack.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

Syntax

```
ntp source <source-address>
no ntp source
```

Parameter	Description
<source-address>	Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.

Default An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

Mode Global Configuration

Usage notes Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the ntp peer and ntp server commands.

Examples To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

Related commands

ntp peer

ntp server

show ntp associations

Overview Use this command to display the status of NTP associations.

Syntax `show ntp associations`

Mode User Exec and Privileged Exec

Example See the sample output of the **show ntp associations** command displaying the status of NTP associations.

Table 68-1: Example output from **show ntp associations**

```
awplus#show ntp associations
 remote           refid            st t when poll reach    delay   offset  disp
------------------------------------------------------------------------------
*server1.example.com
                 192.0.2.2        4 u   47   64   377    0.177    0.021   0.001
+192.168.1.10    10.32.16.80      5 u   46   64   377    0.241   -0.045   0.000
* system peer, # backup, + candidate, - outlier, x false ticker
```

Table 68-2: Parameters in the output from **show ntp associations**

Parameter	Description
`* system peer`	The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.
`# backup`	Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.
`+ candidate`	Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).
`- outlier`	Peers that are not used because their time is significantly different from the other peers.
`x false ticker`	Peers that are not used because they are not consider trustworthy.
`space`	Peers that are not used because they are, for example, unreachable.
`remote`	The peer IP address
`refid`	The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational.

Table 68-2: Parameters in the output from **show ntp associations** (cont.)

Parameter	Description
`st`	The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.
`t`	Type, one of: u: unicast or manycast client b: broadcast or multicast clientl: local reference clock s: symmetric peer A: manycast server B: broadcast server M: multicast server
`when`	When last polled (seconds ago, h hours ago, or d days ago).
`poll`	Time between NTP requests from the device to the server.
`reach`	An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful.
`delay`	The round trip communication delay to the remote peer or server, in milliseconds.
`offset`	The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).
`disp`	The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.

show ntp counters

Overview This command displays packet counters for NTP.

Syntax

```
show ntp counters
```

Mode Privileged Exec

Example To display counters for NTP use the command:

```
awplus# show ntp counters
```

Figure 68-1: Example output from **show ntp counters**

```
awplus#show ntp counters
Server Received           4
Server Dropped            0
Client Sent               90
Client Received           76
Client Valid Received     76
```

Table 68-3: Parameters in the output from **show ntp counters**

Parameter	Description
`Server Received`	Number of NTP packets received from NTP clients.
`Server Dropped`	Number of NTP packets received from NTP clients but dropped.
`Client Sent`	Number of NTP packets sent to servers.
`Client Received`	Number of NTP packets received from servers
`Client Valid Received`	Number of valid NTP packets received from servers.

show ntp counters associations

Overview Use this command to display NTP packet counters for individual servers and peers.

Syntax

```
show ntp counters associations
```

Mode Privileged Exec

Examples To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

Output Figure 68-2: Example output from **show ntp counters associations**

```
awplus#show ntp counters associations
Peer 2001::1
 sent:          -
 received:      -
Peer 10.37.219.100
 sent:          7
 received:      7
```

Table 68-4: Parameters in the output from **show ntp counters associations**

Parameter	Description
Peer	An NTP peer or server that the device is associated with.
sent	The number of NTP packets that this device sent to the peer.
received	The number of NTP packets that this device received from the peer.

Related commands ntp restrict

show ntp status

Overview Use this command to display the status of the Network Time Protocol (NTP).

Syntax

```
show ntp status
```

Mode User Exec and Privileged Exec

Example To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see ntp.org.

Figure 68-3: Example output from **show ntp status**

```
awplus#show ntp status
Reference ID    : C0A8010A (192.168.1.10)
Stratum         : 4
Ref time (UTC)  : Fri Jun 15 05:32:38 2018
System time     : 0.000002004 seconds fast of NTP time
Last offset     : -0.002578615 seconds
RMS offset      : 0.000928071 seconds
Frequency       : 5.099 ppm slow
Residual freq   : -9.120 ppm
Skew            : 17.486 ppm
Precision       : -21 (0.000000477 seconds)
Root delay      : 0.031749818 seconds
Root dispersion : 0.133974627 seconds

Leap status     : Normal
```

69 Precision Time Protocol (PTP) and Transparent Clock Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Precision Time Protocol (PTP) and Transparent Clock.

For more information, see the Precision Time Protocol (PTP) and Transparent Clock Feature Overview and Configuration Guide.

Command List

clock-port

Overview Use this command to associate the port with the clock and enable the required PTP functionality for 1588v2 packets entering and leaving this port. For the transparent clock, this specifically means modification of the Correction Factor to reflect the residence time in the bridge.

Use the **no** variant of this command to remove the port from the clock and disable modification of the Correction Factor.

Syntax

```
clock-port
no clock-port
```

Default Ports are unassociated and disabled with the clock by default.

Mode Interface Configuration (port)

Example To configure the clock-port on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# clock-port
```

To remove port1.0.1 from the clock and disable modification of the Correction Factor, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no clock-port
```

Related commands

ptp global

ptp-clk

show ptp data transparent

show ptp port

Command changes Version 5.4.7-0.1: command added

Version 5.4.8-0.2: added to x230, x550 series products

ptp-clk

Overview Use this command to configure the PTP clock instance on the switch. All values must be specified.

Use the **no** variant of this command to disable the clock and disable timing support on any other ports that were set as clock-ports.

Syntax

```
ptp-clk {ordinary|boundary|transparent} transport-type {udp {v4|v6}|ethernet} delay-mechanism {e2e|p2p} step-type {onestep|twostep}
```

```
no ptp-clk
```

Parameter	Description
`ordinary`	An ordinary clock, able to act as Master, Slave, or Grand Master
`boundary`	A clock able to manage downstream fan-out for an upstream Master
`transparent`	A device that acts as a bridge between a Master and a Slave and participates in the timing protocol by adding the bridge residence time to the correction factor in the packets
`udp v4`	Timing protocol forwarded in IPv4 UDP Packets
`udp v6`	Timing protocol forwarded in IPv6 UDP Packets
`ethernet`	Timing protocol forwarded in Ethernet frames
`e2e`	Specifies that the clock supports end to end messaging sequences between the Master and the Slave and that the Correction Factor is updated based on the Bridge residence time. A Delay_Request sequence is required to determine the link delay
`p2p`	Specifies that the clock supports end to end messaging sequences between the Master and the Slave as well as peer to peer messaging sequences to determine the link delay between this device and its peers. The Correction Factor is updated based on the Bridge residence time plus the peer to peer link delay - so there is no need for a delay_request message sequence.
`onestep`	Specifies that the clock supports modification of the correction factor as the message is transiting the switch
`twostep`	Specifies that the clock requires that a follow-up message be sent that is used to carry the correction factor for the previous 1588v2 message (sync, delay_request or pdelay_req)

Default This command is disabled by default.

Mode Global configuration

Usage notes The clock is not active until the PTP timing service is enabled via the **ptp global** command. It is not possible to make a port a clock port - if the clock has not been configured.

Example To configure a PTP instance on the switch, use the following commands:

```
awplus# configure terminal
awplus(config)# ptp-clk transparent transport-type ethernet
delay-mechanism e2e step-type onestep
```

Related commands ptp global

show ptp data transparent

show ptp port

Command changes Version 5.4.7- 0.1: command added

Version 5.4.8-0.2: added to x230, x550 series products

ptp global

Overview Use this command to enable 1588v2 based timing support on the device.

Use the **no** variant of this command to disable the timing support.

Syntax
```
ptp global
no ptp global
```

Default Disabled

Mode Global Configuration

Example To enable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# ptp global
```

To disable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ptp global
```

Version 5.4.8-0.2: added to x230, x550 series products

show ptp data transparent

Overview Use this command to display configuration information for the PTP transparent clock.

Syntax

```
show ptp data transparent
```

Mode Privileged Exec

Example To display configuration for PTP transparent clock, use the following command:

```
awplus# show ptp data transparent
```

Output Figure 69-1: Example output from **show ptp data transparent**

```
IE300-1#show ptp data transparent

70 SNMP Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see:

- the Support for Allied Telesis Enterprise_MIBs in AlliedWare Plus, for information about which MIB objects are supported.
- the SNMP Feature Overview and Configuration_Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

alias (interface)

Overview Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

Syntax

```
alias <ifAlias>
no alias
```

Parameter	Description
<ifAlias>	64 character name for an interface in a network management system. All printable characters are valid.

Default Not set.

Mode Interface Configuration

Usage notes The interface alias can also be set via SNMP.

Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

Example To configure the alias interface name 'uplink_a' for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

Command changes Version 5.4.8-2.1: command added

clear mac address-table notification mac-change

Overview Use this command to clear the MAC address table change history and counters. This command clears the change history and resets the counters to zero.

Syntax
```
clear mac address-table notification mac-change
```

Mode User Exec

Example To clear the MAC address table change history and counters, use the command:

```
awplus# clear mac address-table notification mac-change
```

Related commands
- mac address-table notification mac-change interval
- mac address-table notification mac-change history-size
- show mac address-table notification mac-change
- snmp trap mac-change

Command changes Version 5.5.1-2.1: command added

debug snmp

Overview This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

Syntax

```
debug snmp
[all|detail|error-string|process|receive|send|xdump]
```

```
no debug snmp
[all|detail|error-string|process|receive|send|xdump]
```

Parameter	Description
`all`	Enable or disable the display of all SNMP debugging information.
`detail`	Enable or disable the display of detailed SNMP debugging information.
`error-string`	Enable or disable the display of debugging information for SNMP error strings.
`process`	Enable or disable the display of debugging information for processed SNMP packets.
`receive`	Enable or disable the display of debugging information for received SNMP packets.
`send`	Enable or disable the display of debugging information for sent SNMP packets.
`xdump`	Enable or disable the display of hexadecimal dump debugging information for SNMP packets.

Mode Privileged Exec and Global Configuration

Example To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

Related commands

show debugging snmp

terminal monitor

undebug snmp

mac address-table notification mac-change

Overview Use this command to enable the mac-change history table. You also need to use the command snmp trap mac-change to set up the trap and snmp-server enable trap to enable the trap for transmission.

Use the **no** variant of this command to disable the mac-change history table.

Syntax
```
mac address-table notification mac-change
no mac address-table notification mac-change
```

Default Disabled

Mode Global Configuration

Usage notes To set up the mac-change trap use the command:

- snmp trap mac-change

To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- snmp-server enable trap

Example To enable the mac-change history table, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
```

Related commands
clear mac address-table notification mac-change
mac address-table notification mac-change history-size
mac address-table notification mac-change interval
mac address-table notification mac-threshold
show mac address-table notification mac-change
snmp-server enable trap
snmp trap mac-change

Command changes Version 5.5.1-2.1: command added

mac address-table notification mac-change history-size

Overview Use this command to set the MAC address table history size to an upper limit on the number of entries that the SNMP table may contain.

Use the **no** variant of this command to set the history size back to the default (1).

Syntax

```
mac address-table notification mac-change history-size <0-500>
no mac address-table notification mac-change history-size
```

Parameter	Description
<0-500>	Set the upper limit on the number of entries that the SNMP MAC address table may contain.

Default Table size is set at 1 entry.

Mode Global Configuration

Usage notes If the mac-change history table is not enabled, then the history size is stored for when it is enabled.

To enable the mac-change history table, use the command:

- mac address-table notification mac-change

Example To configure the size of the MAC change history table to 40, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
history-size 40
```

Related commands

clear mac address-table notification mac-change

mac address-table notification mac-change

mac address-table notification mac-change interval

mac address-table notification mac-threshold

show mac address-table notification mac-change

snmp trap mac-change

Command changes Version 5.5.1-2.1: command added

mac address-table notification mac-change interval

Overview Use this command to set the maximum time that a MAC change SNMP notification is delayed in the MAC address table.

Use the **no** variant of this command to set the interval back to the default (1).

Syntax

```
mac address-table notification mac-change interval
<0-2147483647>
```

```
no mac address-table notification mac-change interval
```

Parameter	Description
<0-2147483647>	Set the interval in seconds.

Default Interval is set at 1 second.

Mode Global Configuration

Usage notes If the mac-change history table is not enabled, then the interval is stored for when it is enabled.

To enable the mac-change history table, use the command:

- mac address-table notification mac-change

Example To configure an interval of 5 seconds for the time between two MAC change SNMP notifications being sent, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# mac address-table notification mac-change
interval 5
```

Command changes Version 5.5.1-2.1: command added

mac address-table notification mac-threshold

Overview Use this command to change the default interval and threshold values for storing and sending Layer 2 forwarding database (FDB) utilization information. These settings are stored in the running configuration.

Use the **no** variant of this command to set the threshold configuration back to the default.

Syntax

```
mac address-table notification mac-threshold {interval
<120-214783647>|limit <0-100>}
```

```
no mac address-table notification mac-threshold
```

Parameter	Description
`interval`	Change the default interval value. The interval value controls the interval between utilization checks.
<120-214783647>	Set the interval in seconds.
`limit`	Change the limit value. When this limit is reached, an SNMP trap is sent.
<0-100>	Set the limit as a percentage.

Default Interval default is 120 seconds and the limit default is 50 percent.

Mode Global Configuration

Usage notes To enable transmission of the mac-threshold trap, specify the parameter **mac-threshold**, use the command:

- snmp-server enable trap

Example To configure the MAC threshold notifications to be sent if the L2 FDB table utilization is more than or equal to 70%, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-threshold
limit 70
```

To set the MAC threshold notifications interval and limit back to default values, use the commands:

```
awplus# configure terminal
awplus(config)# no mac address-table notification mac-threshold
```

Related commands show running-config

snmp-server enable trap

Command changes Version 5.5.1-2.1: command added

show counter snmp-server

Overview This command displays counters for SNMP messages received by the SNMP agent.

Syntax

```
show counter snmp-server
```

Mode User Exec and Privileged Exec

Example To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

Output Figure 70-1: Example output from the **show counter snmp-server** command

```
SNMP-SERVER counters

Table 1: Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
inPkts	The total number of SNMP messages received by the SNMP agent.
inBadVersions	The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages.The SNMP agent on your device supports versions 1, 2C, and 3.
inBadCommunityNames	The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.
inBadCommunityUses	The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.
inASNParseErrs	The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.
inTooBigs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inNoSuchNames	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inBadValues	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inReadOnlys	The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementations of the SNMP.
inGenErrs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.

Table 1: Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
inTotalReqVars	The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.
inTotalSetVars	The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.
inGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.
inGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.
inSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.
inGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.
inTraps	The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.
outPkts	The number of SNMP Messages that the SNMP agent has sent.
outTooBigs	The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outNoSuchNames	The number of SNMP PDUs that the SNMP agent has generated with the value `noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outBadValues	The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGenErrs	The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has generated.

Table 1: Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
outGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has generated.
outSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has generated.
outGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has generated.
outTraps	The number of SNMP Trap PDUs that the SNMP agent has generated.
UnSupportedSecLevels	The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent.
NotInTimeWindows	The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.
UnknownUserNames	The number of received packets that the SNMP agent has dropped because they referenced an unknown user.
UnknownEngineIDs	The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.
WrongDigest	The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.
DecryptionErrors	The number of received packets that the SNMP agent has dropped because they could not be decrypted.
UnknownSecModels	The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.
InvalidMsgs	The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.
UnknownPDUHandlers	The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.

Related commands show snmp-server

show debugging snmp

Overview This command displays whether SNMP debugging is enabled or disabled.

Syntax

```
show debugging snmp
```

Mode User Exec and Privileged Exec

Example To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

Output Figure 70-2: Example output from the **show debugging snmp** command

```
Snmp (SMUX) debugging status:
  Snmp debugging is on
```

Related commands debug snmp

show mac address-table notification mac-change

Overview Use this command to show the MAC change configuration. It includes the MAC change history.

Syntax
```
show mac address-table notification mac-change
```

Mode User Exec

Example To show the MAC change configuration and history, use the command:

```
awplus# show mac address-table notification mac-change
```

Output Figure 70-3: Example output from **show mac address-table notification mac-change**

```
awplus#show mac address-table notification mac-change
MAC Change Feature: Enabled
MAC Change Notification Traps: Enabled
Wait time for MAC Change Notification Traps: 1 seconds
Number of MAC Address Add events: 1
Number of MAC Address Remove events: 0
Number of MAC Change Notification Traps sent: 1
Maximum Number of entries configured in History Table: 1
Number of entries currently in History Table: 1
History Table contents
----------------------
History Index 1, Timestamp(uptime) 0 days 00:39:25 (236500)
MAC Change message:
  Operation: Added   Vlan: 2     MAC Addr: 000d.b950.0c26
Dot1dBasePort: 2
```

Table 70-1: Parameters in the output from **show mac address-table notification mac-change**

Parameter	Description
MAC Change Feature	Displays if the feature is enabled or not. If this is disabled, then no more MAC change events will be generated, no events are added to the history, and no traps are logged.
MAC Change Notification Traps	Displays if MAC change traps are sent when MAC change events are generated. This only affects traps, (MAC change history is not affected).
Wait time for MAC Change Notification Traps	The maximum time a MAC change event waits before a MAC change trap is sent. This is also the maximum time a MAC change event waits before being added to the MAC change history. The time is in seconds.

Table 70-1: Parameters in the output from **show mac address-table notification mac-change** (cont.)

Parameter	Description
Number of MAC Address Add events	The number of MAC-added events processed by the feature.
Number of MAC Address Remove events	The number of MAC-removed events processed by the feature.
Number of MAC Change Notification Traps sent	The number of MAC notification traps sent by the feature.
Maximum Number of entries configured in History Table	The maximum number of entries present in the MAC change table.

```

Related commands show snmp-server

snmp-server view

snmp trap link-status

Overview Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

Syntax

```
snmp trap link-status [enterprise]
no snmp trap link-status
```

Parameter	Description
`enterprise`	Send an Allied Telesis enterprise type of link trap.

Default Disabled

Mode Interface Configuration

Usage notes The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the snmp-server host command. To configure the device globally to send other notifications, use the snmp-server enable trap command.

Examples To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

Related commands

show interface

snmp trap link-status suppress

snmp-server enable trap

snmp-server host

snmp trap link-status suppress

Overview Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

Syntax

```
snmp trap link-status suppress {time {<1-60>|default}|threshold
{<1-20>|default}}
```

```
no snmp trap link-status suppress
```

Parameter	Description
`time`	Set the suppression timer for link status notifications.
<1-60>	The suppress time in seconds.
`default`	The default suppress time in seconds (60).
`threshold`	Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval.
<1-20>	The number of link status notifications.
`default`	The default number of link status notifications (20).

Default By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

Mode Interface Configuration

Usage notes An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

Examples To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# interface port1.0.1-port1.0.3
```

```
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

Related commands

show interface

snmp trap link-status

snmp trap mac-change

Overview Use this command to enable the MAC notification feature to apply mac-change notifications via the mac-change trap. This command configures the trap so that you are notified when MAC addresses are added or removed from the forwarding database (FDB). This is applied to interfaces via a specified port or a range of ports.

Use the **no** variant of this command to disable the MAC notification feature.

Syntax

```
snmp trap mac-change {[add] [remove]}
no snmp trap mac-change [add] [remove]
```

Parameter	Description
`add`	Enable SNMP mac-change traps when a MAC address is added.
`remove`	Enable SNMP mac-change traps when a MAC address is removed.

Default Disabled

Mode Interface Configuration

Usage notes To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- snmp-server enable trap

To enable the mac-change history table, use the command:

- mac address-table notification mac-change

Example To get mac-change notifications whenever a MAC address associated with port1.0.1 is added or removed from the FDB table, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# snmp trap mac-change add remove
```

Related commands

clear mac address-table notification mac-change

snmp-server enable trap

Command changes Version 5.5.1-2.1: command added

snmp-server

Overview Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the snmp-server enable trap command.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

Syntax

```
snmp-server [ip|ipv6]
no snmp-server [ip|ipv6]
```

Parameter	Description
ip	Enable or disable the SNMP agent for IPv4.
ipv6	Enable or disable the SNMP agent for IPv6.

Default By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

Mode Global Configuration

Examples To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

snmp-server location

snmp-server view

snmp-server community

Overview This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read-only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

Syntax

```
snmp-server community <community-name> {view
<view-name>|ro|rw|<access-list>}
```

```
no snmp-server community <community-name>
```

Parameter	Description
<community-name>	Community name. The community name is a case sensitive string of up to 20 characters.
`view`	Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.
<view-name>	View name. The view name is a string up to 20 characters long and is case sensitive.
`ro`	Read-only community.
`rw`	Read-write community.
<access-list>	*<1-99>* Access list number.

Mode Global Configuration

Example Use the following commands to create an SNMP community called 'public' with read-only access to all MIB variables from any management station:

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

Use the following commands to remove an SNMP community called 'public'

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

Related commands

show snmp-server

show snmp-server community

snmp-server view

snmp-server contact

Overview This command sets the contact information for the system. The contact name is:

- displayed in the output of the show system command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

Syntax

```
snmp-server contact <contact-info>
no snmp-server contact
```

Parameter	Description
<contact-info>	The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the system contact information to "support@alliedtelesis.co.nz", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact
support@alliedtelesis.co.nz
```

Related commands

show system

snmp-server location

snmp-server group

snmp-server enable trap

Overview Use this command to enable the transmission of the specified notifications (traps) on your device.

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

Syntax `snmp-server enable trap <trap-list>`

`no snmp-server enable trap <trap-list>`

Depending on your device model, you can enable some or all of the traps in the following table:

Parameter	Description
`atmf`	AMF traps.
`atmfguestnode`	AMF guest node traps.
`atmflink`	AMF link traps.
`atmfnode`	AMF node traps.
`atmfrr`	AMF reboot-rolling traps.
`auth`	Authentication failure.
`bgp`	BGP traps.
`chassis`	Chassis traps.
`cwmap`	Access Point traps with the AWC wireless manager.
`dhcpsnooping`	DHCP snooping and ARP security traps. These notifications must also be set using the **ip dhcp snooping violation** command, and/or the arp security violation **arp security violation** command.
`epsr`	EPSR traps.
`g8032`	G.8032 ERP traps.
`lldp`	Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the **lldp notifications** command, and/or the **lldp med-notifications** command.
`loopprot`	Loop Protection traps.
`mac-change`	MAC address changed.
`mac-move`	MAC address moved between interface.
`mac-threshold`	MAC address table reaches a threshold limit.
`mstp`	MSTP traps.

Parameter	Description
nsm	NSM traps.
ospf	OSPF traps.
pim	PIM traps.
power-inline	Power-inline traps (Power Ethernet MIB RFC 3621).
qsp	QoS Storm Protection.
rmon	RMON traps.
thrash-limit	MAC address Thrash Limiting traps.
vcs	VCS traps.
vrrp	Virtual Router Redundancy (VRRP) traps.
ufo	Upstream Forwarding Only (UFO) traps.

Default Disabled

Mode Global Configuration

Usage notes This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the snmp trap link-status command.

To specify where notifications are sent, use the snmp-server host command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

Examples To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send PoE related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
```

To disable PoE traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap power-inline
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

Version 5.5.1-2.1: **mac-change**, **mac-move**, and **mac-threshold** parameters added

snmp-server engineID local

Overview Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the snmp-server engineID local reset command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

Syntax

```
snmp-server engineID local {<engine-id>|default}
no snmp-server engineID local
```

Parameter	Description
<engine-id>	Specify SNMPv3 Engine ID value, a string of up to 27 characters.
`default`	Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the snmp-server engineID local reset command to force the system to generate a new engine ID.

Mode Global Configuration

Usage notes All devices must have a unique engine ID which is permanently set unless it is configured by the user.

In a stacked environment, if the same engine ID was automatically generated for all members of the stack, conflicts would occur if the stack was dismantled. Therefore, each member of the stack will generate its own engine ID and the stack master's ID is used when transmitting SNMPv3 packets. Should a master failover occur, a different engine ID is transmitted. You can modify this behavior by manually assigning all stack members the same engine ID using the snmp-server engineID local command. However, should you decide to separate the stack and use the devices individually, you must remember to change or remove this configuration to prevent conflicts.

Example To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

Output The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) ............ 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ............ 0x80001f888029af52e149198483
```

Related commands

snmp-server engineID local reset

snmp-server group

snmp-server engineID local reset

Overview Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the snmp-server engineID local command to set SNMPv3 engine ID to a system generated value.

Syntax

```
snmp-server engineID local reset
```

Mode Global Configuration

Example To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

Related commands snmp-server engineID local

show snmp-server

snmp-server group

Overview This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

Syntax

```
snmp-server group <groupname> {auth|noauth|priv} [read
<readname>|write <writename>|notify <notifyname>]
```

```
no snmp-server group <groupname>
```

Parameter	Description
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
`auth`	Authentication.
`noauth`	No authentication and no encryption.
`priv`	Authentication and encryption.
`read`	Configure read view.
<readname>	Read view name.
`write`	Configure write view.
<writename>	Write view name. The view name is a string up to 20 characters long and is case sensitive.
`notify`	Configure notify view.
<notifyname>	Notify view name. The view name is a string up to 20 characters long and is case sensitive.

Mode Global Configuration

Examples To add SNMP group, for ordinary users, user the following commands:

```
awplus# configure terminal
```

```
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete the SNMP group called 'usergroup', use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no snmp-server group usergroup
```

Related commands

snmp-server

show snmp-server

show snmp-server group

snmp-server host

Overview This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

Syntax

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>]
```

```
snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>
```

```
snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

```
no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>
```

```
no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>
```

```
no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

Syntax (VRF-Lite)

```
snmp-server host {<ipv4-address>|<ipv6-address>} [vrf
<vrf-name>] [informs|traps] version 1|2c|3 {auth|noauth|priv}
<user-name> {<community-name>|<user-name>}
```

```
no snmp-server host {<ipv4-address>|<ipv6-address>} [vrf
<vrf-name>] [informs|traps] version 1|2c|3 {auth|noauth|priv}
<user-name> {<community-name>|<user-name>}
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.
<ipv6-address>	IPv6 trap host address in the format x:x::x:x for example, 2001:db8::8a2e:7334.
vrf *<vrf-name>*	Specify the VRF instance to use. If you do not specify an instance it will use the global VRF.

Parameter	Description
`informs`	Send Inform messages to this host.
`traps`	Send Trap messages to this host (default).
`version`	SNMP version to use for notification messages. Default: version 1.
`1`	Use SNMPv1(default).
`2c`	Use SNMPv2c.
`3`	Use SNMPv3.
`auth`	Authentication.
`noauth`	No authentication.
`priv`	Encryption.
`<community-name>`	The SNMPv1 or SNMPv2c community name.
`<user-name>`	SNMPv3 user name.

Mode Global Configuration

Examples To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name 'private', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c
private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to an IPv4 host destination 192.168.1.2 with the SNMPv2c community name 'public' and on a VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.1.2 vrf red version 2c
public
```

Command changes

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

snmp-server legacy-ifadminstatus

Overview Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

Syntax

```
snmp-server legacy-ifadminstatus
no snmp-server legacy-ifadminstatus
```

Default Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

Mode Global Configuration

Usage notes Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

Example To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

Related commands show interface

snmp-server location

Overview This command sets the location of the system. The location is:

- displayed in the output of the show system command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

Syntax

```
snmp-server location <location-name>
no snmp-server location
```

Parameter	Description
<location-name>	The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

Related commands

show snmp-server

show system

snmp-server contact

snmp-server source-interface

Overview Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

Syntax

```
snmp-server source-interface {traps|informs} <interface-name>
no snmp-server source-interface {traps|informs}
```

Parameter	Description
`traps`	SNMP traps.
`informs`	SNMP informs.
`<interface-name>`	Interface name (must already have an IP address assigned).

Default The originating egress interface of the traps and informs messages

Mode Global Configuration

Usage notes When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

Example The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

Validation Commands show running-config

snmp-server startup-trap-delay

Overview Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

Syntax

```
snmp-server startup-trap-delay <delay-time>
no snmp-server startup-trap-delay
```

Parameter	Description
<delay-time>	Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds.

Default The SNMP server trap delay time is 30 seconds. The no variant restores the default.

Mode Global Configuration

Example To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

Validation Commands show snmp-server

snmp-server user

Overview Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

Syntax

```
snmp-server user <username> <groupname> [encrypted] [auth
{md5|sha|sha-256} <auth-password>] [priv {des|aes}
<privacy-password>]
```

```
no snmp-server user <username>
```

Parameter	Description
<username>	User name. The user name is a string up to 20 characters long and is case sensitive.
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
`encrypted`	Use the encrypted parameter when you want to enter encrypted passwords.
`auth`	Authentication protocol.
`md5`	MD5 Message Digest Algorithms.
`sha`	SHA Secure Hash Algorithm.
`sha-256`	SHA-256 Secure Hash Algorithm. Note: SHA-256 authentication is required in crypto secure-mode.
<auth-password>	Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.
`priv`	Privacy protocol.
`des`	DES: Data Encryption Standard. DES is not available if you enable crypto secure-mode.
`aes`	AES: Advanced Encryption Standards.
<privacy-password>	Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.

Mode Global Configuration

Usage notes Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.

- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

Examples To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth         Privacy
-------             -------------       -------      ----------
authuser            usergroup           md5          aes
```

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv
aes 0x0e0133db5453ebd03822b004eeacb6608f
```

NOTE: *Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup- config** commands respectively, into the command line to avoid key stroke errors issuing this command.*

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth        Privacy
-------             -------------       -------     ----------
authuser            newusergroup        md5         aes
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

Related commands

show snmp-server user

snmp-server view

snmp-server view

Overview Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

NOTE: *The object identifier must be specified in a sequence of integers separated by decimal points.*

The **no** variant of this command removes the specified view on the device. The view must already exist.

Syntax

```
snmp-server view <view-name> <mib-name> {included|excluded}
no snmp-server view <view-name>
```

Parameter	Description
`<view-name>`	SNMP server view name. The view name is a string up to 20 characters long and is case sensitive.
`<mib-name>`	Object identifier of the MIB.
`included`	Include this OID in the view.
`excluded`	Exclude this OID in the view.

Mode Global Configuration

Examples The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

Related commands

show snmp-server view

snmp-server community

snmp-server vrf

Overview Use this command to isolate the SNMP Agent to operate within a previously configured non-global named VRF. This means the SNMP Agent can only respond to requests from SNMP Managers operating within the same VRF.

Use the **no** variant of this command to revert the SNMP Agent to operating within the default global VRF.

Syntax

```
snmp-server vrf <vrf-name>
no snmp-server vrf
```

Parameter	Description
`vrf`	The VRF instance to operate within.
<vrf-name>	The VRF instance name.

Default Global VRF

Mode Global Configuration

Examples To configure the SNMP Agent to operate within the VRF instance named 'red', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server vrf red
```

To revert the SNMP Agent to operating within the default global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server vrf
```

71 LLDP Commands

Introduction

Overview

LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the Support for Allied Telesis Enterprise MIBs in AlliedWare Plus).

The Voice VLAN feature can be configured using commands in VLAN Commands chapter.

For more information about LLDP, see the LLDP Feature Overview and Configuration Guide.

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the SNMP Feature Overview and Configuration Guide).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

Command List

clear lldp statistics

Overview This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

Syntax

```
clear lldp statistics [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the statistics are to be cleared.

Mode Privileged Exec

Examples To clear the LLDP statistics on ports 1.0.1 and 1.0.6, use the command:

```
awplus# clear lldp statistics interface port1.0.1,port1.0.6
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

Related commands show lldp statistics

show lldp statistics interface

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

clear lldp table

Overview This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

Syntax

```
clear lldp table [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the neighbor information table is to be cleared.

Mode Privileged Exec

Examples To clear the table of neighbor information received on ports 1.0.1 and 1.0.6, use the command:

```
awplus# clear lldp table interface port1.0.1,port1.0.6
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

Related commands show lldp neighbors

debug lldp

Overview This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

Syntax

```
debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
debug lldp operation
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface
[<port-list>]]
no debug lldp operation
no debug lldp all
```

Parameter	Description
`rx`	LLDP receive debug.
`rxpkt`	Raw LLDPDUs received in hex format.
`tx`	LLDP transmit debug.
`txpkt`	Raw Tx LLDPDUs transmitted in hex format.
<port-list>	The ports for which debug is to be configured.
`operation`	Debug for LLDP internal operation on the switch.
`all`	Disables all LLDP debugging for all ports.

Default By default no debug is enabled for any ports.

Mode Privileged Exec

Examples To enable debugging of LLDP receive on ports 1.0.1 and 1.0.6, use the command:

```
awplus# debug lldp rx interface port1.0.1,port1.0.6
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on ports 1.0.1 and 1.0.6, use the command:

```
awplus# no debug lldp rx interface port1.0.1,port1.0.6
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

Related commands

show debugging lldp

show running-config lldp

terminal monitor

lldp faststart-count

Overview Use this command to set the fast start count for LLDP-MED. The fast start count determines how many fast start advertisements LLDP sends from a port when it starts sending LLDP-MED advertisements from the port, for instance, when it detects a new LLDP-MED capable device.

The **no** variant of this command resets the LLDPD-MED fast start count to the default (3).

Syntax

```
lldp faststart-count <1-10>
no lldp faststart-count
```

Parameter	Description
<1-10>	The number of fast start advertisements to send.

Default The default fast start count is 3.

Mode Global Configuration

Examples To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

Related commands show lldp

lldp holdtime-multiplier

Overview This command sets the holdtime multiplier value. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

Syntax

```
lldp holdtime-multiplier <2-10>
no lldp holdtime-multiplier
```

Parameter	Description
<2-10>	The multiplier factor.

Default The default holdtime multiplier value is 4.

Mode Global Configuration

Usage The Time-To-Live defines the period for which the information advertised to the neighbor is valid. If the Time-To-Live expires before the neighbor receives another update of the information, then the neighbor discards the information from its database.

Examples To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp holdtime-multiplier 2
```

Related commands show lldp

lldp management-address

Overview This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

Syntax

```
lldp management-address <ipaddr>
no lldp management-address
```

Parameter	Description
<ipaddr>	The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device.

Default The local loopback interface primary IPv4 address if set, else the primary IPv4 interface address of the lowest numbered VLAN the port belongs to, else the MAC address of the device's baseboard if no VLAN IP addresses are configured for the port.

Mode Interface Configuration

Usage notes To see the management address that will be advertised, use the show lldp interface command or show lldp local-info command.

Examples To set the management address advertised by port1.0.1 and port1.0.2, to be 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp management-address
```

Related commands show lldp interface

show lldp local-info

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp med-notifications

Overview Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

Syntax

```
lldp med-notifications
no lldp med-notifications
```

Default The sending of LLDP-MED notifications is disabled by default.

Mode Interface Configuration

Examples To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp med-tlv-select

Overview Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

Syntax

```
lldp med-tlv-select [capabilities] [network-policy] [location]
[power-management-ext] [inventory-management]

lldp med-tlv-select all

no lldp med-tlv-select [capabilities] [network-policy]
[location] [power-management-ext] [inventory-management]

no lldp med-tlv-select all
```

Parameter	Description
`capabilities`	LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the lldp tlv-select command.
`network-policy`	Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: • switchport voice dscp • switchport voice vlan • switchport voice vlan priority
`location`	Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: • location elin-location-id • location civic-location identifier • location civic-location configuration • location coord-location identifier • location coord-location configuration • location elin-location
`power-management-ext`	Extended Power-via-MDI TLV. This TLV is transmitted if the port is PoE capable, and PoE is enabled (power-inline enable command).

Parameter	Description
`inventory-management`	Inventory Management TLV Set, including the following TLVs: • Hardware Revision • Firmware Revision • Software Revision • Serial Number • Manufacturer Name • Model Name • Asset ID
`all`	All LLDP-MED Organizationally Specific TLVs.

Default By default LLDP-MED Capabilities, Network Policy, Location Identification and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the lldp run command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

Mode Interface Configuration

Usage notes LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the show lldp neighbors command.

Examples To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

Command changes

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp non-strict-med-tlv-order-check

Overview Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

Syntax

```
lldp non-strict-med-tlv-order-check
no lldp non-strict-med-tlv-order-check
```

Default By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

Mode Global Configuration

Usage notes The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

Examples To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

Related commands show running-config lldp

lldp notification-interval

Overview This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

Syntax

```
lldp notification-interval <5-3600>
no lldp notification-interval
```

Parameter	Description
<5-3600>	The interval in seconds.

Default The default notification interval is 5 seconds.

Mode Global Configuration

Examples To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

Related commands lldp notifications

show lldp

lldp notifications

Overview This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

Syntax

```
lldp notifications
no lldp notifications
```

Default The sending of LLDP SNMP notifications is disabled by default.

Mode Interface Configuration

Examples To enable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp notifications
```

Related commands

lldp notification-interval

snmp-server enable trap

lldp port-number-type

Overview This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

Syntax

```
lldp port-number-type [number|ifindex]
no lldp port-number-type
```

Parameter	Description
`number`	Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.
`ifindex`	Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries.

Default The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

Mode Global Configuration

Examples To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

Related commands show lldp

lldp reinit

Overview This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

Syntax

```
lldp reinit <1-10>
no lldp reinit
```

Parameter	Description
<1-10>	The delay in seconds.

Default The default reinitialization delay is 2 seconds.

Mode Global Configuration

Examples To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

Related commands show lldp

lldp run

Overview This command enables the operation of LLDP on the device.

The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

Syntax

```
lldp run
no lldp run
```

Default LLDP is disabled by default.

Mode Global Configuration

Examples To enable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp run
```

Related commands show lldp

lldp timer

Overview This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

Syntax

```
lldp timer <5-32768>
no lldp timer
```

Parameter	Description
<5-32768>	The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer (lldp tx-delay command).

Default The default transmit interval is 30 seconds.

Mode Global Configuration

Examples To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

Related commands lldp tx-delay

show lldp

lldp tlv-select

Overview This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

Syntax

```
lldp tlv-select {[<tlv>]...}
lldp tlv-select all
no lldp tlv-select {[<tlv>]...}
no lldp tlv-select all
```

Parameter	Description
`<tlv>`	The TLV to transmit in LLDP advertisements. One of these keywords: • port-description (specified by the description (interface) command) • system-name (specified by the hostname command) • system-description • system-capabilities • management-address • port-vlan • port-and-protocol-vlans • vlan-names • protocol-ids • mac-phy-config • power-management (Power Via MDI TLV) • link-aggregation • max-frame-size
`all`	All TLVs.

Default By default no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV (**mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

Mode Interface Configuration

Examples

To include the management-address and system-name TLVs in advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp tlv-select management-address
system-name
```

To include all optional TLVs in advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp tlv-select management-address
system-name
```

To exclude all optional TLVs from advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp tlv-select all
```

lldp transmit receive

Overview This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

Syntax

```
lldp {[transmit] [receive]}
no lldp {[transmit] [receive]}
```

Parameter	Description
`transmit`	Enable or disable transmission of LLDP advertisements via this port or ports.
`receive`	Enable or disable reception of LLDP advertisements via this port or ports.

Default LLDP advertisement transmission and reception are enabled on all ports by default.

Mode Interface Configuration

Examples To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp tx-delay

Overview This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

Syntax

```
lldp tx-delay <1-8192>
no lldp tx-delay
```

Parameter	Description
<1-8192>	The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval (lldp timer command).

Default The default transmission delay timer is 2 seconds.

Mode Global Configuration

Examples To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

Related commands lldp timer

street-name-pre-modifier <street-name-pre-modifier>
no street-name-pre-modifier
streetname-post-modifier <streetname-post-modifier>
no streetname-post-modifier
```

Parameter	Description
<country>	Upper-case two-letter country code, as specified in ISO 3166.
<state>	State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).
<county>	County (CA Type 2): County, parish, gun (JP), district (IN).
<city>	City (CA Type 3): city, township, shi (JP).
<division>	City division (CA Type 4): City division, borough, city district, ward, chou (JP).
<neighborhood>	Neighborhood (CA Type 5): neighborhood, block.
<street-group>	Street group (CA Type 6): group of streets below the neighborhood level.
<leading-street-direction>	Leading street direction (CA Type 16).
<trailing-street-suffix>	Trailing street suffix (CA Type 17).
<street-suffix>	Street suffix (CA Type 18): street suffix or type.
<house-number>	House number (CA Type 19).
<house-number-suffix>	House number suffix (CA Type 20).
<landmark>	Landmark or vanity address (CA Type 21).
<additional-information>	Additional location information (CA Type 22).
<name>	Name (CA Type 23): residence and office occupant.
<postal-code>	Postal/zip code (CA Type 24).
<building>	Building (CA Type 25): structure.
<unit>	Unit (CA Type 26): apartment, suite.
<floor>	Floor (CA Type 27).
<room>	Room (CA Type 28).
<place-type>	Type of place (CA Type 29).
<postal-community-name>	Postal community name (CA Type 30).
<post-office-box>	Post office box (P.O. Box) (CA Type 31).
<additional-code>	Additional code (CA Type 32).
<seat>	Seat (CA Type 33): seat (desk, cubicle, workstation).
<primary-road-name>	Primary road name (CA Type 34).
<road-section>	Road section (CA Type 35).

Parameter	Description
<branch-road-name>	Branch road name (CA Type 36).
<sub-branch-road-name>	Sub-branch road name (CA Type 37).
<street-name-pre-modifier>	Street name pre-modifier (CA Type 38).
<street-name-post-modifier>	Street name post-modifier (CA Type 39).

Default By default no civic address location information is configured.

Mode Civic Address Location Configuration

Usage notes The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the LLDP Feature Overview and Configuration Guide.

To specify the civic address location, use the location civic-location identifier command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command. To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command location civic-location-id command.

Examples To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

Related commands location civic-location-id

location civic-location identifier

show lldp local-info

show location

location civic-location identifier

Overview Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

Syntax

```
location civic-location identifier <civic-loc-id>
no location civic-location identifier <civic-loc-id>
```

Parameter	Description
<civic-loc-id>	A unique civic address location ID, in the range 1 to 4095.

Default By default there are no civic address locations.

Mode Global Configuration

Usage notes To configure the location information for this civic address location identifier, use the location civic-location configuration command. To associate this civic location identifier with particular ports, use the location elin-location-id command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

Examples To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

Related commands

location civic-location-id

location civic-location configuration

show location

show running-config lldp

location civic-location-id

Overview Use this command to assign a civic address location to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax

```
location civic-location-id <civic-loc-id>
no location civic-location-id [<civic-loc-id>]
```

Parameter	Description
<civic-loc-id>	Civic address location ID, in the range 1 to 4095.

Default By default no civic address location is assigned to ports.

Mode Interface Configuration

Usage notes The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- location civic-location identifier command
- location civic-location configuration command

If a civic-address location is deleted using the **no** variant of the location civic-location identifier command, it is automatically removed from all ports.

Examples To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

Related commands

location coord-location configuration

Overview Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

Syntax

```
latitude <latitude>
lat-resolution <lat-resolution>
longitude <longitude>
long-resolution <long-resolution>
altitude <altitude> {meters|floor}
alt-resolution <alt-resolution>
datum {wgs84|nad83-navd|nad83-mllw}
```

Parameter	Description
<lat-resolution>	Latitude resolution, as a number of valid bits, in the range 0 to 34.
<latitude>	Latitude value in degrees in the range -90.0 to 90.0
<long-resolution>	Longitude resolution, as a number of valid bits, in the range 0 to 34.
<longitude>	Longitude value in degrees, in the range -180.0 to 180.0.
<alt-resolution>	Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value.
<altitude>	Altitude value, in meters or floors.
`meters`	The altitude value is in meters.
`floors`	The altitude value is in floors.
`datum`	The geodetic system (or datum) that the specified coordinate values are based on.
`wgs84`	World Geodetic System 1984.
`nad83-navd`	North American Datum 1983 - North American Vertical Datum.
`nad83-mllw`	North American Datum 1983 - Mean Lower Low Water vertical datum.

Default By default no coordinate location information is configured.

Mode Coordinate Configuration

Usage Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise

altitude is stored as a 30- bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the show location command. For example, a user-entered latitude value of "2.77" degrees is displayed as "2.76999998092651367187500000".

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the location coord-location identifier command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command. To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the location elin-location-id command.

Example To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# la-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# lo-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

Related commands

location coord-location-id

location coord-location identifier

show lldp local-info

show location

location coord-location identifier

Overview Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

Syntax

```
location coord-location identifier <coord-loc-id>
no location coord-location identifier <coord-loc-id>
```

Parameter	Description
<coord-loc-id>	A unique coordinate location identifier, in the range 1 to 4095.

Default By default there are no coordinate locations.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the location coord-location configuration command. To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the location coord-location-id command.

Examples To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

Related commands

location coord-location-id

location coord-location configuration

show lldp local-info

show location

location coord-location-id

Overview Use this command to assign a coordinate location to the ports. The coordinate location must already exist. This replaces any previous assignment of coordinate location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location from the ports.

Syntax

```
location coord-location-id <coord-loc-id>
no location coord-location-id [<coord-loc-id>]
```

Parameter	Description
<coord-loc-id>	Coordinate location ID, in the range 1 to 4095.

Default By default no coordinate location is assigned to ports.

Mode Interface Configuration

Usage notes The coordinate location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the following commands:

- location coord-location identifier command
- location coord-location configuration command

If a coordinate location is deleted using the **no** variant of the location coord-location identifier command, it is automatically removed from all ports.

Examples To assign coordinate location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location coord-location-id 1
```

To remove a coordinate location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location coord-location-id
```

location elin-location

Overview Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

Syntax

```
location elin-location <elin> identifier <elin-loc-id>
no location elin-location identifier <elin-loc-id>
```

Parameter	Description
<elin>	Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long.
<elin-loc-id>	A unique ELIN location identifier, in the range 1 to 4095.

Default By default there are no ELIN location identifiers.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the location elin-location-id command.

Examples To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

Related commands

location elin-location-id

Overview Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax

```
location elin-location-id <elin-loc-id>
no location elin-location-id [<elin-loc-id>]
```

Parameter	Description
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.

Default By default no ELIN location is assigned to ports.

Mode Interface Configuration

Usage notes An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the location elin-location command.

If an ELIN location is deleted using the **no** variant of one of the location elin-location command, it is automatically removed from all ports.

Examples To assign ELIN location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location elin-location-id 1
```

To remove ELIN location 1 from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location elin-location-id 1
```

show debugging lldp

Overview This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

Syntax

```
show debugging lldp [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the LLDP debug settings are shown.

Mode User Exec and Privileged Exec

Examples To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

To display LLDP debug settings for ports 1.0.1 to 1.0.6, use the command:

```
awplus# show debugging lldp interface port1.0.1-1.0.6
```

Output Figure 71-1: Example output from the **show debugging lldp** command

```
LLDP Debug settings:
Debugging for LLDP internal operation is on
Port       Rx    RxPkt   Tx    TxPkt
-----------------------------------
1.0.1      Yes   Yes     No    No
1.0.2      Yes   No      No    No
1.0.3      No    No      No    No
1.0.4      Yes   Yes     Yes   No
1.0.5      Yes   No      Yes   No
1.0.6      Yes   Yes     Yes   Yes
```

Table 1: Parameters in the output of the **show debugging lldp** command

Parameter	Description
Port	Port name.
Rx	Whether debugging of LLDP receive is enabled on the port.
RxPkt	Whether debugging of LLDP receive packet dump is enabled on the port.
Rx	Whether debugging of LLDP transmit is enabled on the port.
RxPkt	Whether debugging of LLDP transmit packet dump is enabled on the port.

Related commands debug lldp

show lldp

Overview This command displays LLDP status and global configuration settings.

Syntax

```
show lldp
```

Mode User Exec and Privileged Exec

Example To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

Output

Table 2: Example output from the **show lldp** command

```
awplus# show lldp

LLDP Global Configuration:              [Default Values]
LLDP Status ............... Enabled     [Disabled]
Notification Interval ..... 5 secs      [5]
Tx Timer Interval ......... 30 secs     [30]
Hold-time Multiplier ...... 4           [4]
(Computed TTL value ....... 120 secs)
Reinitialization Delay .... 2 secs      [2]
Tx Delay .................. 2 secs      [2]

Port Number Type........... Ifindex     [Port-Number]
Fast Start Count .......... 5           [3]

LLDP Global Status:
Total Neighbor Count ...... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

Table 3: Parameters in the output of the **show lldp** command

Parameter	Description
LLDP Status	Whether LLDP is enabled. Default is disabled.
Notification Interval	Minimum interval between LLDP notifications.
Tx Timer Interval	Transmit interval between regular transmissions of LLDP advertisements.
Hold-time Multiplier	The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.
Reinitialization Delay	The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.

Table 3: Parameters in the output of the **show lldp** command (cont.)

Parameter	Description
`Tx Delay`	The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information.
`Port Number Type`	The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.
`Fast Start Count`	The number of times fast start advertisements are sent for LLDP-MED.
`Total Neighbor Count`	Number of LLDP neighbors discovered on all ports.
`Neighbors table last updated`	The time since the LLDP neighbor table was last updated.

Table 4: Parameters in the output of the **show lldp interface** command

Parameter	Description
`Port`	Port name.
`Rx`	Whether reception of LLDP advertisements is enabled on the port.
`Tx`	Whether transmission of LLDP advertisements is enabled on the port.
`Notif`	Whether sending SNMP notification for LLDP is enabled on the port: • RM = Remote Tables Change Notification • TP = LLDP-MED Topology Change Notification
`Management Addr`	Management address advertised to neighbors.
`Base TLVs Enabled for Tx`	List of optional Base TLVs enabled for transmission: • Pd = Port Description • Sn =System Name • Sd = System Description • Sc =System Capabilities • Ma = Management Address
`802.1 TLVs Enabled for Tx`	List of optional 802.1 TLVs enabled for transmission: • Pv = Port VLAN ID • Pp = Port And Protocol VLAN ID • Vn = VLAN Name • Pi =Protocol Identity
`802.3 TLVs Enabled for Tx`	List of optional 802.3 TLVs enabled for transmission: • Mp = MAC/PHY Configuration/Status • Po = Power Via MDI (PoE) • La = Link Aggregation • Mf = Maximum Frame Size
`MED TLVs Enabled for Tx`	List of optional LLDP-MED TLVs enabled for transmission: • Mc = LLDP-MED Capabilities • Np = Network Policy • Lo = Location Information, • Pe = Extended Power-Via-MDI • In = Inventory

Related commands

show lldp

show running-config lldp

show lldp local-info

Overview This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

Syntax
```
show lldp local-info [base] [dot1] [dot3] [med] [interface
<port-list>]
```

Parameter	Description
`base`	Information for base TLVs.
`dot1`	Information for 802.1 TLVs.
`dot3`	Information for 802.3 TLVs.
`med`	Information for LLDP-MED TLVs.
<port-list>	The ports for which the local information is to be shown.

Mode User Exec and Privileged Exec

Usage notes Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements (lldp transmit receive command)
- which TLVs it is configured to send (lldp tlv-select command, lldp med-tlv-select command)

Examples To display local information transmitted via port 1.0.1, use the command:

```
awplus# show lldp local-info interface port1.0.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

Output Figure 71-3: Example output from **show lldp local-info**

```

Table 71-1: Parameters in the output of **show lldp local-info**

Parameter	Description
`Chassis ID Type`	Type of the Chassis ID.
`Chassis ID`	Chassis ID that uniquely identifies the local device.
`Port ID Type`	Type of the Port ID.
`Port ID`	Port ID of the local port through which advertisements are sent.
`TTL`	Number of seconds that the information advertised by the local port remains valid.
`Port Description`	Port description of the local port, as specified by the description (interface) command.
`System Name`	System name, as specified by the hostname command.
`System Description`	System description.
`System Capabilities (Supported)`	Capabilities that the local port supports.
`System Capabilities (Enabled)`	Enabled capabilities on the local port.
`Management Addresses`	Management address associated with the local port. To change this, use the lldp management-address command.
`Port VLAN ID (PVID)`	VLAN identifier associated with untagged or priority tagged frames received via the local port.
`Port & Protocol VLAN (Supported)`	Whether Port & Protocol VLANs (PPV) is supported on the local port.
`Port & Protocol VLAN (Enabled)`	Whether the port is in one or more Port & Protocol VLANs.
`Port & Protocol VLAN (VIDs)`	List of identifiers for Port & Protocol VLANs that the port is in.
`VLAN Names`	List of VLAN names for VLANs that the local port is assigned to.
`Protocol IDs`	List of protocols that are accessible through the local port.
`MAC/PHY Auto-negotiation`	Auto-negotiation support and current status of the 802.3 LAN on the local port.

Table 71-1: Parameters in the output of **show lldp local-info** (cont.)

Parameter	Description
Power Via MDI (PoE)	PoE-capability and current status on the local port.
Port Class	Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device).
Pair Control Ability	Whether power pair selection can be controlled.
Power Pairs	Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled.
Power Class	The power class of the PD device on the port (class 0, 1, 2, 3 or 4).
Link Aggregation	Whether the link is capable of being aggregated and it is currently in an aggregation.
Aggregated Port-ID	Aggregated port identifier.
Maximum Frame Size	The maximum frame size capability of the implemented MAC and PHY.
LLDP-MED Device Type	LLDP-MED device type.
LLDP-MED Capabilities	Capabilities LLDP-MED capabilities supported on the local port.
Network Policy	List of network policies configured on the local port.
VLAN ID	VLAN identifier for the port for the specified application type.
Tagged Flag	Whether the VLAN ID is to be used as tagged or untagged.
Layer-2 Priority:	Layer 2 User Priority (in the range 0 to 7).
DSCP Value	Diffserv codepoint (in the range 0 to 63).
Location Identification	Location configured on the local port.
Extended Power Via MDI (PoE)	PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.
Power Source	The power source the switch currently uses; either primary power or backup power.
Power Priority	The power priority configured on the port; either critical, high or low.

Table 71-1: Parameters in the output of **show lldp local-info** (cont.)

Parameter	Description
`Power Value`	The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side.
`Inventory Management`	Inventory information for the device.

hostname

lldp transmit receive

show lldp neighbors

Overview This command displays a summary of information received from neighbors via specified ports. If no port list is supplied, neighbor information for all ports is displayed.

Syntax

```
show lldp neighbors [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the neighbor information is to be shown.

Mode User Exec and Privileged Exec

Examples To display neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors
```

To display neighbor information received via ports 1.0.1 and 1.0.6 with LLDP-MED configuration, use the command:

```
awplus# show lldp neighbors interface port1.0.1,port1.0.6
```

Output Figure 71-4: Example output from the **show lldp neighbors** command

```
LLDP Neighbor Information:

Total number of neighbors on these ports .... 4

1.0.6    00ee.4352.df51  192.168.1.2     Jim's desk phone         --B--T--    3  PSE
```

Table 72: Parameters in the output of the **show lldp neighbors** command

Parameter	Description
`Local Port`	Local port on which the neighbor information was received.
`Neighbor Chassis ID`	Chassis ID that uniquely identifies the neighbor.
`Neighbor Port Name`	Port ID of the neighbor.
`Neighbor Sys Name`	System name of the LLDP neighbor.
`Neighbor Capability`	Capabilities that are supported and enabled on the neighbor.
`System Capability`	System Capabilities of the LLDP neighbor.
`MED Device Type`	LLDP-MED Device class (Class I, II, III or Network Connectivity)
`MED Power Source`	LLDP-MED Power Source

Related commands show lldp neighbors detail

show lldp neighbors detail

Overview This command displays in detail the information received from neighbors via specified ports. If no port list is supplied, detailed neighbor information for all ports is displayed.

Syntax

```
show lldp neighbors detail [base] [dot1] [dot3] [med] [interface
<port-list>]
```

Parameter	Description
`base`	Information for base TLVs.
`dot1`	Information for 802.1 TLVs.
`dot3`	Information for 803.1 TLVs.
`med`	Information for LLDP-MED TLVs.
<port-list>	The ports for which the neighbor information is to be shown.

Mode User Exec and Privileged Exec

Examples To display detailed neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors detail
```

To display detailed neighbor information received via ports 1.0.1, use the command:

```
awplus# show lldp neighbors detail interface port1.0.1
```

Output Figure 71-5: Example output from the **show lldp neighbors detail** command

```
awplus#show lldp neighbors detail interface port1.0.1
LLDP Detailed Neighbor Information:

Table 73: Parameters in the output of the **show lldp neighbors detail** command

Parameter	Description
`Chassis ID Type`	Type of the Chassis ID.
`Chassis ID`	Chassis ID that uniquely identifies the neighbor.
`Port ID Type`	Type of the Port ID.
`Port ID`	Port ID of the neighbor.
`TTL`	Number of seconds that the information advertised by the neighbor remains valid.
`Port Description`	Port description of the neighbor's port.
`System Name`	Neighbor's system name.
`System Description`	Neighbor's system description.
`System Capabilities (Supported)`	Capabilities that the neighbor supports.
`System Capabilities (Enabled)`	Capabilities that are enabled on the neighbor.
`Management Addresses`	List of neighbor's management addresses.
`Port VLAN ID (PVID)`	VLAN identifier associated with untagged or priority tagged frames for the neighbor port.
`Port & Protocol VLAN (Supported)`	Whether Port & Protocol VLAN is supported on the LLDP neighbor.
`Port & Protocol VLAN (Enabled)`	Whether Port & Protocol VLAN is enabled on the LLDP neighbor.
`Port & Protocol VLAN (VIDs)`	List of Port & Protocol VLAN identifiers.
`VLAN Names`	List of names of VLANs that the neighbor's port belongs to.
`Protocol IDs`	List of protocols that are accessible through the neighbor's port.
`MAC/PHY Auto-negotiation`	Auto-negotiation configuration and status
`Power Via MDI (PoE)`	PoE configuration and status of 802.3 Power-Via-MDI TLV
`Link Aggregation`	Link aggregation information

Table 73: Parameters in the output of the **show lldp neighbors detail** command (cont.)

Parameter	Description
`Maximum Frame Size`	The maximum frame size capability
`LLDP-MED Device Type`	LLDP-MED Device type
`LLDP-MED Capabilities`	LLDP-MED capabilities supported
`Network Policy`	List of network policies
`Location Identification`	Location information
`Extended Power Via MDI (PoE)`	PoE-capability and current status
`Inventory Management`	Inventory information

Related commands show lldp neighbors

show lldp statistics

Overview This command displays the global LLDP statistics (packet and event counters).

Syntax

```
show lldp statistics
```

Mode User Exec and Privileged Exec

Example To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

Output

Table 74: Example output from the **show lldp statistics** command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

  Frames:    Out ................... 345
             In .................... 423
             In Errored ............ 0
             In Dropped ............ 0
  TLVs:      Unrecognized .......... 0
             Discarded ............. 0
  Neighbors: New Entries ........... 20
             Deleted Entries ....... 20
             Dropped Entries ....... 0
             Entry Age-outs ........ 20
```

Table 75: Parameters in the output of the **show lldp statistics** command

Parameter	Description
Frames Out	Number of LLDPDU frames transmitted.
Frames In	Number of LLDPDU frames received.
Frames In Errored	Number of invalid LLDPDU frames received.
Frames In Dropped	Number of LLDPDU frames received and discarded for any reason.
TLVs Unrecognized	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
TLVs Discarded	Number of LLDP TLVs discarded for any reason.
Neighbors New Entries	Number of times the information advertised by neighbors has been inserted into the neighbor table.

Table 75: Parameters in the output of the **show lldp statistics** command (cont.)

Parameter	Description
`Neighbors Deleted Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table.
`Neighbors Dropped Entries`	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
`Neighbors Entry Age-outs Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

Related commands

clear lldp statistics

show lldp statistics interface

show lldp statistics interface

Overview This command displays the LLDP statistics (packet and event counters) for specified ports. If no port list is supplied, LLDP statistics for all ports are displayed.

Syntax

```
show lldp statistics interface [<port-list>]
```

Parameter	Description
<port-list>	The ports for which the statistics are to be shown.

Mode User Exec and Privileged Exec

Examples To display LLDP statistics information for all ports, use the command:

```
awplus# show lldp statistics interface
```

To display LLDP statistics information for ports 1.0.1 and 1.0.6, use the command:

```
awplus# show lldp statistics interface port1.0.1,port1.0.6
```

Output

Table 76: Example output from the **show lldp statistics interface** command

```
awplus# show lldp statistics interface port1.0.1,port1.0.6

LLDP Packet and Event Counters:

port1.0.1
  Frames:    Out ................... 27
             In .................... 22
             In Errored ............ 0
             In Dropped ............ 0
  TLVs:      Unrecognized .......... 0
             Discarded ............. 0
  Neighbors: New Entries ........... 3
             Deleted Entries ....... 0
             Dropped Entries ....... 0
             Entry Age-outs ........ 0

port1.0.6
  Frames:    Out ................... 15
             In .................... 18
             In Errored ............ 0
             In Dropped ............ 0
  TLVs:      Unrecognized .......... 0
             Discarded ............. 0
  Neighbors: New Entries ........... 1
             Deleted Entries ....... 0
             Dropped Entries ....... 0
             Entry Age-outs ........ 0
```

Table 77: Parameters in the output of the **show lldp statistics interface** command

Parameter	Description
`Frames Out`	Number of LLDPDU frames transmitted.
`Frames In`	Number of LLDPDU frames received.
`Frames In Errored`	Number of invalid LLDPDU frames received.
`Frames In Dropped`	Number of LLDPDU frames received and discarded for any reason.
`TLVs Unrecognized`	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
`TLVs Discarded`	Number of LLDP TLVs discarded for any reason.
`Neighbors New Entries`	Number of times the information advertised by neighbors has been inserted into the neighbor table.
`Neighbors Deleted Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table.
`Neighbors Dropped Entries`	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
`Neighbors Entry Age-outs Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

clear lldp statistics

show lldp statistics

show location

Overview Use this command to display selected location information configured on the switch.

Syntax

```
show location {civic-location|coord-location|elin-location}
```

```
show location {civic-location|coord-location|elin-location}
identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}
```

```
show location {civic-location|coord-location|elin-location}
interface <port-list>
```

Parameter	Description
`civic-location`	Display civic location information.
`coord-location`	Display coordinate location information.
`elin-location`	Display ELIN (Emergency Location Identifier Number) information.
<civic-loc-id>	Civic address location identifier, in the range 1 to 4095.
<coord-loc-id>	Coordinate location identifier, in the range 1 to 4095.
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.
<port-list>	Ports to display information about.

Mode User Exec and Privileged Exec

Examples To display a civic address location configured on port1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

Table 78: Example output from the **show location** command

```
awplus# show location civic-location interface port1.0.1
Port     ID   Element Type          Element Value
-------------------------------------------------------------
1.0.1    1    Country               NZ
              City                  Christchurch
              Street-suffix         Avenue
              House-number          27
              Primary-road-name     Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

Table 79: Example output from the **show location** command

```
awplus# show location coord-location identifier 1
  ID  Element Type             Element Value
------------------------------------------------------------------
  1   Latitude Resolution      15 bits
      Latitude                 38.898648113012313842773437 5 degrees
      Longitude Resolution     15 bits
      Longitude                130.232322293128967285156250 degrees
      Altitude Resolution      10 bits
      Altitude                 2.50000000 meters
      Map Datum                WGS 84
```

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the location coord-location configuration command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

Table 80: Example output from the **show location elin-location** command

```
awplus# show location elin-location
  ID  ELIN
-----------------------------------

72 Mail (SMTP) Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the Mail (SMTP) Feature Overview and Configuration Guide.

Command List

debug mail

Overview This command turns on debugging for sending emails.

The **no** variant of this command turns off debugging for sending emails.

Syntax

```
debug mail
no debug mail
```

Mode Privileged Exec

Examples To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

Related commands

delete mail

mail

mail from

mail smtpserver

show counter mail

show mail

undebug mail

delete mail

Overview This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

Syntax

```
delete mail [mail-id <mail-id>|all]
```

Parameter	Description	
`mail-id`	Deletes a single mail from the mail queue.	
	<mail-id>	A unique mail ID number. Use the show mail command to display this for an item of mail.
`all`	Delete all the mail in the queue.	

Mode Privileged Exec

Examples To delete the unique mail item "20060912142356.1234" from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

Related commands

debug mail

mail

mail from

mail smtpserver

show mail

mail

Overview This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the mail from command and a mail server using the mail smtpserver command.

Syntax `mail [to <to>] [subject <subject>] [file <filename>]`

Parameter	Description
`to`	The email recipient.
	`<to>` Email address.
`subject`	Description of the subject of this email. Use quote marks when the subject text contains spaces.
	`<subject>` String.
`file`	File to insert as text into the message body.
	`<filename>` String.

Mode Privileged Exec

Usage notes When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

Parameter	Description
`<%N>`	When this parameter is specified, the %N is replaced by the host name of your device.
`<%S>`	When this parameter is specified, the %S is replaced by the serial number of your device.

`<%D>`
`<%L>`
`<%T>`
	When any of these parameters is specified, they are replaced by the current date and time (local time) on your device.

`<%U>`	When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.

NOTE: *If no local time is configured, it will use UTC.*

Examples

To send an email to “admin@example.com” with the subject “test email” and with the message body inserted from the file “test.conf”, use the command:

```
awplus# mail to admin@example.com subject "test email" filename
test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from
Hostname:%N Serial Number:%S Date:%T"
```

Related commands

debug mail

delete mail

mail from

mail smtpserver

mail smtpserver authentication

mail smtpserver port

show counter mail

show mail

mail from

Overview This command sets an email address as the sender. You must specify a sending email address with this command before you can send email.

Use the **no** variant of this command to remove the "mail from" address.

Syntax

```
mail from <from>
no mail from
```

Parameter	Description
<from>	The email address that the mail is sent from (also known as the hostname).

Mode Global Configuration

Example To set up your email address as the sender "kaji@nerv.com", use the command:

```
awplus(config)# mail from kaji@nerv.com
```

Related commands

debug mail

delete mail

mail

mail smtpserver

show counter mail

show mail

undebug mail

mail smtpserver

Overview This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

Syntax

```
mail smtpserver {<ip-address>|<name>}
no mail smtpserver
```

Parameter	Description
<ip-address>	Internet Protocol (IP) address for the mail server.
<name>	Domain name (FQDN) for the mail server (also known as the host name).

Mode Global Configuration

Usage notes If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the ip domain-lookup command.

Examples To specify a mail server at "192.168.0.1", use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of "smtp.example.com", use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

Related commands

debug mail

delete mail

mail

mail from

show counter mail

show mail

mail smtpserver authentication

Overview Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

Syntax

```
mail smtpserver authentication {crammd5|login|plain} username
<username> password [8] <password>
```

```
no mail smtpserver authentication
```

Parameter	Description
`crammd5`	This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.
`login`	A BASE64 encryption method
`plain`	A BASE64 encryption method
<username>	Registered user name
`8`	The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use.
<password>	Registered user password

Default No authentication option is set by default.

Mode Global Configuration

Usage notes You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:

```
% Error: authentication configuration still exists
```

Examples To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# mail smtpserver authentication crammd5 username
admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no mail smtpserver authentication
```

Output Figure 72-1: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-------------------------------------------------------------
State                                : Alive
SMTP Server                          : 1.2.3.4
Host Name                            : admin@example.com
Authentication                       : crammd5
Username                             : admin
Debug                                : Disabled

awplus#show running-config

Command changes Version 5.4.8-1.1: command added

mail smtpserver port

Overview Use this command to configure the SMTP mail client/server communication port.

Use the **no** variant of this command to remove the configured port and set it back to the default port.

Syntax

```
mail smtpserver port <port>
no mail smtpserver port
```

Parameter	Description
<port>	Port number from the range 1 to 65535

Default The default port value is 25 if TLS is not enabled for the SMTP server, 587 if TLS is enabled with STARTTLS, and 465 if TLS is enabled with SMTPS.

Mode Global Configuration

Examples To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver port 587
```

To revert to the default SMTP mail server communication port, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver port
```

Output Figure 72-2: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-------------------------------------------------------------
State                                : Alive
SMTP Server                          : 10.24.165.4
Host Name                            : admin@example.com
Authentication                       : plain
Username                             : admin
Port                                 : 587
Use TLS                              : STARTTLS
Debug                                : Disabled

mail smtpserver

mail smtpserver tls

show counter mail

show mail

Command changes Version 5.4.8-1.1: command added

mail smtpserver tls

Overview Use this command to configure the device to send emails over a TLS connection to the SMTP server instead of sending in clear-text. If the SMTP server does not support receiving emails over a TLS connection, sending emails from the device will fail.

Use the **no** variant of this command to configure the device to send emails over an unencrypted TCP connection (clear text).

Syntax

```
mail smtpserver tls [starttls|smtps]
no mail smtpserver tls
```

Parameter	Description
`starttls`	The connection starts as clear-text SMTP first and then the client establishes a TLS connection using the STARTTLS extension.
`smtps`	Use a TLS connection from the start.

Default By default, TLS is disabled and the device sends emails in clear-text.

Mode Global Configuration

Examples To send emails to the SMTP server over a TLS connection that will be established by the STARTTLS method, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver tls starttls
```

To send emails to the SMTP server over a TLS connection from the beginning, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver tls smpts
```

To send emails to the SMTP server in clear text, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver tls
```

mail smtpserver port

mail smtpserver authentication

Command changes Version 5.5.3-0.1: command added

show counter mail

Overview This command displays the mail counters.

Syntax

```
show counter mail
```

Mode User Exec and Privileged Exec

Example To show the emails in the queue use the command:

```
awplus# show counter mail
```

Output Figure 72-3: Example output from the **show counter mail** command

```
Mail Client (SMTP) counters
Mails Sent            ......... 2
Mails Sent Fails      ......... 1
```

Table 1: Parameters in the output of the **show counter mail** command

Parameter	Description
`Mails Sent`	The number of emails sent successfully since the last device restart.
`Mails Sent Fails`	The number of emails the device failed to send since the last device restart.

73 RMON Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see the RMON Feature Overview and Configuration Guide.

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

rmon alarm

Overview Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the rmon event command.

Use the **no** variant of this command to remove the alarm configuration.

NOTE: *You can only configure alarms for switch port interfaces, not for VLANs.*

Syntax **User-defined alarm:**

```
rmon alarm <alarm-index> <oid.index> interval <1-2147483647>
{delta|absolute} rising-threshold <1-2147483647> event
<rising-event-index> falling-threshold <1-2147483647> event
<falling-event-index> [alarmstartup {1|2|3}] [owner <owner>]
```

Eventwatch alarm, do not use (used by Vista Manager EX only):

```
rmon alarm <alarm-index> <oid.index> interval <1-4294967295>
{delta|absolute} rising-threshold <1-2147483647> event
eventwatch falling-threshold <1-2147483647> event eventwatch
[owner <owner>]
```

```
no rmon alarm <alarm-index>
```

Parameter	Description
<alarm-index>	Alarm entry index value from the range 1 to 65535 seconds.
<oid.index>	The variable SNMP MIB Object Identifier (OID) name to be monitored, for either etherStats or etherHistory entries. The entries can be either of the following formats: - etherStatsEntry.<*field*>.<*stats-index*> or etherHistoryEntry.<*field*>.<*history-index*>, or - etherStatsFieldName.<*stats-index*> or etherHistoryFieldName.<*history-index*>. To define the <*stats-index*>, use the rmon collection stats command. To define the <*history-index*>, use the rmon collection history command.
`interval <1-2147483647>`	Polling interval in seconds from the range 1 to 2147483647.
`delta`	The RMON MIB alarmSampleType: the change in the monitored MIB object value between the beginning and end of the polling interval.
`absolute`	The RMON MIB alarmSampleType: the value of the monitored MIB object.

Parameter	Description
`rising-threshold <1-2147483647>`	Rising threshold value of the alarm entry in seconds from the range 1 to 2147483647.
`<rising-event-index>`	From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the rising threshold value. This is the event index of an event specified by the rmon event command.
`eventwatch`	The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the `<rising-event-index>` parameter instead.
`falling-threshold <1-2147483647>`	Falling threshold value of the alarm entry in seconds from the range 1 to 2147483647.
`<falling-event-index>`	From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the rmon event command.
`eventwatch`	The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the `<rising-event-index>` parameter instead.
`alarmstartup {1|2|3}`	Whether RMON can trigger a falling alarm (1), a rising alarm (2) or either (3) when you first start monitoring. See the Usage section for more information. The default is setting 3 (either).
`owner <owner>`	Arbitrary owner name to identify the alarm entry.

Default By default, there are no alarms.

Mode Global Configuration

Usage notes RMON alarms have a rising and falling threshold. Once the alarm monitoring is operating, you cannot have a falling alarm unless there has been a rising alarm and vice versa.

However, when you start RMON alarm monitoring, an alarm must be generated without the other type of alarm having first been triggered. The **alarmstartup** parameter allows this. It is used to say whether RMON can generate a rising alarm (1), a falling alarm (2) or either alarm (3) as the first alarm.

Note that you specify the SNMP MIB Object Identifier (OID) as a dotted decimal value, using one of the following forms:

- etherStatsEntry.<*field*>.<*stats-index*> or etherHistoryEntry.<*field*>.<*history-index*>. For example, etherHistoryEntry.8.8

- or, etherStatsFieldName.<*stats-index*> or etherHistoryFieldName.<*history-index*>.
  For example, etherHistoryMulticastPkts.8

If you enter the first form (etherHistoryEntry.8.8), the device will save it as the second form (etherHistoryMulticastPkts.8) in the running-config.

Example To configure an alarm to:

- monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the rmon collection stats command)
- and trigger event 2 (defined by the rmon event command) when the change reaches the rising threshold 400
- and trigger event 3 when it reaches the falling threshold 200
- and identify this alarm as belonging to the user with username Maria

use the following commands:

```
awplus# configure terminal
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60
delta rising-threshold 400 event 2 falling-threshold 200 event
3 alarmstartup 3 owner maria
```

To configure an alarm that:

- every 10 seconds, checks the number of multicast packets
- in the latest history control table entry controlled by history-index 8
- to see if the number of packets has increased to 15 or dropped to 5
- and if it has, triggers event 10

use either of the following commands:

```
awplus(config)# rmon alarm 56 etherHistoryMulticastPkts.8
interval 10 absolute rising-threshold 15 event 10
falling-threshold 5 event 10
awplus(config)# rmon alarm 56 etherHistoryEntry.8.8 interval 10
absolute rising-threshold 15 event 10 falling-threshold 5 event
10
```

Related commands

rmon collection history

rmon collection stats

rmon event

rmon collection history

Overview Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

NOTE: *A history can only be collected for switch port interfaces, not for VLANs.*

Syntax

```
rmon collection history <history-index> [buckets <1-65535>]
[interval <1-3600>] [owner <owner>]
```

```
no rmon collection history <history-index>
```

Parameter	Description
<history-index>	A unique RMON history control entry index value from the range 1 to 65535.
buckets *<1-65535>*	Number of requested buckets to store snapshots from the range 1 to 65535. The default is 50 buckets.
interval *<1-3600>*	Polling interval in seconds. Default 1800 second polling interval from the range 1 to 3600.
owner *<owner>*	Owner name to identify the entry.

Default The default interval is 1800 seconds and the default number of buckets is 50.

Mode Interface Configuration

Example To create a history statistics control group with ID 200 to store 500 snapshots with an interval of 600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection history 200 buckets 500
interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection history 200
```

Related commands

rmon alarm

rmon collection stats

rmon event

rmon collection stats

Overview Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

NOTE: *Statistics can only be collected for switch port interfaces, not for VLANs.*

Syntax

```
rmon collection stats <collection-index> [owner <owner>]
no rmon collection stats <collection-index>
```

Parameter	Description
`<collection-index>`	Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port. Use a number in the range of 1 to 65535.
`owner <owner>`	An arbitrary owner name to identify this statistics collection entry.

Default RMON statistics are not enabled by default.

Mode Interface Configuration

Example To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection stats 200
```

Related commands

rmon alarm

rmon collection history

rmon event

rmon event

Overview Use this command to create an event definition for a log or a trap or both. Then you can use this event index in the rmon alarm command to indicate whether to send an SNMP trap or log message (or both) when an alarm is triggered.

Use the **no** variant of this command to remove the event definition.

Syntax

```
rmon event <event-index> [description <description>|owner
<owner>| trap <trap>]
```

```
rmon event <event-index> [log [description <description>|owner
<owner>|trap <trap>] ]
```

```
rmon event <event-index> [log trap [description
<description>|owner <owner>] ]
```

```
no rmon event <event-index>
```

Parameter	Description
<event-index>	*<1-65535>* Unique event entry index value.
log	Log event type.
trap	Trap event type.
log trap	Log and trap event type.
description*<description>*	Event entry description.
owner *<owner>*	Owner name to identify the entry.

Default No event is configured by default.

Mode Global Configuration

Example To create an event definition with an index of 299 for a log, use this command:

```
awplus# configure terminal
awplus(config)# rmon event 299 log description cond3 owner
alfred
```

To remove the event definition, use the command:

```
awplus# configure terminal
awplus(config)# no rmon event 299
```

Related commands rmon alarm

show rmon alarm

Overview Use this command to display the alarms and threshold configured for the RMON probe.

Syntax
```
show rmon alarm
```

Mode User Exec and Privileged Exec

Example To display the alarms and threshold, use this command:

```
awplus# show rmon alarm
```

Related commands rmon alarm

show rmon event

Overview Use this command to display the events configured for the RMON probe.

Syntax

```
show rmon event
```

Mode User Exec and Privileged Exec

Output Figure 73-1: Example output from the **show rmon event** command

```
awplus#sh rmon event
 event Index = 787
       Description TRAP
        Event type log & trap
         Event community name gopher
       Last Time Sent = 0
       Owner  RMON_SNMP

 event Index = 990
       Description TRAP
        Event type trap
         Event community name teabo
       Last Time Sent = 0
       Owner  RMON_SNMP
```

NOTE: *The following etherStats counters are not currently available for Layer 3 interfaces:*

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

Example To display the events configured for the RMON probe, use this command:

```
awplus# show rmon event
```

Related commands rmon event

show rmon history

Overview Use this command to display the parameters specified on all the currently defined RMON history collections on the device.

Syntax

```
show rmon history
```

Mode User Exec and Privileged Exec

Output Figure 73-2: Example output from the **show rmon history** command

```
awplus#sh rmon history
 history index = 56
         data source ifindex = 4501
         buckets requested = 34
        buckets granted = 34
        Interval = 2000
        Owner Andrew

 history index = 458
         data source ifindex = 5004
         buckets requested = 400
        buckets granted = 400
        Interval = 1500
        Owner trev
=======================================================
```

NOTE: *The following etherStats counters are not currently available for Layer 3 interfaces:*

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

Example To display the parameters specified on all the currently defined RMON history collections, us the commands:

```
awplus# show rmon history
```

Related commands rmon collection history

show rmon statistics

Overview Use this command to display the current values of the statistics for all the RMON statistics collections currently defined on the device.

Syntax

```
show rmon statistics
```

Mode User Exec and Privileged Exec

Example To display the current values of the statistics for all the RMON statistics collections, us the commands:

```
awplus# show rmon statistics
```

Output Figure 73-3: Example output from the **show rmon statistics** command

```
awplus#show rmon statistics
    rmon collection index 45
    stats->ifindex = 4501
    input packets 1279340, bytes 85858960, dropped 00, multicast packets 1272100
    output packets 7306090, bytes 268724, multicast packets 7305660 broadcast
packets 290
    rmon collection index 679
    stats->ifindex = 5013
    input packets 00, bytes 00, dropped 00, multicast packets 00
    output packets 8554550, bytes 26777324, multicast packets 8546690 broadcast
packets 7720
```

NOTE: *The following etherStats counters are not currently available for Layer 3 interfaces:*

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

74 Secure Shell (SSH) Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure Secure Shell (SSH). For more information, see the SSH Feature Overview and Configuration Guide.

Command List

banner login (SSH)

Overview This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

Syntax

```
banner login
no banner login
```

Default No banner is defined by default.

Mode Global Configuration

Examples To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login
```

The screen will prompt you to enter the message:

```
Type CNTL/D to finish.
... banner message comes here ...
```

Enter the message. Use Ctrl+D to finish, like this:

```
^D
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

Related commands show banner login

clear ssh

Overview This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

Syntax

```
clear ssh {<1-65535>|all}
```

Parameters	Description
<1-65535>	Specify a session ID in the range 1 to 65535 to delete a specific session.
`all`	Delete all SSH sessions.

Mode Privileged Exec

Examples To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

Related commands service ssh

ssh

crypto key destroy hostkey

Overview This command deletes the existing public and private keys of the SSH server.

Syntax

```
crypto key destroy hostkey {dsa|ecdsa|ed25519|rsa|rsa1}
```

Parameters	Description
`dsa`	Deletes the existing DSA public and private keys.
`ecdsa`	Deletes the existing ECDSA public and private keys.
`ed25519`	Deletes the existing Ed25519 public and private keys.
`rsa`	Deletes the existing RSA public and private keys that were configured for SSH version 2 connections.
`rsa1`	Deletes the existing RSA public and private keys that were configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported.

Mode Global Configuration

Example To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

Related commands crypto key generate hostkey

service ssh

Command changes Version 5.5.2-2.1: **ed25519** parameter added

crypto key destroy userkey

Overview This command destroys the existing public and private keys of an SSH user configured on the device.

Syntax

```
crypto key destroy userkey <username>
{dsa|ecdsa|ed25519|rsa|rsa1}
```

Parameters	Description
<username>	Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
dsa	Deletes the existing DSA userkey.
ecdsa	Deletes the existing ECDSA userkey.
ed25519	Deletes the existing Ed25519 userkey.
rsa	Deletes the existing RSA userkey that was configured for SSH version 2 connections.
rsa1	Deletes the existing RSA userkey that was configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported.

Mode Global Configuration

Example To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

Related commands

crypto key generate hostkey

crypto key generate userkey

show ssh

show crypto key hostkey

Command changes Version 5.5.2-2.1: **ed25519** parameter added

crypto key generate hostkey

Overview This command generates public and private keys for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using Ed25519 with a keysize of 256, ECDSA with a curve length of 384, and RSA with a 2048-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax

```
crypto key generate hostkey rsa [<1024-16384>]
crypto key generate hostkey ecdsa [<256|384|521>]
crypto key generate hostkey ed25519
```

Parameters	Description
`rsa`	Creates an RSA hostkey.
`ecdsa`	Creates an ECDSA hostkey.
`ed25519`	Creates an Ed25519 hostkey with a keysize of 256.
<1024-16384>	The length in bits of the generated key.
<256|384|521>	The ECDSA key size in bits.

Default The default key length for RSA is 2048 bits.

The default key size for ECDSA is 384 bits.

Mode Global Configuration

Examples To generate an RSA host key that is 4096 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 4096
```

To generate an ECDSA host key with an elliptic curve size of 521 bits, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ecdsa 521
```

To generate an Ed25519 host key with a keysize of 256, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ed25519
```

Related commands

crypto key destroy hostkey

service ssh

show crypto key hostkey

Command changes

Version 5.5.2-2.1: **ed25519** parameter added

Version 5.5.2-0.1: changes to key length and key size ranges and defaults

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

crypto key generate userkey

Overview This command generates public and private keys for an SSH user using an RSA, ECDSA, or ED25519 cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax

```
crypto key generate userkey <username> rsa [<1024-16384>]
crypto key generate userkey <username> ecdsa [<256|384|521>]
crypto key generate userkey <username> ed25519
```

Parameters	Description
<username>	Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
rsa	Creates an RSA userkey.
ecdsa	Creates an ECDSA userkey.
ed25519	Creates an Ed25519 userkey with a keysize of 256.
<1024-16384>	The length in bits of the generated key. The default is 2048 bits.
<256|384|521>	The ECDSA key size in bits. The default is 384.

Default The default key length for RSA is 2048 bits.

The default key size for ECDSA is 384 bits.

Mode Global Configuration

Examples To generate a 4096-bit RSA user key for SSH version 2 connections for the user 'bob', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 4096
```

To generate an ECDSA user key of key size 521 for the user 'lapo', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ecdsa 521
```

To generate an Ed25519 user key of key size 256 for the user 'lapo', use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ed25519
```

Related commands

crypto key pubkey-chain userkey

show crypto key userkey

Command changes

Version 5.5.2-2.1: **ed25519** parameter added

Version 5.5.2-0.1: changes to key length and key size ranges and defaults

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

crypto key pubkey-chain knownhosts

Overview This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

Syntax
```
crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [ecdsa|rsa]
no crypto key pubkey-chain knownhosts <1-65535>
```

Syntax (VRF-lite)
```
crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [ecdsa|rsa]
no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>
```

Parameter	Description
`vrf`	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name
`ip`	Keyword used prior to specifying an IPv4 address
`ipv6`	Keyword used prior to specifying an IPv6 address
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format `a.b.c.d` for an IPv4 address, or in the format `x:x::x:x` for an IPv6 address.
`ecdsa`	Specify the ECDSA public key of the server to be added to the known host database.
`rsa`	Specify the RSA public key of the server to be added to the known host database.
<1-65535>	Specify a key identifier when removing a key using the **no** parameter.

Default If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

Mode Privilege Exec

Usage notes

This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

Examples

To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

Examples (VRF-lite)

To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF 'red' to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF 'red', use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

Validation Commands

show crypto key pubkey-chain knownhosts

crypto key pubkey-chain userkey

Overview This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

Syntax

```
crypto key pubkey-chain userkey <username> [<filename>]
no crypto key pubkey-chain userkey <username> <1-65535>
```

Parameters	Description
<username>	Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default
<filename>	Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.
<1-65535>	The key ID number of the user's key. Specify the key ID to delete a key.

Mode Global Configuration

Usage notes You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey** <*username*>, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey** <*username*> command. Use [Ctrl]+D after entering it to save it.

Examples To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit
awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluh

ZZfeITzvvyZW4/I4pbN8=control-D
awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

Related commands show crypto key pubkey-chain userkey

debug ssh client

Overview This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

Syntax

```
debug ssh client [brief|full]
no debug ssh client
```

Parameter	Description
`brief`	Enables brief debug mode.
`full`	Enables full debug mode.

Default SSH client debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

Related commands

debug ssh server

show ssh client

undebug ssh client

debug ssh server

Overview This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

Syntax

```
debug ssh server [brief|full]
no debug ssh server
```

Parameter	Description
`brief`	Enables brief debug mode.
`full`	Enables full debug mode.

Default SSH server debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

Related commands

debug ssh client

show ssh server

undebug ssh server

service ssh

Overview Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use the crypto key generate hostkey command to generate that key before you enable the SSH server.

Use the **no** variant of this command to disable the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the clear ssh command.

Syntax

```
service ssh [ip|ipv6]
no service ssh [ip|ipv6]
```

Default The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

The server supports SSH version 2 only (not SSH version 1).

Mode Global Configuration

Examples To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

show banner login

Overview This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

Syntax

```
show banner login
```

Mode User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

Example To display the current login banner message, use the command:

```
awplus# show banner login
```

Related commands banner login (SSH)

show crypto key hostkey

Overview This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

Syntax

```
show crypto key hostkey [dsa|ecdsa|rsa|rsa1]
```

Parameter	Description
dsa	Displays the DSA algorithm public key.
ecdsa	Displays the ECDSA algorithm public key.
rsa	Displays the RSA algorithm public key for SSH version 2 connections.
rsa1	Displays the RSA algorithm public key for SSH version 1 connections. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.

Mode User Exec, Privileged Exec and Global Configuration

Examples To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

Output Figure 74-1: Example output from the **show crypto key hostkey** command

```
Type  Bits   Fingerprint
-------------------------------------------------------------
rsa   1024 SHA256:T/sVz5OoA1HHXcov9dXzGGQg8avRUYh1psxNSUcSOvs
ecdsa 384 SHA256:qVn/KpN5X5ct5CJakxE4OmPWmPvW2vIbBjF4SA2bZkM
```

Table 1: Parameters in output of the **show crypto key hostkey** command

Parameter	Description
Type	Algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the public key.

Related commands

crypto key destroy hostkey

crypto key generate hostkey

show crypto key pubkey-chain knownhosts

Overview This command displays the list of public keys maintained in the known host database on the device.

Syntax
```
show crypto key pubkey-chain knownhosts [<1-65535>]
```

Syntax (VRF-lite)
```
show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global]
[<1-65535>]
```

Parameter	Description
`global`	When VRF-lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<1-65535>	Key identifier for a specific key. Displays the public key of the entry if specified.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Usage When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the VRF Lite Feature Overview and Configuration Guide.

Examples To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

Output Figure 74-2: Example output from the **show crypto key public-chain knownhosts** command

```
No     Hostname         Type Fingerprint
-------------------------------------------------------------------
1      172.16.23.1      rsa  c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18
2      172.16.23.10     rsa  c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd

                        rsa1 af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57
```

Table 2: Parameters in the output of the **show crypto key public-chain knownhosts** command

Parameter	Description
`No`	Number ID of the key.
`Hostname`	Host name of the known SSH server.
`Type`	The algorithm used to generate the key.
`Fingerprint`	Checksum value for the public key.

Related commands crypto key pubkey-chain knownhosts

show crypto key pubkey-chain userkey

Overview This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

Syntax

```
show crypto key pubkey-chain userkey <username> [<1-65535>]
```

Parameter	Description
<username>	User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<1-65535>	Key identifier for a specific key.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Example To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

Output Figure 74-3: Example output from the **show crypto key public-chain userkey** command

```
No Type Bits Fingerprint
-------------------------------------------------------------------
1  dsa  1024 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd
2  rsa  2048 6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e
```

Table 3: Parameters in the output of the **show crypto key userkey** command

Parameter	Description
`No`	Number ID of the key.
`Type`	The algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the key.

Related commands crypto key pubkey-chain userkey

show crypto key userkey

Overview This command displays the public keys created on this device for the specified SSH user.

Syntax

```
show crypto key userkey <username> [dsa|rsa|rsa1]
```

Parameter	Description
<username>	User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
dsa	Displays the DSA public key.
rsa	Displays the RSA public key used for SSH version 2 connections.
rsa1	Displays the RSA key used for SSH version 1 connections.

Mode User Exec, Privileged Exec and Global Configuration

Examples To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file “user.pub”, use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

Output Figure 74-4: Example output from the **show crypto key userkey** command

```
Type Bits   Fingerprint
-----------------------------------------------------------
rsa  2048   e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11
rsa1 1024   12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b
```

Table 4: Parameters in the output of the **show crypto key userkey** command

Parameter	Description
Type	The algorithm used to generate the key.
Bits	Length in bits of the key.
Fingerprint	Checksum value for the key.

Related commands crypto key generate userkey

show running-config ssh

Overview This command displays the current running configuration of Secure Shell (SSH).

Syntax

```
show running-config ssh
```

Mode Privileged Exec and Global Configuration

Example To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

Output Figure 74-5: Example output from the **show running-config ssh** command

```
!
ssh server session-timeout 600
ssh server login-timeout 30
ssh server allow-users manager 192.168.1.*
ssh server allow-users john
ssh server deny-user john*.a-company.com
ssh server
```

Table 5: Parameters in the output of the **show running-config ssh** command

Parameter	Description
`ssh server`	SSH server is enabled.
`ssh server v2`	SSH server is enabled and only support SSHv2.
`ssh server<port>`	SSH server is enabled and listening on the specified TCP port.
`no ssh server scp`	SCP service is disabled.
`no ssh server sftp`	SFTP service is disabled.
`ssh server session-timeout`	Configure the server session timeout.
`ssh server login-timeout`	Configure the server login timeout.
`ssh server max-startups`	Configure the maximum number of concurrent sessions waiting authentication.
`no ssh server authentication password`	Password authentication is disabled.
`no ssh server authentication publickey`	Public key authentication is disabled.

Table 5: Parameters in the output of the **show running-config ssh** command

Parameter	Description
`ssh server allow-users`	Add the user (and hostname) to the allow list.
`ssh server deny-users`	Add the user (and hostname) to the deny list.

Related commands

                             manager    user-auth
```

Table 6: Parameters in the output of the **show ssh** command

Parameter	Description
ID	Unique identifier for each SSH session.
Type	Session type; either SSH, SCP, or SFTP.
Mode	Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session.
Peer Host	The hostname or IP address of the remote server or client.
Username	Login user name of the server.

Table 6: Parameters in the output of the **show ssh** command (cont.)

Parameter	Description	
State	The current state of the SSH session. One of:	
	connecting	The device is looking for a remote server.
	connected	The device is connected to the remote server.
	accepted	The device has accepted a new session.
	host-auth	host-to-host authentication is in progress.
	user-auth	User authentication is in progress.
	authenticated	User authentication is complete.
	open	The session is in progress.
	download	The user is downloading a file from the device.
	upload	The user is uploading a file from the device.
	closing	The user is terminating the session.
	closed	The session is closed.
Filename	Local filename of the file that the user is downloading or uploading.	

Related commands clear ssh

show ssh client

Overview This command displays the current configuration of the Secure Shell client.

Syntax

```
show ssh client
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

Output Figure 74-7: Example output from the **show ssh client** command

```
Secure Shell Client Configuration
-----------------------------------------------------------------
Port                            : 22
Version                         : 2,1
Connect Timeout                 : 30 seconds
Session Timeout                 : 0 (off)
Debug                           : NONE
```

Table 7: Parameters in the output of the **show ssh client** command

Parameter	Description
Port	SSH server TCP port where the SSH client connects to. The default is port 22.
Version	SSH server version, either "2" or "2,1". From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.
Connect Timeout	Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout.
Debug	Whether debugging is active on the client.

                                      diffie-hellman-group14-sha1
```

Table 8: Parameters in the output of the **show ssh server** command

Parameter	Description
SSH Server	Whether the Secure Shell server is enabled or disabled.
Port	TCP port where the Secure Shell server listens for connections. The default is port 22.
Version	SSH server version; either '2' or '2,1'. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.
Services	List of the available Secure Shell services; one or more of SHELL, SCP or SFTP.

Table 8: Parameters in the output of the **show ssh server** command (cont.)

Parameter	Description
`User Authentication`	List of available authentication methods.
`Login Timeout`	Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.
`Idle Timeout`	Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off.
`Maximum Startups`	The maximum number of concurrent connections that are waiting authentication. The default is 10.
`Debug`	Whether debugging is active on the server.
`Ciphers`	List of ciphers permitted.
`KEX`	List of available Key Exchange algorithms.

Related commands

show ssh server allow-users

Overview This command displays the user entries in the allow list of the SSH server.

Syntax

```
show ssh server allow-users
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

Output Figure 74-9: Example output from the **show ssh server allow-users** command

```
Username          Remote Hostname (pattern)
----------------- --------------------------------
awplus            192.168.*
john
manager           *.alliedtelesis.com
```

Table 9: Parameters in the output of the **show ssh server allow-users** command

Parameter	Description
`Username`	User name that is allowed to access the SSH server.
`Remote Hostname (pattern)`	IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts.

Related commands

ssh server allow-users

ssh server deny-users

show ssh server deny-users

Overview This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

Syntax
```
show ssh server deny-users
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

Output Figure 74-10: Example output from the **show ssh server deny-users** command

```
Username          Remote Hostname (pattern)
----------------- --------------------------------
john              *.b-company.com
manager           192.168.2.*
```

Table 10: Parameters in the output of the **show ssh server deny-user** command

Parameter	Description
`Username`	The user that this rule applies to.
`Remote Hostname (pattern)`	IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts.

Related commands
ssh server allow-users

ssh server deny-users

ssh

Overview Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

NOTE: *A hostname specified with SSH cannot begin with a hyphen (-) character.*

Syntax
```
ssh [ip|ipv6] [user <username>|port <1-65535>|version 2]
<remote-device> [<command>]
```

Syntax in secure mode
```
ssh [cipher
{aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-ctr}]
[hmac {hmac-sha2-256}]
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}]
[key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}]
[ip|ipv6] [user <username>|port <1-65535>|version 2]
<remote-device> [<command>]
```

Syntax (VRF-lite)
```
ssh vrf <vrf-name> [ip|ipv6] [user <username>|port
<1-65535>|version 2] <remote-device> [<command>]
```

Parameter	Description
`cipher`	The supported cipher name. Select either: aes128-cbc or aes256-cbc.
`hmac`	The supported hmac name: hmac-sha2-256
`public-key`	The supported public-key name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
`key-exchange`	The supported key-exchange name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
`vrf`	Apply the command to the specified VRF instance. When using VRF, specifying a VRF name means the command will apply to that VRF instance, and not specifying a VRF name means the command will apply to the global VRF.
<vrf-name>	The name of the VRF instance.
`ip`	Specify IPv4 SSH.
`ipv6`	Specify IPv6 SSH.

Parameter	Description
`user`	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.
	<username> User name to login on the remote server.
`port`	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.
	<1-65535> TCP port.
`version`	SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.
<remote-device>	IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.
<command>	A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

Mode User Exec and Privileged Exec

Usage notes This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

Examples To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

Example (VRF-lite) To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

Command changes

Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.

Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

Version 5.5.1-1.1: support removed for SSH protocol v1

ssh client

Overview This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the ssh client command, and restores the defaults.

This command does not affect the existing SSH sessions.

Syntax
```
ssh client {port <1-65535>|version 2|session-timeout
<0-3600>|connect-timeout <1-600>}
```
```
no ssh client {port|version|session-timeout|connect-timeout}
```

Syntax (VRF-lite)
```
ssh client {port <1-65535>|version 2|session-timeout
<0-3600>|connect-timeout <1-600>|vrf <vrf-name>}
```
```
no ssh client
{port|version|session-timeout|connect-timeout|vrf}
```

Parameter	Description
`port`	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: 22
	<1-65535> TCP port number.
`version`	The SSH version used by the client for SSH sessions. From 5.5.1-1.1 onwards, the SSH client supports only version 2
`session-timeout`	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: 0 (session timer remains off)
	<0-3600> Timeout in seconds.
`connect-timeout`	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: 30
	<1-600> Timeout in seconds.
`vrf <vrf-name>`	The VRF to use for SSH clients. Default: the global VRF.

Mode Privileged Exec

Examples To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

Example (VRF-lite) To configure SSH clients to use the VRF named 'red', use the command:

```
awplus# ssh client vrf red
```

Related commands show ssh client

ssh

Command changes Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

ssh client allow-legacy-ssh-rsa

Overview Use this command to enable support for the legacy ssh-rsa algorithm on the SSH client. Support for this algorithm was removed in version 5.5.1-1.1 due to security concerns. Support for it is still disabled by default and you should only enable it if you cannot avoid using ssh-rsa. It cannot be enabled when the device is in Secure Mode.

Use the **no** variant of this command to disable support for the legacy ssh-rsa algorithm on the SSH client.

Syntax

```
ssh client allow-legacy-ssh-rsa
no ssh client allow-legacy-ssh-rsa
```

Default Disabled

Mode Global Configuration

Example To enable SSH client support for the legacy ssh-rsa algorithm, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client allow-legacy-ssh-rsa
```

Related commands

show ssh client

ssh client

ssh server allow-legacy-ssh-rsa

Command changes Version 5.5.3-0.1: command added

ssh client vrf

Overview Use this command to modify the configured VRF of the SSH client. Use this configuration for any SSH client on the device to connect to remote SSH servers.

Use the **no** variant of this command to restore the configured VRF to the default VRF (global VRF).

Syntax

```
ssh client vrf <vrf-name>
no client vrf
```

Parameter	Description
`vrf<vrf-name>`	The name of the VRF to use for SSH clients. This overrides the default.

Default Global VRF

Mode Global Configuration

Usage notes Any VRF parameter specified on the SSH client explicitly overrides the default configuration parameters. This also affects the copy commands that utilize SSH such as **copy scp** and **copy sftp**.

This change affects all new user shell sessions. Existing sessions will not be affected.

A user may override this on a per-session basis using the executive mode variant of this command.

Examples To configure the VRF named 'management' for SSH clients, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client vrf management
```

To restore to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh client vrf
```

Related commands show ssh client

ssh client

Command changes Version 5.5.2-2.1: command added

ssh server

Overview Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the service ssh command.

Syntax

```
ssh server <1-65535>
ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]
[max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout]
[max-startups]}
```

Parameter	Description
<1-65535>	The TCP port number that the server listens to for incoming SSH sessions. Default: 22
`session-timeout`	The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages. Default: 0 (session timer remains off).
	Enter a timeout between 0-3600 seconds.
`login-timeout`	The maximum time period the server waits before disconnecting an unauthenticated client. Default: 60
	Enter a timeout between 1- 600 seconds.
`max-startups`	The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection. Default: 10
	Enter a number of sessions in the range of 1-128.

Mode Global Configuration

Examples To set the session timer of the SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server session-timeout 600
```

To set the login timeout of the SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from the SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To return the limit on the number of waiting connections to the default of 10, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the SSH server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

```
awplus# configure terminal
awplus(config)# ssh server allow-legacy-ssh-rsa
```

Related commands

show ssh server

ssh server

ssh client allow-legacy-ssh-rsa

Command changes Version 5.5.3-0.1: command added

ssh server allow-users

Overview This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
ssh server allow-users <username-pattern> [<hostname-pattern>]
no ssh server allow-users <username-pattern>
[<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Examples To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server allow-users john 192.168.1.*
```

Related commands

show running-config ssh

show ssh server allow-users

ssh server deny-users

ssh server authentication

Overview This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

Syntax

```
ssh server authentication {password|publickey}
no ssh server authentication {password|publickey}
```

Parameter	Description
`password`	Specifies user password authentication for SSH server.
`publickey`	Specifies user publickey authentication for SSH server.

Default Both RSA public-key authentication and password authentication are enabled by default.

Mode Global Configuration

Usage For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

Examples To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

Related commands

crypto key pubkey-chain userkey

service ssh

show ssh server

ssh server deny-users

Overview This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
ssh server deny-users <username-pattern> [<hostname-pattern>]
no ssh server deny-users <username-pattern>
[<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Examples To deny the user `john` to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user `john` to access SSH login from `b-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server deny-users john 192.168.2.*
```

Related commands

ssh server allow-users

ssh server disallow-cbc-ciphers

Overview Use this command to disallow CBC mode ciphers on SSH servers. You can only use this command when your device is in Secure Mode (see the crypto secure-mode command).

Use the **no** variant of this command to allow CBC mode ciphers.

Syntax
```
ssh server disallow-cbc-ciphers
no ssh server disallow-cbc-ciphers
```

Default CBC mode ciphers are allowed by default.

Mode Global Configuration

Example To disallow CBC mode ciphers for SSH server in Secure Mode, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server disallow-cbc-ciphers
```

Related commands
crypto secure-mode

service ssh

ssh server

Command changes Version 5.5.1-2.1: command added

ssh server max-auth-tries

Overview Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

Syntax

```
ssh server max-auth-tries <1-32>
no ssh server max-auth-tries
```

Parameter	Description
<1-32>	Maximum number of SSH authentication attempts the device will allow.

Default 6 attempts

Mode Global Configuration

Usage By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command aaa login fail-delay.

Example To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

Related commands show ssh server

ssh server resolve-host

Overview This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

Syntax

```
ssh server resolve-hosts
no ssh server resolve-hosts
```

Default This feature is disabled by default.

Mode Global Configuration

Usage notes Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the ip name-server command to add a DNS server to the list of servers that the device queries.

Example To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

Related commands

ip name-server

show ssh server

ssh server allow-users

ssh server deny-users

ssh server scp

Overview This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

Syntax

```
ssh server scp
no ssh server scp
```

Mode Global Configuration

Examples To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

Related commands

show running-config ssh

show ssh server

ssh server secure-algs

Overview Use this command to force the SSH server to only use ciphers, key exchange algorithms and Message Authentication Code (MAC) algorithms that are currently considered best-practice.

This command is the same as using all of the commands ssh server secure-ciphers, ssh server secure-hostkey, ssh server secure-mac, and ssh server secure-kex. However, it does not include the optional **exclude-nist-curves** parameter of ssh server secure-kex.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of algorithms.

Syntax

```
ssh server secure-algs
no ssh server secure-algs
```

Default Disabled.

Mode Global Configuration

Usage notes To see the list of algorithms, use the show ssh server command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

Example To force the SSH server to use best-practice algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-algs
```

Related commands

Command changes Version 5.5.2-2.1: command added

ssh server secure-kex

Overview Use this command to force the SSH server to only use key exchange algorithms that are currently considered best-practice.

For example, using this command stops the device from using the diffie-hellman-group-exchange-sha1 key exchange algorithm.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of key-exchange algorithms.

Syntax

```
ssh server secure-kex [exclude-nist-curves]
no ssh server secure-kex
```

Parameter	Description
`exclude-nist-curves`	Also exclude all NIST key exchange algorithms. Using this parameter may reduce compatibility with older SSH clients.

Default Disabled.

Mode Global Configuration

Usage notes To see the list of key exchange algorithms, use the show ssh server command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

Example To force the SSH server to use best-practice key-exchange algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-kex
```

Overview Use this command to force the SSH server to only use Message Authentication Code (MAC) algorithms that are currently considered best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of MAC algorithms.

Syntax

```
ssh server secure-mac
no ssh server secure-mac
```

Default Disabled.

Mode Global Configuration

Usage notes To see the list of MAC algorithms, use the show ssh server command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

Example To force the SSH server to use best-practice MAC algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-mac
```

Related commands

show ssh server

ssh server secure-ciphers

ssh server secure-hostkey

ssh server secure-kex

Command changes Version 5.5.1-1.1: command added

ssh server sftp

Overview This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

Syntax

```
ssh server sftp
no ssh server sftp
```

Mode Global Configuration

Examples To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

Related commands show running-config ssh

show ssh server

ssh server tcpforwarding

Overview Use this command to enable TCP port forwarding on the SSH server. It is disabled by default, to enhance security.

Use the **no** variant of this command to disable TCP port forwarding again.

Syntax

```
ssh server tcpforwarding
no ssh server tcpforwarding
```

Default Disabled

Mode Global Configuration

Example To enable TCP port forwarding, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server tcpforwarding
```

To disable it again, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server tcpforwarding
```

Related commands show ssh server

Command changes Version 5.5.2-1.1: command added

ssh server vrf

Overview Use this command to specify a VRF for the SSH server to operate within.

Use the **no** variant of this command to return the SSH server to the default VRF.

Syntax

```
ssh server vrf [<vrf-name>]
no ssh server vrf
```

Parameter	Description
<vrf-name>	The name of the VRF instance

Default The global VRF

Mode Global Configuration

Example To configure the SSH server to operate within the VRF instance named 'red', use the command:

```
awplus# configure terminal
awplus(config)# ssh server vrf red
```

To return the SSH server to operating within the global VRF instance, use the command:

```
awplus# configure terminal
awplus(config)# no ssh server vrf
```

75 Trigger Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure Triggers. For more information, see the Triggers Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

active (trigger)

Overview This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

Syntax

```
active
no active
```

Default Active, which means that triggers are enabled by default

Mode Trigger Configuration

Usage notes Configure a trigger first before you use this command to activate it.

For information about configuring a trigger, see the Triggers_Feature Overview and Configuration Guide.

Examples To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

Related commands

show trigger

trigger

trigger activate

day

Overview This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

Syntax

```
day every-day
day <1-31>
day <1-31> <month>
day <1-31> <month> <year>
day <weekday>
```

Parameter	Description
`every-day`	Sets the trigger so that it can activate on any day.
`<1-31>`	Day of the month the trigger is permitted to activate on.
`<month>`	Sets the month that the trigger is permitted to activate on. Valid keywords are: **january, february, march, april, may, june, july, august, september, october, november**, and **december**.
`<year>`	Sets the year that the trigger is permitted to activate in, between 2000 and 2035.
`<weekday>`	Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: **monday, tuesday, wednesday, thursday, friday, saturday**, and **sunday**.

Default **every-day**, so by default, the trigger can activate on any day.

Mode Trigger Configuration

Usage notes For example trigger configurations that use the **day** command, see "Restrict Internet Access" and "Turn off Power to Port LEDs" in the Triggers Feature Overview and Configuration Guide.

Examples

To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

trigger

Command changes

Version 5.4.8-2.1: day of the month functionality added

debug trigger

Overview This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

Syntax

```
debug trigger
no debug trigger
```

Mode Privilege Exec

Examples To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

Related commands

show debugging trigger

show trigger

test

trigger

undebug trigger

description (trigger)

Overview This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters.

Mode Trigger Configuration

Examples To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger `36`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

Related commands

show trigger

test

trigger

repeat

Overview This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

Syntax

```
repeat {forever|no|once|yes|<1-4294967294>}
```

Parameter	Description
`yes|forever`	The trigger repeats indefinitely, or until disabled.
`no|once`	The trigger activates only once.
<1-4292967294>	The trigger repeats the specified number of times.

Mode Trigger Configuration

Examples To allow trigger `21` to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger `22` to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger `23` to activate only the first `10` times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

Related commands show trigger

trigger

script

Overview This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus scripts only need to be readable. You can't use ASH scripts when the device is in Secure Mode.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

Syntax

```
script <1-5> {<filename>}
no script {<1-5>|<filename>|all}
```

Parameter	Description
<1-5>	The position of the script in execution sequence. The trigger runs the lowest numbered script first.
<filename>	The path to the script file.

Mode Trigger Configuration

Examples To configure trigger 71 to run the script flash:/cpu_trig.sh in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts flash:reconfig.scp, flash:cpu_trig.sh and flash:email.scp in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3
flash:/cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

Related commands

show trigger

trigger

show debugging trigger

Overview This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the debug trigger command.

Syntax

```
show debugging trigger
```

Mode User Exec and Privileged Exec

Example To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

Output Figure 75-1: Example output from the **show debugging trigger** command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

Related commands debug trigger

show running-config trigger

Overview This command displays the current running configuration of the trigger utility.

Syntax

```
show running-config trigger
```

Mode Privileged Exec

Example To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

Output Figure 75-2: Example output from the **show running-config trigger** command

```
trigger 1
 type card in
trigger 2
 type card out
!
```

Related commands show trigger

show trigger

Overview This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

Syntax

```
show trigger [<1-250>|counter|full]
```

Parameter	Description
<1-250>	Displays detailed information about a specific trigger, identified by its trigger ID.
`counter`	Displays statistical information about all triggers.
`full`	Displays detailed information about all triggers.

Mode Privileged Exec

Example To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Table 75-1: Example output from **show trigger**

```
awplus#show trigger
TR# Type & Details       Name                 Ac Te Repeat      #Scr Days/Date
-------------------------------------------------------------------------------
001 CPU (80% any)        Busy CPU             Y  N  5            1   smtwtfs
005 Periodic (30 min)    Regular status check Y  N  Continuous   1   -mtwtf-
007 Memory (85% up)      High mem usage       Y  N  8            1   smtwtfs
011 Time (00:01)         Weekend access       Y  N  Continuous   1   ------s
013 Reboot                                    Y  N  Continuous   2   smtwtfs
019 Ping-poll (5 up)     Connection to svr1   Y  N  Continuous   1   smtwtfs
-------------------------------------------------------------------------------
```

Table 75-2: Parameters in the output of **show trigger**

Parameter	Description
`TR#`	Trigger identifier (ID).
`Type & Details`	The trigger type, followed by the trigger details in brackets.
`Name`	Descriptive name of the trigger configured with the description (trigger) command.
`Ac`	Whether the trigger is active (Y), or inactive (N).
`Te`	Whether the trigger is in test mode (Y) or not (N).

Table 75-2: Parameters in the output of **show trigger** (cont.)

Parameter	Description
Repeat	Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the **show trigger** <1-250> command.
#Scr	Number of scripts associated with the trigger.
Days/Date	Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated.

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

Figure 75-3: Example output from **show trigger** for a specific trigger

```
awplus#show trigger 1

Table 76: Parameters in the output of **show trigger full** and **show trigger** for a specific trigger

Parameter	Description
`Trigger`	The ID of the trigger.
`Name`	Descriptive name of the trigger.
`Type and details`	The trigger type and its activation conditions.
`Days`	The days on which the trigger is permitted to activate.

Table 76: Parameters in the output of **show trigger full** and **show trigger** for a specific trigger (cont.)

Parameter	Description
Date	The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".
Active	Whether or not the trigger is permitted to activate.
Test	Whether or not the trigger is operating in diagnostic mode.
Trap	Whether or not the trigger is enabled to send SNMP traps.
Repeat	Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets.
Modified	The date and time of the last time that the trigger was modified.
Number of activations	Number of times the trigger has been activated since the last restart of the device.
Last activation	The date and time of the last time that the trigger was activated.
Number of scripts	How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

Figure 75-4: Example output from **show trigger counter**

```
awplus# show trigger counter
Trigger Module Counters
-----------------------------------------------------
Trigger activations                              4
Last trigger activated                          55
Time triggers activated today                    0
Periodic triggers activated today                0
Interface triggers activated today               1
CPU triggers activated today                     2
Memory triggers activated today                  1
Reboot triggers activated today                  0
Ping-poll triggers activated today               0
USB event triggers activated today               0
Stack master fail triggers activated today       0
Stack member triggers activated today            0
Stack link triggers activated today              0
ATMF node triggers activated today               0
ATMF guest triggers activated today              0
Log triggers activated today                     0
-----------------------------------------------------
```

Related commands

active (trigger)

debug trigger

script

trigger

trigger activate

test

Overview This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates, the scripts associated with the trigger will be run, as normal.

Syntax

```
test
no test
```

Mode Trigger Configuration

Usage notes Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the Triggers_Feature Overview and Configuration Guide.

Examples To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

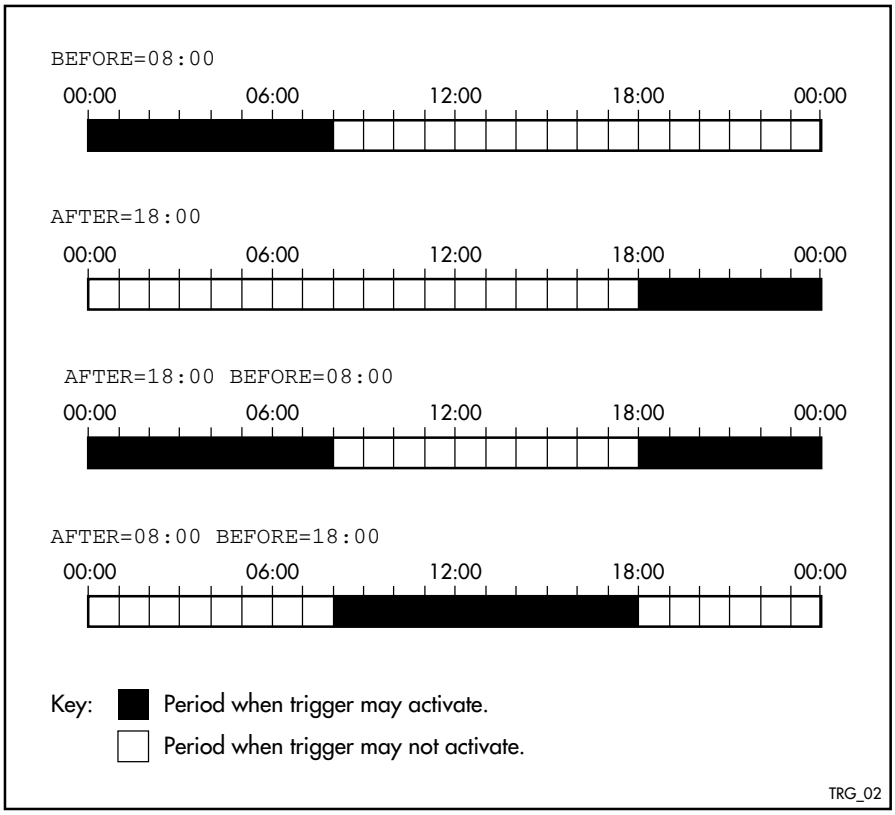
Related commands show trigger

trigger

time (trigger)

Overview This command specifies the time of day when the trigger is permitted to activate. The after parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from **"** after **"** to **"** before **"** is defined, during which the trigger may activate. This command is not applicable to time triggers (**type time**).

The following figure illustrates how the **before** and **after** parameters operate.



Syntax `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

Parameter	Description
`after`*<hh:mm:ss>*	The earliest time of day when the trigger may be activated.
`before`*<hh:mm:ss>*	The latest time of day when the trigger may be activated.

Mode Trigger Configuration

Usage notes

For example trigger configurations that use the **time (trigger)** command, see "Restrict Internet Access" and "Turn off Power to Port LEDs" in the Triggers Feature Overview and Configuration Guide.

Examples

To allow trigger `63` to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger `64` to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger `65` to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

Related commands

show trigger

trigger

trap

Overview This command enables the specified trigger to send SNMP traps.

Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

Syntax

```
trap
no trap
```

Default SNMP traps are enabled by default for all defined triggers.

Mode Trigger Configuration

Usage notes You must configure SNMP before using traps with triggers. For more information, see:

- Support for Allied Telesis Enterprise_MIBs_in_AlliedWare Plus, for information about which MIB objects are supported.
- the SNMP Feature Overview and Configuration_Guide.
- the SNMP Commands chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the Support for Allied Telesis Enterprise_MIBs_in AlliedWare Plus for further information about the relevant SNMP MIB.

Examples To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

Related commands trigger

show trigger

trigger

Overview This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

Syntax

```
trigger <1-250>
no trigger <1-250>
```

Parameter	Description
<1-250>	A trigger ID.

Mode Global Configuration

Examples To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# no trigger 12
```

Related commands show trigger

trigger activate

trigger activate

Overview This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

Syntax

```
trigger activate <1-250>
```

Parameter	Description
<1-250>	A trigger ID.

Mode Privileged Exec

Usage notes This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

Example To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

Related commands

active (trigger)

show trigger

trigger

type atmf guest

Overview This command configures a trigger to activate when an AMF guest node joins or leaves.

Syntax

```
type atmf guest {join|leave}
```

Parameter	Description
`join`	AMF guest node joins.
`leave`	AMF guest node leaves.

Mode Trigger Configuration

Example To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

Related commands show trigger

Command changes Version 5.5.1-1.1: command added

type atmf node

Overview This command configures a trigger to activate when an AMF node joins or leaves.

Syntax

```
type atmf node {join|leave}
```

Parameter	Description
join	AMF node joins.
leave	AMF node leaves.

Mode Trigger Configuration

Example 1 To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

Example 2 The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
====================
node1, node2, node3:
====================

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=======
node1:
=======

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
001 Periodic (2 min)   Periodic Status Chk  Y  N  Y Continuous  1   smtwtfs

Related commands show trigger

type cpu

Overview This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax

```
type cpu <1-100> [up|down|any]
```

Parameter	Description
<1-100>	The percentage of CPU usage at which to trigger.
`up`	Activate when CPU usage exceeds the specified level.
`down`	Activate when CPU usage drops below the specified level
`any`	Activate when CPU usage passes the specified level in either direction

Mode Trigger Configuration

Usage notes For an example trigger configuration that uses the **type cpu** command, see "Capture Unusual CPU and RAM Activity" in the Triggers Feature Overview and Configuration Guide.

Examples To configure trigger `28` to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger `5` to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

Related commands show trigger

trigger

type env-sensor

Overview

Use this command to create a trigger that will run a script when the device's environment sensors detect an event. Environment sensors are shown in the output of the command show system environment, and include things like device temperature, power settings and voltage.

Depending on the device and sensor, you can create a trigger to run when:

- the sensor's state changes, for example when a loss of power is detected for a power supply, or when power is restored, or both.
- the sensor's reading crosses a high or low threshold, for example when the device temperature becomes too high, or returns to normal, or both.

Syntax when a sensor changes state

```
type env-sensor [node <number>] resource <resource-id> sensor
<sensor-id> state {true|false|any}
```

Parameter	Description
`node <number>`	The VCStack member ID that the sensor is on, for example, 3 for stack member 3. You can leave this parameter out on standalone devices.
`resource <resource-id>`	The 'Resource ID' for the device, as shown in output of the command show system environment.
`sensor <sensor-id>`	The 'ID' for the sensor, as shown in output of the command show system environment.
`state true`	The trigger will activate if this sensor reading changes to 'Yes' or 'Open' in the output of show system environment.
`state false`	The trigger will activate if this sensor reading changes to 'No' or 'Closed' in the output of show system environment.
`state any`	The trigger will activate if this sensor reading changes to any of 'Yes', 'Open', 'No', or 'Closed'.

Syntax when a sensor crosses a threshold

```
type env-sensor [node <number>] resource <resource-id> sensor
<sensor-id> {low-limit|high-limit} {exceeded|cleared|any}
```

Parameter	Description
`node <number>`	The VCStack member ID that the sensor is on, for example, 3 for stack member 3. You can leave this parameter out on standalone devices.
`resource <resource-id>`	The 'Resource ID' for the device, as shown in output of the command show system environment.
`sensor <sensor-id>`	The 'ID' for the sensor, as shown in output of the command show system environment.

Parameter	Description
`low-limit`	The trigger will activate when the sensor reading falls below the 'Low Limit' alarm threshold shown in show system environment, or returns to an acceptable value after being too low, or both. The alarm threshold values are pre-defined within the device and cannot be changed.
`high-limit`	The trigger will activate when the sensor reading rises above the 'High Limit' alarm threshold shown in show system environment, or returns to an acceptable value after being too high, or both. The alarm threshold values are pre-defined within the device and cannot be changed.
`exceeded`	If you chose low-limit, the trigger will trigger if the sensor's reading falls below the low limit. If you chose high-limit, the trigger will trigger if the sensor's reading goes above the high limit.
`cleared`	If you chose low-limit, the trigger will trigger if the sensor's reading rises to above the low limit again. If you chose high-limit, the trigger will trigger if the sensor's reading falls below the high limit again. Some temperature sensors include a hysteresis value and will not clear until the temperature has changed significantly. For example, if a sensor has a high alarm threshold of 75 degrees Celsius, the hysteresis value may mean that the alarm clears when the temperature falls to 63 degrees Celsius.
`any`	The trigger will trigger if the low or high limit is either exceeded or cleared.

Mode Global Configuration

Example To configure trigger 1, which will activate when the internal temperature becomes too high or drops to a low-enough value after being too high, use the following commands. This example monitors the internal temperature of stack member 2, and has a resource ID of 3 and a sensor ID of 8:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config)# type env-sensor node 2 resource 3 sensor 8
high-limit any
```

Related commands show system environment

show trigger

trigger

Command changes Version 5.5.2-1.1: command added

type interface

Overview This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

Syntax

```
type interface <interface> {up|down|any}
```

Parameter	Description
<interface>	Interface name.
up	Activate when interface becomes operational.
down	Activate when the interface closes.
any	Activate when any interface link status event occurs.

Mode Trigger Configuration

Example To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

Related commands show trigger

trigger

type linkmon-probe

Overview Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

Syntax

```
type linkmon-probe <probename> <profilename>
{good|bad|unreachable|any}
```

Parameter	Description
<probename>	The name of the Link Health Monitoring probe that will be used for executing the trigger.
<profilename>	The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable.
`good`	If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.
`bad`	If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.
`unreachable`	If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.
`any`	If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.

Mode Trigger Configuration

Example When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus# trigger 1
awplus(config)# script 1 link-bad.scp
awplus(config)# type linkmon-probe test-probe test-profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus# trigger 2
awplus(config)# script 1 link-good.scp
awplus(config)# type linkmon-probe test-probe test-profile good
```

Related commands trigger

Command changes Version 5.4.8-1.1: command added

type log

Overview Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

Syntax

```
type log <log-message-string>
```

Parameter	Description
<log-message-string>	A string or a regular expression (PCRE) to match a log message or part of a log message.

Default There is no type or log message string set by default.

Mode Trigger Configuration

Usage notes Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

Example To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

Related commands show trigger

trigger

Command changes Version 5.4.7-2.1: command added

type memory

Overview This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax

```
type memory <1-100> [up|down|any]
```

Parameter	Description
<1-100>	The percentage of memory usage at which to trigger.
`up`	Activate when memory usage exceeds the specified level.
`down`	Activate when memory usage drops below the specified level.
`any`	Activate when memory usage passes the specified level in either direction.

Mode Trigger Configuration

Examples To configure trigger `12` to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger `40` to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

Related commands show trigger

trigger

type periodic

Overview This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

Syntax

```
type periodic <1-1440>
```

Parameter	Description
<1-1440>	The number of minutes between activations.

Mode Trigger Configuration

Usage notes A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

For an example trigger configuration that uses the **type periodic** command, see "See Daily Statistics" in the Triggers_Feature Overview and Configuration Guide.

Example To configure trigger `44` to activate periodically at `10` minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

Related commands show trigger

trigger

type ping-poll

Overview This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

Syntax

```
type ping-poll <1-100> {up|down}
```

Parameter	Description
<1-100>	The ping poll ID.
`up`	The trigger activates when ping polling detects that the target is reachable.
`down`	The trigger activates when ping polling detects that the target is unreachable.

Mode Trigger Configuration

Example To configure trigger `106` to activate when ping poll `12` detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

Related commands show trigger

trigger

type reboot

Overview This command configures a trigger that activates when your device is rebooted.

Syntax

```
type reboot
```

Mode Trigger Configuration

Example To configure trigger `32` to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

Related commands show trigger

trigger

type stack disabled-master

Overview This command (configured to the stack) configures a trigger to activate on a stack member if it becomes the disabled master.

A disabled master has the same configuration as the active master, but has all its links shutdown.

Although this command could activate any trigger script, the intention here is that the script will reactivate the links from their previously shutdown state, to enable the user to manage the device. An appropriate trigger script must already exist that will apply the shutdown command on the deactivated links.

CAUTION: *It is important that any ports that are configured as trunked ports across master and stack members are disabled at their stack member termination when operating in the fallback configuration. Otherwise, the trunked ports will not function correctly on the device that is connected downstream.*

If the stack virtual-mac command is enabled, the stack uses a virtual MAC address. The stack will always use this MAC address and the new elected master will still retain the originally configured virtual MAC address. If the **stack virtual-mac** command is disabled, the stack will use the MAC address of the current master. If the stack master fails, the stack MAC address changes to reflect the new master's MAC address. For more information about virtual MAC addresses, see the VCStack Feature Overview and Configuration Guide.

Syntax

```
type stack disabled-master
```

Mode Trigger Configuration

Examples To configure trigger 82 to activate on a device if it becomes the disabled master, use the following commands. These commands enter the Trigger Configuration mode for trigger 82, specify the trigger type, and then specify the script to run.

```
awplus# configure terminal
awplus(config)# trigger 82
awplus(config-trigger)# type stack disabled master
awplus(config-trigger)# script 1 flash:/disabled.scp
awplus(config-trigger)# exit
```

Related commands

stack disabled-master-monitoring

trigger

type stack master-fail

type stack member

type stack link

type stack link

Overview This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a stacking link is either activated or deactivated.

Syntax

```
type stack link {up|down}
```

Parameter	Description
up	Stack link up event
down	Stack link down event

Mode Trigger Configuration

Example To configure trigger 86 to activate when the stack link down event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack link down
```

Related commands

show trigger

trigger

type stack master-fail

type stack master-fail

Overview This command (configured to the stack) initiates the action of a pre-configured trigger to occur when the stack enters the fail-over state.

Syntax

```
type stack master-fail
```

Mode Trigger Configuration

Example To configure trigger 86 to activate when stack master fail-over event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack master-fail
```

Related commands

stack disabled-master-monitoring

trigger

type stack disabled-master

type stack member

type stack link

type stack member

Overview This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a device either joins or leaves the stack.

Syntax

```
type stack member {join|leave}
```

Parameter	Description
`join`	Neighbor join event
`leave`	Neighbor leave event

Mode Trigger Configuration

Example To configure a pre-configured trigger number `86` to activate when a new device joins the stack.

Note that the number 86 has no particular significance: you can assign any (previously created) numbered trigger.

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack member join
```

Related commands

trigger

type stack master-fail

type stack link

type time

Overview This command configures a trigger that activates at a specified time of day.

Syntax

```
type time <hh:mm>
```

Parameter	Description
<hh:mm>	The time to activate the trigger.

Mode Trigger Configuration

Usage A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

Example To configure trigger `86` to activate at `15:53`, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

Related commands show trigger

trigger

type usb

Overview Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

Syntax

```
type usb {in|out}
```

Parameter	Description
`in`	Trigger activates on insertion of a USB storage device.
`out`	Trigger activates on removal of a USB storage device.

Mode Trigger Configuration

Usage notes USB triggers cannot execute script files from a USB storage device.

Examples To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

Overview This command applies the functionality of the **no** debug trigger command.

76 Ping-Polling Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the Ping Polling Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Table 76-1: The following table lists the default values when configuring a ping poll

Default	Value
Critical-interval	1 second
Description	No description
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

Command List

active (ping-polling)

Overview This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the ip (ping-polling) command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

Syntax

```
active
no active
```

Mode Ping-Polling Configuration

Examples To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

Related commands

debug ping-poll

ip (ping-polling)

ping-poll

show ping-poll

clear ping-poll

Overview This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the critical-interval command. The device status changes to reachable once the device responses have reached the up-count.

Syntax

```
clear ping-poll {<1-100>|all}
```

Parameter	Description
<1-100>	A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable.
`all`	Clears the counters and changes the device status of all polling instances.

Mode Privileged Exec

Examples To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

Related commands

active (ping-polling)

ping-poll

show ping-poll

critical-interval

Overview This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the normal-interval command.

The **no** variant of this command sets the critical interval to the default of one second.

Syntax

```
critical-interval <1-65536>
no critical-interval
```

Parameter	Description
<1-65536>	Time in seconds between pings, when the device has failed to a ping, or the device is unreachable.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

Related commands

fail-count

normal-interval

sample-size

show ping-poll

timeout (ping polling)

up-count

debug ping-poll

Overview This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

Syntax

```
debug ping-poll <1-100>
no debug ping-poll {<1-100>|all}
```

Parameter	Description
<1-100>	A unique ping poll ID number.
all	Turn off all ping-poll debugging.

Mode Privileged Exec

Examples To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

Related commands

active (ping-polling)

clear ping-poll

ping-poll

show ping-poll

undebug ping-poll

description (ping-polling)

Overview This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	The description of the target. Valid characters are any printable character and spaces. There is no maximum character length.

Mode Ping-Polling Configuration

Examples To add the text “Primary Gateway” to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

Related commands ping-poll

show ping-poll

fail-count

Overview This command specifies the number of pings that must be unanswered, within the total number of pings specified by the sample-size command, for the ping-polling instance to consider the device unreachable.

If the number set by the sample-size command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the sample-size command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

Syntax

```
fail-count <1-100>
no fail-count
```

Parameter	Description
<1-100>	The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

Related commands

critical-interval

normal-interval

ping-poll

timeout (ping polling)

up-count

ip (ping-polling)

Overview This command specifies the IPv4 address of the device you are polling.

Syntax

```
ip {<ip-address>|<ipv6-address>}
```

Parameter	Description
<ip-address>	An IPv4 address in dotted decimal notation `A.B.C.D`
<ipv6-address>	An IPv6 address in hexadecimal notation `X:X::X:X`

Mode Ping-Polling Configuration

Examples To set ping-poll instance 5 to poll the device with the IP address `192.168.0.1`, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address `2001:db8::`, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

Related commands

ping-poll

source-ip

show ping-poll

length (ping-poll data)

Overview This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

Syntax

```
length <4-1500>
no length
```

Parameter	Description
<4-1500>	The number of data bytes to include in the data portion of the ping packet.

Default The default is 32.

Mode Ping-Polling Configuration

Examples To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping- poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

Related commands ping-poll

show ping-poll

normal-interval

Overview This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

Syntax

```
normal-interval <1-65536>
no normal-interval
```

Parameter	Description
<1-65536>	Time in seconds between pings when the target is reachable.

Default The default is 30 seconds.

Mode Ping-Polling Configuration

Examples To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

show ping-poll

timeout (ping polling)

up-count

ping-poll

Overview This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no-ping poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the ip (ping-polling) command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

Syntax

```
ping-poll <1-100>
no ping-poll <1-100>
```

Parameter	Description
<1-100>	A unique ping poll ID number.

Mode Global Configuration

Examples To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

Related commands

clear ping-poll

debug ping-poll

description (ping-polling)

ip (ping-polling)

length (ping-poll data)

show ping-poll

source-ip

sample-size

Overview This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and fail-count command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the fail-count command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the fail-count value.

The polling instance uses the number of pings specified by the up-count command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

Syntax

```
sample-size <1-100>
no sample size
```

Parameter	Description
<1-100>	Number of pings that determines critical and up counts.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

show counter ping-poll

Overview This command displays the counters for ping polling.

Syntax

```
show counter ping-poll [<1-100>]
```

Parameter	Description
<1-100>	A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls.

Mode User Exec and Privileged Exec

Output Figure 76-1: Example output from the **show counter ping-poll** command

```
Ping-polling counters
Ping-poll: 1
PingsSent              ......... 15
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 0
ErrorSendingPing       ......... 2
CurrentUpCount         ......... 13
CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0

Ping-poll: 2
PingsSent              ......... 15
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 0
ErrorSendingPing       ......... 2
CurrentUpCount         ......... 13
CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0

Ping-poll: 5
PingsSent              ......... 13
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 2
ErrorSendingPing       ......... 2
CurrentUpCount         ......... 9
CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0
```

Table 77: Parameters in output of the **show counter ping-poll** command

Parameter	Description
`Ping-poll`	The ID number of the polling instance.
`PingsSent`	The total number of pings generated by the polling instance.
`PingsFailedUpState`	The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.
`PingsFailedDownState`	Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.
`ErrorSendingPing`	The number of pings that were not successfully sent to the target device. This error can occur when your device does not have a route to the destination.
`CurrentUpCount`	The current number of sequential ping replies.
`CurrentFailCount`	The number of ping requests that have not received a ping reply in the current sample-size window.
`UpStateEntered`	Number of times the target device has entered the Up state.
`DownStateEntered`	Number of times the target device has entered the Down state.

Example To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

Related commands

debug ping-poll

ping-poll

show ping-poll

show ping-poll

Overview This command displays the settings and status of ping polls.

Syntax `show ping-poll [<1-100>|state {up|down}] [brief]`

Parameter	Description	
<1-100>	Displays settings and status for the specified polling instance.	
`state`	Displays polling instances based on whether the device they are polling is currently reachable or unreachable.	
	`up`	Displays polling instance where the device state is reachable.
	`down`	Displays polling instances where the device state is unreachable.
`brief`	Displays a summary of the state of ping polls, and the devices they are polling.	

Mode User Exec and Privileged Exec

Output Figure 76-2: Example output from the **show ping-poll brief** command

```
Ping Poll Configuration
-------------------------------------------------------
Id Enabled State Destination
-------------------------------------------------------
1  Yes     Down  192.168.0.1
2  Yes     Up    192.168.0.100
```

Table 78: Parameters in output of the **show ping-poll brief** command

Parameter	Meaning
Id	The ID number of the polling instance, set when creating the polling instance with the ping-poll command.
Enabled	Whether the polling instance is enabled or disabled.

Table 78: Parameters in output of the **show ping-poll brief** command (cont.)

Parameter	Meaning	
State	The current status of the device being polled:	
	Up	The device is reachable.
	Down	The device is unreachable.
	Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Destination	The IP address of the polled device, set with the ip (ping-polling) command.	

Figure 76-3: Example output from the **show ping-poll** command

```
Ping Poll Configuration
---------------------------------------------------------

Poll 1:
Description                         : Primary Gateway
Destination IP address              : 192.168.0.1
Status                              : Down
Enabled                             : Yes
Source IP address                   : 192.168.0.10
Critical interval                   : 1
Normal interval                     : 30
Fail count                          : 10
Up count                            : 5
Sample size                         : 50
Length                              : 32
Timeout                             : 1
Debugging                           : Enabled
```

```
Poll 2:
Description                          : Secondary Gateway
Destination IP address               : 192.168.0.100
Status                               : Up
Enabled                              : Yes
Source IP address                    : Default
Critical interval                    : 5
Normal interval                      : 60
Fail count                           : 20
Up count                             : 30
Sample size                          : 100
Length                               : 56
Timeout                              : 2
Debugging                            : Enabled
```

Table 79: Parameters in output of the **show ping-poll** command

Parameter	Description	
Description	Optional description set for the polling instance with the description (ping-polling) command.	
Destination IP address	The IP address of the polled device, set with the ip (ping-polling) command.	
Status	The current status of the device being polled:	
	Up	The device is reachable.
	Down	The device is unreachable.
	Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Enabled	Whether the polling instance is enabled or disabled. The active (ping-polling) and active (ping-polling) commands enable and disable a polling instance.	
Source IP address	The source IP address sent in the ping packets. This is set using the source-ip command.	
Critical interval	The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the critical-interval command.	
Normal interval	The time period between pings when the device is reachable. This is set with the normal-interval command.	

Table 79: Parameters in output of the **show ping-poll** command (cont.)

Parameter	Description
`Fail count`	The number of pings that must be unanswered, within the total number of pings specified by the sample-size command, for the polling instance to consider the device unreachable. This is set using the fail-count command.
`Up count`	The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the up-count command.
`Sample size`	The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the sample-size command.
`Length`	The number of data bytes to include in the data portion of the ping packet. This is set using the length (ping-poll data) command.
`Timeout`	The time in seconds that the polling instance waits for a response to a ping packet. This is set using the timeout (ping polling) command.
`Debugging`	Indicates whether ping polling debugging is **Enabled** or **Disabled**. This is set using the debug ping-poll command.

Examples

To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

Related commands

debug ping-poll

ping-poll

source-ip

Overview This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

Syntax

```
source-ip {<ip-address>|<ipv6-address>}
no source-ip
```

Parameter	Description
<ip-address>	An IPv4 address in dotted decimal notation `A.B.C.D`
<ipv6-address>	An IPv6 address in hexadecimal notation `X:X::X:X`

Mode Ping-Polling Configuration

Examples To configure the ping-polling instance 43 to use the source IP address `192.168.0.1` in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address `2001:db8::` in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

Related commands

description (ping-polling)

ip (ping-polling)

length (ping-poll data)

ping-poll

show ping-poll

timeout (ping polling)

Overview This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

Syntax

```
timeout <1-30>
no timeout
```

Parameter	Description
<1-30>	Length of time, in seconds, that the polling instance waits for a response from the polled device.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

show ping-poll

up-count

up-count

Overview This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

Syntax

```
up-count <1-100>
no up-count
```

Parameter	Description
<1-100>	Number of replied pings before an unreachable device is classified as reachable.

Default The default is 30.

Mode Ping-Polling Configuration

Examples To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

77 sFlow Commands

Introduction

Overview This chapter provides an alphabetical reference for sFlow commands.

For more information, see the sFlow Feature Overview and Configuration Guide.

Command List

debug sflow

Overview This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

Syntax

```
debug sflow [interface <port-list>] [sampling][polling]
no debug sflow [interface <port-list>] [sampling][polling]
```

Parameter	Description
`interface`	Interface information.
<port-list>	The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: • a switch port (e.g. `port1.0.12`) • a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.24` • a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.1-1.0.24`.
`sampling`	Debug sFlow sampling for the specified port(s).
`polling`	Debug sFlow polling for the specified port(s).

Default The sFlow sampling and or polling debug is disabled.

Mode Privileged Exec

Examples To enable sFlow debug message logging for polling and sampling on port1.0.1 and port1.0.7, use the commands:

```
awplus# debug sflow interface port1.0.1,port1.0.7 sampling
polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

Related commands show debugging sflow

no debug all

debug sflow agent

Overview This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

Syntax

```
debug sflow agent
no debug sflow agent
```

Default The sFlow agent debug message logging (that is not port specific) is disabled.

Mode Privileged Exec

Example To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

Related commands show debugging sflow

debug sflow

sflow agent

Overview This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then uses this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommended that you set the sFlow® agent IP address to be the **local address** that is configured on the switch. For information on local addresses and how to set them up, see the interface (to configure) command. This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

Syntax

```
sflow agent {ip <ip-address>|ipv6 <ipv6-address>}
no sflow agent {ip|ipv6}
```

Parameter	Description
<ip-address>	The IPv4 address of the switch that is acting as the sFlow agent.
<ipv6-address>	The IPv6 address of the switch that is acting as the sFlow agent. The IPv6 address uses the format X:X::X:X.

Default The sFlow agent address is unset.

Mode Global Configuration

Examples To set the sFlow agent (IPv4) address to `192.0.2.23`, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to `2001:0db8::1`, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

Related commands

show running-config sflow

show sflow

sflow collector

Overview

This command has been deprecated. It has been replaced by the sflow collector id command.

This command sets the sFlow® agent's collector IP address and/or UDP port.

Command changes

Version 5.5.1-1.1: command deprecated.

sflow collector id

Overview Use this command to set the sFlow® agent's collector IP address and optionally the port and maximum datagram size. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address.

Use the **no** variant of this command to remove the configuration for that collector and render it inactive.

Syntax

```
sflow collector id <1-5> ip <ip-address> [port
<1-65535>|max-datagram-size <200-1500>]
sflow collector id <1-5> ipv6 <ipv6-address> [port
<1-65535>|max-datagram-size <200-1500>]
no sflow collector id <1-5>
```

Syntax (VRF-lite)

```
sflow collector id <1-5> ip <ip-address> [vrf <vrf-name>] [port
<1-65535>|max-datagram-size <200-1500>]
no sflow collector id <1-5>
```

Parameter	Description
<ip-address>	IPv4 address of the remote sFlow collector.
<ipv6-address>	IPv6 address of remote sFlow collector. The IPv6 address uses the format X:X::X:X.
vrf	The VRF instance to operate within.
<vrf-name>	The VRF instance name.
port	Destination UDP port for sFlow datagrams sent to the collector.
<1-65535>	UDP port number (default: 6343).
max-datagram-size	The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector.
<200-1500>	The value set for the max-datagram-size.

Default By default the collector does not exist until configured with a valid IP address.

Default (VRF-lite) If no VRF is specified it will operate within the default global VRF.

Mode Global Configuration

Examples To set the address of collector 1 to 192.168.1.36 with default port and max-datagram size, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 1 ip 192.168.1.36
```

To set the address of collector 2 to 12ae::213d::213d::333f and use UDP port 500, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 2 ipv6
12ae::213d::213d::333f port 500
```

To set the address of collector 5 to 10.42.2.70 and use UDP port 7777 and have a max-datagram-size of 800, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 5 ip 10.42.2.70 port 7777
max-datagram-size 800
```

To delete collector 5, use the commands:

```
awplus# configure terminal
awplus(config)# no sflow collector id 5
```

Examples (VRF-lite)

To set the address of collector 4 to 10.0.0.1 with VRF 'red' and port 9000, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 4 ip 10.0.0.1 vrf red port
9000
```

To delete collector 4, use the commands:

```
awplus# configure terminal
awplus(config)# no sflow collector id 4
```

Related commands

show running-config sflow

show sflow

Command changes

Version 5.5.1-1.1: command added.

Version 5.5.2-2.1: VRF parameter added.

sflow collector max-datagram-size

Overview

This command has been deprecated. It has been replaced by the sflow collector id command.

This command sets the maximum size of the sFlow® datagrams sent to the collector.

Command changes

Version 5.5.1-1.1: command deprecated

sflow enable

Overview This command enables sFlow® globally on the switch.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

Syntax

```
sflow enable
no sflow enable
```

Default sFlow is disabled globally on the switch.

Mode Global Configuration

Example To enable sFlow operation, use the command:

```
awplus# configure terminal
awplus(config)# sflow enable
```

Related commands show running-config sflow

show sflow

sflow max-header-size

Overview This command sets the maximum header size of the Ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the Ethernet destination address and excludes the Ethernet FCS fields.

If a sampled Ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

Syntax

```
sflow max-header-size <14-200>
no sflow max-header-size
```

Parameter	Description
<14-200>	The maximum number of header bytes to be sampled.

Default The max-header-size is 128 bytes.

Mode Interface Configuration

Usage notes The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

- For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

  Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

  IPv4 header = 24 bytes

  TCP header = 24 bytes

  Total = 66 bytes

  CAUTION: *For IPv4, any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-66=62 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.*

  For more information, see the sFlow Feature Overview and Configuration Guide.

- A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

  Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

  IPv6 header = 40 bytes

  TCP header = 24 bytes

  Total = 82 bytes

  CAUTION: *For IPv6, any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-82=46 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.*

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

Example To set the maximum header size to 160 bytes for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow max-header-size 160
```

Related commands

sflow max-header-size

sflow polling-interval

Overview This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

Syntax

```
sflow polling-interval {0|<1-16777215>}
no sflow polling-interval
```

Parameter	Description
0	Disable polling (the default).
<1-16777215>	The polling interval in seconds.

Default The polling-interval is 0 (polling disabled).

Mode Interface Configuration

Example To set the polling interval to 60 seconds for ports 1.0.1 and 1.0.7, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow polling-interval 60
```

Related commands show running-config sflow

show sflow interface

sflow sampling-rate

Overview This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received, i.e. one in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified port(s).

The **no** variant of this command applies the default.

Syntax

```
sflow sampling-rate <256-16777215>
no sflow sampling-rate
```

Parameter	Description
<256-16777215>	The sampling rate N, measured in Ethernet frames.

Default The sampling-rate is 0 (sampling disabled).

Mode Interface Configuration

Example To set the sampling rate to 500 for port1.0.1 and port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.3
awplus(config-if)# sflow sampling-rate 500
```

Related commands show running-config sflow

show sflow interface

show debugging sflow

Overview This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

Syntax

```
show debugging sflow [interface <port-list>]
```

Parameter	Description
`interface`	The interface information.
`<port-list>`	The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: • a switch port (e.g. `port1.0.6`) • a continuous range of ports separated by a hyphen, e.g. `port1.0.1-1.0.6` • a comma-separated list of ports and port ranges, e.g. `port1.0.1,port1.0.3-1.0.6`.

Mode User Exec and Privileged Exec

Example To display sFlow debug settings on the agent, and for sampling and polling on ports 1.0.1 to 1.0.9, use the command:

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

Output Figure 77-1: Sample obtained for an sFlow agent

```
awplus# show debugging sflow interface port1.0.1-1.0.9

sFlow Agent Debug:    Enabled

          Sampling      Polling
Port       Debug         Debug
-------------------------------
1.0.1     Enabled       Enabled
1.0.2     Enabled          -
1.0.3        -             -
1.0.4        -             -
1.0.5        -             -
1.0.6        -          Enabled
1.0.7        -             -
1.0.8        -          Enabled
1.0.9        -          Enabled
```

To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

Related commands

show running-config sflow

show sflow interface

show running-config sflow

Overview This command displays the running system information specific to the sFlow feature.

Syntax

```
show running-config sflow
```

Mode Privileged Exec and Global Configuration

Example To display the sFlow running configuration information, use the command:

```
awplus# show running-config sflow
```

Output Figure 77-2: Example output from the **show running-config sflow** command

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.11-port1.0.22
 sflow sampling-rate 512
```

Related commands show running-config

show sflow

Overview This command displays non-port-specific sFlow agent configuration and operational status.

Syntax

```
show sflow
```

Mode Privileged Exec

Example To display sFlow configuration and operational status, use the command:

```
awplus# show sflow
```

Output

Table 1: Example output from the **show sflow** command

```
sFlow Agent Configuration:                    Default Values
  sFlow Admin Status ........ Disabled        [Disabled]
  sFlow Agent Address ....... [not set]       [not set]
  Collector Address ......... 0.0.0.0         [0.0.0.0]
  Collector UDP Port ........ 6343            [6343]
  Tx Max Datagram Size ...... 1200            [1400]

sFlow Agent Status:
  Polling/sampling/Tx ....... Inactive because:
                                - sFlow is disabled
                                - Agent Addr is not set
                                - Collector Addr is 0.0.0.0
                                - Polling & sampling disabled
                                  on all ports
```

Table 2: Parameters in the output of the **show sflow** command

Output Parameter	Description
sFlow Admin Status	Whether sFlow agent operation is administratively enabled.
sFlow Agent Address	The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.
Collector Address	The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0:0::0.0.
Collector UDP Port	The UDP port on the collector to which sFlow datagrams are sent.

Table 2: Parameters in the output of the **show sflow** command (cont.)

Output Parameter	Description
`Tx Max Datagram Size`	The maximum size of the sFlow datagrams sent to the collector.
`Polling/sampling/ Tx`	Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed.

Related commands

show running-config sflow

show sflow interface

show sflow interface

Overview This command displays sFlow agent sampling and polling configuration for all ports or a specified port.

Syntax

```
show sflow interface [<ifrange>]
```

Parameter	Description
<ifrange>	The interface range.

Mode Privileged Exec

Example To display the sFlow sampling and polling configuration for port1.0.1, use the command:

```
awplus# show sflow interface port1.0.1
```

Output Figure 77-3: Example output from the **show sflow interface** command

```
awplus#show sflow interface

sFlow Port Configuration:
  Default Values:
    Sampling Rate ........... 0 pkts (= disabled)
    Max Sample Header Size .. 128 bytes
    Polling Interval ........ 0 secs (= disabled)

               Sampling     Max Header     Polling
                 Rate          Size        Interval
Port         (1 in N pkts)    (bytes)       (secs)
-----------------------------------------------------
port1.0.1            0          128             0
port1.0.2            0          128             0
port1.0.3            0          128             0
...
```

78 MODBUS Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure MODBUS (Modicon Communication Bus).

MODBUS is a serial communications protocol for client-server communication between a switch (server) and a device in the network running MODBUS client software (client). You can use MODBUS to connect a computer to a remote terminal unit (RTU) in supervisory control and data acquisition (SCADA) systems.

The MODBUS feature allows AlliedWare Plus™ devices to be used for some SCADA processes - such as gathering sensor and alarm information and to control and monitor the state of ports and their PoE state.

The device encapsulates a request or response message in a MODBUS TCP application data unit (ADU). A client sends a message to a TCP port on the switch. The default port number is 502.

For more information, see the MODBUS Feature Overview and Configuration Guide.

Command List

clear scada modbus tcp server connection

Overview Use this command to forcefully disconnect a MODBUS client that is currently connected to the MODBUS TCP server.

Syntax

```
clear scada modbus tcp server connection <ip-address> <1-65535>
```

Parameter	Description
<ip-address>	The IPv4 or IPv6 address of the MODBUS TCP server.
<1-65535>	The port ID number.

Mode Privileged Exec

Example To forcefully disconnect a client from the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# clear scada modbus tcp server connection
198.51.100.200 33229
```

Related commands

scada modbus tcp server port

scada modbus tcp server access

clear scada modbus tcp server statistics

show scada modbus tcp server connections

Command changes

Version 5.4.8-2.1: command added

Version 5.4.9-0.1: MODBUS support added for x930, x950 series

Version 5.5.0-1.1: MODBUS support added for IE510 series

clear scada modbus tcp server statistics

Overview Use this command to reset the MODBUS TCP server statistics.

Syntax
```
clear scada modbus tcp server statistics
```

Mode Privileged Exec

Example To clear the MODBUS TCP server statistics, use the following commands:

```
awplus# configure terminal
awplus(config)# clear scada modbus tcp server statistics
```

Related commands

Command changes

Version 5.4.8-2.1: command added

Version 5.4.9-0.1: MODBUS support added for x930, x950 series

Version 5.5.0-1.1: MODBUS support added for IE510 series

scada modbus tcp server access

Overview Use this command to configure the type of requests that are allowed to be made to the MODBUS TCP server.

Use the **no** variant of this command to revert to the default of read-only.

Syntax

```
scada modbus tcp server access {read-only|read-write}
no scada modbus tcp server access
```

Default Read-only.

Mode Global Configuration

Example To allow read and write requests to the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server access read-write
```

To change from read-write access back to the default of read-only, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server access
```

Related commands

Command changes

Version 5.4.8-2.1: command added

Version 5.4.9-0.1: MODBUS support added for x930, x950 series

Version 5.5.0-1.1: MODBUS support added for IE510 series

scada modbus tcp server access permit

Overview Use this command to limit access to a MODBUS TCP server to specific IP addresses.

When no permitted IP addresses are configured, then any IP address can connect to the MODBUS TCP server.

When permitted IP addresses are configured, only those IP addresses will be allowed to connect to the MODBUS TCP server. All other IP addresses will be rejected.

Use the **no** variant of this command to remove an IP address from the list of permitted addresses.

Syntax

```
scada modbus tcp server access permit <ip-address>
no scada modbus tcp server access permit
```

Parameter	Description
<ip-address>	The IPv4 or IPv6 address to permit.

Default No IP addresses are configured.

Mode Global Configuration

Example To allow only 192.168.2.200 to use the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server access permit
192.168.2.200
```

To remove 192.168.2.200 from the permitted MODBUS TCP server client IP addresses, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server access permit
192.168.2.200
```

Related commands

clear scada modbus tcp server connection

clear scada modbus tcp server statistics

show scada modbus tcp server connections

Command changes Version 5.4.9-0.1: command added

Version 5.5.0-1.1: MODBUS support added for IE510 series

scada modbus tcp server connection

Overview Use this command to configure the maximum number of concurrent MODBUS TCP clients allowed to be connected to the MODBUS TCP server.

Use the **no** variant of this command to revert to the default of 1.

Syntax

```
scada modbus tcp server connection <1-5>
no scada modbus tcp server connection
```

Parameter	Description
<1-5>	The maximum number of concurrent MODBUS TCP clients allowed to be connected to the MODBUS TCP server.

Default 1

Mode Global Configuration

Example To configure the maximum limit of MODBUS TCP clients to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server connection 5
```

To reset the maximum limit of the MODBUS TCP clients back to the default of 1, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server connection
```

scada modbus tcp server port

Overview Use this command to set the port of the MODBUS TCP server on a device. Clients will use this port to connect to the MODBUS TCP server.

Use the **no** variant of this command to disable MODBUS TCP.

Syntax

```
scada modbus tcp server port <0-65535>
no scada modbus tcp server
```

Parameter	Description
<0-65535>	The port number of the MODBUS TCP server

Default Port 502

Mode Global Configuration

Example To configure port number 34567 as the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server port 34567
```

To reset the port number of the MODBUS TCP server to the default of 502, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server port
```
